Rev.1.70 Jan, 2022

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall be responsible for determining what licenses are required from any third parties, and obtaining such licenses for the lawful import, export, manufacture, sales, utilization, distribution or other disposal of any products incorporating Renesas Electronics products, if required.
5. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
6. Renesas Electronics products are classified according to the following two quality grades: “Standard” and “High Quality”. The intended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below.
   "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
   "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.
   Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user’s manual or other Renesas Electronics document.
7. No semiconductor product is absolutely secure. Notwithstanding any security measures or features that may be implemented in Renesas Electronics hardware or software products, Renesas Electronics shall have absolutely no liability arising out of any vulnerability or security breach, including but not limited to any unauthorized access to or use of a Renesas Electronics product or a system that uses a Renesas Electronics product. RENESAS ELECTRONICS DOES NOT WARRANT OR GUARANTEE THAT RENESAS ELECTRONICS PRODUCTS, OR ANY SYSTEMS CREATED USING RENESAS ELECTRONICS PRODUCTS WILL BE INVULNERABLE OR FREE FROM CORRUPTION, ATTACK, VIRUSES, INTERFERENCE, HACKING, DATA LOSS OR THEFT, OR OTHER SECURITY INTRUSION (“Vulnerability Issues”). RENESAS ELECTRONICS DISCLAIMS ANY AND ALL RESPONSIBILITY OR LIABILITY ARISING FROM OR RELATED TO ANY VULNERABILITY ISSUES. FURTHERMORE, TO THE EXTENT PERMITTED BY APPLICABLE LAW, RENESAS ELECTRONICS DISCLAIMS ANY AND ALL WARRANTIES, EXPRESS OR IMPLIED, WITH RESPECT TO THIS DOCUMENT AND ANY RELATED OR ACCOMPANYING SOFTWARE OR HARDWARE, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY, OR FITNESS FOR A PARTICULAR PURPOSE.
8. When using Renesas Electronics products, refer to the latest product information (data sheets, user’s manuals, application notes, “General Notes for Handling and Using Semiconductor Devices” in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
12. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
13. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
14. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.
(Note2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.

General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Precaution against Electrostatic Discharge (ESD)
   A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.
2. Processing at power-on
   The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.
3. Input of signal during power-off state
   Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.
4. Handling of unused pins
   Handle unused pins in accordance with the directions given under handling of unused pins in the manual. The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of the LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible.
5. Clock signals
   After applying a reset, only release the reset line after the operating clock signal becomes stable. When switching the clock signal during program execution, wait until the target clock signal is stabilized. When the clock signal is generated with an external resonator or from an external oscillator during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Additionally, when switching to a clock signal produced with an external resonator or by an external oscillator while program execution is in progress, wait until the target clock signal is stable.
6. Voltage application waveform at input pin
   Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between V_{IL} (Max.) and V_{IH} (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between V_{IL} (Max.) and V_{IH} (Min.).
7. Prohibition of access to reserved addresses
   Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.
8. Differences between products
   Before changing from one product to another, for example to a product with a different part number, confirm that the change will not lead to problems. The characteristics of a microprocessing unit or microcontroller unit products in the same group but having a different part number might differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

How to Use This Manual

1. Objective and Target Users

This manual was written to explain the hardware functions and electrical characteristics of this LSI to the target users, i.e. those who will be using this LSI in the design of application systems. Target users are expected to understand the fundamentals of electrical circuits, logic circuits, and microcomputers.
This manual is organized in the following items: an overview of the product, descriptions of the CPU, system control functions, and peripheral functions, electrical characteristics of the device, and usage notes.

When designing an application system that includes this LSI, take all points to note into account.
Points to note are given in their contexts and at the final part of each section, and in the section giving usage notes.

The list of revisions is a summary of major points of revision or addition for earlier versions. It does not cover all revised items. For details on the revised points, see the actual locations in the manual.

The following documents have been prepared for the RZ/T1 Group. Before using any of the documents, please visit our web site to verify that you have the most up-to-date available version of the document.

Document Type	Contents	Document Title	Document No.
Data Sheet	Overview of hardware and electrical characteristics	—	—
User's manual: Hardware	Hardware specifications (pin assignments, memory maps, peripheral specifications, electrical characteristics, and timing charts) and descriptions of operation	RZ/T1 Group User's manual: Hardware	This User's manual
User's manual: Software	Please find this information from the Arm® Ltd. home page.		
Application Note	Examples of applications and sample programs	—	—
Renesas Technical Update	Preliminary report on the specifications of a product, document, etc.	—	—

2. Description of Registers

Each register description includes a bit chart, illustrating the arrangement of bits, and a table of bits, describing the meanings of the bit settings. The standard format and notation for bit charts and tables are described below.

X.X.X ... Register

Address(es): xxxx xxxxxh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	... [1:0]		...4	—	—	—	...0
Value after reset:	x	0	0	0	0	0	0	0

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b0	... 0	... Bit	0: ..... 1: Setting prohibited (3)	R/W (1)
b3 to b1	—	Reserved (2)	The read value is 0. The write value should be 0.	R/W
b4	... 4	... Bit	0: 1:	R
b6, b5	... [1:0]	... Bit	0 0: ..... 0 1: ..... Settings other than above are prohibited (3)	R/(W)*
b7	—	Reserved	The read value is undefined. Writing to this bit has no effect.	R

(1) R/W: The bit or field is readable and writable.
R/(W): The bit or field is readable and writable. However, writing to this bit or field has some limitations. For details on the limitations, see the description or notes of respective registers.
R: The bit or field is readable. Writing to this bit or field has no effect.

(2) Reserved. Make sure to use the specified value when writing to this bit or field; otherwise, the correct operation is not guaranteed.

(3) Setting prohibited. The correct operation is not guaranteed if such a setting is performed.

3. List of Abbreviations and Acronyms

Abbreviation	Full Form
bps	bits per second
CRC	Cyclic Redundancy Check
DMA	Direct Memory Access
DMAC	Direct Memory Access Controller
Hi-Z	High Impedance
I/O	Input/Output
LSB	Least Significant Bit
MSB	Most Significant Bit
NC	Non-Connect
PLL	Phase Locked Loop
PWM	Pulse Width Modulation
UART	Universal Asynchronous Receiver/Transmitter

4. Description of the Access Size

Access size:
8 bits = Byte
16 bits = Word
32 bits = Longword

Table of Contents

300 MHz/450 MHz/600 MHz, MCU with Arm® Cortex®-R4 and -M3*1, on-chip FPU, 498/747/996 DMIPS, up to 1 Mbyte of on-chip extended SRAM, Ethernet MAC, EtherCAT*1, USB 2.0 high-speed, CAN, various communications interfaces such as an SPI multi-I/O bus controller, ΔΣ interface, safety functions, encoder interfaces*1, and security functions*1

Features

■ On-chip 32-bit Arm Cortex-R4 processor
- High-speed realtime control with maximum operating frequency of 300/450/600 MHz
  Capable of 498/747/996 DMIPS (in operation at 300/450/600 MHz)
- On-chip 32-bit Arm Cortex-R4 (revision r1p4)
- Tightly coupled memory (TCM) with ECC: 512 Kbytes/32 Kbytes
- Instruction cache/data cache with ECC: 8 Kbytes per cache
- High-speed interrupt
- The FPU supports addition, subtraction, multiplication, division, multiply-and-accumulate, and square-root operations at single-precision and double-precision.
- Harvard architecture with 8-stage pipeline
- Supports the memory protection unit (MPU)
- Arm CoreSight architecture, includes support for debugging through JTAG and SWD interfaces

■ On-chip 32-bit Arm Cortex-M3 processor (in products incorporating an R-IN engine)
- 150-MHz operating frequency
- On-chip 32-bit Arm Cortex-M3 (revision r2p1)
- RISC Harvard architecture with 3-stage pipeline
- Supports the memory protection unit (MPU)

■ Low power consumption
- Standby mode, sleep mode, and module stop function

■ On-chip extended SRAM
- Up to 1 Mbyte of the on-chip extended SRAM with ECC
- 150 MHz

■ Data transfer
- DMAC: 16 channels × 2 units
- DMAC for the Ethernet controller: 1 channel

■ Event link controller
- Module operations can be started by event signals rather than by interrupt handlers.
- Linked operation of modules is available even while the CPU is in the sleep state.

■ Reset and power supply voltage control
- Four reset sources including a pin reset
- Dual power-voltage configuration: 3.3 V (I/O unit), 1.2 V (internal)

■ Clock functions
- External clock/oscillator input frequency: 25 MHz
- CPU clock frequency: Up to 300/450/600 MHz
- Low-speed on-chip oscillator (LOCO): 240 kHz

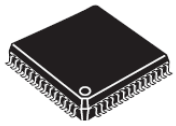
■ Independent watchdog timer
- Operated by a clock signal obtained by frequency-dividing the clock signal from the low-speed on-chip oscillator: Up to 120 kHz

■ Safety functions
- Register write protection, input clock oscillation stop detection, CRC, IWDTa, and A/D self-diagnosis
- An error control module is incorporated to generate a pin signal output, interrupt, or internal reset in response to errors originating in the various modules.

■ Security functions (optional)*2
- Boot mode with security through encryption

■ Encoder interfaces (optional)
- 2 channels*3
- EnDat 2.2, BiSS-C, FA-CODER, A-format, and HIPERFACE DSL-compliant interfaces*4
- Frequency-divided output from an encoder

PRBG0320GA-A 17×17 mm, 0.8-mm pitch



PLQP0176LD-A 20 × 20 mm, 0.4-mm pitch

■ Various communications interfaces
- Ethernet
  - EtherCAT slave controller: 2 ports (optional)
  - Ethernet MAC: 1 port (an Ethernet switch is not used)
    or
  - Ethernet MAC: 1 port (an Ethernet switch to support 2 ports is used)
- USB 2.0 high-speed host/function : 1 channel
- CAN (compliant with ISO11898-1): 2 channels (max.)
- SCIFA with 16-byte transmission and reception FIFOs: 5 channels
- I^2C bus interface: 2 channels for transfer at up to 400 kbps
- RSPIa: 4 channels
- SPIBSC: Provides a single interface for multi-I/O compatible serial flash memory

■ External address space
- Buses for high-speed data transfer at 75 MHz (max.)
- Support for up to 6 CS areas
- 8-, 16-, or 32-bit bus space is selectable per area

■ Up to 33 extended-function timers
- 16-bit TPUa (12 channels), MTU3a (9 channels), GPTa (4 channels): Input capture, output compare, PWM waveform output
- 16-bit CMT (6 channels), 32-bit CMTW (2 channels)

■ Serial sound interface (1 channel)

■ ΔΣ interface
- Up to 4 ΔΣ modulators are connectable externally.

■ 12-bit A/D converters
- 12 bits × 2 units (max.)
  (8 channels for unit 0; 16 channels for unit 1)
- Self diagnosis
- Detection of analog input disconnection

■ Temperature sensor for measuring temperature within the chip

■ General-purpose I/O ports
- 5-V tolerance, open drain, input pull-up

■ Multi-function pin controller
- The locations of input/output functions for peripheral modules are selectable from among multiple pins.

■ Operating temperature range
- Tj = -40°C to +125°C
  Tj: Junction temperature

Note 1. Optional
Note 2. Details of these optional functions will only be disclosed after completion of a binding non-disclosure agreement. For details, contact our sales representative.
Note 3. For use of two channels, use them in combination of any two protocols among EnDat2.2, BiSS-C, FA-CODER, and A-format.
Note 4. BiSS is a registered trademark of iC-Haus GmbH.

1. Overview

1.1 Outline of Specifications

This LSI circuit is a high-performance MCU equipped with the Arm® Cortex®-R4 processor with FPU and Cortex-M3 processor (for products incorporating an R-IN engine), and incorporating integrated peripheral functions necessary for system configuration. Table 1.1 lists the specifications in outline, and Table 1.2 gives a comparison of the functions of products in different packages.

Table 1.1 shows the outline of maximum specifications, and the number of peripheral module channels differs depending on the pin number on the package. For details, see Table 1.2, List of Functions.

Table 1.1 Outline of Specifications (1 / 7)

Classification	Module/Function	Description
CPU	Central processing unit (Cortex-R4)	• Maximum operating frequency 320-pin FBGA: 300 MHz/450 MHz/600 MHz 176-pin HLFQFP: 450 MHz • 32-bit CPU Cortex-R4 designed by Arm (core revision r1p4) • Address space: 4 Gbytes • Instruction cache: 8 Kbytes (with ECC) • Data cache: 8 Kbytes (with ECC) • Tightly coupled memory (TCM) ATCM: 512 Kbytes (with ECC) BTCM: 32 Kbytes (with ECC) • Instruction set: Arm v7-R architecture, so support includes Thumb® and Thumb-2 • Data arrangement Instructions: Little endian Data: Little endian • Memory protection unit (MPU)
	Central processing unit (Cortex-M3) (for products incorporating an R-IN engine)	• Operating frequency: 150 MHz • 32-bit CPU Cortex-M3 designed by Arm (core revision r2p1) • Address space: 4 Gbytes • Instruction set: Arm v7-M architecture, so support includes Thumb® and Thumb-2 • Data arrangement Instructions: Little endian Data: Little endian • Memory protection unit (MPU)
	FPU (Cortex-R4)	• Supports addition, subtraction, multiplication, division, multiply-and-accumulate, and square-root operations at single- and double-precision. • Registers 32-bit single-word registers: 32 bits × 32 (can be used as 16 double-word registers: 64 bits × 16)
Memory	On-chip extended SRAM with ECC	• Capacity: Up to 1 Mbyte • Operating frequency: 150 MHz • SEC-DED (single error correction/double error detection)
Operating modes		• The operating mode can be selected from the following three boot modes SPI boot mode (for booting up from serial flash memory) 16-bit bus boot mode (NOR Flash) 32-bit bus boot mode (NOR Flash)
Clock	Clock generation circuit	• The input clock can be selected from an external clock or external resonator. • Detection of input clock oscillation stopping • The following clocks are generated. CPU clock: 300/450/600 MHz (max.) System clock: 150 MHz (fixed) High-speed peripheral module clock: 150 MHz (fixed) Low-speed peripheral module clock: 75 MHz (fixed) ADCCLK in the 12-bit A/D converter (S12ADCa): 60 MHz (max.) External bus clock: 75 MHz (max.) Low-speed on-chip oscillator: 240 kHz (fixed)
Reset		RES# pin reset, error control module (ECM) reset, software reset

Table 1.1 Outline of Specifications (2 / 7)

Classification	Module/Function	Description
Low power	Low-power consumption function	• Standby mode (Cortex-R4) • Sleep mode (Cortex-M3) (for products incorporating an R-IN engine) • Module stop function
Interrupt	Cortex-R4 vector interrupt controller (VIC)	• Peripheral function interrupts: 290 sources / 292 sources (for products incorporating an R-IN engine) • External interrupts: 20 sources (NMI, IRQ0 to IRQ15, ETH0_INT, ETH1_INT, and ETH2_INT pins) • Software interrupts: 1 source • Non-maskable interrupts: 2 sources • Sixteen levels specifiable for the order of priority
	Cortex-M3 nested-type vector interrupt controller (NVIC) (only included in products incorporating an R-IN engine)	• Peripheral function interrupts: 101 sources • External interrupts: 19 sources (IRQ0 to IRQ15, ETH0_INT, ETH1_INT, and ETH2_INT pins) • Software interrupts: 1 source • Non-maskable interrupts: 1 source • Sixteen levels specifiable for the order of priority
External bus extension	Bus state controller (BSC)	• The external address space is divided into six areas (CS0 to CS5) for management. • The following features settable for each area independently. Bus size (8, 16, or 32 bits): Available sizes depend on the area. Number of access wait cycles (different wait cycles can be specified for read and write access cycles in some areas) Idle wait cycle insertion (between same area access cycles or different area access cycles) Specifying the memory to be connected to each area enables direct connection to SRAM, SRAM with byte selection, SDRAM, and burst ROM (clocked synchronous or asynchronous). The address/data multiplexed I/O (MPX) interface is also available. • Outputs a chip select signal (CS0# to CS5#) according to the target area (CS assert or negate timing can be selected by software) • SDRAM refresh Auto refresh or self-refresh mode selectable • SDRAM burst access
Data transfer	Direct memory access controller (DMAC)	• 2 units (16 channels for unit 0, 16 channels for unit 1) • Transfer modes: Single transfer mode and block transfer mode • Transfer size Unit 0: 1/2/4/16/32/64 bytes Unit 1: 1/2/4/16 bytes • Activation sources: External requests (DREQ0 to DREQ2), external interrupts, on-chip peripheral module requests, and software requests
I/O ports	General-purpose I/O ports	• 320-pin FBGA I/O pins: 209 Input pins: 9 Pull-up/pull-down resistors: 209 5-V tolerance: 9 • 176-pin HLFQFP I/O pins: 97 Input pins: 5 Pull-up/pull-down resistors: 97 5-V tolerance: 5
Event link controller (ELC)		• Up to 103 event signals can be interlinked with the operation of modules. • In particular, the operation of timer modules can be started by input event signals. • Event-linked operation of signals of ports B and E is to be possible.
Multi-function pin controller (MPC)		The locations of input/output functions are selectable from among multiple pins.

Table 1.1 Outline of Specifications (3 / 7)

Classification	Module/Function	Description
Timers	16-bit timer pulse unit (TPUa)	• (16 bits × 6 channels) × 2 units*1 • Maximum 16 lines of pulse input/output × 2 units • Select from among seven or eight counter-input clock signals for each channel (with maximum operating frequency of 75 MHz) • Input capture/output compare function • Counter clear operation (synchronous clearing by compare match/input capture) • Simultaneous writing to multiple timer counters (TCNT) • Simultaneous register input/output by synchronous counter operation • Output of PWM waveforms in up to 15 phases × 2 units in PWM mode • Support for buffered operation, phase-counting mode (two phase encoder input) and cascade-connected operation (32 bits × 4 channels) depending on the channel. • PPG output trigger can be generated (unit 0 only) • Capable of generating conversion start triggers for the A/D converters • Digital noise filtering of signals from the input capture pins • Event linking by the ELC (unit 0 only)
	Multifunction timer pulse unit (MTU3a)	• 9 channels (16 bits × 8 channels, 32 bits × 1 channel) • Maximum of 28 pulse-input/output and 3 pulse-input possible • Select from among 10, 11, 12 or 14 counter-input clock signals for each channel (with maximum operating frequency of 150 MHz) • Input capture function • 39 output compare/input capture registers • Counter clear operation (synchronous clearing by compare match/input capture) • Simultaneous writing to multiple timer counters (TCNT) • Simultaneous register input/output by synchronous counter operation • Buffered operation • Support for cascade-connected operation • Pulse output mode Toggle/PWM/complementary PWM/reset-synchronized PWM • Complementary PWM output mode Outputs non-overlapping waveforms for controlling 3-phase inverters Automatic specification of dead times PWM duty cycle: Selectable as any value from 0% to 100% Delay can be applied to requests for A/D conversion. Non-generation of interrupt requests at crest or trough values of counters can be selected. Double buffer configuration • Reset synchronous PWM mode Three phases of positive and negative PWM waveforms can be output with desired duty cycles. • Phase-counting mode: 16-bit mode (channels 1 and 2); 32-bit mode (channels 1 and 2 in cascade connection) • Counter functionality for dead-time compensation • Generation of triggers for A/D converter conversion • A/D converter start triggers can be skipped • Digital noise filter function for signals on the input capture and external counter clock pins • PPG output trigger can be generated • Event linking by the ELC

Table 1.1 Outline of Specifications (4 / 7)

Classification	Module/Function	Description
Timers	General PWM timer (GPTa)	• 16 bits × 4 channels • Counting up or down (saw-wave), counting up and down (triangle-wave) selectable for all channels • Select from among four counter-input clock signals for each channel (with maximum operating frequency of 150 MHz) • 2 input/output pins per channel • 2 output compare/input capture registers per channel • For the 2 output compare/input capture registers of each channel, 4 registers are provided as buffer registers and are capable of operating as compare registers when buffering is not in use. • In output compare operation, buffer switching can be at crests or troughs, enabling the generation of laterally asymmetrically PWM waveforms. • Registers for setting up frame intervals on each channel (with capability for generating interrupts on overflow or underflow) • Synchronizable operation of the several counters • Modes of synchronized operation (synchronized, or displaced by desired times for phase shifting) • Generation of dead times in PWM operation • Through combination of three counters, generation of automatic three-phase PWM waveforms incorporating dead times • Starting, clearing, and stopping counters in response to external or internal triggers • Internal trigger sources: software, and compare-match • Generation of triggers for A/D converter conversion • Digital noise filter function for signals on the input capture and external trigger pins • Event linking by the ELC
	Programmable pulse generator (PPG)	• (4 bits × 4 groups) × 2 units*1 • Pulse output with the MTU3a or TPUa output as a trigger • Maximum of 32 pulse-output possible
	Compare match timer (CMT)	• (16 bits × 2 channels) × 3 units • Select from among four counter-input clock signals for each channel (with maximum operating frequency of 75 MHz) • Event linking by the ELC (channel 1 of unit 0 only)
	Compare match timer W (CMTW)	• (32 bits × 1 channel) × 2 units • Compare-match, input-capture input, and output-comparison output are available. • Select from among four counter-input clock signals for each channel (with maximum operating frequency of 75 MHz) • Interrupt requests can be output in response to compare-match, input-capture, and output-comparison events. • Digital noise filter function for signals on the input capture pins • Event linking by the ELC
	Watchdog timer (WDTA)	• 14 bits × 1 channel Products incorporating an R-IN engine: 14 bits × 2 channels • Select from among six counter-input clock signals for each channel (with maximum operating frequency of 75 MHz)
	Independent watchdog timer (IWDTa)	• 14 bits × 1 channel • Counter-input clock: Low-speed on-chip oscillator (LOCO)/2 Dedicated clock/1, dedicated clock/16, dedicated clock/32, dedicated clock/64, dedicated clock/128, dedicated clock/256 (with maximum operating frequency of 120 kHz)
	Port output enable 3 (POE3)	• Control of the high-impedance state of the MTU3a / GPTa's waveform output pins • Initiation by inputs on 4 pins, POE0#, POE4#, POE8#, and POE10# • Initiation on detection of short-circuited outputs (detection of simultaneous PWM output to the active level) • Initiation by input clock oscillation-stoppage detection, PLL oscillation abnormality detection, or software • Additional programming of output control target pins is enabled

Table 1.1 Outline of Specifications (5 / 7)

Classification	Module/Function	Description
Communication function	Ethernet MAC (ETHERC)	• 1 port (Use of two ports is possible with the Ethernet switch function) • IEEE802.3 is supported • 10BASE and 100BASE are supported • Full duplex and half duplex are supported • Automatic pause packet transmission function • Auto broadcast suspension function by the pause packet reception • MII/RMII interface is supported
	Ethernet switch	• 2-port PHY interfaces • IEEE802.3 • 10BASE and 100BASE are supported • Full and half duplex • Hardware switching, lookup, and filtering • QoS with frame prioritization • Priority control based on VLAN Priority (IEEE802.1q), which enables priority reassignment • Classification and priority assignment based on IPv4 DiffServ Code Point Field, IPv6 Class of Service • Queue with four priority levels • Multicasting and broadcasting • VLAN frame • IEEE1588 timer module • Cut-through and hub features • Device level ring (DLR)
	EtherCAT Slave Controller (ECATC)*2	• 1 channel (2 ports)*3 • EtherCAT Slave Controller IP core (made by Beckhoff Automation GmbH) implemented
	USB 2.0 HS host/ function module	• 1 port • Compliance with the USB 2.0 specification • Transfer rate High speed (480 Mbps), full speed (12 Mbps) • Communications buffer Incorporates 1 Kbyte of RAM for host mode Incorporates 8 Kbytes of RAM for function mode
	Serial communication interface with FIFO (SCIFA)	• 5 channels • Serial communications modes: Asynchronous, clock synchronous • On-chip baud rate generator allows selection of the desired bit rate • Choice of LSB-first or MSB-first transfer • Both the transmission and reception sections are equipped with 16-byte FIFO buffers, allowing continuous transmission and reception. • Bit rate modulation
	I^2C bus interface (RIICa)	• 2 channels • Supports I^2C bus format • Supports the multi-master • Max. transfer rate: 400 kbps • Event linking by the ELC
	CAN module (RSCAN)	• 2 channels • Compliance with the ISO11898-1 specification (standard frame and extended frame) • Message buffers Max. 64 × 2 channels of reception message buffers, which are used by all channels 16 transmission message buffers per channel • Max. transfer rate: 1 Mbps

Table 1.1 Outline of Specifications (6 / 7)

Classification	Module/Function	Description
Communication function	Serial peripheral interface (RSPIa)	• 4 channels • RSPI transfer facility Using the MOSI (master out slave in), MISO (master in slave out), SSL (slave select), and RSPCK (RSPI clock) signals enables serial transfer through SPI operation (four lines) or clock-synchronous operation (three lines) Capable of handling serial transfer as a master or slave • Data formats Switching between MSB first and LSB first The number of bits in each transfer can be changed to any number of bits from 8 to 16, or 20, 24, or 32 bits. 128-bit buffers for transmission and reception Up to four frames can be transmitted or received in a single transfer operation (with each frame having up to 32 bits) • Buffered structure Double buffers for both transmission and reception • RSPCK can be stopped automatically with the reception buffer full for master reception • Event linking by the ELC
	SPI multi I/O bus controller (SPIBSC)	• 1 channel • One serial flash memory with multiple I/O bus sizes (single/dual/quad) can be connected. • External address space read mode (built-in read cache) • SPI operating mode • Clock polarity and clock phase can be selected. • Maximum transfer rate: 300 Mbps (for quad)
Serial sound interface (SSI)		• 1 channel • Duplex communication • Support of various serial audio formats • Support of master and slave functions • Generation of serial bit clock • Support of 8, 16, 18, 20, 22, 24, and 32-bit data formats • Support of eight-stage FIFO for transmission and reception • Support of WS continue mode in which the SSIWS signal is not stopped.
ΔΣ interface (DSMIF)		• 4 channels (unit 0: 3 channels, unit 1: 1 channel) • Up to 4 ΔΣ modulators are externally connectable • Sync filter can be selected as first, second, or third order
12-bit A/D converter (S12ADCa)		• 12 bits × 2 units (unit 0: 8 channels, unit 1: 16 channels)*1 • 12-bit resolution • Conversion time Unit 0: 0.483 µs per channel Unit 1: 0.883 µs per channel • Operating mode Scan mode (single scan mode, continuous scan mode, or group scan mode) Group A priority control (only for group scan mode) • Sample-and-hold function Common sample-and-hold circuit included In addition, channel-dedicated sample-and-hold function (4 channels: in unit 0 only) included • Sampling variable Sampling time can be set up for each channel • Self-diagnostic function The self-diagnostic function internally generates three analog input voltages (unit 0: VREFL0, VREFH0 × 1/2, VREFH0; unit 1: VREFL1, VREFH1 × 1/2, VREFH1) • Double trigger mode (A/D conversion data duplicated) • Detection of analog input disconnection • Three ways to start A/D conversion Software trigger, timer (MTU3a, GPTa, TPUa) trigger, external trigger • Event linking by the ELC
Temperature sensor		• 1 channel • Relative precision: ±1°C • The voltage of the temperature is converted into a digital value by the 12-bit A/D converter (unit 0).

Table 1.1 Outline of Specifications (7 / 7)

Classification	Module/Function	Description
Safety	Register write protection function	Protects important registers from being overwritten in cases where a program runs out of control.
	CRC calculator (CRC)	• CRC code generation for arbitrary amounts of data in 8-, 16-, or 32-bit units • Select any of four generating polynomials: $X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X + 1$ (32-Ethernet), $X^{16} + X^{12} + X^5 + 1$ (16-CCITT), $X^8 + X^4 + X^3 + X^2 + 1$ (8-SAEJ1850), $X^8 + X^5 + X^3 + X^2 + X + 1$ (8-0x2F)
	Input clock oscillation stop function	Input clock oscillation stop detection: Available
	Clock monitor circuit (CLMA)	Monitors the abnormal output clock frequency from the PLL circuit or low-speed on-chip oscillator.
	Data operation circuit (DOC)	The function to compare, add, or subtract 16-bit data
	Error control module (ECM)	• Generates an interrupt, internal reset, or error output for the error signal input from each module. • Time-out function • The error control is duplicated in the master and the checker.
Security	Secure boot mode*4	As an option, a boot mode with encryption as a security function is available.
Encoder interfaces*5		• 2 channels*6 • EnDat 2.2, BiSS-C, FA-CODER, A-format, and HIPERFACE DSL-compliant interfaces • Frequency-divided output from an encoder
Power supply voltage		VDD = PLLVDD0 = PLLVDD1 = DVDD_USB = 1.14 to 1.26 V VCCQ33 = AVCC0 = AVCC1 = VREFH0 = VREFH1 = VDD33_USB = 3.0 to 3.6 V
Operating temperature		Tj = -40 to +125°C
Package		320-pin FBGA: 17 × 17 mm, 0.8-mm pitch PRBG0320GA-A 176-pin HLFQFP: 20 × 20 mm, 0.4-mm pitch PLQP0176LD-A
Debugging interface		• CoreSight architecture designed by Arm • Debugging function by the JTAG/SWD interface, and trace function by the trace port/ SWV interface

Note 1. One unit for 176-pin devices (only unit 0 is provided)
Note 2. EtherCAT is a registered trademark of Beckhoff Automation GmbH, Germany. (optional)
Note 3. Not included in 176-pin devices.
Note 4. See Table 1.3, List of Products, for the products that have the secure boot mode. Details of these optional functions will only be disclosed after completion of a binding non-disclosure agreement. For details, contact our sales representative.
Note 5. This applies to the devices with the encoder interfaces. For details, contact our sales representative.
Note 6. For use of two channels, use them in combination of any two protocols among EnDat2.2, BiSS-C, FA-CODER, and A-format.

Table 1.2 Comparison of Functions for Different Packages

Module/Function		RZ/T1 Group		
		320 Pins		
		R-IN Engine Incorporated	R-IN Engine Not-Incorporated	176 Pins
External bus	External bus width	32 bits		
Interrupt	External interrupt	NMI, IRQ0 to IRQ15, ETH0_INT, ETH1_INT, ETH2_INT		NMI, IRQ0 to IRQ15, ETH0_INT, ETH1_INT
DMA	DMA controller (DMAC)	ch0 to ch31		
Timers	16-bit timer pulse unit (TPUa)	ch0 to ch11 (Unit 0, Unit 1)		ch0 to ch5 (Unit 0)
	Multi-function timer pulse unit 3 (MTU3a)	ch0 to ch8		
	General-purpose PWM timer (GPTa)	ch0 to ch3		
	Port output enable 3 (POE3)	Available		
	Programmable pulse generator (PPG)	Unit 0, Unit 1		Unit 0
	Compare match timer (CMT)	ch0 to ch5		
	Compare match timer W (CMTW)	ch0, ch1		
	Watchdog timer (WDTA)	ch0, ch1	ch0	
	Independent watchdog timer (IWDTa)	Available		
Communication function	Ethernet controller (ETHERC)	1 port*1		
	EtherCAT slave controller (ECATC)	2 ports*1	2 ports*1 (optional)	Not supported
	USB 2.0 HS host/function module (USB)	ch0		
	Serial communications interface with FIFO (SCIFA)	ch0 to ch4		
	I2C bus interface (RIICa)	ch0, ch1		
	Serial peripheral interface (RSPIa)	ch0 to ch3		
	CAN module (RSCAN)	ch0, ch1		
	SPI multi I/O bus controller (SPIBSC)	ch0		
Serial sound interface (SSI)		ch0		
ΔΣ interface (DSMIF)		ch0 to ch3		
12-bit A/D converter (S12ADCa)		AN000 to AN007 (unit 0) AN100 to AN115 (unit 1)		AN000 to AN007 (unit 0)
Temperature sensor		Available		
CRC calculator (CRC)		Available		
Data operation circuit (DOC)		Available		
Clock monitor circuit (CLMA)		Available		
Secure boot mode*2		Optional		
Event link controller (ELC)		Available		
Encoder interfaces*3		Optional		Not supported

Note 1. Combining the Ethernet controller and the EtherCAT slave controller (optional) makes a total of three ports. The Ethernet controller can support two ports with the use of the Ethernet switch.
Note 2. See Table 1.3, List of Products for the products that have the secure boot mode. Details of these optional functions will only be disclosed after completion of a binding non-disclosure agreement. For details, contact our sales representative.
Note 3. For details, contact our sales representative.

1.2 List of Products

Table 1.3 is a list of products.

Table 1.3 List of Products (1 / 2)

Part No.	Package	CPU	On-Chip Extended SRAM Capacity	EtherCAT	Operating Frequency (max.)	Security Function *1	Optional Function
R7S910001CFP	176 pins (PLQP0176LD-A)	Cortex-R4	Not supported	Not supported	450 MHz	Not supported	—
R7S910101CFP	176 pins (PLQP0176LD-A)	Cortex-R4	Not supported	Not supported	450 MHz	Available	—
R7S910002CBG	320 pins (PRBG0320GA-A)	Cortex-R4	Not supported	Not supported	450 MHz	Not supported	—
R7S910102CBG	320 pins (PRBG0320GA-A)	Cortex-R4	Not supported	Not supported	450 MHz	Available	—
R7S910006CBG	320 pins (PRBG0320GA-A)	Cortex-R4	1 Mbyte	Not supported	450 MHz	Not supported	—

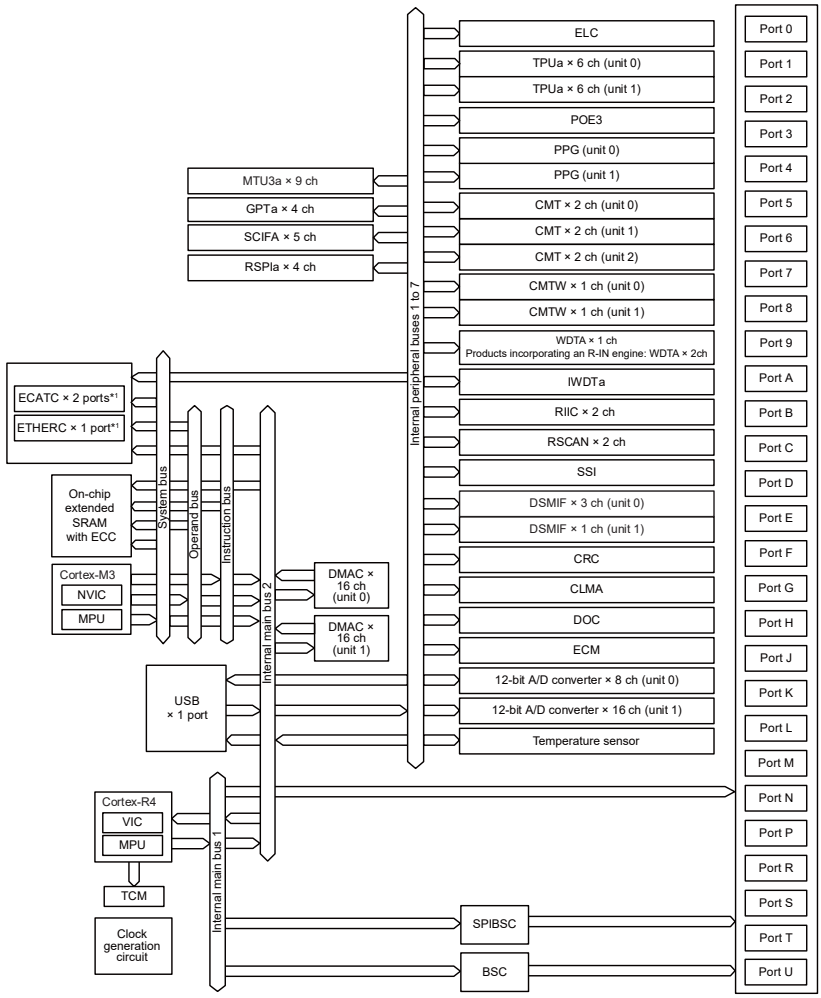
Note: See the separate documents regarding the encoder I/F.

Note 1. Details of these optional functions will only be disclosed after completion of a binding non-disclosure agreement. For details, contact our sales representative.

1.3 Block Diagram

Figure 1.1 shows a block diagram of a 320-pin device.



ETHERC:	Ethernet controller
ECATC:	EtherCAT slave controller
DMAC:	DMA controller
BSC:	Bus state controller
SPIBSC:	SPI multi I/O bus controller
WDTA:	Watchdog timer
IWDTa:	Independent watchdog timer
SCIFA:	Serial communication interface with FIFO
RSPIa:	Serial peripheral interface
USB:	USB 2.0 HS host/function module
VIC:	Vector interrupt controller
NVIC:	Nested-type vector interrupt controller
MPU:	Memory protection unit
ELC:	Event link controller
TPUa:	16-bit timer pulse unit
MTU3a:	Multi-function timer pulse unit 3
POE3:	Port output enable 3

GPTa:	General-purpose PWM timer
PPG:	Programmable pulse generator
CMT:	Compare match timer
CMTW:	Compare match timer W
RIICa:	I^2C bus interface
RSCAN:	CAN module
SSI:	Serial sound interface
DSMIF:	ΔΣ interface
CRC:	CRC (cyclic redundancy check) calculator
CLMA:	Clock monitor circuit
DOC:	Data operation circuit
ECM:	Error control module

Note 1. Combining the Ethernet controller and the EtherCAT slave controller (optional) makes a total of three ports. The Ethernet controller can support two ports with the use of the Ethernet switch.

Figure 1.1 Block Diagram

1.4 Pin Functions

Table 1.4 lists the pin functions.

Table 1.4 Pin Functions (1 / 7)

Classifications	Pin Name	I/O	Description
Power supply	VDD	Input	Power supply pin. Connect this pin to the system power supply.
	VSS	Input	Ground pin. Connect this pin to the system power supply (0 V).
	VCCQ33	Input	Power supply pin for I/O pins
	PLLVDD0, PLLVDD1	Input	Power supply pins for the on-chip PLL oscillator
	PLLVSS0, PLLVSS1	Input	Ground pins for the on-chip PLL oscillator. Connect these pins to the system power supply (0 V).
Clock	XTAL	Output	Connected to a crystal resonator. An external clock signal may also be input to the EXTAL pin.
	EXTAL	Input	
	CKIO	Output	Outputs the external bus clock for external devices.
	AUDIO_CLK	Input	Inputs the external clock for audio.
	CLKOUT25M0, CLKOUT25M1, CLKOUT25M2	Output	Output the external clock for Ethernet PHY.
Operating mode control	MD0 to MD2	Input	Input the operating mode select signal.
System control	RES#	Input	Reset signal input pin. This LSI enters the reset state when this signal goes low.
	BSCANP	Input	Inputs the boundary scan enable signal. Boundary scan is enabled when this pin goes high. When not used, it should be driven low.
	OSCTH	Input	Inputs the clock input mode select signal. When an external clock is input, this pin should be driven high. When a crystal resonator is connected, it should be driven low.
	ERROROUT#	Output	Outputs the error signal from the error control module (ECM).
	RSTOUT#	Output	Outputs the reset signal externally.
Debugging interface	TRST#	Input	Test reset pin for on-chip emulator
	TMS	I/O	Test mode select pin for on-chip emulator
	TDI	Input	Test data input pin for on-chip emulator
	TDO	Output	Test data output pin for on-chip emulator
	TCK	Input	Test clock pin for on-chip emulator
	TRACECLK	Output	Outputs the clock for synchronization with the trace data.
	TRACECTL	Output	Outputs the enable signal for trace control.
	TRACEDATA0 to TRACEDATA7	Output	Output the trace data.

Table 1.4 Pin Functions (2 / 7)

Classifications	Pin Name	I/O	Description
Bus state controller (BSC)	A25 to A0	Output	Output the address.
	D31 to D0	I/O	Input and output the data.
	CS0# to CS5#	Output	Output the chip select signal for the external memory or device.
	RD#	Output	Outputs the strobe signal which indicates reading is in progress.
	RD/WR#	Output	Outputs the strobe signal which indicates the read or write access.
	BS#	Output	Outputs the status signal which indicates the start of bus cycles.
	AH#	Output	Outputs the address hold signal for the device that uses the multiplexed I/O bus.
	WAIT#	Input	Inputs the external wait control signal which inserts a wait cycle into the bus cycles.
	WE0#	Output	Outputs the write strobe signal to D7 to D0.
	WE1#	Output	Outputs the write strobe signal to D15 to D8.
	WE2#	Output	Outputs the write strobe signal to D23 to D16.
	WE3#	Output	Outputs the write strobe signal to D31 to D24.
	DQMLL	Output	Outputs the data mask enable signal to D7 to D0 when SDRAM is connected.
	DQMLU	Output	Outputs the data mask enable signal to D15 to D8 when SDRAM is connected.
	DQMUL	Output	Outputs the data mask enable signal to D23 to D16 when SDRAM is connected.
	DQMUU	Output	Outputs the data mask enable signal to D31 to D24 when SDRAM is connected.
	RAS#	Output	Outputs the low-address strobe signal to the SDRAM. This pin should be connected to the RAS# pin on the SDRAM.
	CAS#	Output	Outputs the column-address strobe signal to the SDRAM. This pin should be connected to the CAS# pin on the SDRAM.
	CKE	Output	Outputs the clock enable signal to the SDRAM. This pin should be connected to the CKE pin on the SDRAM.
Direct memory access controller (DMAC)	DREQ0 to DREQ2	Input	Input the DMA transfer request signal from the external device.
	DACK0 to DACK2	Output	Output the acknowledge signal which indicates acceptance of the DMA transfer request from the external device.
	TEND0 to TEND2	Output	Output the DMA transfer end signal.
Interrupt	NMI	Input	Inputs the non-maskable interrupt request signal.
	IRQ0 to IRQ15	Input	Input the external interrupt request signal.
	ETH0_INT, ETH1_INT, ETH2_INT	Input	Input the Ethernet PHY interrupt request signal.

Table 1.4 Pin Functions (3 / 7)

Classifications	Pin Name	I/O	Description
Multi-function timer pulse unit 3 (MTU3a)	MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D	I/O	MTU0.TGRA to MTU0.TGRD input capture input/output compare output/PWM output pins
	MTIOC1A, MTIOC1B	I/O	MTU1.TGRA and MTU1.TGRB input capture input/output compare output/PWM output pins
	MTIOC2A, MTIOC2B	I/O	MTU2.TGRA and MTU2.TGRB input capture input/output compare output/PWM output pins
	MTIOC3A, MTIOC3B, MTIOC3C, MTIOC3D	I/O	MTU3.TGRA to MTU3.TGRD input capture input/output compare output/PWM output pins
	MTIOC4A, MTIOC4B, MTIOC4C, MTIOC4D	I/O	MTU4.TGRA to MTU4.TGRD input capture input/output compare output/PWM output pins
	MTIC5U, MTIC5V, MTIC5W	Input	MTU5.TGRU, MTU5.TGRV, and MTU5.TGRW input capture input/ dead time compensation input pins
	MTIOC6A, MTIOC6B, MTIOC6C, MTIOC6D	I/O	MTU6.TGRA to MTU6.TGRD input capture input/output compare output/PWM output pins
	MTIOC7A, MTIOC7B, MTIOC7C, MTIOC7D	I/O	MTU7.TGRA to MTU7.TGRD input capture input/output compare output/PWM output pins
	MTIOC8A, MTIOC8B, MTIOC8C, MTIOC8D	I/O	MTU8.TGRA to MTU8.TGRD input capture input/output compare output
	MTCLKA, MTCLKB, MTCLKC, MTCLKD	Input	External clock input pins for MTU3a
Port output enable 3 (POE3)	POE0#, POE4#, POE8#, POE10#	Input	Input the request signal to place the MTU3a or GPTa in the high impedance state.
General-purpose PWM timer (GPTa)	GTIOC0A, GTIOC0B	I/O	GPT0.GTCCRA and GPT0.GTCCRB input capture input/output compare output/PWM output pins
	GTIOC1A, GTIOC1B	I/O	GPT1.GTCCRA and GPT1.GTCCRB input capture input/output compare output/PWM output pins
	GTIOC2A, GTIOC2B	I/O	GPT2.GTCCRA and GPT2.GTCCRB input capture input/output compare output/PWM output pins
	GTIOC3A, GTIOC3B	I/O	GPT3.GTCCRA and GPT3.GTCCRB input capture input/output compare output/PWM output pins
	GTETRG	Input	External trigger input pin for GPTa

Table 1.4 Pin Functions (4 / 7)

Classifications	Pin Name	I/O	Description
16-bit timer pulse unit (TPUa)	TIOCA0, TIOCB0, TIOCC0, TIOCD0	I/O	TGRA0 to TGRD0 input capture input/output compare output/ PWM output pins
	TIOCA1, TIOCB1	I/O	TGRA1 and TGRB1 input capture input/output compare output/ PWM output pins
	TIOCA2, TIOCB2	I/O	TGRA2 and TGRB2 input capture input/output compare output/ PWM output pins
	TIOCA3, TIOCB3, TIOCC3, TIOCD3	I/O	TGRA3 to TGRD3 input capture input/output compare output/ PWM output pins
	TIOCA4, TIOCB4	I/O	TGRA4 and TGRB4 input capture input/output compare output/ PWM output pins
	TIOCA5, TIOCB5	I/O	TGRA5 and TGRB5 input capture input/output compare output/ PWM output pins
	TCLKA, TCLKB, TCLKC, TCLKD	Input	External clock input pins for TPUa (unit 0)
	TIOCA6, TIOCB6, TIOCC6, TIOCD6	I/O	TGRA6 to TGRD6 input capture input/output compare output/ PWM output pins
	TIOCA7, TIOCB7	I/O	TGRA7 and TGRB7 input capture input/output compare output/ PWM output pins
	TIOCA8, TIOCB8	I/O	TGRA8 and TGRB8 input capture input/output compare output/ PWM output pins
	TIOCA9, TIOCB9, TIOCC9, TIOCD9	I/O	TGRA9 to TGRD9 input capture input/output compare output/ PWM output pins
	TIOCA10, TIOCB10	I/O	TGRA10 and TGRB10 input capture input/output compare output/ PWM output pins
	TIOCA11, TIOCB11	I/O	TGRA11 and TGRB11 input capture input/output compare output/ PWM output pins
	TCLKE, TCLKF, TCLKG, TCLKH	Input	External clock input pins for TPUa (unit 1)
Programmable pulse generator (PPG)	PO0 to PO31	Output	Pulse output pins
Compare match timer W (CMTW)	TIC0 to TIC3	Input	CMTW input capture input pins
	TOC0 to TOC3	Output	CMTW output compare output pins
Serial communication interface with FIFO (SCIFA)	SCK0 to SCK4	I/O	Clock I/O pins
	RXD0 to RXD4	Input	Input the receive data.
	TXD0 to TXD4	Output	Output the transmit data.
	CTS0# to CTS4#	I/O	Hardware flow control input (transmission enable signal)/general output
	RTS0# to RTS4#	Output	Hardware flow control output (transmission request signal)/general output
I^2C bus interface (RIICa)	SCL0, SCL1	I/O	Clock I/O pins. The bus can be directly driven by the N-channel open drain.
	SDA0, SDA1	I/O	Data I/O pins. The bus can be directly driven by the N-channel open drain.

Table 1.4 Pin Functions (5 / 7)

Classifications	Pin Name	I/O	Description
Ethernet controller (ETHERC)	ETH0_TXC, ETH1_TXC, ETH2_TXC	Input	Input the 10 M/100 M transmission clock (2.5 MHz/25 MHz).
	ETH0_TXEN, ETH1_TXEN, ETH2_TXEN	Output	Output the transmission enable signal.
	ETH0_TXER, ETH1_TXER, ETH2_TXER	Output	Output the transmission error signal.
	ETH0_TXD0 to 3, ETH1_TXD0 to 3, ETH2_TXD0 to 3	Output	Output the transmission data signal.
	ETH0_RXC, ETH1_RXC, ETH2_RXC	Input	Receive clock input pins
	ETH0_RXDV, ETH1_RXDV, ETH2_RXDV	Input	Input the receive data enable signal.
	ETH0_RXER, ETH1_RXER, ETH2_RXER	Input	Input the receive data error signal.
	ETH0_RXD0 to 3, ETH1_RXD0 to 3, ETH2_RXD0 to 3	Input	Input the receive data signal.
	ETH0_CRS, ETH1_CRS, ETH2_CRS	Input	Input the carrier sense signal.
	ETH0_COL, ETH1_COL, ETH2_COL	Input	Input the collision detection signal.
	ETH_MDC, MII2_MDC	Output	Output the management interface clock.
	ETH_MDIO, MII2_MDIO	I/O	Management data signal I/O pins
	PHYLINK0, PHYLINK1	Input	Input the PHY Link signal.
	ETHSWSECOUT	Output	Outputs the Ethernet switch SYNCOUT signal.
	PHYRESETOUT#, PHYRESETOUT2#	Output	Output the PHY RESET signal (PHYRESETOUT#: for Ether0 and Ether1, PHYRESETOUT2#: for Ether2)
EtherCAT slave controller (ECATC) (optional)	CATLEDRUN	Output	Outputs the EtherCAT RUN LED signal.
	CATIRQ	Output	Outputs the EtherCAT IRQ signal.
	CATLEDSTER	Output	Outputs the EtherCAT Dual-color state LED signal.
	CATLEDERR	Output	Outputs the EtherCAT error LED signal.
	CATLINKACT0, CATLINKACT1	Output	Output the EtherCAT link/activity LED signal.
	CATSYNC0, CATSYNC1	Output	Output the EtherCAT SYNC signal.
	CATLATCH0	Input	Input the EtherCAT LATCH signal.
	CATLATCH1	Input	Input the EtherCAT LATCH signal.
	CATI2CCLK	Output	Outputs the EtherCAT EEPROM I^2C clock signal.
	CATI2CDATA	I/O	Inputs/outputs the EtherCAT EEPROM I^2C data signal.

Table 1.4 Pin Functions (6 / 7)

Classifications	Pin Name	I/O	Description
USB 2.0 host/function module	VDD33_USB	Input	Power supply input pin for USB
	VSS_USB	Input	Ground input pin for USB
	DVDD_USB	Input	Digital power supply input pin for USB
	USB_RREF	Input	Reference current input pin for USB. Connect this pin to the VSS_USB pin via 200 Ω (±1%).
	USB_DP	I/O	USB bus D+ data I/O pin
	USB_DM	I/O	USB bus D- data I/O pin
	USB_VBUSEN	Output	Outputs the VBUS power enable signal for USB.
	USB_OVRCUR	Input	Inputs the overcurrent signal for USB.
	USB_VBUSIN	Input	USB cable connection/disconnection detection input pin
CAN module (RSCAN)	CRXD0, CRXD1	Input	Receive data input pins
	CTXD0, CTXD1	Output	Transmit data output pins
Serial peripheral interface (RSPIa)	RSPCK0 to RSPCK3	I/O	Clock I/O pins
	MOSI0 to MOSI3	I/O	Master transmit data I/O pins
	MISO0 to MISO3	I/O	Slave transmit data I/O pins
	SSL00, SSL10, SSL20, SSL30	I/O	Slave select signal I/O pins
	SSL01, SSL02, SSL03, SSL11	Output	Slave select signal output pins
SPI multi I/O bus controller (SPIBSC)	SPBCLK	Output	Clock output pin
	SPBSSL	Output	Slave select signal output pin
	SPBMO/SPBIO0	I/O	Master transmit data/data 0 I/O pin
	SPBMI/SPBIO1	I/O	Master input data/data 1 I/O pin
	SPBIO2, SPBIO3	I/O	Data 2, data 3 I/O pins
Serial sound interface (SSI)	SSISCK0	I/O	SSI serial bit clock I/O pin
	SSIWS0	I/O	Word select I/O pin
	SSITXD0	Output	Serial data output pin
	SSIRXD0	Input	Serial data input pin
	AUDIO_CLK	Input	Master clock pin for audio
ΔΣ interface (DSMIF)	MCLK0 to MCLK3	I/O	Clock I/O pins
	MDAT0 to MDAT3	Input	Data input pins
12-bit A/D converter (S12ADCa)	AN000 to AN007, AN100 to AN115	Input	Analog input pins for A/D converter
	ADTRG0, ADTRG1	Input	External trigger input pins for the start of A/D conversion
	AN1_ANEX0	Output	Extended analog outpu pin
	AN1_ANEX1	Input	Extended analog input pin
Analog power supply	AVCC0	Input	Analog power supply input pin for the 12-bit A/D converter (unit 0). Connect this pin to the VCCQ33 pin if the 12-bit A/D converter is not to be used.
	AVSS0	Input	Analog ground input pin for the 12-bit A/D converter (unit 0). Connect this pin to the VSS pin if the 12-bit A/D converter is not to be used.
	VREFH0	Input	Reference power supply input pin for the 12-bit A/D converter (unit 0). Connect this pin to the VCCQ33 pin if the 12-bit A/D converter is not to be used.
	VREFL0	Input	Reference ground pin for the 12-bit A/D converter (unit 0). Connect this pin to the VSS pin if the 12-bit A/D converter is not to be used.

Table 1.4 Pin Functions (7 / 7)

Classifications	Pin Name	I/O	Description
Analog power supply	AVCC1	Input	Analog power supply input pin for the 12-bit A/D converter (unit 1). Connect this pin to the VCCQ33 pin if the 12-bit A/D converter is not to be used.
	AVSS1	Input	Analog ground input pin for the 12-bit A/D converter (unit 1). Connect this pin to the VSS pin if the 12-bit A/D converter is not to be used.
	VREFH1	Input	Reference power supply input pin for the 12-bit A/D converter (unit 1). Connect this pin to the VCCQ33 pin if the 12-bit A/D converter is not to be used.
	VREFL1	Input	Reference ground pin for the 12-bit A/D converter (unit 1). Connect this pin to the VSS pin if the 12-bit A/D converter is not to be used.
I/O ports	P00 to P07	I/O	8-bit I/O pin
	P10 to P17	I/O	8-bit I/O pin
	P20 to P27	I/O	8-bit I/O pins
	P30 to P37	Input, I/O	1-bit input pin (P30), 7-bit I/O pins (P31 to P37) I/O pins
	P40 to P47	I/O	8-bit I/O pins
	P50 to P56	I/O	7-bit I/O pins
	P60 to P67	I/O	8-bit I/O pins
	P70 to P77	I/O	8-bit I/O pins
	P80 to P87	I/O	8-bit I/O pins
	P90 to P97	I/O	8-bit I/O pins
	PA0 to PA7	I/O	8-bit I/O pins
	PB0 to PB7	I/O	8-bit I/O pins
	PC0 to PC7	Input	8-bit input pins
	PD0 to PD7	I/O	8-bit I/O pins
	PE0 to PE7	I/O	8-bit I/O pins
	PF5 to PF7	I/O	3-bit I/O pins
	PG0 to PG7	I/O	8-bit I/O pins
	PH0 to PH7	I/O	8-bit I/O pins
	PJ0 to PJ7	I/O	8-bit I/O pins
	PK0 to PK7	I/O	8-bit I/O pins
	PL0 to PL7	I/O	8-bit I/O pins
	PM0 to PM7	I/O	8-bit I/O pins
	PN0 to PN7	I/O	8-bit I/O pins
	PP0 to PP7	I/O	8-bit I/O pins
	PR0 to PR7	I/O	8-bit I/O pins
	PS0 to PS7	I/O	8-bit I/O pins
	PT0 to PT7	I/O	8-bit I/O pins
	PU0 to PU7	I/O	8-bit I/O pins
Encoder I/F*1	ENCIF00 to ENCIF12	I/O	I/O pins for multi-protocol encoder interface

Note 1. Only in products with the encoder interfaces.

1.5 Pin Assignments

Figure 1.2 and Figure 1.3 show the pin arrangement. Table 1.5 and Table 1.6 show the pin assignments. Table 1.7 and Table 1.8 show the lists of pin functions.

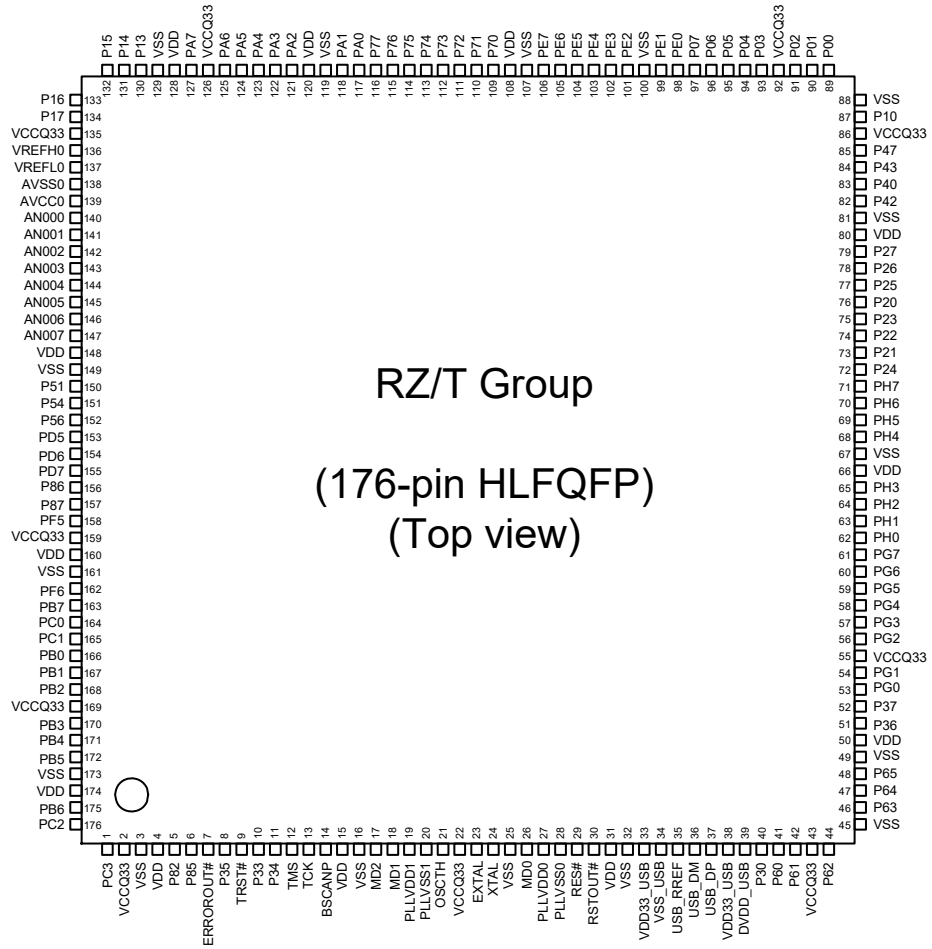
Figure 1.2 Pin Arrangement (320-Pin FBGA) (Top View)



Note 1. This figure indicates the power supply pins and I/O port pins. For the pin configuration, see Table 1.8, List of Pin and Pin Functions (176-Pin HLFQFP).

Note 2. It is recommended to connect the exposed die pad of HLFQFP to VSS.

Figure 1.3 Pin Arrangement (176-pin HLFQFP)

2. CPU

These LSI products include a Cortex-R4 CPU or, in products incorporating an R-IN engine, a Cortex-R4 CPU and Cortex-M3 CPU. The revision of each module is r1p4 (Cortex-R4) and r2p1 (Cortex-M3).

2.1 Overview

Table 2.1 Specifications of CPU

Item		Specification
Cortex-R4 (r1p4)	Minimum instruction execution time	One clock per instruction
	Address space	4 Gbytes
	Instruction cache size	8 Kbytes (with ECC)
	Data cache size	8 Kbytes (with ECC)
	Tightly coupled memory (TCM) size	ATCM: 512 Kbytes (with ECC) BTCM: 32 Kbytes (with ECC)
	Instruction set	Arm v7-R architecture supporting Thumb®/Thumb-2
	Data arrangement	Instruction: Little endian Data: Little endian
	Memory protection	Memory protection unit (MPU)
	FPU	• Supports addition, subtraction, multiplication, division, product-sum operation, and square-root operation in single-precision and double-precision • 32-bit single word register: 32 registers Can also be used as 16 64-bit double word registers
Cortex-M3 (r2p1) (in products incorporating an R-IN engine)	Minimum instruction execution time	One clock per instruction
	Address space	4 Gbytes
	Instruction set	Arm v7-M architecture supporting Thumb®/Thumb-2
	Data arrangement	Instruction: Little endian Data: Little endian
	Memory protection	Memory protection unit (MPU)

For details, refer to the following documents supplied by Arm.

- Arm Architecture Reference Manual Arm v7-A and Arm v7-R edition Issue C
- Arm v7-M Architecture Reference Manual

2.2 Configuration Information

Table 2.2 lists the configuration information for the Cortex-R4 of this LSI.

Table 2.2 Setting Values for Cortex-R4 Configuration Signals

Item		Setting Value
Endian	CFGEE	0
	CFGIE	0
Interrupt	CFGNMFI	1
Exception vector	TEINIT	0
	VINITHI	1
TCM configuration	INITRAMA	1
	INITRAMB	1
	LOCZRAMA	1
	CFGATCMSZ[3:0]	Ah
	CFGBTCMSZ[3:0]	6h
	ENTCM1IF	0
	SLBTCMSB	1 (don't care)
ECC, etc.	PARECCENRAM[2:0]	000b
	ERRENRAM[2:0]	000b
	RMWENRAM[1:0]	00b
	PARLVRAM	0 (don't care)

Table 2.3 only applies to products incorporating an R-IN engine and lists information on the configuration of the Cortex-M3 they incorporate.

Table 2.3 Setting Values for Cortex-M3 Configuration Signals

Item	Setting Value
BIGEND	0
DNOTITRANS	0
MPUDISABLE	0
STKALIGNINIT	1
DBGEN	1

2.3 Restrictions on CPU

For details on restrictions on Cortex-R4 and Cortex-M3 mounted on this LSI, refer to the information provided at the website of Arm.

2.4 Register Descriptions

2.4.1 ATCM Wait Control Register (SYTATCMWAIT)

SYTATCMWAIT is a register that controls ATCM access wait.
This register can be protected by the register write protection function. When writing to this register, cancel the write protection of bit 3 in the protection register (PRCR). For details, see section 11, Register Write Protection Function.

Address(es): A00B 0800h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ATCMWAIT[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Bit Name	Description	R/W
b1, b0	ATCMWAIT[1:0]	ATCM Wait Setting *1, *2	b1 b0 0 0: 1-wait with optimization 0 1: 1-wait without optimization 1 0: 0-wait 1 1: Setting prohibited	R/W
b31 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. When the CPU clock frequency is 450 MHz or 600 MHz, set these bits for “1-wait with optimization” or “1-wait without optimization”.
For 320-pin FBGA, “0-wait” can be set only when the CPU clock frequency is 150 MHz or 300 MHz. It cannot be set when the frequency is 450 MHz or 600 MHz.
For 176-pin HLFQFP, “0-wait” can be set only when the CPU clock frequency is 150 MHz. It cannot be set when the frequency is 300 MHz or 450 MHz.

Note 2. If the ATCMWAIT[1:0] setting changes, operation cannot be guaranteed when the bus maser such as CPU accesses ACTM (including instruction fetch). To prevent fetch access from CPU, these bits should be handled by programs allocated in memory areas other than ATCM.

ATCMWAIT[1:0] Bits (ATCM Wait Setting)

These bits specify the number of memory access waits for ATCM.
In case of “with optimization”, memory access speed can be increased practically to 0-wait by prefetching the next address when instructions are fetched from sequential addresses in ATCM.

2.4.2 Semaphore Enable Register (SYTSEMFEN) (Only in products incorporating an R-IN engine)

SYTSEMFEN is a register that controls read clear function of the semaphore register n (SYTSEMFn, n = 0 to 7).

Address(es): A00B 0920h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SEMFEN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	SEMFEN	Semaphore Enable	0: Read clear function disabled. 1: Read clear function enabled.	R/W
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

SEMFEN Bit (Semaphore Enable)

This bit specifies enable/disable of the read clear function of the semaphore register n. When the semaphore register (SYTSEMFn) is used, set this bit to 1 to enable the read clear function (n = 0 to 7).

2.4.3 Semaphore Register n (SYTSEMFn, n = 0 to 7) (Only in products incorporating an R-IN engine)

The SYTSEMFn register is used to perform semaphore for synchronization and exclusive control between the main CPU (Cortex-R4) and the sub-CPU (Cortex-M3). Resource status can be controlled when the resource is shared between CPUs.

Address(es): SYTSEMF0: A00B 0930h, SYTSEMF1: A00B 0934h, SYTSEMF2: A00B 0938h, SYTSEMF3: A00B 093Ch, SYTSEMF4: A00B 0940h, SYTSEMF5: A00B 0944h, SYTSEMF6: A00B 0948h, SYTSEMF7: A00B 094Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SEMFn
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	SEMFn	Semaphore Bit n	0: Resource being used 1: Resource not being used	R/W*1
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. When the read clear function is disabled (SYTSEMFEN.SEMFEN bit = 0), reading this bit does not clear it and its value is maintained.

SEMFn Bit (Semaphore Bit n)

This bit is used to set the status of the resource shared between CPUs to indicate whether the resource is being used or not. Writing 1 to this bit maintains it value. When the read clear function is enabled (SYTSEMFEN.SEMFEN bit = 1), reading this bit clears its value to 0.

Semaphore Control Procedure between the Main CPU (Cortex-R4) and the Sub-CPU (Cortex-M3)

When the semaphore register 0 (SYTSEMF0) is used for semaphore control for a resource A, for example, the following procedure takes place:

(1) Use the initialization routine of the main CPU to set the SYTSEMFEN.SEMFEN bit to 1 (this enables the read clear function).
(2) Set the SEMF0 bit to 1 (resource not being used) in the semaphore register 0 (SYTSEMF0).
(3) For example, when the sub-CPU attempts to use the resource A, the sub-CPU reads the semaphore register 0 (SYTSEMF0) repeatedly until 1 is read.
(4) When SEMF0 = 1 is read, the sub-CPU confirms that the resource is not being used.
This operation clears the SEMF0 bit of the semaphore register 0 (SYTSEMF0) to 0.
(5) Then the sub-CPU uses the resource A.
If the main CPU attempts to use the resource A while the sub-CPU is using it, 0 is read from the SYTSEMF0.SEMF0 bit (resource A being used by the sub-CPU). The main CPU repeats read operation and waits until the resource is released.
(6) When the sub-CPU completes its use of the resource A, 1 is written in the SYTSEMF0.SEMF0 bit to indicate that the resource A is released.
(7) If the main CPU attempts to use the resource A after the above step (6), it confirms whether the resource is used or not by reading the SYTSEMF0.SEMF0 bit. When the SYTSEMF0.SEMF0 bit is 1, the main CPU starts to use the resource A. This operation clears the SYTSEMF0.SEMF0 bit to 0.

2.5 Usage Notes

2.5.1 Releasing the Cortex-M3 from the Reset State

After power for the RZ/T1 is on, or after an RES# pin reset, ECM reset, or software reset, the initial setting is for the Cortex-M3 and WDTA for the Cortex-M3 to remain in the reset state.
To use the Cortex-M3 and WDTA for the Cortex-M3, control software reset register 2 (SWRR2) to release them from the reset state.
For details, see section 6.2.3, Software Reset Register 2 (SWRR2) (for products incorporating an R-IN engine).

2.5.2 Handling of Semaphore Register n (SYTSEMFn, n = 0 to 7)

For writing to a shared memory, for example, the target resource is to be made available by setting semaphore register n (SYTSEMFn). At this time, the previous round of writing to the same memory must have been completed. This is ensured by executing the DMB instruction before setting semaphore register n (see the following example program). By doing so, setting of the concerned register becomes possible only after the previous round of writing to the target memory is completed.

- Program Example

```
asm(“dmb”);                              // DMB instruction
SYSTEM.SYTSEMF0.BIT.SEMF0 = 1;
```

Note: The program format may differ from a compiler to another. Confirm the specification of the compiler you are using.

3. Operating Modes

3.1 Overview

This LSI chip is intended for booting up from an external flash memory. Three boot modes are available for types of flash memory that support three different operating modes. In each of the boot modes, the user program stored in the corresponding external flash memory is booted up and then runs.
Secure boot mode (in which a user program is protected by encryption) can also be selected for the products that support security function*1.

Note 1. This function is provided upon signing a nondisclosure agreement. For details, contact Renesas Electronics Corporation's sales office.

3.2 Types and Selection of Operating Modes

One of the three types of operating modes can be selected, depending on the method of connecting to an external memory. An operating mode is selected based on the input levels of the mode setting pins (MD2, MD1, and MD0) at the time pin reset (except software reset 2) is released.

Table 3.1 describes the relationship between the input levels of the mode setting pins (MD2, MD1, and MD0) at the time reset is released and the selected operating mode. For details on individual operating modes, see section 3.5, Operating Mode Descriptions.

Table 3.1 Selection of Operating Mode for Each Combination of Levels of Mode Setting Pins (MD2, MD1, and MD0)

Mode Setting Pins			
MD2	**MD1**	**MD0**	**Operating Mode**
Low	Low	Low	SPI boot mode (Serial flash) Boots a program from a serial flash memory connected to the SPI multi-I/O bus space.
Low	High	Low	16-bit bus boot mode (NOR flash) Boots a program from a NOR flash memory (bus width: 16 bits) connected to the CS0 space.
Low	High	High	32-bit bus boot mode (NOR flash) Boots a program from a NOR flash memory (bus width: 32 bits) connected to the CS0 space.
Other than above			Reserved (Setting prohibited)

3.3 Hardware Used in Individual Operating Modes

Table 3.2 describes hardware used in individual operating modes.
“Pins to be Used” indicates pins required to execute each operating mode. The functions for these pins are automatically configured at boot.

Table 3.2 Hardware Used in Individual Operating Modes

Operating Mode	Peripheral Module	Pins to be Used
SPI boot mode (Serial flash)	SPI Multi-I/O bus controller (SPIBSC)	SPBCLK, SPBSSL SPBMO, SPBMI
16-bit bus boot mode (NOR flash)	Bus state controller (BSC)	A20 to A1, D15 to D0 CS0#, RD#
32-bit bus boot mode (NOR flash)	Bus state controller (BSC)	A20 to A2, D31 to D0 CS0#, RD#

3.4 Register Descriptions

3.4.1 Mode Monitor Register (MDMONR)

Mode monitor register (MDMONR) indicates input levels of the MD2, MD1, and MD0 pins.

Address(es): A00B 0A60h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

	—	—	—	—	—	—	—	—	—	—	—	—	—	MD2	MD1	MD0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0/1 *1	0/1 *1	0/1 *1

Bit	Symbol	Bit Name	Description	R/W
b0	MD0	MD0 pin status flag	0: The MD0 pin is “Low”. 1: The MD0 pin is “High”.	R
b1	MD1	MD1 pin status flag	0: The MD1 pin is “Low”. 1: The MD1 pin is “High”.	R
b2	MD2	MD2 pin status flag	0: The MD2 pin is “Low”. 1: The MD2 pin is “High”.	R
b31 to b3	—	Reserved	These bits are read as 0.	R

Note 1. This value differs depending on the pin level at the time reset is released. For details, see section 6, Reset.

3.5 Operating Mode Descriptions

3.5.1 Boot Function

After reset is released on this LSI, the boot function executes the boot processing described below. The boot processing can extract a loader program that was stored in an external memory in advance by a user, to the internal tightly coupled memory (TCM) area, and hand over the processing to the loader program at the start address of that program.

(1) Setting the bus controller (SPIBSC or BSC) specified by the mode setting pins (MD2, MD1, and MD0)
(2) Loading parameters for the loader from an external memory, and executing checksum
(3) Setting for speeding up the bus controller (SPIBSC or BSC) by using parameters for the loader
(4) Loading the loader program from an external memory
(5) Branching off to the start address of the loader program extracted to the tightly coupled memory (TCM)

Parameters for the loader can have configuration information that suite for the user system, such as, loader program information, cache setting for speeding up the boot processing, and bus controller (SPIBSC or BSC) settings. Parameters for the loader must be stored in an external memory in advance by a user.

Figure 3.1 shows the operating overview of boot processing.

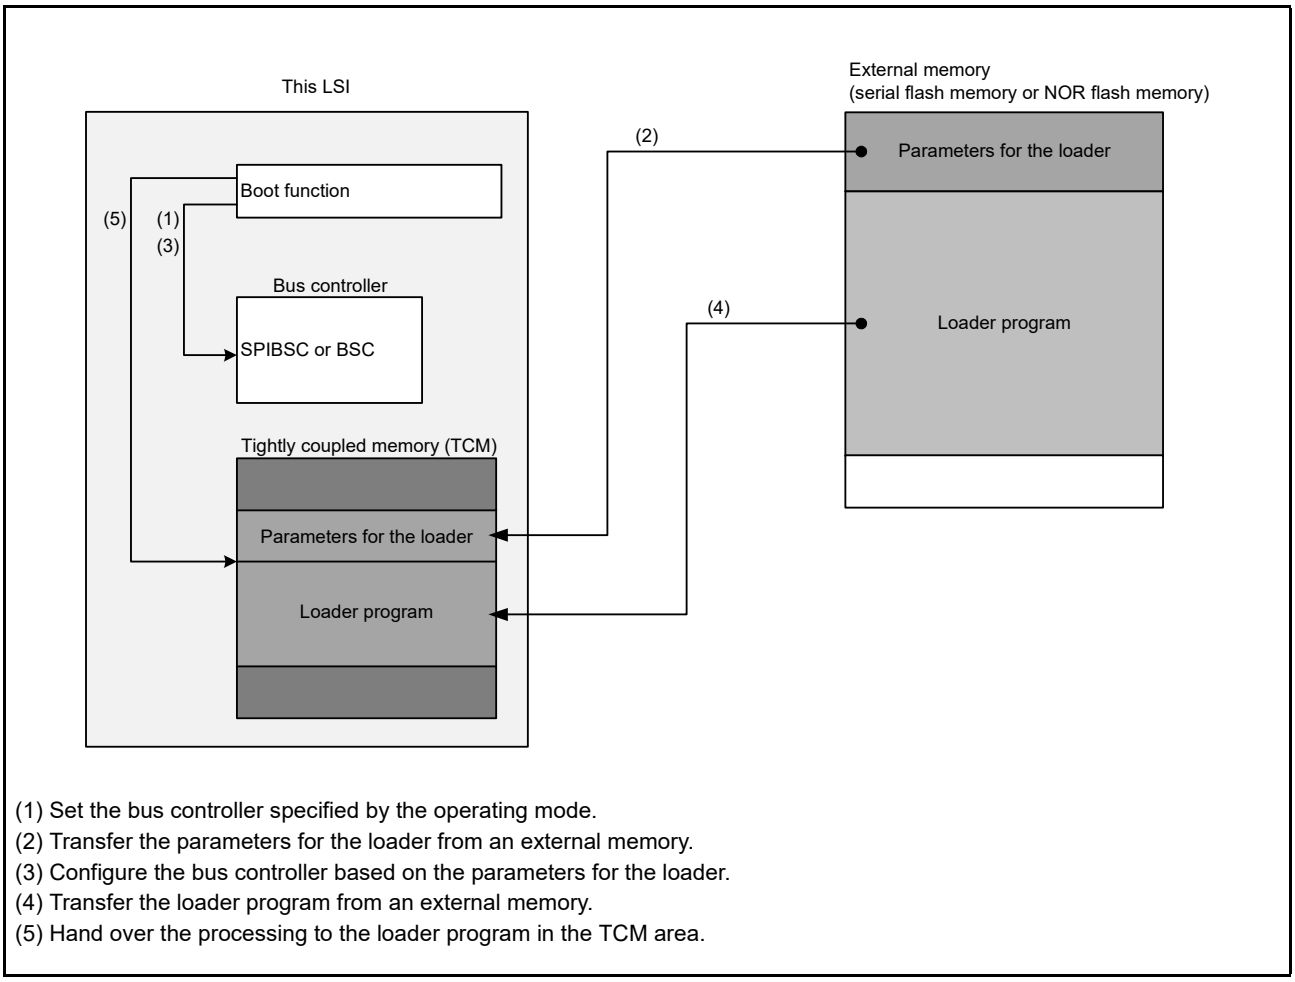

Figure 3.1 Operating Overview of Boot Processing

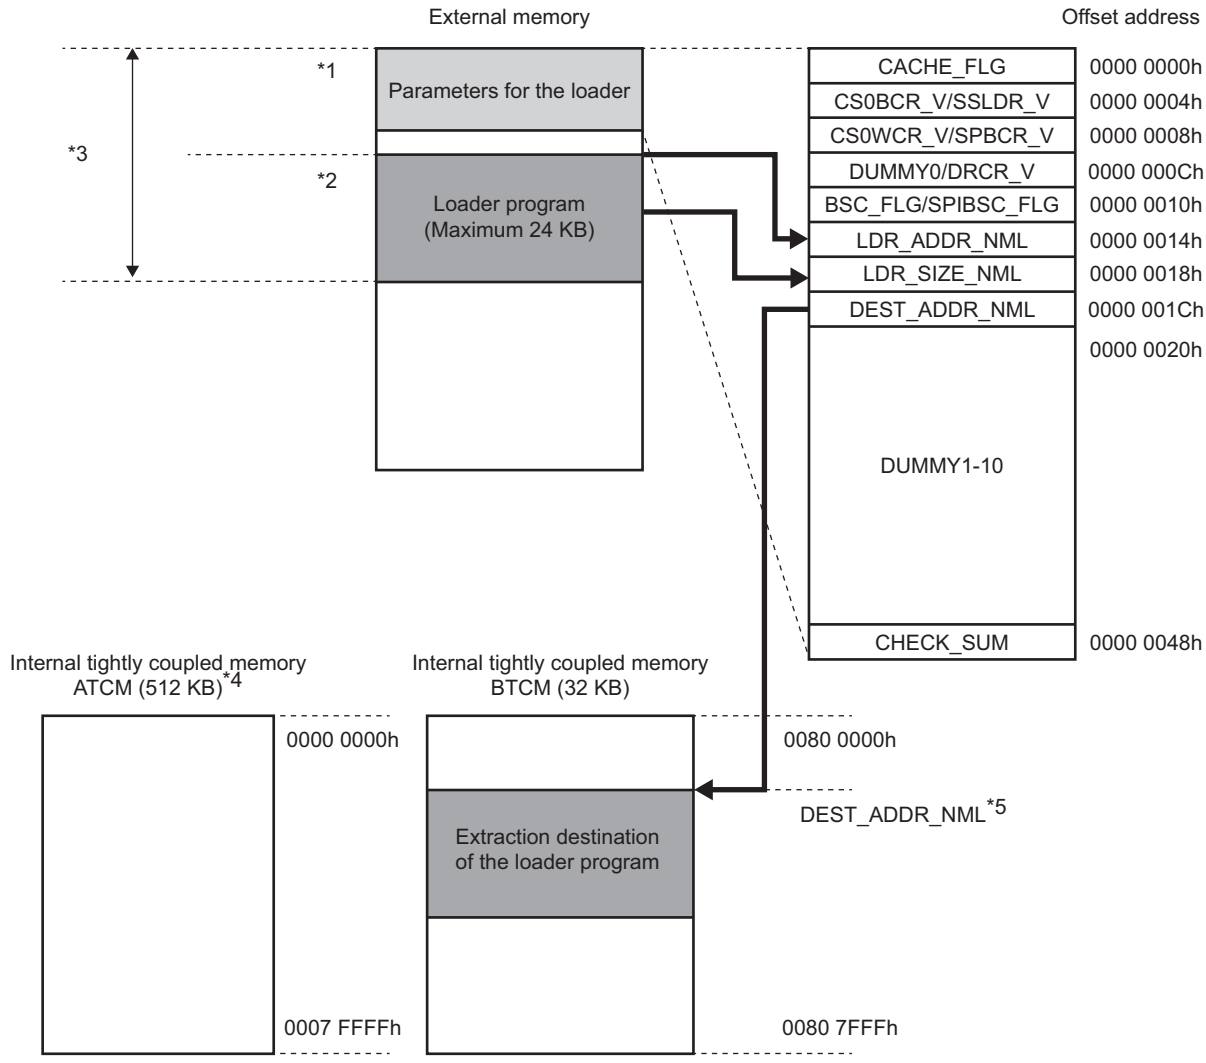
3.5.2 Parameters for the Loader

The parameters for the loader are setting parameters for boot processing, which are loaded from an external memory during boot processing and used by the boot function. The parameters for the loader specify information, such as the cache settings during boot processing in individual operating modes, setting of the bus controller (SPIBSC or BSC) used for communication with an external memory, and the size of the loader program.
Figure 3.2 shows memory assignment of the loader program and parameters for the loader.



Note 1. The parameters for the loader must be stored in the following address range:
SPI boot mode: SPI multi-I/O bus space (3000 0000h and higher)
16-bit or 32-bit bus boot mode: External address space (CS0) (4000 0000h and higher)
Note 2. The loader program can be stored in any address (LDR_ADDR_NML). Note that, however, the program size (LDR_SIZE_NML) must be multiples of 512 bytes and no more than 24 Kbytes.
Note 3. In SPI boot mode, address output is 3 bytes, so only use addresses in the range from 3000 0000h to 30FF FFFFh.
In 16-bit or 32-bit bus boot mode, use addresses in the range from 4000 0000h to 401F FFFFh because the address output pins (A1 to A20 for 16-bit bus boot mode and A2 to A20 for 32-bit bus boot mode) of the bus state controller (BSC) is used in this mode.
Note 4. The ATCM area is assumed to be used for storing user application programs.
Note 5. Specify the extraction destination area of the loader program so that the area falls in the range from 0080 2000h to 0080 7FFFh.

Figure 3.2 Memory Assignment of the Loader Program and Parameters for the Loader

Table 3.3 describes parameter information for the loader in 16-bit or 32-bit bus boot mode. Table 3.4 describes parameter information for the loader in SPI boot mode.

Table 3.3 Parameter Information for the Loader in 16-bit or 32-bit Bus Boot Mode

Offset Address	Parameter Name	Description
0000 0000h	CACHE_FLG	Selects whether to enable the I1 cache and D1 cache of Cortex-R4 during boot processing (for speeding up). 0000 0001h: Enables the I1 and D1 caches. Other setting values than above: Disables the I1 and D1 caches.
0000 0004h	CS0BCR_V	Setting value of the CS0 space bus control register (CS0BCR) This parameter value is set to the CS0BCR register during the setting for speeding up of BSC in (3) of section 3.5.1, Boot Function.*1
0000 0008h	CS0WCR_V	Setting value of the CS0 space wait control register (CS0WCR) This parameter value is set to the CS0WCR register during the setting for speeding up of BSC in (3) of section 3.5.1, Boot Function.*1
0000 000Ch	DUMMY0	Option (Not used in this mode.)
0000 0010h	BSC_FLG	Selects whether to change the BSC setting back to the initial value after the boot processing finishes. 2236 0679h: Changes the BSC setting value back to the initial value after the boot processing finishes. Other setting values than above: Retains the BCS setting value used in the boot processing.*2
0000 0014h	LDR_ADDR_NML	Sets the start address of the loader program stored in the external memory.*3
0000 0018h	LDR_SIZE_NML	Specifies the size of the loader program. Note that the program size must be multiples of 512 bytes and no more than 24 Kbytes.*3
0000 001Ch	DEST_ADDR_NML	Specifies the start address of the tightly coupled memory (BTCM) that is used as the extraction destination of the loader program. Specify the extraction destination area of the loader program so that the area falls in the range from 0080 2000h to 0080 7FFFh.
0000 0020h	DUMMY1	Option (Not used in this mode.)
0000 0024h	DUMMY2	Option (Not used in this mode.)
0000 0028h	DUMMY3	Option (Not used in this mode.)
0000 002Ch	DUMMY4	Option (Not used in this mode.)
0000 0030h	DUMMY5	Option (Not used in this mode.)
0000 0034h	DUMMY6	Option (Not used in this mode.)
0000 0038h	DUMMY7	Option (Not used in this mode.)
0000 003Ch	DUMMY8	Option (Not used in this mode.)
0000 0040h	DUMMY9	Option (Not used in this mode.)
0000 0044h	DUMMY10	Option (Not used in this mode.)
0000 0048h	CHECK_SUM	Checksum value for the parameters for the loader This parameter specifies the sum of the higher-order 16 bits and the lower-order 16 bits of the parameters (in unsigned long (32-bit) format) in the range of the offset addresses 0000h to 0044h*4.

Note 1. For details on the CS0BCR and CS0WCR registers, see section 14, Bus State Controller.
Note 2. For details on the settings of individual peripheral modules after the boot processing finishes, see section 3.5.5.1, Operation Settings in 16-Bit and 32-Bit Bus Boot Modes.
Note 3. LDR_ADDR_NML must be in the range from 4000 004Ch and LDR_ADDR_NML + LDR_SIZE_NML ≤ 4020 0000h in the external address space (CS0).
Note 4. An example for calculating CHECK_SUM is given below.
If CS0BCR_V = 36DB 0C00h,
CS0WCR_V = 0000 0340h,
LDR_ADDR_NML = 4000 004Ch,
LDR_SIZE_NML = 0000 6000h,
DEST_ADDR_NML= 0080 2000h, and
others = 0000 0000h,
CHECK_SUM is calculated as below ((0000h) is omitted in the formula):
CHECK_SUM = (36DBh) + (0C00h) + (0340h) + (4000h) + (004Ch) + (6000h) + (0080h) + (2000h) = (0001 06E7h)

Table 3.4 Parameter Information for the Loader in SPI Boot Mode

Offset Address	Parameter Name	Description
0000 0000h	CACHE_FLG	Selects whether to enable the I1 cache and D1 cache of Cortex-R4 at boot processing (for speeding up). 0000 0001h: Enables the I1 and D1 caches. Other setting values than above: Disables the I1 and D1 caches.
0000 0004h	SSLDR_V	Setting value of the SSL delay register (SSLDR) This parameter value is set to the SSLDR register during the setting for speeding up of SPIBSC in (3) of section 3.5.1, Boot Function.*1
0000 0008h	SPBCR_V	Setting value of the bit-rate configuration register (SPBCR) This parameter value is set to the SPBCR register during the setting for speeding up of SPIBSC in (3) of section 3.5.1, Boot Function.*1
0000 000Ch	DRCR_V	Setting value of the data read control register (DRCR) This parameter value is set to the DRCR register during the setting for speeding up of SPIBSC in (3) of section 3.5.1, Boot Function.*1
0000 0010h	SPIBSC_FLG	Selects whether to change the SPIBSC setting back to the initial value after the boot processing finishes. 2236 0679h: Changes the SPIBSC setting value back to the initial value after the boot processing finishes. Other setting values than above: Retains the SPIBCS setting value used during boot processing.*2
0000 0014h	LDR_ADDR_NML	Sets the start address of the loader program stored in the external memory.*3
0000 0018h	LDR_SIZE_NML	Specifies the size of the loader program. Note that the program size must be multiples of 512 bytes and no more than 24 Kbytes.*3
0000 001Ch	DEST_ADDR_NML	Specifies the start address of the tightly coupled memory (BTCM) that is used as the extraction destination of the loader program. Specify the extraction destination area of the loader program so that the area falls in the range from 0080 2000h to 0080 7FFFh.
0000 0020h	DUMMY1	Option (Not used in this mode.)
0000 0024h	DUMMY2	Option (Not used in this mode.)
0000 0028h	DUMMY3	Option (Not used in this mode.)
0000 002Ch	DUMMY4	Option (Not used in this mode.)
0000 0030h	DUMMY5	Option (Not used in this mode.)
0000 0034h	DUMMY6	Option (Not used in this mode.)
0000 0038h	DUMMY7	Option (Not used in this mode.)
0000 003Ch	DUMMY8	Option (Not used in this mode.)
0000 0040h	DUMMY9	Option (Not used in this mode.)
0000 0044h	DUMMY10	Option (Not used in this mode.)
0000 0048h	CHECK_SUM	Checksum value of the parameters for the loader This parameter specifies the sum of the higher-order 16 bits and the lower-order 16 bits of the parameters (in unsigned long (32-bit) format) in the range of the offset addresses 0000h to 0044h.*4

Note 1. For details about the SSLDR, SPBCR, and DRCR registers, see section 37, SPI Multi I/O Bus Controller (SPIBSC).
Note 2. For details about the setting status of the individual peripheral modules after the boot processing finishes, see section 3.5.4.1, Operation Settings in SPI Boot Mode.
Note 3. LDR_ADDR_NML must be in the range from 3000 004Ch and LDR_ADDR_NML + LDR_SIZE_NML ≤ 3100 0000h in the external address space (SPI).
Note 4. An example for calculating CHECK_SUM is given below.
If SSLDR_V = 0007 0707h,
SPBCR_V = 0000 0003h,
LDR_ADDR_NML = 3000 004Ch,
LDR_SIZE_NML = 0000 6000h,
DEST_ADDR_NML = 0080 2000h, and
others = 0000 0000h,
CHECK_SUM is calculated as below ((0000h) is omitted in the formula):
CHECK_SUM = (0007h) + (0707h) + (0003h) + (3000h) + (004Ch) + (6000h) + (0080h) + (2000h) = (0000 B7DDh)

3.5.3 Loader Program

The loader program is a user program that is transferred from an external memory to the internal tightly coupled memory (TCM) by the boot function, and starts its processing after the boot processing finishes. The loader program can execute such processing that suites the user system, for example, extracting a user application program from an external memory to the internal TCM area and executing it at high speed.
Set the loader program so that the following conditions are satisfied:

- Program size (LDR_SIZE_NML): Multiples of 512 bytes and no more than 24 Kbytes
- Storage address in the external memory (LDR_ADDR_NMI) in 16-bit or 32-bit bus boot mode: Address range from A1 to A20 for 16-bit bus boot mode and A2 to A20 for 32-bit bus boot mode
- Storage address in the external memory (LDR_ADDR_NML) in SPI boot mode: Address range from 3000 004Ch and LDR_ADDR_NML + LDR_SIZE_NML ≤ 3100 0000h

These setting values must be stored in an external memory as parameters for the loader. For details, see section 3.5.2, Parameters for the Loader.

3.5.4 SPI Boot Mode (Serial Flash)

In SPI boot mode, this LSI boots a program from an external serial flash memory connected to the SPI multi-I/O bus space.
In this mode, the SPI multi-I/O bus controller is set to the mode of reading the external address space, and the SPBCLK, SPBSSL, SPBMO, and SPBMI pins are enabled.
After the reset is released, this LSI executes the boot processing. The loader program stored in a serial flash memory connected to the SPI multi-I/O bus space is extracted to the internal memory (TCM), and then the processing is executed.
Figure 3.3 shows the connection diagram of this LSI with a serial flash memory.

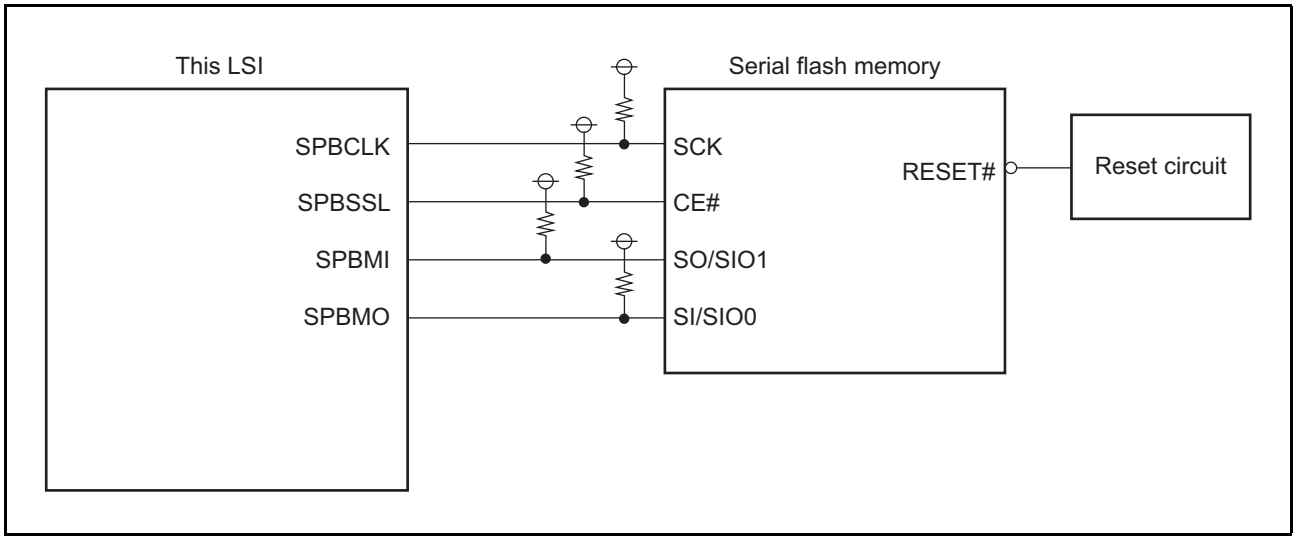


Figure 3.3 Connection Diagram of This LSI with a Serial Flash Memory

3.5.4.1 Operation Settings in SPI Boot Mode

Immediately after the boot processing starts in SPI boot mode after the reset is released, this LSI operates with the following initial setting values, and executes processing until transferring parameters for the loader.

- CPU clock (CPUCLK): 150 MHz
- SPIBSC bit rate (SPBCLK): 18.75 MHz
- Supported command: Read (03h)
- Address output: 3 bytes
- Dummy cycles: None
- Data read width: 1 bit
- SPI mode: CPOL = 0 (positive pulse)
  CPHAR = 0 (data reception at odd edge)
  CPHAT = 0 (data transmission at even edge)

After the parameters for the loader are loaded, the settings for the I1 and D1 caches of Cortex-R4 and for the SSLDR, SPBCR, and DRCR registers are performed based on the values of parameters CACHE_FLG, SSLDR_V, SPBCR_V, and DRCR_V, so that the processing can be speed up.

Table 3.5 describes the setting values of the individual peripheral modules and registers at the time SPI boot mode finishes.

Also, Table 3.6 describes the setting values of Arm general-purpose registers at the time the boot processing finishes, and Table 3.7 describes the status of the Arm CP15 registers at the time the boot finishes.

Table 3.5 Setting Values of the Individual Peripheral Modules and Registers at the Time SPI Boot Mode Finishes

		Setting Value at the Time the Boot Processing Finishes	
Peripheral Module	**Register**	**When SPIBSC is initialized (SPIBSC_FLG = 2236 0679h)**	**When SPIBSC is not initialized (SPIBSC_FLG ≠ 2236 0679h)**
Low power consumption	MSTPCRC	0000 7DFEh (Initial value)	0000 7DFEh
SPIBSC	SSLDR	0007 0707h (Initial value)	Setting value of SSLDR_V
	SPBCR	0000 0003h (Initial value)	Setting value of SPBCR_V
	DRCR	0000 0000h (Initial value)	Setting value of DRCR_V
I/O ports	PORT6 .PMR	1Dh*1	1Dh*1
	MPC.PmnPFS	1Bh*1	1Bh*1

Note 1. Bits corresponding to the SPBCLK, SPBSSL, SPBMI, and SPBMO pins

Table 3.6 Setting Values of the Arm General-Purpose Registers at the Time the Boot Processing Finishes

No.	Register Name	Setting Values for Individual Processor Modes					
		User Mode/Current Mode	IRQ	FIQ	Undef	Abort	SVC
1	R0	Undefined	—	—	—	—	—
2	R1	Undefined	—	—	—	—	—
3	R2	Undefined	—	—	—	—	—
4	R3	Undefined	—	—	—	—	—
5	R4	Undefined	—	—	—	—	—
6	R5	Undefined	—	—	—	—	—
7	R6	Undefined	—	—	—	—	—
8	R7	Undefined	—	—	—	—	—
9	R8	Undefined	—	Undefined	—	—	—
10	R9	Undefined	—	Undefined	—	—	—
11	R10	Undefined	—	Undefined	—	—	—
12	R11	Undefined	—	Undefined	—	—	—
13	R12	Undefined	—	Undefined	—	—	—
14	R13(sp)	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
15	R14(lr)	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
16	R15(pc)	Arbitrary	—	—	—	—	—
17	cpsr	xxxx xx93h ([31:8] is undefined.) [7]I = 1 [6]F = 0*1 [5]T = 0 [4:0]MD = 10011b(SVC)	—	—	—	—	—
18	spsr	—	Undefined	Undefined	Undefined	Undefined	Undefined

—: Non-existent register

sp: Stack pointer

lr: Link register (which stores the return address when calling a subroutine call)

pc: Program counter

cpsr: Abbreviation of “current program status register”. It monitors or controls internal operations.

spsr: Abbreviation of “saved program status register”. It saves cpsr in the previous mode.

Note 1. In this product, the non-maskable interrupt has been assigned to FIQ. The boot processing changes the [6]F bit of the CPSR register from 1 to 0 to enable non-maskable interrupt after the boot processing finishes.

Note: After the boot processing sets the [6]F bit in the CPSR register to 0, if a non-maskable interrupt (FIQ exception) occurs before the processing reaches the branch to the loader program, the processing is jumped to the FIQ exception handler address and goes into an infinite loop. For details, see section 3.5.8, Note.

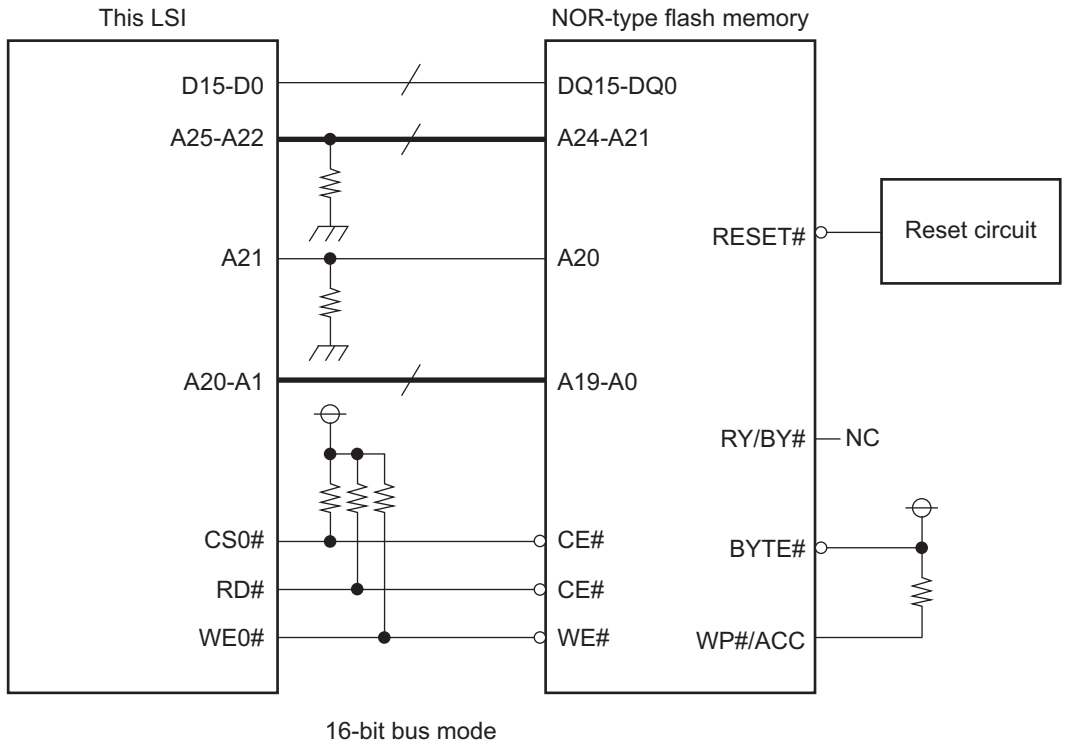
Table 3.7 Status of the Arm CP15 Registers at the Time the Boot Finishes

Register Name	Symbol	Setting Value at the Time the Boot Processing Finishes	Remarks
System control register	SCTLR	09E5 2878h*1	[24]VE = 1: Sets the IRQ exception vector address in VIC.
System control auxiliary register	ACTLR	0E00 0020h (When ATCM and BTCM are used)	ECC enable for TCM All areas of ATCM and BTCM are written and processed in 32-bit units during boot processing and initialized.
Invalidate all Instruction Caches Register	—	—	The I1 cache entry is not invalidated after the boot processing finishes.
Invalidate all Data Caches Register	—	—	The D1 cache entry is not invalidated after the boot processing finishes.
MPU Memory Region Number Register	RGNR	0000 0000h	All MPU settings are initialized even when the cache is enabled by the parameters for the loader.
Data Region Base Address Register	DRBAR	0000 0000h	
Data Region Size and Enable Register	DRSR	0000 0000h	
Data Region Access Control Register	DRACR	0000 0000h	

Note 1. When the boot processing finishes, the register is in high vector status, where V[13] = 1 (FFFF 0000h). Use the loader program to write appropriate processing in the low vectors (0000 0000h), and then to change the register to low vector status, where V[13] = 0 (0000 0000h).

3.5.5 16-Bit and 32-Bit Bus Boot Modes (NOR Flash Memory)

In 16-bit and 32-bit bus boot modes, this LSI boots a program from an external NOR flash memory connected to the external address space (CS0). The bus width is fixed to 16 bits or 32 bits, respectively.
In 16-bit bus boot mode, the A20 to A1, D15 to D0, CS0#, and RD# pins of the bus state controller are enabled.
In 32-bit bus boot mode, the A20 to A2, D31 to D0, CS0#, and RD# pins of the bus state controller are enabled.
After the reset is released, this LSI executes the boot processing. The loader program stored in a NOR flash memory connected to the CS0 space is extracted to the internal memory (TCM), and then the processing is executed.
Figure 3.4 shows the connection diagram of this LSI with a NOR flash memory.



Note: The 32-bit-bus boot mode requires the connection of two flash memory chips. In this case, D31 to D16 should be connected to the second flash memory chip and A2 should be connected to A0.

Figure 3.4 Connection Diagram of This LSI with a NOR Flash Memory

3.5.5.1 Operation Settings in 16-Bit and 32-Bit Bus Boot Modes

After the reset is released, if the boot processing starts in 16-bit or 32-bit bus boot mode, the following setting values are used:

- CPU clock (CPUCLK): 150 MHz
- External bus clock (CKIO): 50 MHz

After the parameters for the loader are loaded, the settings for the I1 and D1 caches of Cortex-R4 and for the CS0BCR and CS0WCR registers are performed based on the values of parameters CACHE_FLG, CS0BCR_V, and CS0WCR_V, so that the processing can be speed up.

Table 3.8 describes the setting values of the individual peripheral modules and registers at the time 16-bit or 32-bit bus boot mode finishes.

The setting values of Arm general-purpose registers and the status of the CP15 registers at the time the boot processing finishes are the same as those in SPI bus boot mode. For details, see Table 3.6 and Table 3.7.

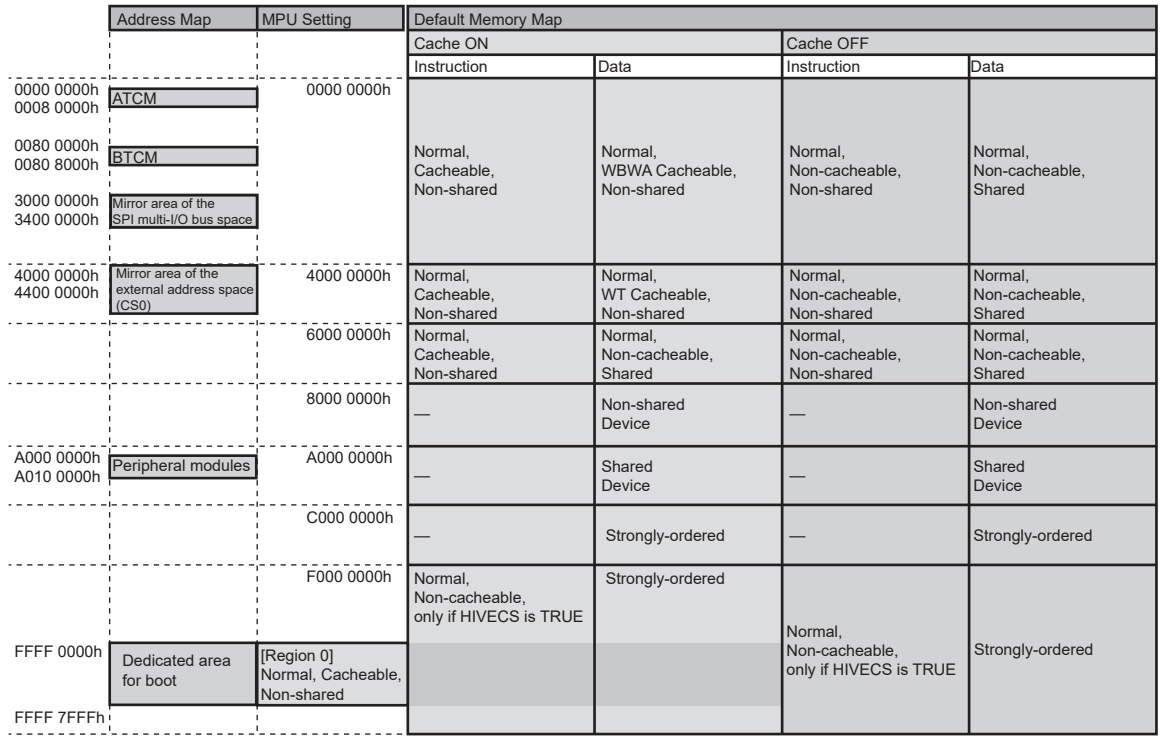
Table 3.8 Setting Values of the Individual Peripheral Modules and Registers at the Time 16-bit or 32-bit Bus Boot Mode Finishes

		Setting Value at the Time the Boot Processing Finishes	
Peripheral Module	**Register**	**When BSC is initialized (BSC_FLG = 2236 0679h)**	**When BSC is not initialized (BSC_FLG ≠ 2236 0679h)**
Low power consumption	MSTPCRC	0000 7F7Eh	0000 7F7Eh (Initial value)
BSC	CS0BCR	36DB 0C00h (Initial value)	Setting value of CS0BCR_V
	CS0WCR	0000 0500h (Initial value)	Setting value of CS0WCR_V
I/O ports	PORTn.PMR	Only the corresponding bits are 1.*1	Only the corresponding bits are 1.*1
	MPC.PmnPFS	22h*1	22h*1

Note 1. The bits corresponding to A1 to A20 pins, D0 to D15 pins, RD# pin, and CS0# pin in 16-bit bus boot mode.
The bits corresponding to A2 to A20 pins, D0 to D31 pins, RD# pin, and CS0# pin in 32-bit bus boot mode.

3.5.6 MPU Setting

The boot function uses the primary instruction cache (I1) and primary data cache (D1) of Cortex-R4 when the parameter CACHE_FLG for the loader is set to 0000 0001h.
However, the dedicated area for boot processing (FFFF 0000h to FFFF 7FFFh), which is used by the boot function, is set as the non-cache area in the default map of Cortex-R4, so the MPU (memory protection unit) redefines the cache area during the boot processing.
The boot function defines the high-vector area (FFFF 0000h to FFFF 7FFFh) as the cache area of Region 0, and uses other areas for the default memory map.
When the boot processing finishes, the I1 and D1 caches are invalidated, and all areas are initialized to the default memory map.
Figure 3.5 shows the relationship between the memory map definition during the boot processing and the default memory map of Cortex-R4.



Note 1. Because SCTLR[17] BR is set to 1, the default memory map is applied to the areas for which no region is set.

Figure 3.5 Relationship Between the Memory Map Definition During the Boot Processing and the Default Memory Map of Cortex-R4

3.5.7 Boot-Related Information and Error Processing

The boot function determines whether the boot processing finishes normally, and retains the result in a specific address. If the processing is determined to be an error, the boot processing is aborted, and an infinite loop is executed.
If the debugger is connected, reading the result of the boot processing that was stored in a specific address at the point of break can determine the error source.
Table 3.9 describes the error sources and the results of the boot processing.

Table 3.9 Error Sources and Results of Boot Processing

Storage Address*1	Stored Value*1	Error Sources and Results of Boot Processing
0080 09C4h	0	The boot processing finished normally.
	-1	A mode error occurred. When the setting is prohibited in the read value of the mode monitor register (MDMONR)
	-2	Checksum error of the parameters for the loader When the checksum (CHECK_SUM) of the parameters for the loader does not match
	-3	Error in a parameter for the loader When one of the following is satisfied: - The size of the loader program is smaller than 512 bytes. - The size of the loader program is larger than 24 Kbytes. - The size of the loader program is not a multiple of 512 bytes. - The destination address of the loader program is outside of the TCM area.

Note 1. The access size is 32 bits.

3.5.8 Note

3.5.8.1 Exception Processing

Only the reset exception due to the RES#-pin reset can be accepted during the boot processing. When a reset exception occurs, this LSI is reset, and the boot processing restarts. If an exception processing other than reset exception occurs, the jump instruction to the relevant exception handler address repeats an infinite loop.

Table 3.10 Exception Processing During the Boot Processing

Exception	Handler Address	Operation During the Boot Processing
Reset exception	FFFF 0000h	Branched to the reset exception handler
Undefined instruction exception	FFFF 0004h	Branched to the undefined instruction exception handler (Infinite loop)
Software interrupt exception	FFFF 0008h	Branched to the software interrupt exception handler (Infinite loop)
Prefetch abort exception	FFFF 000Ch	Branched to the prefetch abort exception handler (Infinite loop)
Data abort exception	FFFF 0010h	Branched to the data abort exception handler (Infinite loop)
IRQ exception	FFFF 0018h	Branched to the IRQ exception handler (Infinite loop)
FIQ exception	FFFF 001Ch	Branched to the FIQ exception handler (Infinite loop)

Note: Before the boot processing finishes, the register is in high vector status, where SCTLR V[13] = 1 (FFFF 0000h). Use the loader program to write appropriate processing in the low vectors (0000 0000h), and then to change the register to low vector status, where V[13] = 0 (0000 0000h).

3.5.8.2 Serial Flash Memory in SPI Boot Mode

In SPI boot mode, after release from the reset state, boot processing starts by reading from the serial flash memory via the SPI multi-I/O bus controller (SPIBSC) with the initial settings given in section 3.5.4.1, Operation Settings in SPI Boot Mode.

The setting of serial flash memory can be changed via the SPIBSC after the processing to boot up is finished. Depending on the settings, however, reading from the serial flash memory may not be possible when boot processing needs to be started again following a reset. Therefore, caution is required on this point.

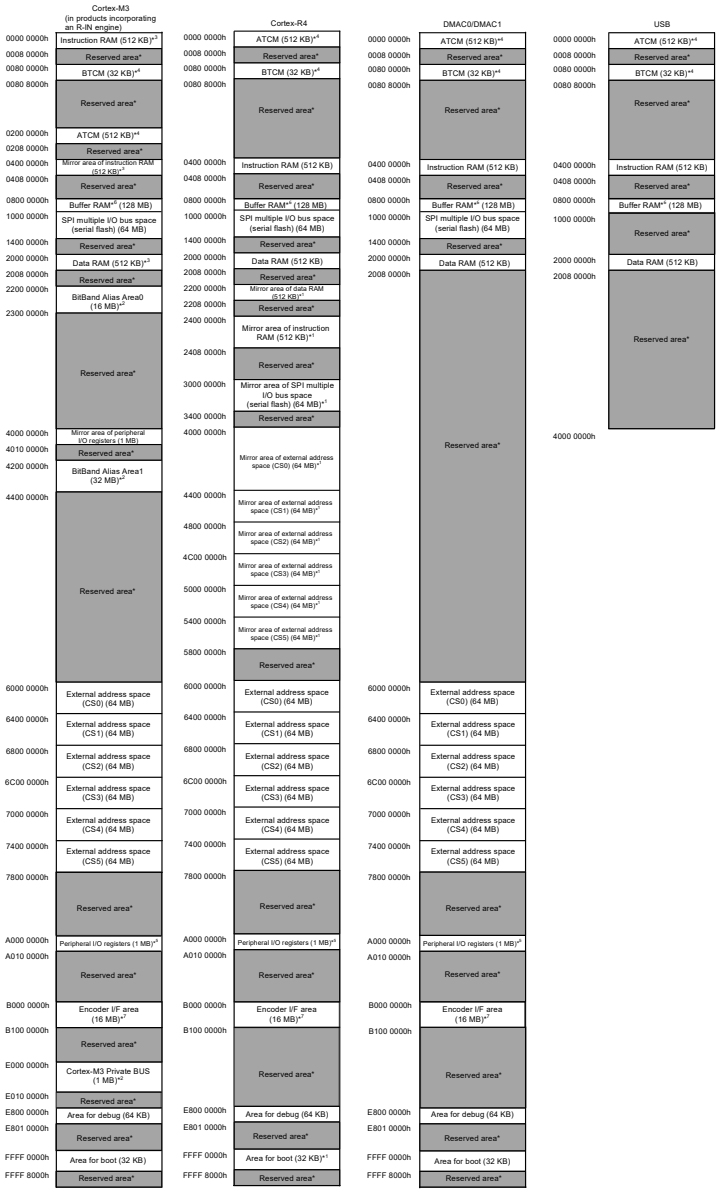
When the active level of the signal on the RES# pin is applied to reset this LSI chip, the serial flash memory can be simultaneously initialized by input of the same reset signal to the reset pin of the serial flash memory. Therefore, we recommend using serial flash memory that includes a reset pin. As the reset signal of a serial flash memory in a small package may be multiplexed with another pin function, make sure that the reset function is selected.

In addition, when an internal reset such as a software reset or ECM reset is to be generated, initialize the serial flash memory by software in advance so that it can be connected in boot processing.

4. Address Space

4.1 Address Space

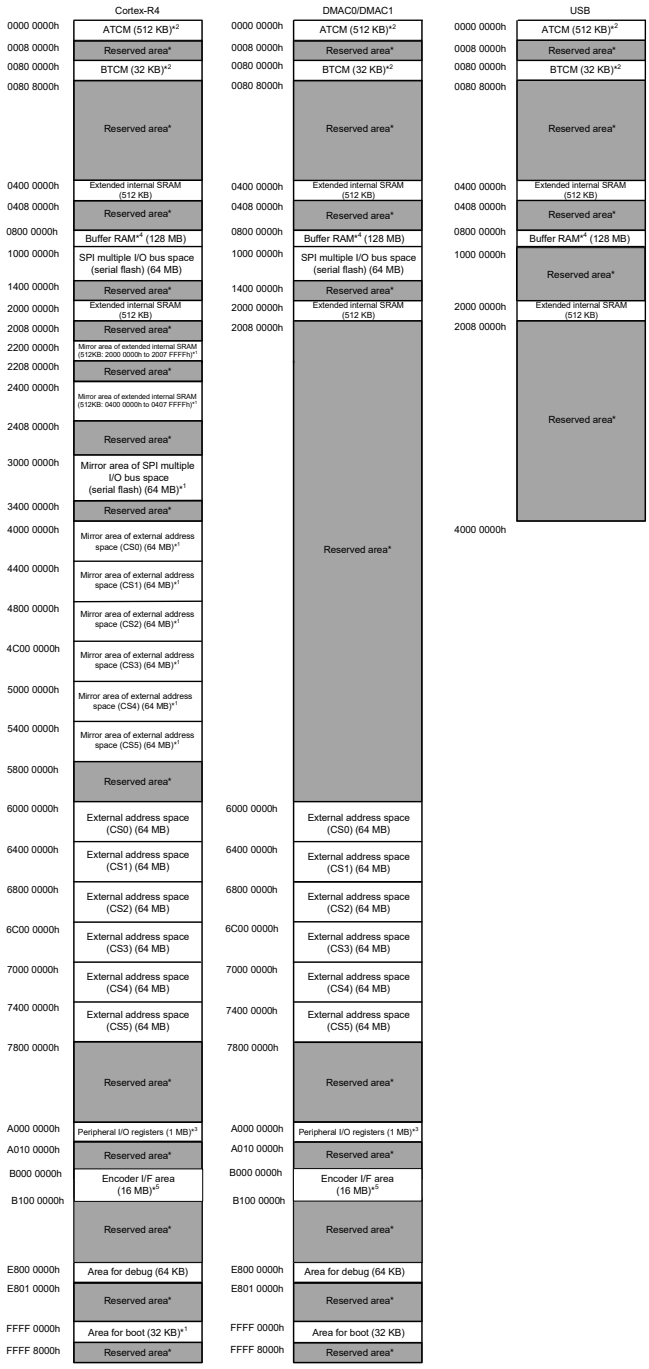
This LSI has a 4-Gbyte address space ranging from 0000 0000h to FFFF FFFFh. That is, up to total 4 Gbytes of program and data areas can be accessed linearly.
Figure 4.1, Figure 4.2 and Figure 4.3 show the memory maps for respective products.
Accessible areas will differ depending on the operating mode and the states of control bits.
In addition, since a non-cached access area from each bus master is assigned to the same area in this product, in access from the Cortex-R4, a mirror area is set as a cache-enabled area. The MPU should not enable caching of areas other than the mirror area.



Note 1. Can be cached.
(For other areas, caching should not be enabled by the MPU.)
Note 2. Accessible only from Cortex-M3. Bitband alias areas 0 and 1 are the data RAM and the peripheral I/O registers area, respectively.
Note 3. Cortex-M3 SRAM space (Extra-RAM)
Note 4. Cortex-R4 tightly coupled memory space
Note 5. Peripheral space
Note 6. For details, see section 28.3.1.3, Buffer Allocator.
Note 7. Peripheral space. Only for products with the encoder IF (optional).

Note: Reserved areas should not be accessed.

Figure 4.1 Memory Map



Note 1. Can be cached.
(For other areas, caching should not be enabled by the MPU.)

Note 3. Peripheral space
Note 4. For details, see section 28.3.1.3, Buffer Allocator.
Note 5. Peripheral space. Only for products with the encoder I/F (optional).

Note: Reserved areas should not be accessed.

Figure 4.3 Memory Map (0-Kbyte Extended Internal SRAM)

5. I/O Registers

This section gives information on the on-chip I/O register addresses. The information is given as shown below.

(1) I/O register addresses (address order)

- Registers are listed from the lower allocation addresses.
- Registers are classified according to module symbols.
- Among the internal I/O register area, addresses not listed in the list of registers are reserved. Reserved addresses must not be accessed. Do not access these addresses; otherwise, the operation when accessing these bits and subsequent operations cannot be guaranteed.

5.1 I/O Register Addresses (Address Order)

Table 5.1 List of I/O Registers (Address Order) (1 / 86)

Address	Module Symbol	Register Name	Register Symbol	Number of Bits	Access Size
A000 0000h	PORT0	Port direction register	PDR	16	16
A000 0002h	PORT1	Port direction register	PDR	16	16
A000 0004h	PORT2	Port direction register	PDR	16	16
A000 0006h	PORT3	Port direction register	PDR	16	16
A000 0008h	PORT4	Port direction register	PDR	16	16
A000 000Ah	PORT5	Port direction register	PDR	16	16

A00F 3110h	ECCRAM	2-bit ECC error counter register	RAMDBECNT	32	32

Note 1. Optional

6. Reset

6.1 Overview

Available reset types are RES# pin reset, error control module (ECM) reset, software reset, and software reset 2. Table 6.1 lists the reset names and sources.

Table 6.1 Reset Names and Sources

Reset Name	Source
RES# pin reset	Voltage input to the RES# pin is low.
ECM reset	Reset request from the error control module (ECM)
Software reset	SWRR1 register setting
Software reset 2 (for products incorporating an R-IN engine)	SWRR2 register setting

The internal states and pins are initialized by reset.
Table 6.2 lists the reset targets to be initialized for each reset type. For details on reset control during debugging, see section 10.3.5, Reset Configuration and the Method of Connecting with the Emulator.

Table 6.2 Targets to Be Initialized for Each Reset Type (√: To be initialized, —: No change)

	Reset Source			
Reset Target	**RES# Pin Reset**	**ECM Reset**	**Software Reset**	**Software Reset 2*5**
RES# pin reset flag (RSTSR0.TRF)	—	√	√	—
ECM reset detect flag (RSTSR0.ECMRF)	√	—	√	—
Software reset detect flag (RSTSR0.SWRF1)	√	√	—	—
Pin state	√	√	√	—
Operation mode	√*1	—*2	—*2	—
Cortex-M3 (for products incorporating an R-IN engine)	√	√	√	√
WDTA (for Cortex-M3) (for products incorporating an R-IN engine)	√	√	√	√
ECM ECM master error source status registers 0 to 2 ECM checker error source status registers 0 to 2 ECM error output clear disable setting register	√	—	—	—
Registers other than the above, and internal state	√	√	√	—
RSTOUT# pin output	√ (Low)*3	√ (Low)*3	√ (Low)*3	—
ERROROUT# pin output	√ (Low)	*4	—	—

Note 1. An operation mode is selected according to the input level of the mode setting pin (MD2, MD1, or MD0) when the pin reset state (RES# and TRST# pins are both low) is released. For details on the operation mode, see section 3.2, Types and Selection of Operating Modes.
Note 2. The operating mode is not initialized in response to this type of reset and the chip will be in the operating mode that was selected following the previous release from the reset state applied by the low level on the RES#. For details, see section 3, Operating Modes.
Note 3. For the low output period, see section 6.3.6, Reset Output Pin (RSTOUT#).
Note 4. Depends on the ECM setting. For details, see section 42, Error Control Module (ECM).
Note 5. The initial setting of software reset register 2 (SWRR2) is to remain in the reset state. For details, see section 6.2.3, Software Reset Register 2 (SWRR2) (for products incorporating an R-IN engine).

Table 6.3 lists the input and output pins related to the reset.

Table 6.3 Input and Output Pins Related to Reset

Pin Name	I/O	Function
RES#	Input	Reset pin. Use this pin to reset the entire LSI except the debugging circuit and TAP (Test Access Port). Since the power-on reset circuit is not incorporated in RZ/T1, a reset circuit must be implemented outside this LSI. For an example of configuration of the external reset circuit, see section 10.3.5, Reset Configuration and the Method of Connecting with the Emulator.
TRST#	Input	Test reset pin. Use this pin to reset TAP. If you design a board which enables an emulator, set the TRST# pin to Low level during the same period as the RES# pin at the time of power-on. The TRST# pin should also be controllable independently. When unused, this pin must be set to low level or connected to the same signal as the RES# pin. For details, see section 10.3.5, Reset Configuration and the Method of Connecting with the Emulator.
RSTOUT#	Output	Reset output pin. This pin outputs low-level signal upon occurrence of reset. For details, see section 6.3.6, Reset Output Pin (RSTOUT#). This pin can be used for resetting the external device.

Note: For details on resetting the debugging circuit, see section 10, Debugging Interface.

6.2 Register Descriptions

The reset status register 0 contains bits assigned to respective reset types to indicate reset generation sources. RSTSR0 and SWRR1, and SWRR2 are protected by the register write protection function. To write these registers, clear the write protection bit 1 in the protect register (PRCR). For details on the register write protection, see section 11, Register Write Protection Function.

6.2.1 Reset Status Register 0 (RSTSR0)

RSTSR0 is the register that indicates reset generation sources.

Address(es): RSTSR0: A00B 0200h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	SWR1F	ECMRF	TRF	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	*1	*1	*1	0

Bit	Symbol	Bit Name	Description	R/W
b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/(W)
b1	TRF	RES# Pin Reset Detect Flag	0: RES# pin reset not detected 1: RES# pin reset detected [Setting condition] • When Low is input to the RES# pin. [Clearing conditions] • When a ECM reset or software reset occurs. • When “0000 0000h” is written to RSTSR0 after RSTSR0 is read.	R/(W)*2
b2	ECMRF	ECM Reset Detect Flag	0: ECM reset not detected 1: ECM reset detected [Setting condition] • When an error predefined as a reset source by ECM setting occurs. [Clearing conditions] • When an RES# pin reset or software reset occurs. • When “0000 0000h” is written to RSTSR0 after RSTSR0 is read.	R/(W)*2
b3	SWR1F	Software Reset Detect Flag	0: Software reset not detected. 1: Software reset detected. [Setting condition] • When a software reset occurs. [Clearing conditions] • When an RES# pin reset or ECM reset occurs. • When “0000 0000h” is written to RSTSR0 after RSTSR0 is read.	R/(W)*2
b31 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/(W)

Note 1. The value after reset depends on the reset source.
Note 2. Only 0 can be written to clear the flag.

6.2.2 Software Reset Register (SWRR1)

SWRR1 is a register that controls the software reset.

Address(es): SWRR1: A00B 0210h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	SWRR1[31:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	SWRR1[31:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	SWRR1[31:0]	Software Reset	When “4321 A501h” is written, a software reset occurs. These bits are read as 0000 0000h.	R/W

6.2.3 Software Reset Register 2 (SWRR2) (for products incorporating an R-IN engine)

SWRR2 is a register that controls the software reset 2.

Address(es): SWRR2: A00B 0220h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	SWRR2[31:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	SWRR2[31:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	SWRR2[31:0]	Software Reset 2	These bits are used to control reset of Cortex-M3 and WDTA for Cortex-M3. When 4321 A50Fh is written, a software reset 2 occurs, and Cortex-M3 and WDTA for Cortex-M3 enter the reset state. To clear the reset, write 0000 0000h. These bits are read as 0000 0001h during reset, and as 0000 0000h when reset is released. Note: After an RES# pin reset, ECM reset, or software reset occurred, the reset state due to the software reset 2 takes place as the initial state. When it is necessary to release the software reset 2, write 0000 0000h to the SWRR2 register of Cortex-R4.	R/W

6.2.4 Module Reset Control Register C (MRCTLC)

MRCTLC is a register that controls the reset of peripheral modules.

Address(es): MRCTLC: A00B 0248h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MRUSBH	MRUSBF
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1

Bit	Symbol	Bit Name	Description	R/W
b0	MRUSBF	USB (Func) Reset Control	0: USB (Func) is released from reset. 1: USB (Func) is in the reset state.	R/W
b1	MRUSBH	USB (Host) Reset Control	0: USB (Host) is released from reset. 1: USB (Host) is in the reset state.	R/W
b31 to b2	—	Reserved	These bits are always read as 0. The write value should always be 0.	R/W

6.3 Operation

6.3.1 RES# Pin Reset

This reset occurs when a signal arrives at the RES# pin from the externally connected reset circuit. When the signal becomes Low at the RES# pin, all the ongoing processes are aborted and the LSI enters the reset state. In order to reset the LSI without fail, the RES# pin should be held at Low level for the specified time after power-on. For details on the reset configuration, see section 10.3.5, Reset Configuration and the Method of Connecting with the Emulator.
After the reset is released, the CPU (Cortex-R4) starts reset exception handling.
When an RES# pin reset occurs, the RSTSR0.TRF flag is set to 1.

6.3.2 ECM Reset

This reset is generated in response to a reset request from ECM (Error Control Module).
ECM receives serious errors, such as oscillation stop detection, from individual modules in the LSI, and generates reset requests corresponding to respective errors. For details on the ECM operation, see section 42, Error Control Module (ECM). When an ECM reset occurs, all the ongoing processes are aborted and the LSI enters the reset state.
After the reset is released, the CPU (Cortex-R4) starts reset exception handling.
When an ECM reset occurs, the RSTSR0.ECMRF flag is set to 1.

6.3.3 Software Reset

The software reset occurs when “4321 A501h” is written to the SWRR1 register. When a software reset occurs, all the ongoing processes are aborted and the LSI enters the reset state.
After the reset is released, the CPU (Cortex-R4) starts reset exception handling.
When the software reset occurs, the RSTSR0.SWR1F flag is set to 1.

6.3.4 Software Reset 2 (for products incorporating an R-IN engine)

The software reset 2 applies to Cortex-M3 and WDTA for Cortex-M3. It occurs when 4321 A50Fh is written to the SWRR2 register. When an RES# pin reset, ECM reset, or software reset occurs, the software reset 2 becomes the reset state of the initial state.
To release the reset state of the software reset 2, write 0000 0000h to the SWRR2 register of Cortex-R4.

6.3.5 Determination of Reset Generation Source

Reading the RSTSR0 register determines which reset source was used for reset execution. Figure 6.1 shows an example of the flow to identify a reset generation source.

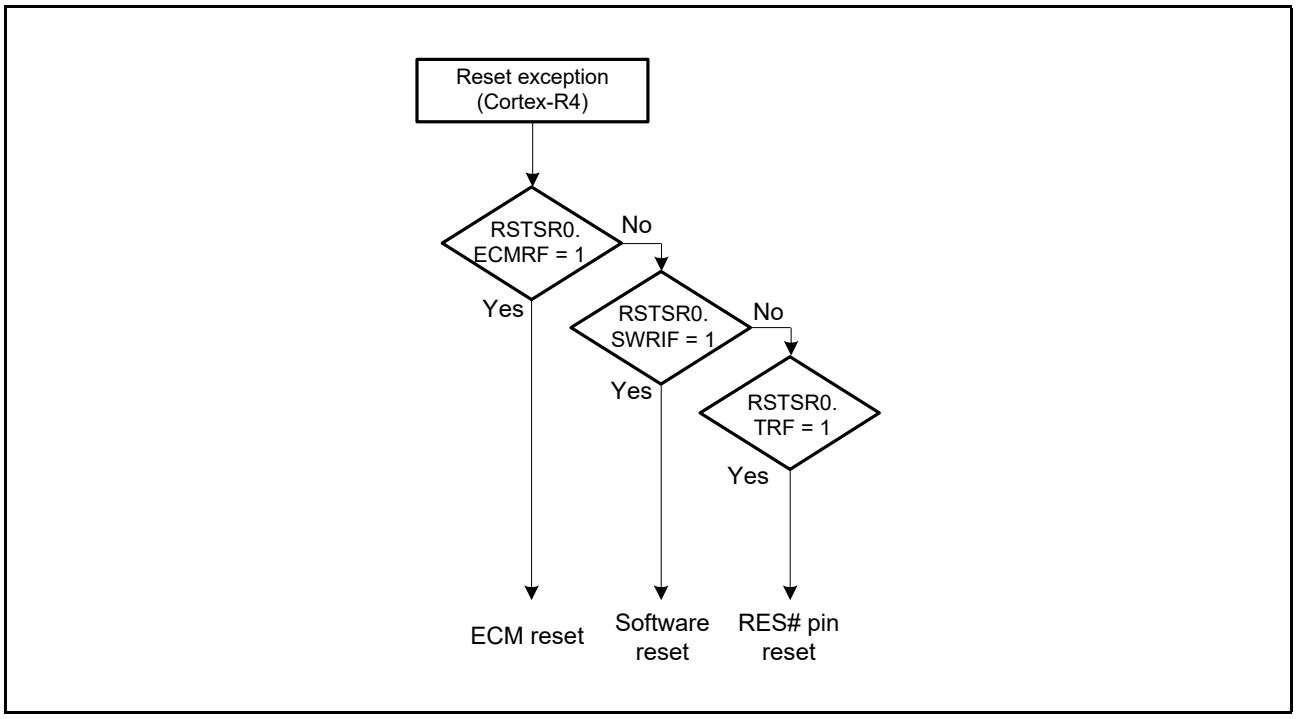

Figure 6.1 Example of Reset Generation Source Determination Flow

6.3.6 Reset Output Pin (RSTOUT#)

The reset output pin (RSTOUT#) outputs Low level upon occurrence of reset when the input level of the RES# pin is Low. It also outputs Low level upon occurrence of an ECM reset or software reset.

If the RES# pin remains Low for a specified time period and then changes to high, the reset output remains Low for 500 us (Typ.) and then changes to High. Similarly, when an ECM reset or software reset occurs, the reset output remains Low for 500 us (Typ.) and then changes to High.

6.3.7 Noise Cancellation for Reset Input

Noise cancellation using analog delay is applied to the RES# pin. This can eliminate noises within 100 ns (Min.).

6.4 Usage Note

6.4.1 Connection of Reset Output Pin (RSTOUT#)

The low level is output for a specified period of time on RSTOUT# after de-assertion of the signal on the RES# pin. This means that RSTOUT# should not be directly connected as a reset signal for a flash memory to be used in booting the LSI chip. Otherwise, release of the LSI chip itself from the reset state may precede that for the flash memory.
However, using RSTOUT# as the reset signal for external device is still possible as long as the timing requirement imposed by the output on the RSTOUT# pin is satisfied.
For details, see section 6.3.6, Reset Output Pin (RSTOUT#).

7. Clock Generation Circuit

7.1 Overview

This LSI incorporates a clock generation circuit.
Table 7.1 shows the specifications of the clock generation circuit. Figure 7.1, Figure 7.2 shows a block diagram of the clock generation circuit.

Table 7.1 Specifications of Clock Generation Circuit

Item	Specifications
Main clock oscillator	Resonator frequency: 25 MHz
	External clock input frequency: 25 MHz
	Connectable resonator or additional circuit: Ceramic resonator, crystal resonator Connection pin: EXTAL, XTAL
	Oscillation stop detection function: When an oscillation stop is detected with the main clock, the system clock source is switched to LOCO, and MTU3a and GPT output can be forcedly driven to the high-impedance.
PLL0 circuit	Input clock source: Main clock oscillator
	Input frequency: 25 MHz
	Frequency multiplication ratio: 48 multiplication
	Output clock frequency of the PLL0 circuit: 1200 MHz
	Oscillation abnormality detection function: When the CLMA0 detects an abnormality in oscillation of the PLL0, the system clock source is switched to main clock, and MTU3a and GPTa pins are placed in the high-impedance state.
PLL1 circuit	Input clock source: PLL0 clock divided by 80
	Input frequency: 15 MHz
	Frequency multiplication ratio: Selectable from 60 and 80
	Output clock frequency of the PLL1 circuit: 900 MHz, 1200 MHz
	Oscillation abnormality detection function: When the CLMA1 detects an abnormality in oscillation of the PLL1, the system clock source is switched to main clock, and MTU3a and GPTa pins are placed in the high-impedance state.
Low-speed on-chip oscillator (LOCO)	Oscillation frequency: 240 kHz
	Oscillation abnormality detection function: The CLMA2 can detect an abnormality in oscillation of the LOCO.
External clock input for SSI (AUDIO_CLK)	Input frequency: 50 MHz (max.)
External clock input (TCK) for JTAG	Input frequency: 50 MHz (max.)

Table 7.2 Specifications of Clock Generation Circuit (Internal Clock) (1 / 2)

Item	Clock Source	Supplied to	Frequency
CPU clock (CPUCLK)	Selected from frequency-dividing clocks for PLL0 or PLL1	CPU (Cortex-R4)	150 MHz 300 MHz 450 MHz 600 MHz
System clock (ICLK)	Selected from frequency-dividing clocks for PLL0 or PLL1	CPU (Cortex-M3 (for products incorporating an R-IN engine)), DMAC, interrupt controller, on-chip extended SRAM	150 MHz
High-speed peripheral module clock (PCLKA)	Selected from frequency-dividing clocks for PLL0 or PLL1	Peripheral module	150 MHz
Low-speed peripheral module clock (PCLKB)	Selected from frequency-dividing clocks for PLL0 or PLL1	Peripheral module	75 MHz
High-speed peripheral module clock (PCLKC)	Frequency-dividing clock for PLL0	Peripheral modules (GPTa, MTU3a)	150 MHz
Low-speed peripheral module clock (PCLKD)	Frequency-dividing clock for PLL0	Peripheral modules (CRC, DOC, ECM, ELC, TPU, POE3, PPG, CMT, CMTW, and RIIC)	75 MHz
Low-speed peripheral module clock (PCLKE)	Frequency-dividing clock for PLL0	Peripheral module (WDTA)	Up to 75 MHz
Low-speed peripheral module clock (PCLKF)	Frequency-dividing clock for PLL0	Peripheral module (12-bit A/D converter Unit 0)	Up to 60 MHz
Low-speed peripheral module clock (PCLKG)	Frequency-dividing clock for PLL0	Peripheral module (12-bit A/D converter Unit 1)	Up to 60 MHz
Low-speed peripheral module clock (PCLKH)	Frequency-dividing clock for PLL0	Peripheral module (12-bit A/D converter, bus clock for units 0 and 1)	60 MHz
External bus clock (CKIO)	Frequency-dividing clock for PLL0 or PLL1	External bus	Up to 75 MHz
High-speed serial clock (SERICLK)	Frequency-dividing clock for PLL0	RSPIa, SCIFA	150 MHz, 120 MHz
USB clock M (USBMCLK)	Frequency-dividing clock for PLL0	USB PHY	50 MHz
USB clock P (USBPCLK)	Frequency-dividing clock for PLL0	USB	30 MHz
Ethernet clock A (ETCLKA)	Frequency-dividing clock for PLL0	EtherCAT (optional), Ethernet switch	100 MHz
Ethernet clock B (ETCLKB)	Frequency-dividing clock for PLL0	RMII converter	50 MHz
Ethernet clock C (ETCLKC)	Frequency-dividing clock for PLL0	Ethernet switch	200 MHz
Ethernet clock D (ETCLKD)	Frequency-dividing clock for PLL0	Ethernet MAC (MDC_CLK)	Up to 12.5 MHz
Ethernet clock E (ETCLKE)	Selected from main clock or frequency-dividing clock for PLL0	Ethernet PHY	25 MHz, 50 MHz
Ethernet clock F (ETCLKF)	Frequency-dividing clock for PLL0	EtherCAT (optional)	25 MHz
Ethernet clock G (ETCLKG)	Frequency-dividing clock for PLL0	Ethernet switch	125 MHz
Clock A for RSCAN (CANCLKA)	Frequency-dividing clock for PLL0	RSCAN	24 MHz
Clock B for RSCAN (CANCLKB)	Main clock	RSCAN	25 MHz
CLMAn sampling clock (CLMAMCLKA) (n = 1 or 0)	Main clock divided by 2	CLMA0, CLMA1	12.5 MHz
CLMA2 sampling clock (CLMAMCLKB)	Main clock divided by 256	CLMA2	97.6 kHz
CLMA2 monitor clock (CLMALCLK)	LOCO	CLMA2	240 kHz
CLMA0 monitor clock (CLMAPLCLK0)	PLL0 clock divided by 16	CLMA0	75 MHz

Table 7.2 Specifications of Clock Generation Circuit (Internal Clock) (2 / 2)

Item	Clock Source	Supplied to	Frequency
CLMA1 monitor clock (CLMAPLCLK1)	PLL1 clock divided by 16	CLMA1	75 MHz, 56.25 MHz*1
IWDT clock (IWDTCLK)	LOCO clock divided by 2	IWDT	120 kHz
ECM clock (ECMCKL)	LOCO	ECM	240 kHz
SSI clock (ACLK)	AUDIO_CLK	SSI	1 MHz to 50 MHz
Delta-sigma interface clock 0 (DSCLK0)	Frequency-dividing clock for PLL0	Delta-sigma interface (channels 0 to 2)	Up to 25 MHz
Delta-sigma interface clock 1 (DSCLK1)	Frequency-dividing clock for PLL0	Delta-sigma interface (channel 3)	Up to 25 MHz
JTAG clock (JTAGTCK)	TCK	JTAG	Up to 50 MHz
Trace interface clock (TCLK)	Selected from frequency-dividing clocks for PLL0 or PLL1	CoreSight TPIU	75 MHz

Note 1. Selecting 10b in the PLL1CR.CPUCKSEL[1:0] bits outputs 56.25 MHz. Selecting values other than 10b outputs 75 MHz.

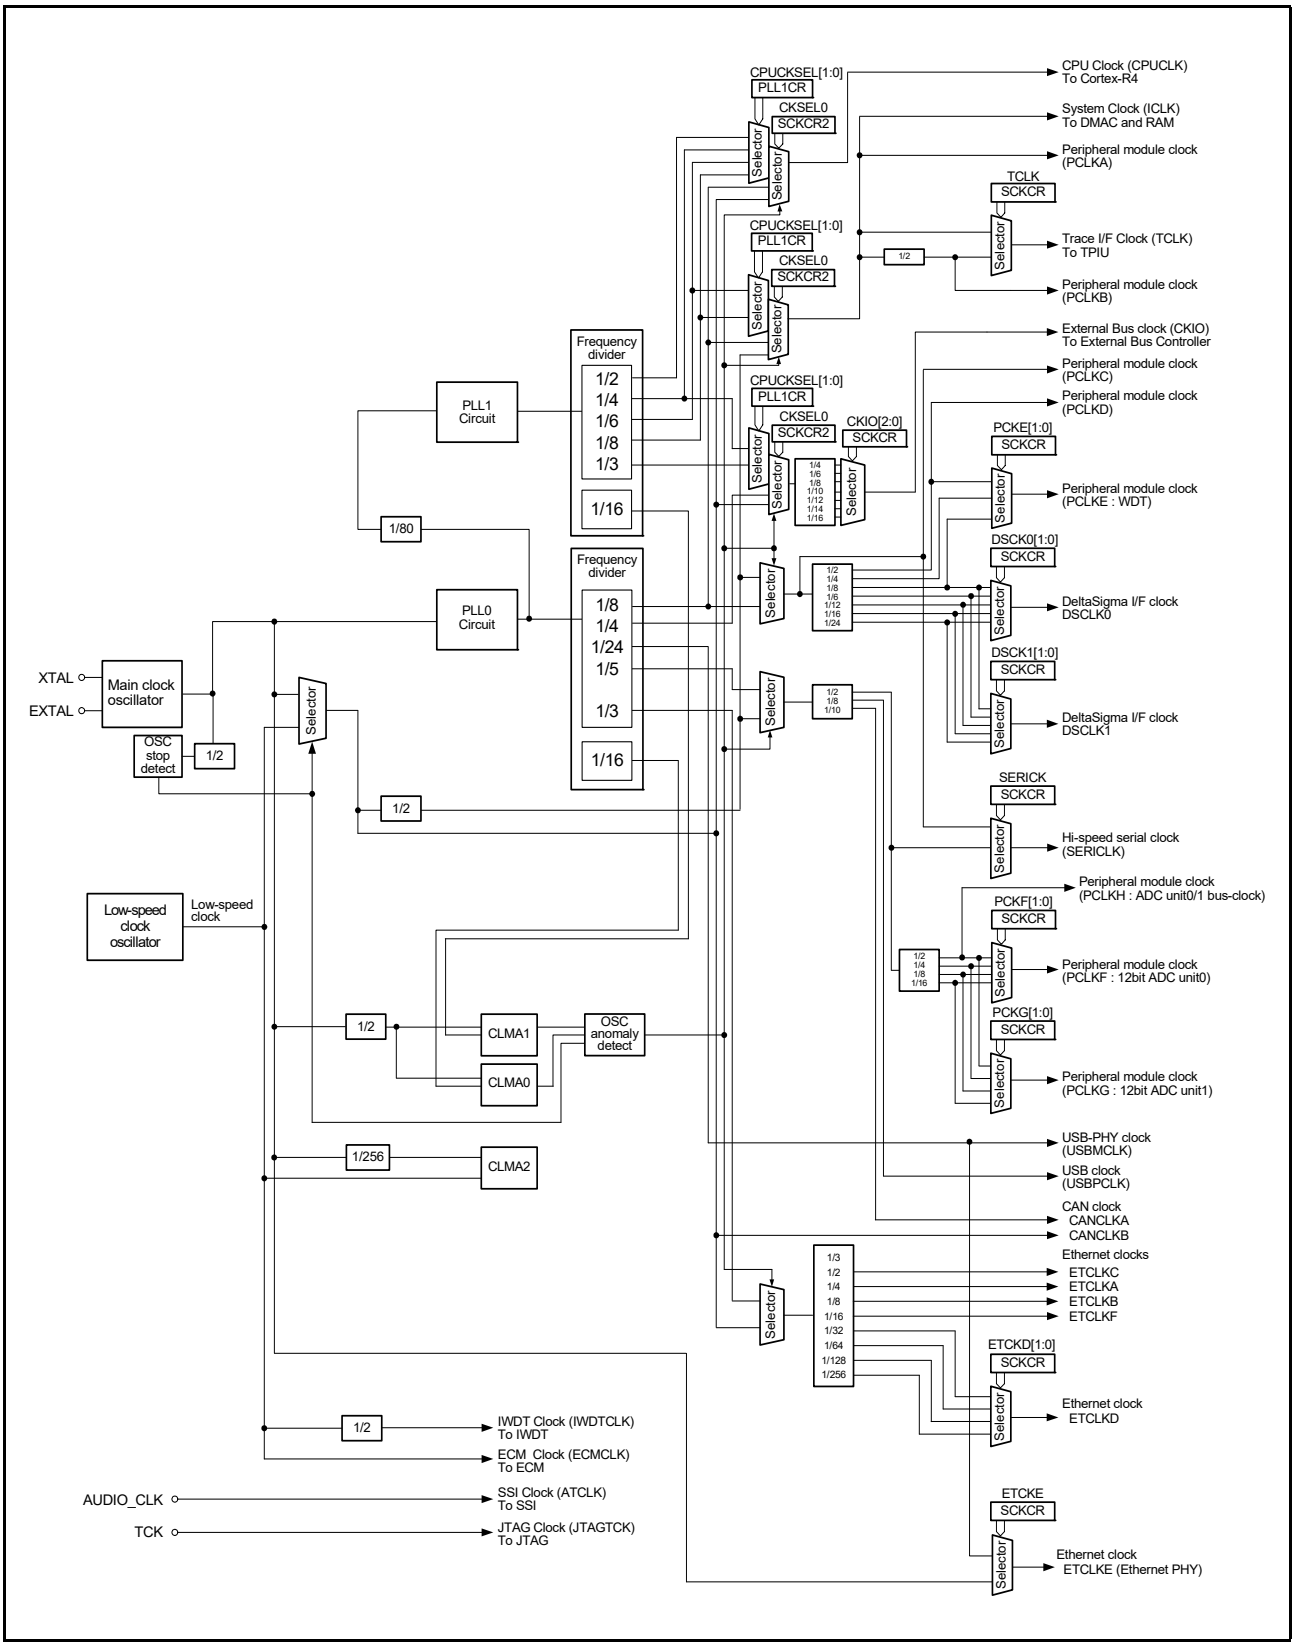

Figure 7.1 Block Diagram of Clock Generation Circuit

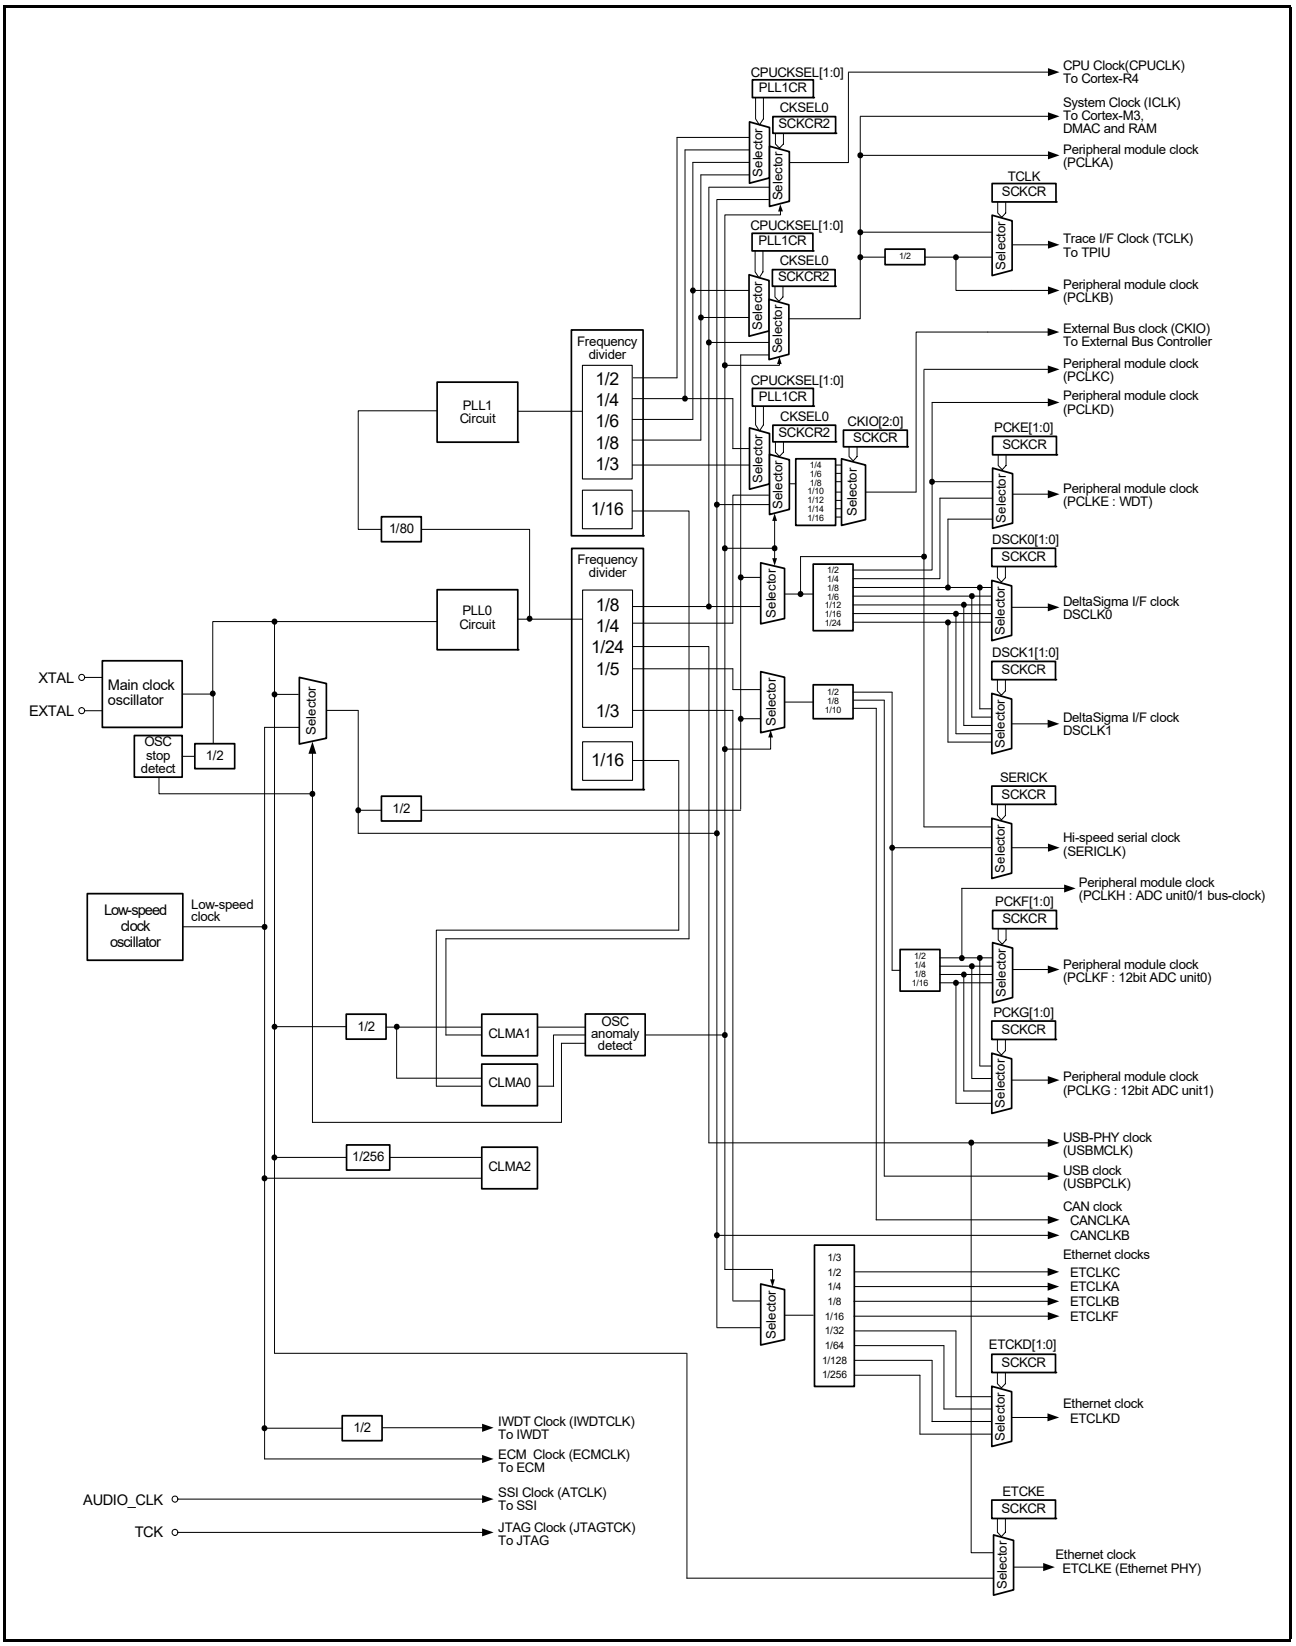

Figure 7.2 Block Diagram of Clock Generation Circuit (for products incorporating an R-IN engine)

Table 7.3 shows the input/output pins of the clock generation circuit.

Table 7.3 Pin Configuration of Clock Generation Circuit

Pin Name	I/O	Description
XTAL	Output	These pins are used to connect a crystal resonator. An external clock signal can also be input to the EXTAL pin. For details, see section 7.3.2, External Clock Input.
EXTAL	Input	
TCK	Input	This pin is used to input the clock for the JTAG.
AUDIO_CLK	Input	This pin is used to input the clock for the SSI.
CKIO	Output	This pin is used to supply the external bus clock (CKIO) to external devices.
OSCTH	Input	How to supply the clock signal to the main clock oscillator is specified based on the input level. Low: Connecting an oscillator High: External clock input
CLKOUT25M0	Output	This pin is used to supply Ethernet PHY0 with the main clock (25 MHz) or frequency-dividing clock of PLL0 (50 MHz).
CLKOUT25M1	Output	This pin is used to supply Ethernet PHY1 with the main clock (25 MHz) or frequency-dividing clock of PLL0 (50 MHz).
CLKOUT25M2	Output	This pin is used to supply Ethernet PHY2 with the main clock (25 MHz) or frequency-dividing clock of PLL0 (50 MHz).
MCLK0	I/O	Clock input/output pins for the delta-sigma interface. These pins are used as output pins when the clock is supplied to a delta-sigma modulator. These pins are used as input pins when the clock is supplied from the external clock generation circuit for the delta-sigma interface. For how to switch the clock, see section 7.2.3, Delta-Sigma Interface Clock Control Register (DSCR).
MCLK1	I/O	
MCLK2	I/O	
MCLK3	I/O	

7.2 Register Descriptions

The registers related to the clock generation circuit can be write-protected. To write to the registers, specify bit 0 of the Protect Register (PRCR) to cancel the write protection. For details, see section 11, Register Write Protection Function.

7.2.1 System Clock Control Register (SCKCR)

The SCKCR register is used to select the frequency for each of the delta-sigma interface clock (DSCLK), trace interface clock (TCLK), high-speed serial clock (SERICLK), Ethernet clocks (ETCLKD and ETCLKE), external bus clock (CKIO), peripheral module clocks (PCLKE, PCLKF, and PCLKG) and the clocks supplied to the delta-sigma interface.

Bit	Symbol	Bit Name	Description	R/W
b1, b0	PCKG[1:0]	Peripheral Module Clock G (PCLKG) Select	Select the low-speed peripheral module clock PCLKG supplied to the 12-bit A/D converter unit 1. 00: 60 MHz 01: 30 MHz 10: 15 MHz 11: 7.5 MHz	R/W
b3, b2	PCKF[1:0]	Peripheral Module Clock F (PCLKF) Select	Select the low-speed peripheral module clock PCLKF supplied to the 12-bit A/D converter unit 0. 00: 60 MHz 01: 30 MHz 10: 15 MHz 11: 7.5 MHz	R/W
b5, b4	PCKE[1:0]	Peripheral Module Clock E (PCLKE) Select	Select the low-speed peripheral module clock PCLKE supplied to the WDTA. 00: 75 MHz 01: 37.5 MHz 10: 18.75 MHz Settings other than above are prohibited.	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b10 to b8	CKIO[2:0]	External Bus Clock (CKIO) Select	Select the frequency of the external bus clock CK10. 000: 75 MHz 001: 50 MHz 010: 37.5 MHz 011: 30 MHz 100: 25 MHz 101: 21.43 MHz 110: 18.75 MHz Settings other than above are prohibited.	R/W
b11	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

Bit	Symbol	Bit Name	Description	R/W
b12	ETCKE	Ethernet Clock E (ETCLKE) Select	Selects the Ethernet clock ETCLKE supplied to Ethernet PHY. 0: Main clock (25 MHz) 1: Frequency-dividing clock of PLL0 (50 MHz)	R/W
b13	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b15, b14	ETCKD[1:0]	Ethernet Clock D (ETCLKD) Select	Select the Ethernet clock ETCLKD supplied to the Ethernet MAC. 00: 12.5 MHz 01: 6.25 MHz 10: 3.125 MHz 11: 1.563 MHz	R/W
b16	SERICK	High-Speed Serial Clock (SERICLK) Select	Selects the high-speed serial clock SERICLK supplied to RSPIa and SCIFA. 0: 150 MHz 1: 120 MHz	R/W
b19 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b20	TCLK	Trace interface clock (TCLK)	Selects the clock supplied to the trace I/F clock TCLK (CoreSight TPIU). 0: Setting prohibited 1: 75 MHz	R/W
b31 to b21	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

7.2.2 System Clock Control Register 2 (SCKCR2)

The SCKCR2 register is used to select PLL0 or PLL1 as the source of clocks supplied to the system clock.

Address(es): A00B 0024h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CKSEL 0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	CKSEL0	System Clock Source Select	Selects the source of the CPU clock (CPUCLK), system clock (ICLK), high-speed peripheral module clock (PCLKA), low-speed peripheral module clock (PCLKB), and external bus clock (CKIO). Switching to a clock source which is not in operation is prohibited. 0: PLL0 is selected. 1: PLL1 is selected.	R/W
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

7.2.3 Delta-Sigma Interface Clock Control Register (DSCR)

The DSCR register is used to select the clocks that are supplied to the delta-sigma interface.

Address(es): A00B 0028h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	DSINV 1	DSCK1[2:0]			DSSEL 1
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	DSCHSEL	DSINV 0	DSCK0[2:0]			DSSEL 0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Bit Name	Description	R/W
b0	DSSEL0	Delta-Sigma Interface Clock 0 Supply Source Select (channels 0 to 2)	Selects the clock supplied to the delta-sigma interface (channels 0 to 2). 0: Supplied from outside the LSI (slave operation) 1: Supplied from the clock generation circuit (master operation)	R/W
b3 to b1	DSCK0[2:0]	Delta-Sigma Interface Clock 0 (DSCLK0) Frequency Select (channels 0 to 2)	Select the frequency of the delta-sigma interface clock output from the MCLKn pin (n = 0 to 2) when the delta-sigma interface operates as a master. The same clock frequency is used for the channels. 000: 25 MHz 001: 18.75 MHz 010: 12.5 MHz 011: 9.375 MHz 100: 6.25 MHz Settings other than above are prohibited.	R/W
b4	DSINV0	Delta-Sigma Interface Clock 0 (DSCLK0) Polarity Select (channels 0 to 2)	In master operation (DSSEL0 = 1): Selects whether to use the inverted internal operating clock for the delta-sigma interface clock output from the MCLKn pin (n = 0 to 2). In slave operation (DSSEL0 = 0): Selects whether to use the inverted internal operating clock for the delta-sigma interface clock input from the MCLKn pin (n = 0 to 2). Change the polarity to adjust the phase with the operating clock of external delta-sigma ADC. 0: Not inverted 1: Inverted	R/W
b5	DSCHSEL	Delta-Sigma Interface (channels 0 to 2) Supply Channel Select	Selects the path of the clock input to the MCLKn pin (n = 0 to 2) when the delta-sigma interface operates as a slave. If 0 is selected, the clocks input to the individual MCLKn pin are used. If 1 is selected, only the clock input to the MCLK0 pin is used. Select this when only one clock is supplied from outside the LSI. 0: Clocks input to the individual MCLKn pin are used. 1: The clock input to the MCLK0 pin is used.	R/W
b15 to b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b16	DSSEL1	Delta-Sigma Interface Clock 1 Supply Source Select (channels 3)	Selects the source of the clock supplied to the delta-sigma interface (channels 3). 0: Supplied from outside the LSI (slave operation) 1: Supplied from the clock generation circuit (master operation)	R/W

Bit	Symbol	Bit Name	Description	R/W
b19 to b17	DSCK1[2:0]	Delta-Sigma Interface Clock 1 (DSCLK1) Frequency Select (channel 3)	Select the frequency of the delta-sigma interface clock output from the MCLK3 pin when the delta-sigma interface operates as a master. 000: 25 MHz 001: 18.75 MHz 010: 12.5 MHz 011: 9.375 MHz 100: 6.25 MHz Settings other than above are prohibited.	R/W
b20	DSINV1	Delta-Sigma Interface Clock 1 (DSCLK1) Polarity Select (channel 3)	In master operation (DSSEL1 = 1): Selects whether to use the inverted internal operating clock for the delta-sigma interface clock output from the MCLK3 pin. In slave operation (DSSEL1 = 0): Selects whether to use the inverted internal operating clock for the delta-sigma interface clock input from the MCLK3 pin. Change the polarity to adjust the phase with the operating clock of external delta-sigma ADC. 0: Not inverted 1: Inverted	R/W
b31 to b21	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

7.2.4 PLL1 Control Register (PLL1CR)

The PLL1CR register is used to set the CPU clock frequency.

Address(es): A00B 0034h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CPUCKSEL [1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b1, b0	CPUCKSEL [1:0]	CPU Operating Frequency Select	Select the CPU clock frequency. After setting this bit to select the CPU operating frequency, use the PLL1CR2 register to control operation of the PLL1 circuit. For the procedure for changing the CPU frequency, see Figure 7.3. b1 b0 00: 150 MHz 01: 300 MHz 10: 450 MHz 11: 600 MHz	R/W
b31 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Set the frequency within the allowable range for the electrical characteristics of the CPU frequency clock.
Note 2. The relationship between the PLL1 frequency multiplication ratio and clock division ratio specified with CPUCKSEL[1:0] is shown in Table 7.4.

Table 7.4 Relationship Between PLL1 Frequency Multiplication Ratio and Clock Division Ratio Specified with CPUCKSEL[1:0]

CPUCKSEL[1:0]	PLL1 Frequency Multiplication Ratio	Clock Division Ratio	CPU Operating Frequency
00	80	1/8	150 MHz
01	80	1/4	300 MHz
10	60	1/2	450 MHz
11	80	1/2	600 MHz

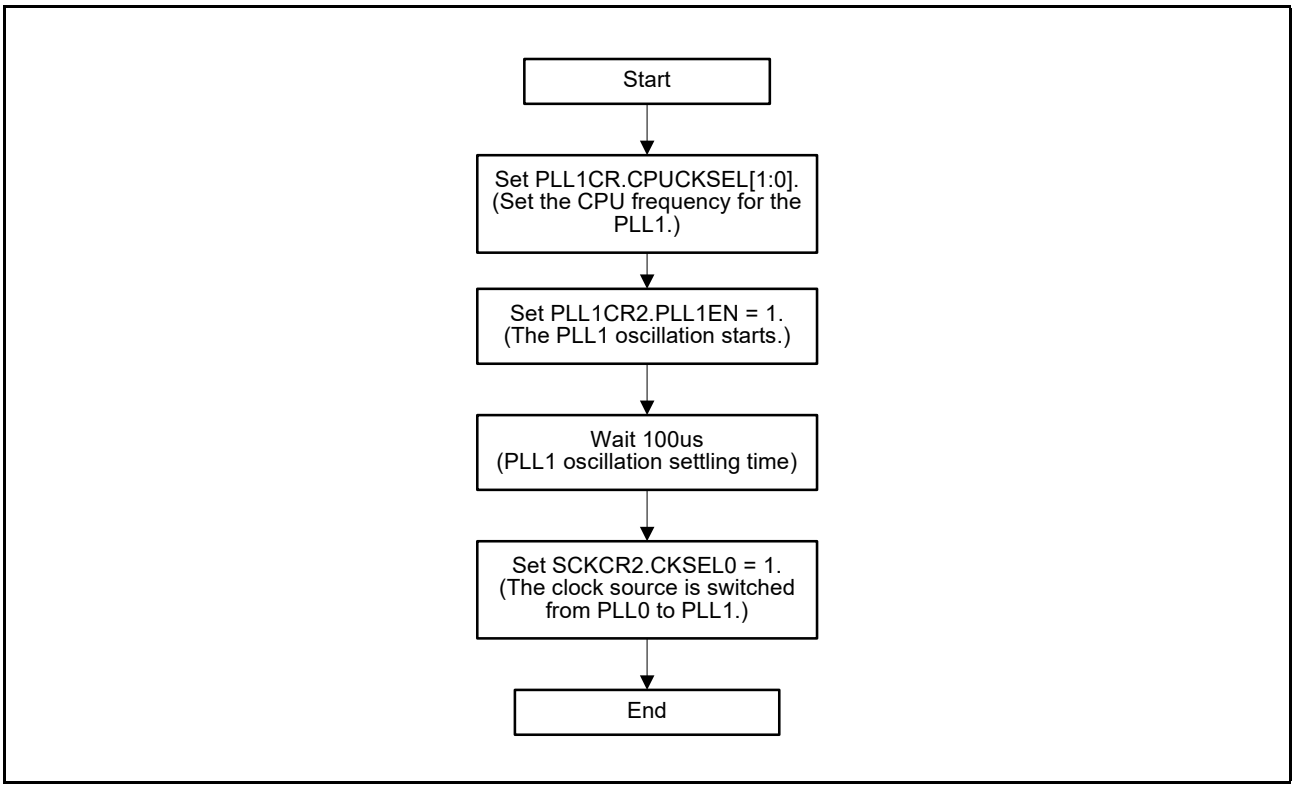

Figure 7.3 Changing the CPU Frequency

7.2.5 PLL1 Control Register 2 (PLL1CR2)

The PLL1CR2 register is used to control operation of the PLL1 circuit.

Address(es): A00B 0038h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	PLL1EN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	PLL1EN	PLL1 Operation Control	Specifies whether to run or stop PLL1. 0: PLL1 stops 1: PLL1 runs If the PLL1EN bit is set to 1, 100 us of the PLL oscillation settling time must be counted by using loop processing in the CPU or by a timer. For details about how to change the CPU frequency, see Figure 7.3.	R/W
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note: Before you attempt to set the CPU clock frequency by using the PLL1CR register, stop the PLL by setting the PLL1EN bit to 0.

7.2.6 Low-Speed On-Chip Oscillator Control Register (LOCOCR)

LOCOCR is used to control operation of a low-speed on-chip oscillator.

Address(es): A00B 0040h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LCSTP
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Bit Name	Description	R/W
b0	LCSTP	LOCO Stop	Specify whether to run or stop the low-speed on-chip oscillator (LOCO). 0: Run 1: Stop After setting this bit to run the LOCO, start using the LOCO clock after the LOCO oscillation stabilization time (t_{LOCOWT}) has elapsed.	R/W
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. To stop the LOCO and then run it again, wait at least the LOCO oscillation stabilization time (t_{LOCOWT}) is elapsed after setting the LCSTP bit to stop the LOCO, and then set the LCSTP bit to run the LOCO again.
To set the bit to stop the LOCO, make sure that the LOCO oscillation is stable.

Note 2. Writing of 1 to the LCSTP bit (stop the LOCO) is prohibited if the oscillation stop detection function is enabled by setting the OSTDCR.OSTDE bit.

7.2.7 Oscillation Stop Detection Control Register (OSTDCR)

The OSTDCR register is used to control the oscillation stop detection function of the main clock.

Address(es): A00B 004Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	OSTDE	—	—	—	—	—	—	OSTDIE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	OSTDIE	Oscillation Stop Detection Interrupt Enable	Enable or disable the oscillation stop detection interrupt (OSTDI). This also specifies whether the oscillation stop detection is notified to the port output enable (POE). 0: Oscillation stop detection interrupt is disabled. Oscillation stop detection is not notified to the POE. 1: Oscillation stop detection interrupt is enabled. Oscillation stop detection is notified to the POE.	R/W
b6 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	OSTDE	Oscillation Stop Detection Function Enable	Enable or disable the oscillation stop detection function. If the oscillation stop detection function is enabled, the LCSTP bit of the low-speed on-chip oscillator control register (LOCOCR) is also set to 0, and the low-speed on-chip oscillator operation starts.*1 0: The oscillation stop detection function is disabled. 1: The oscillation stop detection function is enabled.	R/W
b31 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. The low-speed on-chip oscillator cannot be stopped while the oscillation stop detection function is enabled (OSTDE bit = 1). Writing 1 to the LOCOCR.LCSTP bit is ignored.

7.3 Selecting Input to Main Clock Oscillator

The clock signal is supplied to the main clock oscillator by connecting a resonator. The clock input mode is set based on the status of the OSCTH pin. For details about the settings, see Table 7.5.

Table 7.5 Clock Input Mode Selected for OSCTH Pin

OSCTH Pin	Clock Input Mode
Low	An oscillator is connected
High	External clock is input

7.3.1 Connecting a Crystal Resonator

Figure 7.4 shows an example of connecting a crystal resonator.
A damping resistor Rd should be added, if necessary. Because the resistor values vary depending on the resonator and the oscillation drive capability, use values recommended by the resonator manufacturer. If use of an external feedback resistor (Rf) is directed by the resonator manufacturer, insert an Rf between EXTAL and XTAL by following the instruction.
When connecting a resonator to supply the clock, the frequency of the resonator should be in the frequency range of the resonator for the main clock oscillator described in Table 7.1.

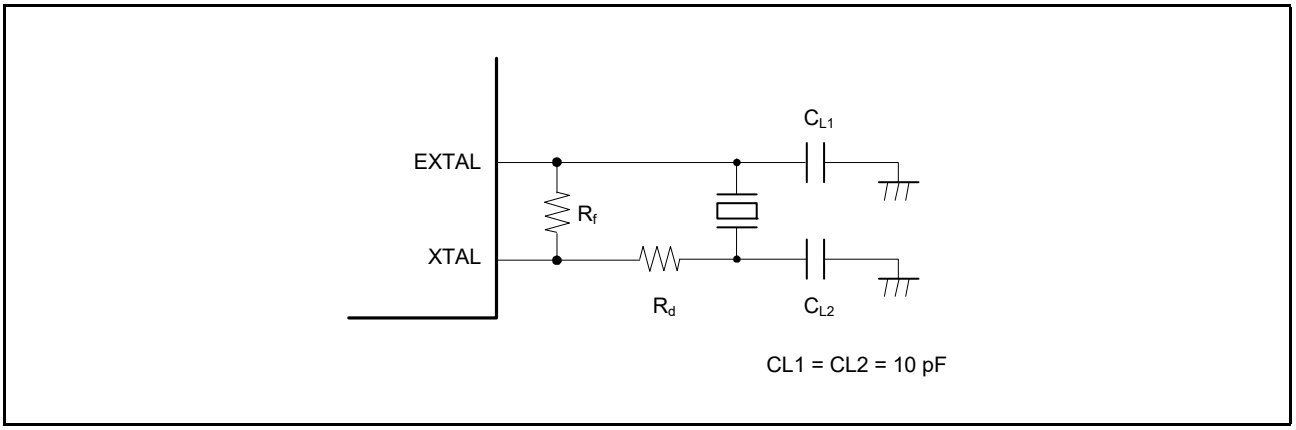

Figure 7.4 Example of Crystal Resonator Connection

Table 7.6 Damping Resistance (Reference Values)

Frequency (MHz)	25
Rd (Ω)	2.2K

Figure 7.5 shows an equivalent circuit of the crystal resonator. Use a crystal resonator that has the characteristics shown in Table 7.7.

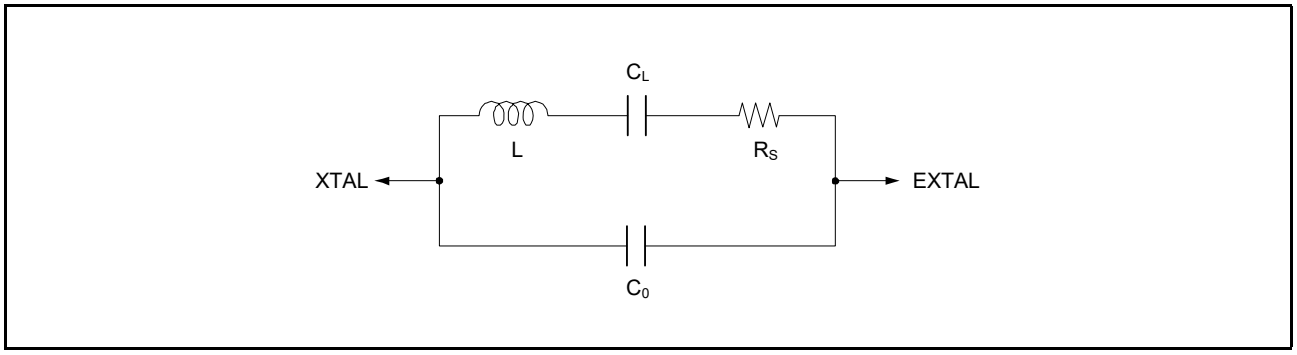

Figure 7.5 Equivalent Circuit of Crystal Resonator

Table 7.7 Crystal Resonator Characteristics (Reference Values)

Frequency (MHz)	25
R_S max (Ω)	100

7.3.2 External Clock Input

Figure 7.6 shows an example of connection of external clock input. To open the XTAL pin, make sure that the parasitic capacity is not more than 10 pF.

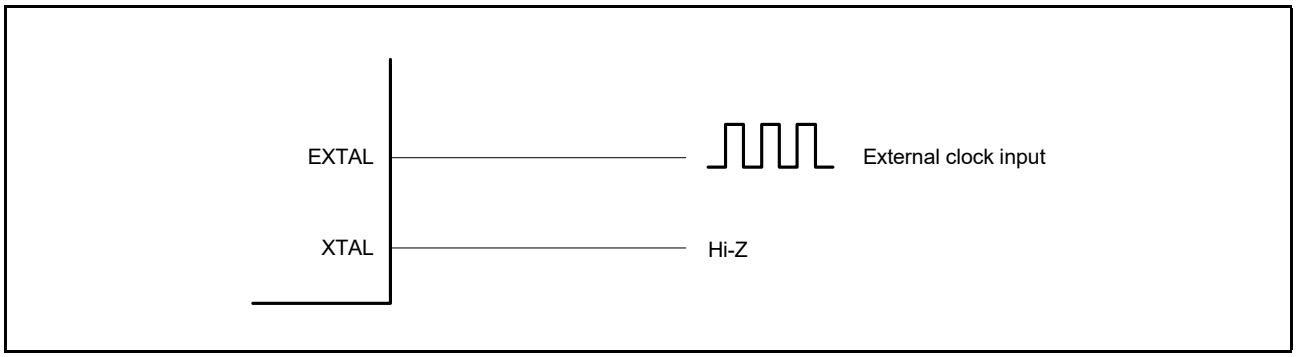

Figure 7.6 Example of External Clock Connection

7.4 Oscillation Stop Detection Function

7.4.1 Oscillation Stop Detection and Operation after Detection

The oscillation stop detection function detects the main clock oscillator stop and to supply LOCO clock pulses from the low-speed on-chip oscillator as the system clock source instead of the main clock, PLL0 clock, and PLL1 clock.
An oscillation stop detection interrupt request can be generated when an oscillation stop is detected. In addition, the MTU3a and GPTa output can be forcedly driven to the high-impedance on the detection. For details, see section 19, Multi-Function Timer Pulse Unit (MTU3a), section 20, Port Output Enable 3 (POE3), and section 21, General PWM Timer (GPTa).
This LSI detects a main clock oscillation stop when the input clock remains to be 0 or 1 for a certain period, for example, due to a malfunction of the main clock oscillator (see Table 47.40, Oscillation Stop Detection Circuit Characteristics, in section 47.8, Oscillation Stop Detection Timing).
When an oscillation stop is detected, clocks are switched to the LOCO clock.

After a reset is released, the oscillation stop detection function is disabled. To enable the oscillation stop detection function, set the OSTDCR.OSTDE bit to 1.
The clocks that are switched to the LOCO clock by the oscillation stop detection are the PLL0 clock, PLL1 clock, and clock B for RSCAN (CANCLKB).

7.4.2 Oscillation Stop Detection Interrupt

An oscillation-stop detection interrupt (OSTDI) will be generated if the oscillation-stop detection interrupt enable bit (OSTDCR.OSTDIE) is 1 (enabling interrupt generation on oscillation stop detection). At this time, the main clock oscillator stop is notified to the port output enable 3 (POE). On accepting the notification of the oscillation stop, the POE sets the OSTST high-impedance flag (POE.OSTSTF).
The oscillation stop detection interrupt is connected to the Error Control Module (ECM) as an error interrupt. Interrupts are disabled in the initial state after a reset release. To use oscillation stop detection interrupts, select maskable or non-maskable interrupt as the operation to be performed when the ECN detects an error interrupt. For details, see section 42, Error Control Module (ECM).

7.5 PLL Oscillation Abnormality Detection Function

The PLL oscillation abnormality detection function detects an abnormality in oscillation of the PLL0 or PLL1 by using the clock monitor circuits (CLMA0 and CLMA1) to monitor the frequency, and supplies the main clock instead of the PLL0 clock or PLL1 clock. For details about the CLMA, see section 8, Clock Monitor Circuit (CLMA).

7.6 Low-Speed On-Chip Oscillator Oscillation Abnormality Detection Function

The clock monitor circuit (CLMA2) can be used to detect an abnormality in oscillation of the low-speed on-chip oscillator. For details about the CLMA, see section 8, Clock Monitor Circuit (CLMA).

7.7 PLL Circuit

The PLL circuit has a function to multiply the frequency from the oscillator.

7.8 Internal Clock

Clock sources of internal clock signals are the main clock, LOCO clock, PLL0 clock, PLL1 clock, and the external clock for JTAG. The 14 types of internal clocks listed below are produced from these sources.

(1) Operating clock of the CPU: CPU clock (CPUCLK)
(2) Operating clock of DMAC, interrupt controller, and RAM with ECC: System clock (ICLK)
(3) Operating clocks of peripheral modules: Peripheral module clocks (PCLKA, PCLKB, PCLKC, PCLKD, PCLKE, PCLKF, PCLKG, and PCLKH)
(4) Clock for the external bus controller and external pin output: External bus clock (CKIO)
(5) Operating clock for high-speed serial clock: High-speed serial clock (SERICLK)
(6) Operating clock for USB-PHY: USB clock M (USBMCLK)
(7) Operating clock for USB: USB clock P (USBPCLK)
(8) Operating clocks for Ethernet: Ethernet clocks (ETCLKA, ETCLKB, ETCLKC, ETCLKD, ETCLKE, ETCLKF, and ETCLKG)
(9) Operating clock for the CLMA module: CLMA clocks (CLMAMCLKA, CLMAMCLKB, CLMALCLK, CLMAPLCLK0, and CLMAPLCLK1)
(10) Operating clock for the IWDT module: IWDT-dedicated clock (IWDTCLK)
(11) Operating clock for SSI: SSI clock (ACLK)
(12) Operating clocks for delta-sigma interface: Delta-sigma interface clocks (DSCLK0 and DSCLK1)
(13) Operating clock for the JTAG module: JTAG clock (JTAGTCK)
(14) Operating clock for the trace interface: Trace interface clock (TCLK)

7.8.1 CPU Clock (CPUCLK)

The CPU clock (CPUCLK) is used as the operating clock of the CPU.
The CPU operating frequency is specified by the PLL1CR.CPUCKSEL[1:0] bits.

7.8.2 System Clock (ICLK)

The system clock (ICLK) is used as the operating clock of DMAC, interrupt controller, and on-chip extended SRAM with ECC.
The frequency of ICLK is fixed to 150 MHz. It cannot be specified by the user.

7.8.3 High-Speed Peripheral Module Clock (PCLKA)

The high-speed peripheral module clock (PCLKA) is used as the operating clock for high-speed peripheral modules.
The frequency of PCLKA is fixed to 150 MHz. It cannot be specified by the user.

7.8.4 Low-Speed Peripheral Module Clock (PCLKB)

The low-speed peripheral module clock (PCLKB) is used as the operating clock for low-speed peripheral modules.
The frequency of PCLKB is fixed to 75 MHz. It cannot be specified by the user.

7.8.5 High-Speed Peripheral Module Clock (PCLKC)

The high-speed peripheral module clock (PCLKC) is used as the operating clock for high-speed peripheral modules.
The frequency of PCLKC is fixed to 150 MHz. It cannot be specified by the user.

7.8.6 Low-Speed Peripheral Module Clocks (PCLKD, PCLKE, PCLKF, PCLKG, and PCLKH)

The unmodulated low-speed peripheral module clocks (PCLKD, PCLKE, PCLKF, PCLKG, and PCLKH) are operating clocks for use by low-speed peripheral modules. The frequencies of PCLKD and PCLKH are respectively fixed to 75 MHz and 60 MHz. They cannot be specified by the user. The frequency of PCLKE, PCLKF, and PCLKG is set by the SCKCR.PCKE[1:0], SCKCR.PCKF[1:0], and SCKCR.PCKG[1:0] bits, respectively.

7.8.7 External Bus Clock (CKIO)

The external bus clock (CK10) is used as an operating clock.
The CK10 operating frequency is specified by the SCKCR.CKIO[2:0] bits.

7.8.8 High-Speed Serial Clock (SERICLK)

The high-speed serial clock (SERICLK) is used as the operating clock for SCIFA and RSPIa.
The SERICLK operating frequency is specified by the SCKCR.SERICK bit.

7.8.9 USB Clock M (USBMCLK)

The USB M (USBMCLK) is used as the operating clock for USB PHY.
The frequency of USBMCLK is fixed to 50 MHz. It cannot be specified by the user.

7.8.10 USB Clock P (USBPCLK)

The clock P (USBPCLK) is used as the operating clock for USB.
The frequency of USBPCLK is fixed to 30 MHz. It cannot be specified by the user.

7.8.11 Ethernet Clocks (ETCLKA, ETCLKB, ETCLKC, ETCLKD, ETCLKE, ETCLKF, and ETCLKG)

Ethernet clocks (ETHCLKA to ETCLKF) are the operating clocks for use with EtherCAT.
The ETCLKD operating frequency is specified by the SCKCR.ETCKD[1:0] bits. The ETCLKE operating frequency is specified by the SCKCR.ETCKE bit.
Frequencies of the Ethernet clocks other than ETCLKD and ETCLKE are fixed. They cannot be specified by the user.

7.8.12 CLMA Clocks (CLMAMCLKA, CLMAMCLKB, CLMALCLK, CLMAPLCLK0, and CLMAPLCLK1)

The CLMA clocks (CLMAMCLKA, CLMAMCLKB, CLMALCLK, CLMAPLCLK0, and CLMAPLCLK1) are used as the operating clocks for the CLMA module.
CLMAMCLKA and CLMAMCLKB are obtained by frequency-dividing the main clock.
CMLAMCLK is generated by internal oscillation of the low-speed on-chip oscillator.
CMLAPLCLK0 and CLMAPLCLK1 are obtained by frequency-dividing the clocks which are generated by internal oscillation of PLL0 and PLL1 circuits.

7.8.13 IWDT Clock (IWDTCLK)

The IWDT clock (IWDTCLK) is used as the operating clock for the IWDT module.
IWDTCLK is a 1/2 clock internally generated by the low-speed on-chip oscillator.

7.8.14 ECM Clock (ECMCLK)

The ECM clock (ECMCLK) is used as the delay counter operating clock for the ECM module.
ECMCLK is generated by internal oscillation of the low-speed on-chip oscillator.

7.8.15 SSI Clock (ACLK)

The SSI clock (ACLK) is used as the operating clock for SSI.
ACLK is supplied from the external clock input for SSI (AUDIO_CLK).

7.8.16 Delta-Sigma Interface Clock 0 (DSCLK0)

The delta-sigma interface clock 0 (DSCLK0) is used as the operating clock for the delta-sigma interface (channels 0 to 2).
If the DSCR.DSSEL0 bit is 0, the clock generated by the external clock input for the delta-sigma interface is selected as DSCLK0. If the DSCR.DSSEL0 bit is 1, the clock generated by the clock generation circuit (PLL0) is selected.
When the clock generated by the clock generation circuit is used, the operating clock is specified by the DSCR.DSCK0[2:0] bits.

7.8.17 Delta-Sigma Interface Clock 1 (DSCLK1)

The delta-sigma interface clock 1 (DSCLK1) is used as the operating clock for the delta-sigma interface (channels 3).
If the DSCR.DSSEL1 bit is 0, the clock generated by the external clock input for the delta-sigma interface is selected as DSCLK1. If the DSCR.DSSEL1 bit is 1, the clock generated by the clock generation circuit (PLL0) is selected.
When the clock generated by the clock generation circuit is used, the operating clock is specified by the DSCR.DSCK1[2:0] bits.

7.8.18 JTAG Clock

The JTAG-dedicated clock (JTAGTCK) is the operating clock for the JTAG.
JTAGTCK is generated by the external clock for JTAG (TCK).

7.8.19 Trace Interface Clock (TCLK)

The trace interface clock (TCLK) is used as the operating clock for the trace interface within Coresight.
This clock is obtained by frequency-dividing the clock which is generated by internal oscillation within the PLL0 or PLL1 circuit.
This clock divided by two is output from the LSI as the trace clock for on-chip debugger (TRACECLK).

7.9 Usage Notes

7.9.1 Notes on Clock Generation Circuit

(1) Note that the operating frequency of the external bus clock (CKIO) and high-speed serial clock (SERICLK) that are supplied to the modules based on the SCKCR register settings varies before and after the frequency is changed.
(2) Do not change the clock frequency during access via the external bus. To start access via the external bus after the clock frequency is changed, confirm that the change to the frequency has been completed before you start access via the bus.
(3) After the clock source of CPUCLK is changed from PLL0 to PLL1, do not change the frequency specified in the PLL1CR.CPUCKSEL bit.
(4) Do not change the PCLKE clock frequency after the WDTA counting started. To start the WDTA counting after the clock frequency is changed, confirm that the change to the frequency has been completed before you start the WDTA counting.
(5) The ETCLKE frequency can be changed when the external Ethernet PHY is in the reset state. Do not change the frequency after release from the reset state.
(6) Do not change the ETCLKD clock frequency while the Ethernet MAC is operating. To cancel the module-stop state after the clock frequency is changed, confirm that the change to the frequency has been completed before you cancel the module-stop state.
(7) Do not change the SERICLK clock frequency while the RSPIa (channels 0 to 3) or SCIFA (channels 0 to 4) is operating. To cancel the module-stop state after the clock frequency is changed, confirm that the change to the frequency has been completed before you cancel the module-stop state.
(8) Do not change the DSCLK0 or DSCLK1 clock frequency or switch the clock while the delta-sigma interface is operating. To cancel the module-stop state after the clock frequency is changed or after the clock is switched, confirm that the change or switching has been completed before you cancel the module-stop state.
(9) In order to secure processing after the clock frequency is changed, dummy read the same register at least three times after writing to change the frequency, and only then proceed with the subsequent processing.

7.9.2 Notes on Resonator

Since various resonator characteristics relate closely to the user's board design, adequate evaluation is required on the user side before use, referencing the resonator connection example shown in this section. The circuit constants for the resonator depend on the resonator to be used and the stray capacitance of the mounting circuit. Therefore, the circuit constants should be determined in full consultation with the resonator manufacturer. The voltage to be applied between the resonator pins must be within the absolute maximum rating.

7.9.3 Notes on Designing the Board

When using a crystal resonator, place the resonator and its load capacitors as close to the XTAL and EXTAL pins as possible. Other signal lines should be routed away from the oscillation circuit as shown in Figure 7.7. This prevents electromagnetic induction from interfering with correct oscillation.

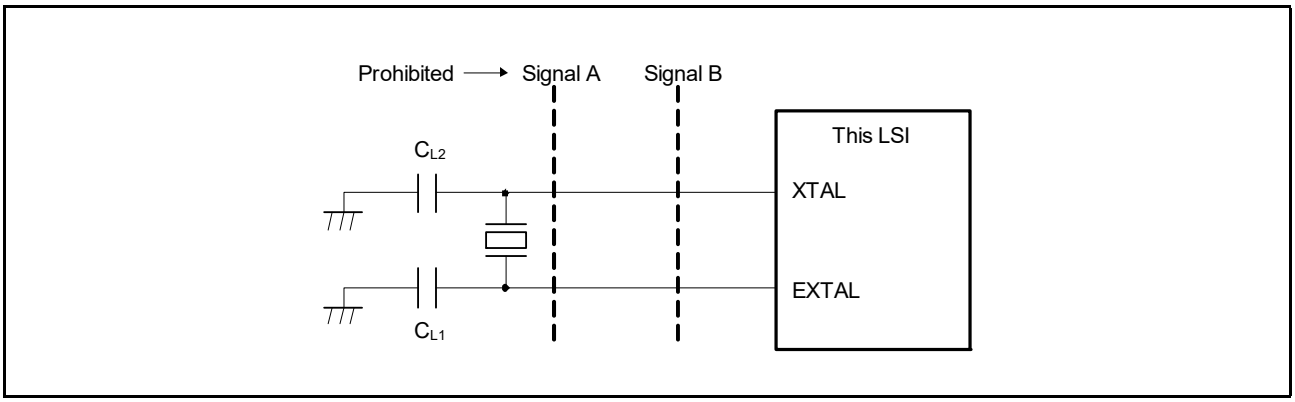

Figure 7.7 Notes on Board Design for Oscillation Circuit

8. Clock Monitor Circuit (CLMA)

A clock monitor circuit (CLMAn) (n = 2 to 0) detects a frequency error in PLL0 output, PLL1 output, or low-speed on-chip oscillator (LOCO) output, and then sends an error signal.

8.1 Overview

CLMAn (n = 2 to 0) can detect a frequency error in PLL0 output, PLL1 output, or on-chip oscillator (LOCO) output. During 16 cycles of the sampling clock, it counts the rising edges of the monitoring clock (frequency-dividing clock from PLL0, PLL1, or LOCO), and then compares the counter value with the compare register.

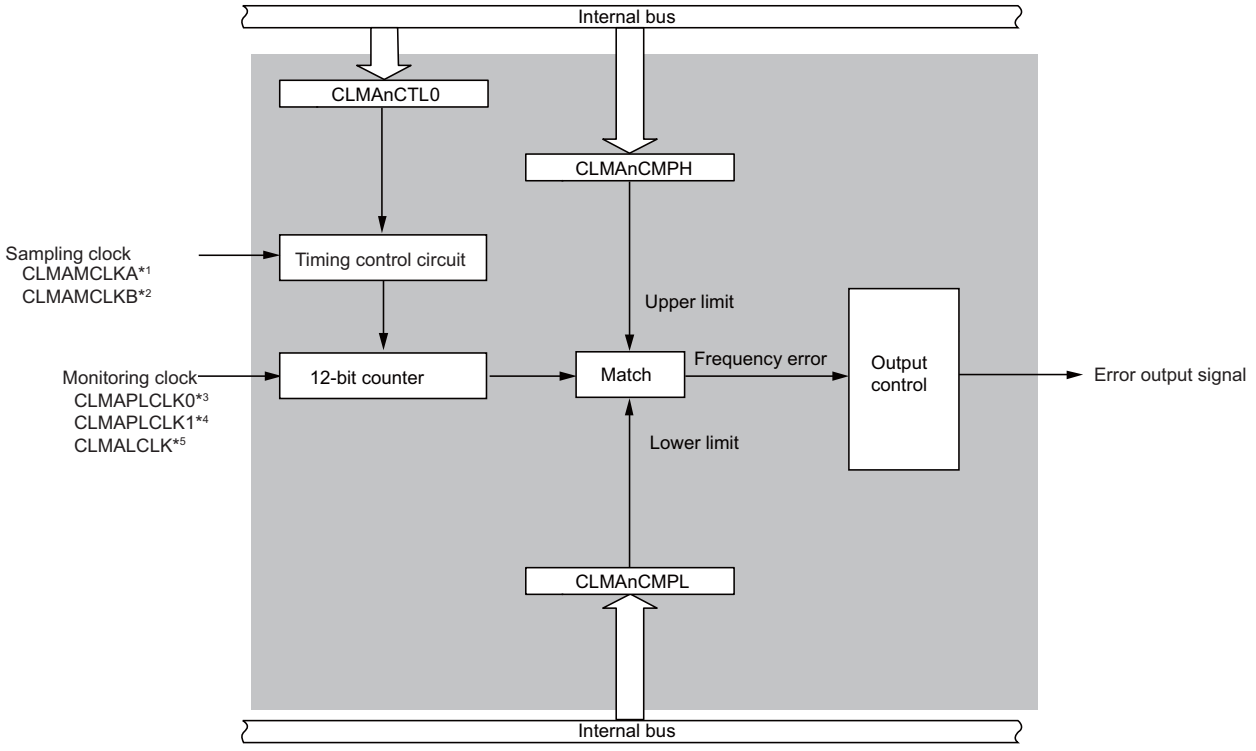
When CLMAn (n = 2 to 0) detects an error, it sends an error signal to the error control module (ECM). Besides, it switches the clock to supply the main clock instead of PLL0 or PLL1 output when it detects an error in PLL0 or PLL1 output.
For details on error signals, see section 42, Error Control Module (ECM).

Table 8.1 Specifications of CLMAn (n = 2 to 0)

Item	Specifications
Monitoring clock	The following monitoring clock frequency errors can be detected: • PLL0 output clock divided by 16 (CLMAPLCLK0, which is to be supplied to CLMA0): 75 MHz • PLL1 output clock divided by 16 (CLMAPLCLK1, which is to be supplied to CLMA1): 75 MHz / 56.25 MHz*1 • Low-speed on-chip oscillator (LOCO) output clock (CLMALCLK, which is to be supplied to CLMA2): 240 kHz
Sampling clock	The following clock frequency errors are monitored as the sampling clock: • Clock which equals to the main clock frequency divided by 2 (CLMAMCLKA, which is to be supplied to CLMA0): 12.5 MHz • Clock which equals to the main clock frequency divided by 2 (CLMAMCLKA, which is to be supplied to CLMA1): 12.5 MHz • Clock which equals to the main clock frequency divided by 256 (CLMAMCLKB, which is to be supplied to CLMA2): 97.66 kHz
Error signal output	When CLMAn detects a frequency error, it sends an error signal to the error control module (ECM). • CLMA0 oscillator-stopped detection error signal • CLMA1 oscillator-stopped detection error signal • CLMA2 oscillator-stopped detection error signal
Clock switching function when an error occurs	When an error is detected in PLL0 or PLL1 output, switches the clock to supply the main clock instead of PLL0 or PLL1 output.

Note 1. 56.25 MHz is selected when 10b is set for CPUCKSEL[1:0] of the PLL1CR register. When a value other than 10b is set, 75 MHz is selected. For details, see section 7, Clock Generation Circuit.

Figure 8.1 is a block diagram of CLMAn (n = 2 to 0).



Note 1. Main clock frequency divided by 2 to be supplied to CLMA0 and CLMA1
Note 2. Main clock frequency divided by 256 to be supplied to CLMA2
Note 3. PLL0 output clock divided by 16 to be supplied to CLMA0
Note 4. PLL1 output clock divided by 16 to be supplied to CLMA1
Note 5. Low-speed on-chip oscillator (LOCO) output clock to be supplied to CLMA2

Figure 8.1 Block Diagram of CLMAn (n = 2 to 0)

8.2 Register Descriptions

8.2.1 CLMAn Control Registers 0 (CLMAnCTL0) (n = 2 to 0)

The CLMAnCTL0 registers control operation of clock monitor circuit CLMAn.
Writing to these registers is protected by a specific command sequence. For details, see section 8.3.1, (1) Enabling operations.

Address(es): CLMA0CTL0: A009 0000h
CLMA1CTL0: A009 0020h
CLMA2CTL0: A009 0040h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	CLMAn CLME
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	CLMAnCLME	Clock Monitor Enable n	Enables or disables operation of clock monitor circuit CLMAn (n = 2 to 0). 0: Disables CLMAn operation. 1: Enables CLMAn operation.	R/W
b7 to b1	—	Reserved	These bits are always read as 0. The write value should be 0.	R/(W)

Note 1. Once the CLMAnCLME bit is set to 1, it cannot be cleared by any operation other than reset (except software reset 2).

8.2.2 CLMAn Compare Registers L (CLMAnCMPL) (n = 2 to 0)

The CLMAnCMPL registers set the lower limit for comparing frequency domains.
Values can be written to these registers when the CLMAnCLME bit is set to 0. When the CLMAnCLME bit is set to 1, writing to these registers has no effect.

Address(es): CLMA0CMPL: A009 0008h
CLMA1CMPL: A009 0028h
CLMA2CMPL: A009 0048h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	CLMAnCMPL[11:0]											
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Bit Name	Description	R/W
b11 to b0	CLMAnCMPL [11:0]	Clock Monitor Compare L	Specify the lower-limit threshold for the frequency domain.*1 • For details, see section 8.3.2, (2) Method of calculating threshold values, CLMAnCMPL.CLMAnCMPL[11:0] and CLMAnCMPH.CLMAnCMPH[11:0]. Recommended value: $f_{CLMATMON\ (min)} / f_{CLMATSMP\ (max)} \times 16 - 1$ $f_{CLMATMON}$: Monitoring clock frequency $f_{CLMATSMP}$: Sampling clock frequency • Minimum value: 0001h	R/W
b15 to b12	—	Reserved	These bits are always read as 0. The write value should be 0.	R/(W)

Note 1. To set the CLMAnCMPL registers, the following conditions must be met:
- 1 ≤ CLMAnCMPL
- CLMAnCMPL + 3 ≤ CLMAnCMPH

8.2.3 CLMAn Compare Registers H (CLMAnCMPH) (n = 2 to 0)

The CLMAnCMPH registers set the upper limit for comparing frequency domains.
Values can be written to the CLMAnCMPH registers when the CLMAnCLME bit is set to 0. When the CLMAnCLME bit is set to 1, writing to these registers has no effect.

Address(es): CLMA0CMPH: A009 000Ch
CLMA1CMPH: A009 002Ch
CLMA2CMPH: A009 004Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	CLMAnCMPH[11:0]											
Value after reset:	0	0	0	0	0	0	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Bit Name	Description	R/W
b11 to b0	CLMAnCMPH[11:0]	Clock Monitor Compare H	Specify the upper-limit threshold for the frequency domain*1. • For details, see section 8.3.2, (2) Method of calculating threshold values, CLMAnCMPL.CLMAnCMPL[11:0] and CLMAnCMPH.CLMAnCMPH[11:0]. Recommended value: $f_{CLMATMON\ (max)} / f_{CLMATSMP\ (min)} \times 16 + 1$ $f_{CLMATMON}$: Monitoring clock frequency $f_{CLMATSMP}$: Sampling clock frequency • Minimum value: CLMAnCMPL + 0003h	R/W
b15 to b12	—	Reserved	These bits are always read as 0. The write value should be 0.	R/(W)

Note 1. To set the CLMAnCMPH registers, the following conditions must be met:
- 1 ≤ CLMAnCMPL
- CLMAnCMPL + 3 ≤ CLMAnCMPH

8.2.4 CLMAn Command Registers (CLMAnPCMD) (n = 2 to 0)

The CLMAnPCMD registers control writing to the protected registers.
For details, see section 8.3.1, (1) Enabling operations.

Address(es): CLMA0PCMD: A009 0010h
CLMA1PCMD: A009 0030h
CLMA2PCMD: A009 0050h

	b7	b6	b5	b4	b3	b2	b1	b0
	CLMAnPR[7:0]							
Value after reset:	1	1	1	1	1	1	1	1

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	CLMAnPR[7:0]	CLMAn Protect Key Code	Write a specific command sequence.	W

8.2.5 CLMAn Protection Status Registers (CLMAnPS) (n = 2 to 0)

The CLMAnPS registers indicate whether writing to the protected register is performed correctly. If writing is not performed correctly, a protection error occurs, and the CLMAnPS.CLMAnPRERR bit is set to 1.
For details, see section 8.3.1, (1) Enabling operations.

Address(es): CLMA0PS: A009 0014h
CLMA1PS: A009 0034h
CLMA2PS: A009 0054h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	CLMAn PRERR
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	CLMAnPRERR	CLMAn Error	0: No protection error occurred. 1: A protection error occurred.	R
b7 to b1	—	Reserved	These bits are always read as 0.	R

8.3 Operation

8.3.1 CLMAn Operation

(1) Enabling operations

Setting the CLMAnCTL0.CLMAnCLME bit to 1 starts monitoring the monitoring clock (PLL0 output divided by 16, PLL1 output divided by 16, and LOCO output) by using clock monitor circuit CLMAn (n = 2 to 0) output. To write 1 in the CLMAnCTL0.CLMAnCLME bit, follow the following command sequence:

1. Write A5h to the CLMAnPCMD register.
2. Writing to CLMAnCTL0 is performed by the following sequence:
   - Write the target setting value (01h).
   - Write the reversed value of the target (FEh).
   - Write the target value (01h) again.
3. Read CLMAnCTL0.
   When the value of CLMAnCTL0 shows 01h, the operation of CLMAn is enabled.
   If it shows another value, check the value of CLMAn protection status register (CLMAnPS).

When CLMAnPS = 01h, the command sequence is not performed correctly. Execute the sequence again from step 1 to perform writing.

(2) Stopping operations

When a monitoring clock stops due to register operation, the corresponding clock monitor circuit (CLMAn) is disabled automatically. After that, when the monitoring clock starts oscillating again and stabilizes, the clock monitor circuit (CLMAn) resumes operation.

8.3.2 Detecting Error Clock Frequency

(1) Detection Method

1. During 16 cycles of the sampling clock, CLMAn counts the rising edge of the monitoring clock (PLL0 output divided by 16, PLL1 output divided by 16, and LOCO output), and compares the counter value with the set threshold (n = 2 to 0).
   - CLMAnCMPL.CLMAnCMPL[11:0] set the lower-limit threshold of the frequency domain.
   - CLMAnCMPH.CLMAnCMPH[11:0] set the upper-limit threshold of the frequency domain.
2. If the monitoring clock stops, or shows a value lower than the expected frequency, the counter value shows a value lower than the setting of CLMAnCMPL.CLMAnCMPL[11:0].
3. If the monitoring clock shows a value higher than the expected frequency, the counter value shows a value higher than the setting of CLMAnCMPH.CLMAnCMPH[11:0].

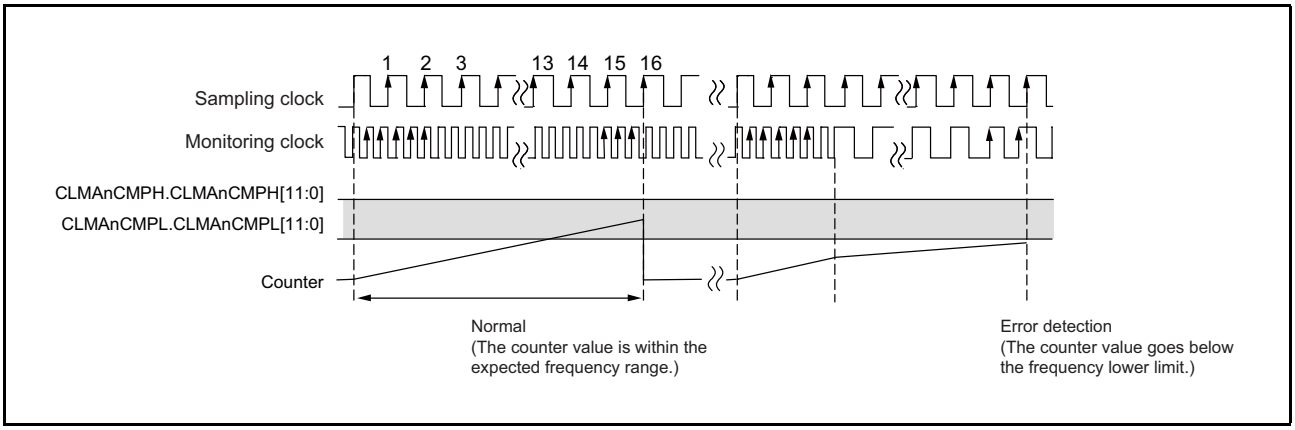


Figure 8.2 Example When the Monitoring Clock Shows a Value Lower Than the Expected Frequency

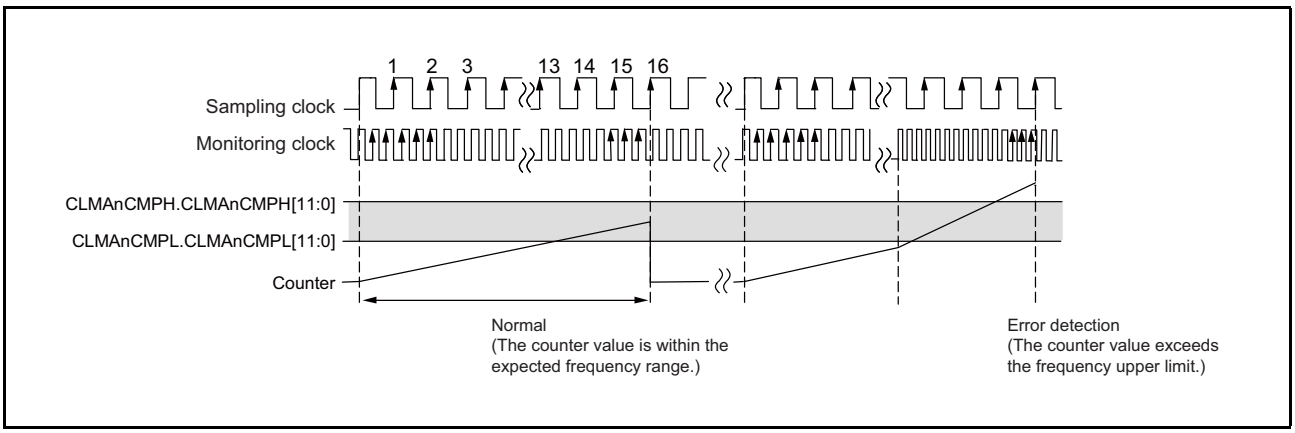

Figure 8.3 Example When the Monitoring Clock Shows a Value Higher Than the Expected Frequency

Note 1. No error is detected if the monitoring clock frequency changes within a sampling interval, and it stays within a valid counter value eventually. A monitoring clock error is detected after a sampling interval (16 cycles of the sampling clock).

(2) Method of calculating threshold values, CLMAnCMPL.CLMAnCMPL[11:0] and CLMAnCMPH.CLMAnCMPH[11:0]

For compare registers CLMAnCMPL and CLMAnCMPH, set the minimum and maximum values of the number of cycles (the number of rising edges) for the monitoring clock which is assumed to be normal within 16 cycles of the sampling clock (main clock frequency dividing clock).

$f_{CLMATSMP}$ indicates the sampling clock frequency, $f_{CLMATMON}$ indicates the monitoring clock frequency, and N indicates the number of cycles (rising edges) of the monitoring clock, which is expected within 16 cycles of the sampling clock.

$$\frac{16}{f_{CLMATSMP}} = \frac{N}{f_{CLMATMON}}$$

$$N = \frac{f_{CLMATMON}}{f_{CLMATSMP}} \times 16$$

Considering allowable frequency deviations for the monitoring clock and the sampling clock, use the following formula to calculate the threshold:

Lower-limit threshold $= N_{min}$

$$= \frac{f_{CLMATMON(min)}}{f_{CLMATSMP(max)}} \times 16 - 1$$

Upper-limit threshold $= N_{max}$

$$= \frac{f_{CLMATMON(max)}}{f_{CLMATSMP(min)}} \times 16 + 1$$

Note: Set the threshold within the following range:
CLMAnCMPL ≥ 0001_H
CLMAnCMPH ≥ CLMAnCMPL + 0003_H

Example: For CLMA0

For example, when the sampling clock equals to the main clock frequency divided by 2, $f_{CLMATSMP}$ = 12.5 MHz (±5%), or the monitoring clock equals to PLL0 output divided by 16, $f_{CLMATMON}$ = 75 MHz (±5%), the recommended threshold is calculated as follows:

$$N_{min} = f_{CLMATMON}(min) / f_{CLMATSMP}(max) = 71.25 / 13.125 \times 16 - 1$$
$$= 85.86$$

CLMAnCMPL = 86 = 0056h

$$N_{max} = f_{CLMATMON}(max) / f_{CLMATSMP}(min) = 78.75 / 11.875 \times 16 + 1$$
$$= 107.11$$

CLMAnCMPH = 107 = 006Bh

8.3.3 Detecting Error Clock Frequency

When the monitoring clock frequency (PLL0 output divided by 16, PLL1 output divided by 16, and LOCO output) is higher than the upper-limit threshold, or lower than the lower-limit threshold, any of the following signals is sent to the error control module (ECM):

- CLMA0 oscillator-stopped detection error signal
- CLMA1 oscillator-stopped detection error signal
- CLMA2 oscillator-stopped detection error signal

For details on error signals, see section 42, Error Control Module (ECM).

8.4 Notes on Using CLMAn

Do not use a clock for which CLMAn detected an error. If you use the clock, operation of the device is not guaranteed.

9. Low-Power Consumption Function

9.1 Overview

This LSI has several functions for reducing power consumption, including the Cortex-R4 standby function , Cortex-M3 (for products incorporating an R-IN engine) sleep function, and the module stop function that stops functions independently for each peripheral module. Power consumption by using clock control such as CLKOUT25Mn output control (n = 2 to 0) and CKIO output control is also possible.
Table 9.1 lists the specifications of low-power consumption functions. Table 9.2 describes how to stop each peripheral module and exit the stop state.

Table 9.1 Specifications of Low-Power Consumption Function

Item	Specifications
Low-power consumption mode	- Standby mode (Cortex-R4) - Sleep mode (Cortex-M3 (for products incorporating an R-IN engine))
Module-stop function	Functions can be stopped independently for each peripheral module.
CLKOUT25Mn (n = 2 to 0) output control function	CLKOUT25Mn (n = 2 to 0) clock output or stop (held at the low level) can be selected.
CKIO output control function	CKIO clock output or stop (held at the low level) can be selected.

Table 9.2 Stopping Peripheral Modules and Exiting Module-Stop State (1 / 2)

Module	How to Stop Operation and Exit the Stop State	Initial State*1
Cortex-R4	Stop condition: Execution of the Wait For Interrupt (WFI) instruction Condition for release from the stop-state: Interrupt	Operating
Cortex-M3 (for products incorporating an R-IN engine)	Stop condition: Execution of the Wait For Interrupt (WFI) instruction Condition for release from the stop-state: Interrupt	Operating
Internal bus	Always operating	Operating
Tightly Coupled Memory (ATCM or BTCM)	Operate only during access	Operate only during access
On-chip extended SRAM (with ECC)	Operate only during access	Operate only during access
Interrupt controller	Operation is always enabled.	Operating
Error control module (ECM)	Operation is always enabled.	Operating
Port output enable 3 (POE3)	Operation is always enabled.	Operating
Multifunction timer pulse unit 3 (MTU3a)	Set the control register to enter or exit the module-stop state.	Stop
General PWM timer (GPTa)	Set the control register to enter or exit the module-stop state.	Stop
16-bit timer pulse unit (TPUa)	Set the control register to enter or exit the module-stop state.	Stop
Programmable pulse generator (PPG)	Set the control register to enter or exit the module-stop state.	Stop
Compare match timer (CMT)	Set the control register to enter or exit the module-stop state.	Stop
Compare match timer W (CMTW)	Set the control register to enter or exit the module-stop state.	Stop
Ethernet switch	Set the control register to exit the module-stop state.*2	Stop
EtherCAT slave controller (EtherCAT) (optional)	Set the control register to exit the module-stop state.*2	Stop
Ethernet RMII	Set the control register to exit the module-stop state.*2	Stop
Ethernet MDIO	Set the control register to exit the module-stop state.*2	Stop

Table 9.2 Stopping Peripheral Modules and Exiting Module-Stop State (2 / 2)

Module	How to Stop Operation and Exit the Stop State	Initial State*1
Ethernet MAC/HW-RTOS (for products incorporating an R-IN engine)	Set the control register to exit the module-stop state*2.	Stop
Serial peripheral interface (RSPIa)	Set the control register to enter or exit the module-stop state.	Stop
Serial communication interface with FIFO (SCIFA)	Set the control register to enter or exit the module-stop state.	Stop
I2C bus interface (RIICa)	Set the control register to enter or exit the module-stop state.	Stop
CAN module (RSCAN)	Set the control register to enter or exit the module-stop state.	Stop
Clock monitor circuit (CLMA)	Set the control register to enter or exit the module-stop state.	Stop
CRC operation part (CRC)	Set the control register to enter or exit the module-stop state.	Stop
Data operation circuit (DOC)	Set the control register to enter or exit the module-stop state.	Stop
SPI multi I/O bus controller (SPIBSC)	Set the control register to enter or exit the module-stop state.	Stop*3
Bus state controller (BSC)	Set the control register to enter or exit the module-stop state.	Operating*3
Event link controller (ELC)	Set the control register to enter or exit the module-stop state.	Stop
12-bit A/D converter (S12ADCa)	Set the control register to enter or exit the module-stop state.	Stop
Temperature sensor	Set the control register to enter or exit the module-stop state.	Stop
Delta-sigma interface (DSMIF)	Set the control register to enter or exit the module-stop state.	Stop
USB	Set the control register to stop the module or exit the module stop state.	Stop
Serial sound interface (SSI)	Set the control register to enter or exit the module-stop state.	Stop
Direct memory access controller (DMAC)	Set the control register to stop the module or exit the module-stop state.	Operating
I/O port	Operation is always enabled.	Operating
Coresight	Set the control register to stop the module or exit the module-stop state.	Operating
Watchdog timer (WDTA (for Cortex-R4))	Operation is always enabled.	Operating
Watchdog timer (WDTA (for Cortex-M3) (for products incorporating an R-IN engine))	Operation is always enabled.	Operating
Independent watchdog timer (IWDTa)	Operation is always enabled.	Operating
Encode interface	Set the control register to enter or exit the module-stop state.	Stop

Note 1. Each module is returned to the initial state by means of the RES# pin reset, error control module (ECM) reset, or software reset. In addition to above, Cortex-M3 and WDT (for Cortex-M3) are set to the initial state when software reset 2 is generated.

Note 2. This module cannot be stopped by specifying the control register. For details, see section 9.2.2, Module Stop Control Register B (MSTPCRB).

Note 3. The state of the SPI multi I/O bus controller (SPIBSC) and bus state controller (BSC) after boot processing varies depending on the settings of the parameters for the loader. For details, see section 3, Operating Modes.

9.2 Register Descriptions

The registers are applicable to the register write protection function. For writing these registers, clear write protection for the target register by setting b1 of the Protect Register (PRCR). For details, see section 11, Register Write Protection Function.

9.2.1 Module Stop Control Register A (MSTPCRA)

The MSTPCRA register controls the module-stop state.
For release from the module-stop state, see section 9.3.1, Module-Stop Function.

b18*1*3	MSTPCRB18	Ethernet MAC/HW-RTOS Module Stop	Target module: Ethernet MAC, HW-RTOS 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
b19*1	MSTPCRB19	CLKOUT25Mn (Ethernet PHY Clock Output) Stop (n = 2 to 0)	0: Clock output from the CLKOUT25Mn pin is permitted 1: Clock output from the CLKOUT25Mn pin is stopped (held at low level)	R/W
b31 to b20	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Ethernet-related functions are stopped in the initial state. To use the functions, specify the MSTPCRB.MSTPCRB14 to MSTPCRB19 bits for release from the module-stop state. Note, however, that after release from the module-stop state, the module stop state cannot be set again. Operation is not guaranteed after release from the module-stop state is initiated the second time. After the modules are returned to the initial state (stop state) by a reset, they can be release from the module-stop state again.

Note 2. This bit is reserved for products other than those incorporating an EtherCAT (optional). It is read as 1. The write value should always be 1.

Note 3. Ethernet MAC/HW-RTOS is only the target of module stopping in products that incorporate an R-IN Engine. For other products, the MAC is the target of module stopping.

9.2.3 Module Stop Control Register C (MSTPCRC)

The MSTPCRC register controls the module-stop state.

For release from the module-stop state, see section 9.3.1, Module-Stop Function.

Address(es): A00B 0308h

b13	MSTPCRC13	CLMA Unit 1 Module Stop	Target module: CLMA unit 1 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W

Bit	Symbol	Bit Name	Description	R/W
b14	MSTPCRC14	CLMA Unit 0 Module Stop	Target module: CLMA unit 0 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
b31 to b15	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. The state of the SPI multi I/O bus controller (SPIBSC) and bus state controller (BSC) after boot processing varies depending on the settings of the parameters for the loader. For details, see section 3, Operating Modes.

9.2.4 Module Stop Control Register D (MSTPCRD)

The MSTPCRD register controls the module stop state.

For release from the module-stop state, see section 9.3.1, Module-Stop Function.

Address(es): A00B 030Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Bit Name	Description	R/W
b0	MSTPCRE0*1	Encode interface Module Stop	Target module: Encode interface 0: Release from the module-stop state 1: Transition to the module stop state is made	R/W
b3 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b4	MSTPCRE4	DMAC Unit 1 Module Stop	Target module: DMAC unit 1 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
b5	MSTPCRE5	DMAC Unit 0 Module Stop	Target module: DMAC unit 0 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
b31 to b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Explicit software-driven release from the module-stop state by the setting of this bit is not required, because the encoder interface configuration library handles processing for release.

9.2.6 Module Stop Control Register F (MSTPCRF)

The MSTPCRF register controls the module-stop state.

For release from the module-stop state, see section 9.3.1, Module-Stop Function.

Address(es): A00B 0314h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit	Symbol	Bit Name	Description	R/W
b0	MSTPCRF0	Coresight Module Stop	Target module: Coresight 0: Release from the module-stop state 1: Transition to the module-stop state is made	R/W
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

9.3 Operation

9.3.1 Module-Stop Function

The module-stop function can stop operation of each module of on-chip peripheral functions.
When the MSTPmi bit (m = A to F, i = 31 to 0) in the MSTPCRA to MSTPCRF registers is set to 1, the specified module stops operating and enters the module-stop state.
Clearing the MSTPmi bit (m = A to F, i = 31 to 0) to 0 leads to release from the module-stop state.
Follow the procedure given below when releasing any of the peripheral modules listed in Table 9.3 from the module-stop state. This procedure is not required for peripheral modules not listed in Table 9.3. However, release from the module-stop state should be in accord with the procedure for initialization described in the section for the given peripheral module.

[Procedures]

(1) Clear the corresponding bit in the relevant module stop control register (MSTPCRm; m = A to E) then immediately dummy-read the MSTPCRm register once.
(2) Dummy-read any register of the peripheral module which is being released from the module-stop state. After that, all registers of that peripheral module will be accessible.

Remarks: The MPU having set the access control attribute for the peripheral I/O register region to ‘Strongly-ordered’ or ‘Device’ is a prerequisite for the procedure.

<Example code>

```
volatile unsigned long dummy;                 //   Declared volatile to prevent optimization being applied

   SYSTEM.MSTPCRA.BIT.MSTPCRA0 = 0;           //   Setting to release CMTW unit 1 from the module-stop state
   dummy = SYSTEM.MSTPCRA.BIT.MSTPCRA0;       //   Step 1: Dummy-read the MSTPCRm register.

   dummy = CMTW1.CMWIOR.WORD;                 //   Step 2: Dummy-read any register of CMTW unit 1.
   CMTW1.CMWIOR.WORD = 0x81;                  //   The first setting for CMTW unit 1 (value is an example)
```

For details about the initial state after a release from the reset state, see Table 9.2, Stopping Peripheral Modules and Exiting Module-Stop State.

Note: Directly after a module is set to the module-stop state, writing might still be possible to the control register of that module.

Table 9.3 Peripheral Functions Requiring the above Procedure for Release from the Module-Stop State (1 / 2)

Peripheral Functions	Corresponding Module-Stop Control Register
CMTW unit 1	MSTPCRA register, MSTPCRA0 bit
CMTW unit 0	MSTPCRA register, MSTPCRA1 bit
CMT unit 2	MSTPCRA register, MSTPCRA2 bit
CMT unit 1	MSTPCRA register, MSTPCRA3 bit
CMT unit 0	MSTPCRA register, MSTPCRA4 bit
PPG unit 1	MSTPCRA register, MSTPCRA5 bit
PPG unit 0	MSTPCRA register, MSTPCRA6 bit
TPUa unit 1	MSTPCRA register, MSTPCRA7 bit
TPUa unit 0	MSTPCRA register, MSTPCRA8 bit
GPTa	MSTPCRA register, MSTPCRA9 bit

Table 9.3 Peripheral Functions Requiring the above Procedure for Release from the Module-Stop State (2 / 2)

Peripheral Functions	Corresponding Module-Stop Control Register
MTU3a	MSTPCRA register, MSTPCRA11 bit
RSCAN	MSTPCRB register, MSTPCRB1 bit
RIICa channel 1	MSTPCRB register, MSTPCRB2 bit
RIICa channel 0	MSTPCRB register, MSTPCRB3 bit
SCIFA channel 4	MSTPCRB register, MSTPCRB5 bit
SCIFA channel 3	MSTPCRB register, MSTPCRB6 bit
SCIFA channel 2	MSTPCRB register, MSTPCRB7 bit
SCIFA channel 1	MSTPCRB register, MSTPCRB8 bit
SCIFA channel 0	MSTPCRB register, MSTPCRB9 bit
RSPIa channel 3	MSTPCRB register, MSTPCRB10 bit
RSPIa channel 2	MSTPCRB register, MSTPCRB11 bit
RSPIa channel 1	MSTPCRB register, MSTPCRB12 bit
RSPIa channel 0	MSTPCRB register, MSTPCRB13 bit
$\Delta\sum$ interface	MSTPCRC register, MSTPCRC2 bit
Temperature sensor	MSTPCRC register, MSTPCRC3 bit
ADC unit 1	MSTPCRC register, MSTPCRC4 bit
ADC unit 0	MSTPCRC register, MSTPCRC5 bit
ELC	MSTPCRC register, MSTPCRC6 bit
BSC	MSTPCRC register, MSTPCRC7 bit
SPIBSC	MSTPCRC register, MSTPCRC9 bit
DOC	MSTPCRC register, MSTPCRC10 bit
CRC	MSTPCRC register, MSTPCRC11 bit
CLMA unit 2	MSTPCRC register, MSTPCRC12 bit
CLMA unit 1	MSTPCRC register, MSTPCRC13 bit
CLMA unit 0	MSTPCRC register, MSTPCRC14 bit
SSI	MSTPCRD register, MSTPCRD2 bit
Encoder interface	MSTPCRE register, MSTPCRE0 bit
DMAC unit 1	MSTPCRE register, MSTPCRE4 bit
DMAC unit 0	MSTPCRE register, MSTPCRE5 bit

9.3.2 Cortex-R4 Standby Mode and Cortex-M3 (for products incorporating an R-IN engine) Sleep Mode

9.3.2.1 Transition to Cortex-R4 Standby Mode and Cortex-M3 (for products incorporating an R-IN engine) Sleep Mode

Cortex-R4 enters standby mode and Cortex-M3 enters sleep mode by execution of a WFI instruction. In standby mode, Cortex-R4 and Cortex-M3 stop operating, thus reducing power consumption. For details, see the technical reference manual provided by Arm.

9.3.2.2 Release from Cortex-R4 Standby Mode and Cortex-M3 (for products incorporating an R-IN engine) Sleep Mode

Release from Cortex-R4 standby mode and Cortex-M3 sleep mode is initiated by any interrupt, the RES# pin reset, an ECM reset, or a software reset. Release from Cortex-M3 sleep mode is also initiated by software reset 2.

- Release triggered by an interrupt signal
  Generation of an interrupt in a CPU triggers release from standby mode or sleep mode of the CPU and the interrupt exception handling starts. Release is triggered by a non-maskable interrupt or a maskable interrupt that meets the following conditions:

  (1) The interrupt request is permitted by using the interrupt enable register.
  (2) Nothing has been assigned to DMAC by using the DMAC source selection register.

- Release by a reset
  After the RES# pin reset, ECM reset, or software reset is cleared, Cortex-R4 starts the reset exception handling. Even after the RES# pin reset, ECM reset, or software reset is cleared, Cortex-R4 is still in the reset state. To clear the reset, Cortex-R4 starts the reset exception handling after accessing the register and clearing software reset 2. For details about resets, see section 6, Reset.

9.4 Usage Notes

9.4.1 I/O Port State

To reduce I/O power consumption, pin processing based on I/O control is required. For details, see section 17, I/O Ports.

9.4.2 Module-Stop State of DMAC

Do not set a module-stop state while DMAC is operating. Make sure that the DMAC is inactive before you attempt to set the module-stop state.
For details, see section 15, DMA Controller (DMACAa).

9.4.3 On-Chip Peripheral Module Interrupts in Module-Stop State

Peripheral modules cannot interrupt in a module-stop state. Therefore, if the module-stop state is set during interrupt processing of the module or during DMA transfer by the DMAC, a CPU interrupt source or a DMAC or DTC startup source cannot be cleared. For this reason, disable the relevant interrupts before setting the module-stop state.

9.4.4 USB Low Power Consumption

For details about how to clear the USB module-stop state and how to enter the USB in low-power consumption mode, see section 31, USB2.0HS Host Module (USBh) and section 32, USB 2.0 HS Function Module (USBf).

9.4.5 Low Power Consumption for Ethernet-Related Functions

Ethernet-related functions are stopped in the initial state. To use the functions, specify the MSTPCRB.MSTPCRB14 to MSTPCRB19 bits for release from the module-stop state. Note, however, that after release from the module-stop state, the module stop state cannot be set again. Operation is not guaranteed after release from the module-stop state is initiated the second time. After the modules are returned to the initial state (stop state) by a reset, they can be released from the module-stop state again.

9.4.6 Write Protection Function

The module stop control registers (MSTPCRA to MSTPCRF) can be write-protected. To write to the MSTPCRA to MSTPCRF registers, specify bit 1 of the Protect Register (PRCR) to unlock the write protection. For details, see section 11, Register Write Protection Function.

10. Debugging Interface

This LSI has an internal debugging interface, which adopts an architecture in which Cortex-R4 and Cortex-M3 (for products incorporating an R-IN engine) are integrated by CoreSight. This LSI supports debugging functions, such as downloading, running, and breaking a program, and trace function, which outputs execution history of programs.

10.1 Overview

This LSI supports JTAG and SWD interfaces as interfaces for debugging, and trace port and SWV interfaces as interfaces for trace.

This LSI has TAP controllers for boundary scan and for CoreSight debugging, which can be selected by the input level of the BSCANP pin. To use debugging function, set the input level of the BSCANP pin to Low.

For details on boundary scan, see section 40, Boundary Scan.

Table 10.1 lists the specifications of CoreSight, and Figure 10.1 and Figure 10.2 are block diagrams of CoreSight. Moreover, Table 10.5 to Table 10.8 indicate the CoreSight address maps. For details on CoreSight, see Arm's technical reference manual.

Table 10.1 CoreSight Specifications

Item	Specifications
Debugging function	• JTAG interface • SWD (Serial Wire Debug) interface
Trace function	• Trace port interface 8 bits × 75 Mbps (37.5 MHz, DDR) trace data pin output Embedded Trace Buffer (ETB) 4 Kbytes • SWV (Serial Wire Viewer) interface

Table 10.8 lists the input/output pins of the debugging interface.

Table 10.8 Configuration of Pins for the Debugging Interface

Name	Pin Name	I/O	Functions
Test Clock	TCK	Input	Data is serially supplied from the Test Data Input (TDI) pin to this module, synchronized with this clock, and output from the Test Data Output (TDO) pin. In SWD mode, this pin works as the SWDCLK pin.
Test Mode Select	TMS	Input/Output	Changing the level of this signal, by synchronizing with TCK, will determine the status of the TAP (Test Access Port) control circuit. The protocol conforms to the JTAG standard (IEEE Std.1149.1). In SWD mode, this pin works as the SWDIO pin.
Test Reset	TRST#*1	Input	This pin accepts input asynchronously with TCK. When the level of this pin is Low, TAP (Test Access Port) is reset. When the levels of the TRST# pin and RES# pin are both Low, TAP and the debugging circuit are reset.
Test Data Input	TDI	Input	Changing the level of this pin, by synchronizing with TCK, will send data to this module. This pin can also be used as a general-purpose port. The initial function is TDI.
Test Data Output	TDO	Output	Reading the level of this pin, by synchronizing with TCK, will read data from this module. This pin can also be selected as the output pin of SWV. This pin can also be used as a general-purpose port. The initial function is TDO.
Trace Clock Output	TRACECLK	Output	This pin is an output pin of the clock used for synchronizing trace data.
Trace Enable Output	TRACECTL	Output	This pin is an output pin of the enable signal for trace control. This pin can also be selected as the output pin of SWV.
Trace Data Output	TRACEDATA7 to TRACEDATA0	Output	This pin is an output pin of trace data. TRACEDATA0 can be selected as an output pin of SWV.
Boundary Scan Setting	BSCANP	Input	Input the high level when boundary scan test is performed. Input Low when debugging is performed by CoreSight. For details on boundary scan, see section 40, Boundary Scan.

Note 1. When you design a board on which an emulator can be used, set the TRST# pin to Low while the RES# pin is asserted at power up, and configure the board so that control is available by the TRST# pin only. When this pin is not used, fix it to Low, or connect it so that the same signal as that on the RES# pin is to be input. For details, see section 10.3.5, Reset Configuration and the Method of Connecting with the Emulator.

10.2 Register Descriptions

10.2.1 Debugging Interface Control Register (DBGIFCNT)

The DBGIFCNT register controls the pins used by the debugging interface.

Address(es): A00B 0A00h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SWVSEL[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b1, b0	SWVSEL[1:0]	SWV Output Select	Selects the pin for SWV (Serial Wire Viewer) output. b1 b0 0 0: SWV output is not output. 0 1: SWV output is output from the TDO pin. 1 0: SWV output is output from the TRACEDATA0 pin. 1 1: SWV output is output from the TRACECTL pin.	R/W
b31 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/(W)

10.3 Operation

10.3.1 JTAG Interface

The JTAG interface uses five signals (TCK, TMS, TDO, TDI, and TRST#) to communicate with the host machine (PC) via the emulator. Figure 10.3 shows an example connection, which includes the RES# pin connection.

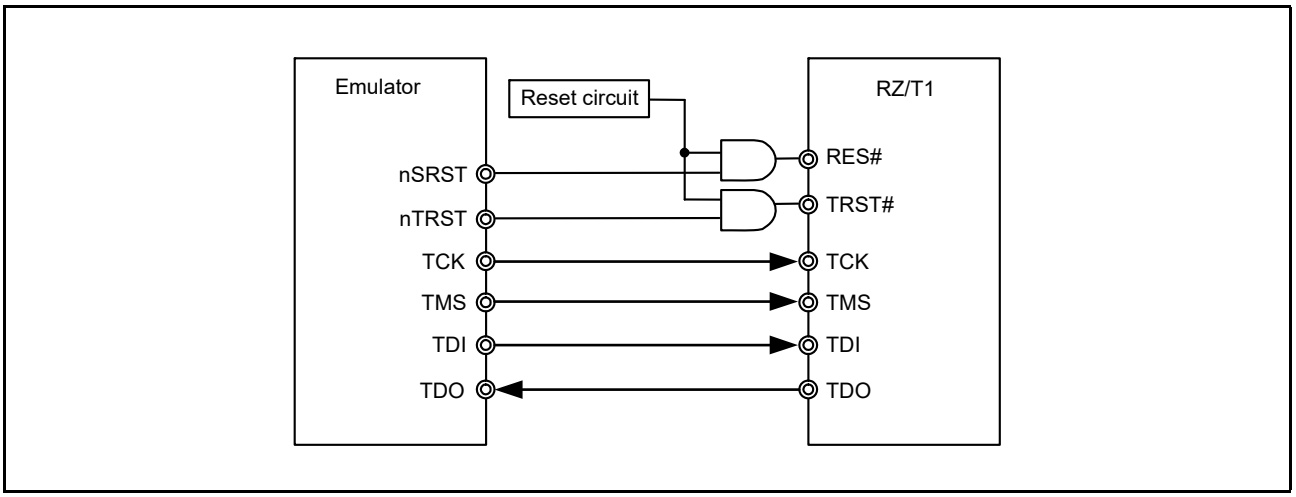

Figure 10.3 Example Connection of the JTAG Interface

10.3.2 SWD Interface

The SWD (Serial Wire Debug) interface uses two signals (SWCLK (TCK) and SWDIO (TMS)) to communicate with the host machine (PC) via the emulator. Figure 10.4 shows an example connection, which includes the RES# pin connection.

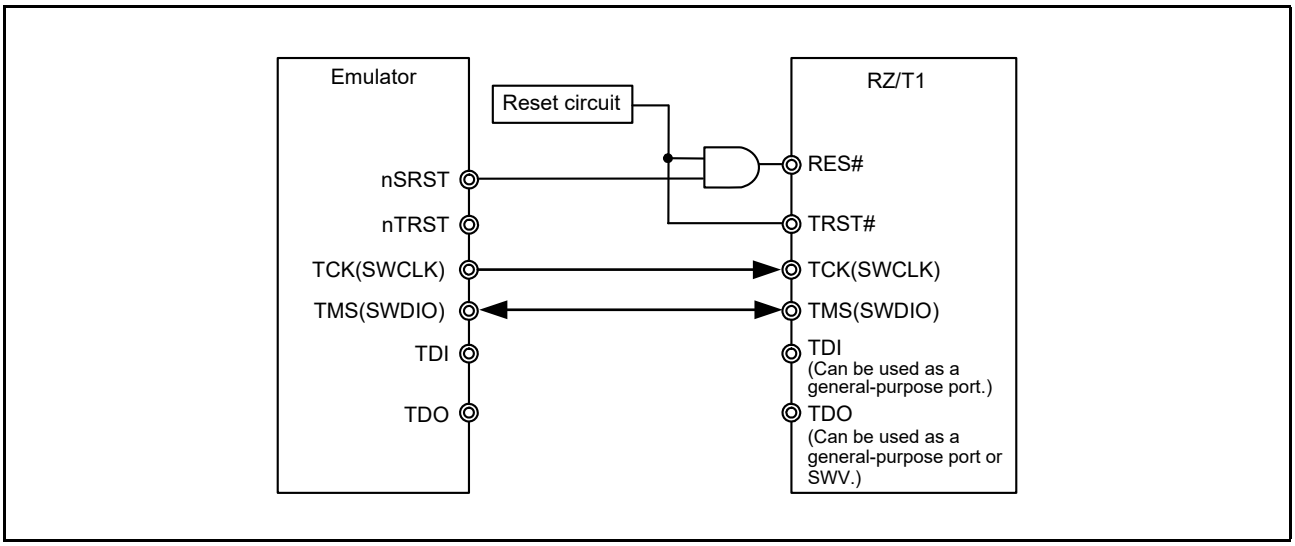

Figure 10.4 Example Connection of the SWD Interface

When the SWD interface is used for debugging, the TDI and TDO pins can be used as general-purpose ports. When you use these pins as general-purpose ports, perform pin settings by referring to section 18, Multi-Function Pin Controller (MPC).

Note: In the initial status of this LSI, the debugging interface is in JTAG mode. If you use the TDI and TDO pins as general-purpose ports and the emulator connection for debugging, switch the mode to SWD (Serial Wire Debug) mode by the control from the debugger, and then start debugging.

10.3.3 Trace Port Interface

The trace port interface uses ten signals (TRACECLK, TRACECTL, and TRACEDATA7 to TRACEDATA0) to output trace information. Information about branch instructions of the executed program (obtained by the ETM (Embedded Trace Macrocell) trace) is output from the trace port interface. After the debugger complements the information, you can know the branch source and destination at the time a branch occurred. For details on trace information, see the manual of each emulator vendor.

Only DDR clocking mode is supported for the synchronization relationship between the TRACECLK pin and TRACEDATA pin.

The maximum number of available TRACEDATA pins is 8. If the number of TRACEDATA pins is smaller than 8, the pins with smaller numbers are used (from TRACEDATA0). Set whether to connect the TRACECTL pin to TPA (Trace Port Analyzer), according to the specifications of the trace data transfer format of the TPA.

As the output frequency of the TRACECLK pin, 37.5 MHz (obtained by dividing the trace I/F clock (TCLK) by 2) can be set. For details, see section 7, Clock Generation Circuit.

In the initial status, different functions are assigned to the TRACECLK, TRACEDATA0 to TRACEDATA7, and TRACECTL pins. Perform pin settings by referring to section 18, Multi-Function Pin Controller (MPC).

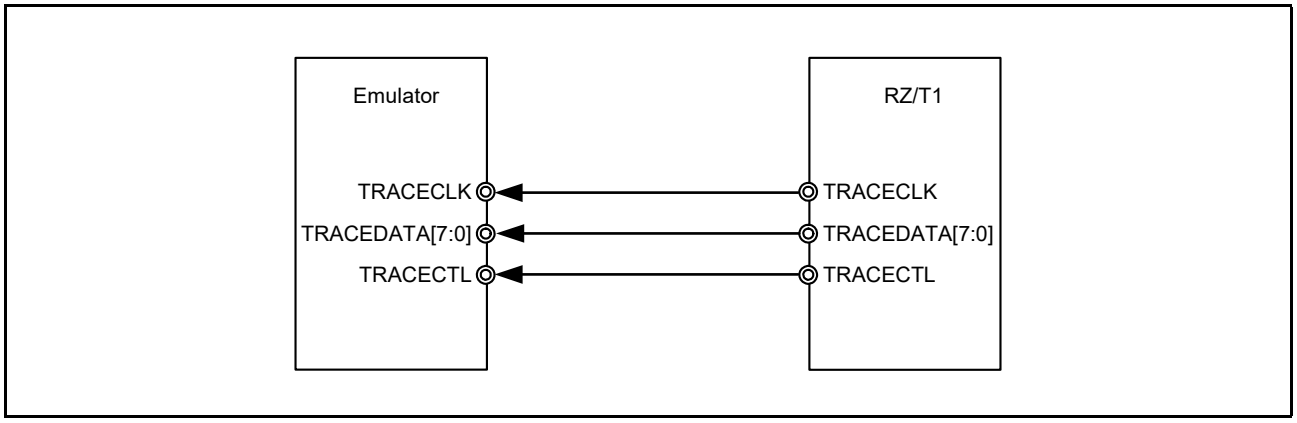

Figure 10.5 Example Connection of the Trace Port Interface

10.3.4 SWV Interface

The SWV (Serial Wire Viewer) interface is used to output trace information from the pin (TDO (SWV), TRACEDATA0 (SWV), or TRACECTL (SWV)) set by the DBGIFCNT register. When the JTAG interface is used, TDO (SWV) cannot be used. The SWV trace is a function that samples specified data at the specified sampling-cycle interval. For details on trace information, see the manual of each emulator vendor.

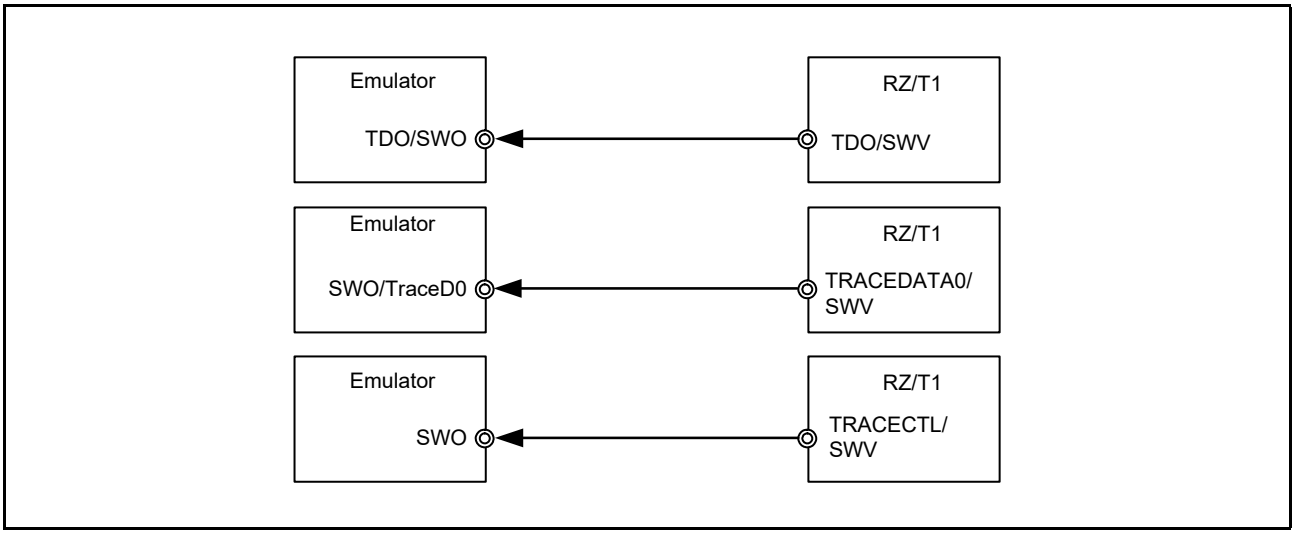

Figure 10.6 Example Connection of the SWV Interface

10.3.5 Reset Configuration and the Method of Connecting with the Emulator

When you design a board on which the emulator can be used, set the TRST# pin to Low while the RES# pin is asserted at power up. Also, configure the board so that control is available by the TRST# pin only.
When debugging is performed, if the initial level of the RES# and TRST# pins are both Low, the CPU and debugging section become the reset status. Then, setting the TRST# pin to High while the RES# pin is kept to Low will enable the debugging setting before CPU startup.
When the emulator is not connected, fix the TRST# pin to Low, or let the signal same as that on the RES# pin input to the TRST# pin.

Note: When debugging is performed by CoreSight, input Low to the BSCANP pin to disable the boundary scan function.

10.3.5.1 Example Connection of the Emulator That Cannot Drive the nTRST Output to High

Figure 10.7 shows an example of connection circuit when an emulator that cannot drive the nTRST output to High is used. The TRST# pin is pulled up, and is asserted to Low by the emulator. To perform debugging settings before CPU startup, follow the timing chart for when the emulator is connected (see Figure 10.7).

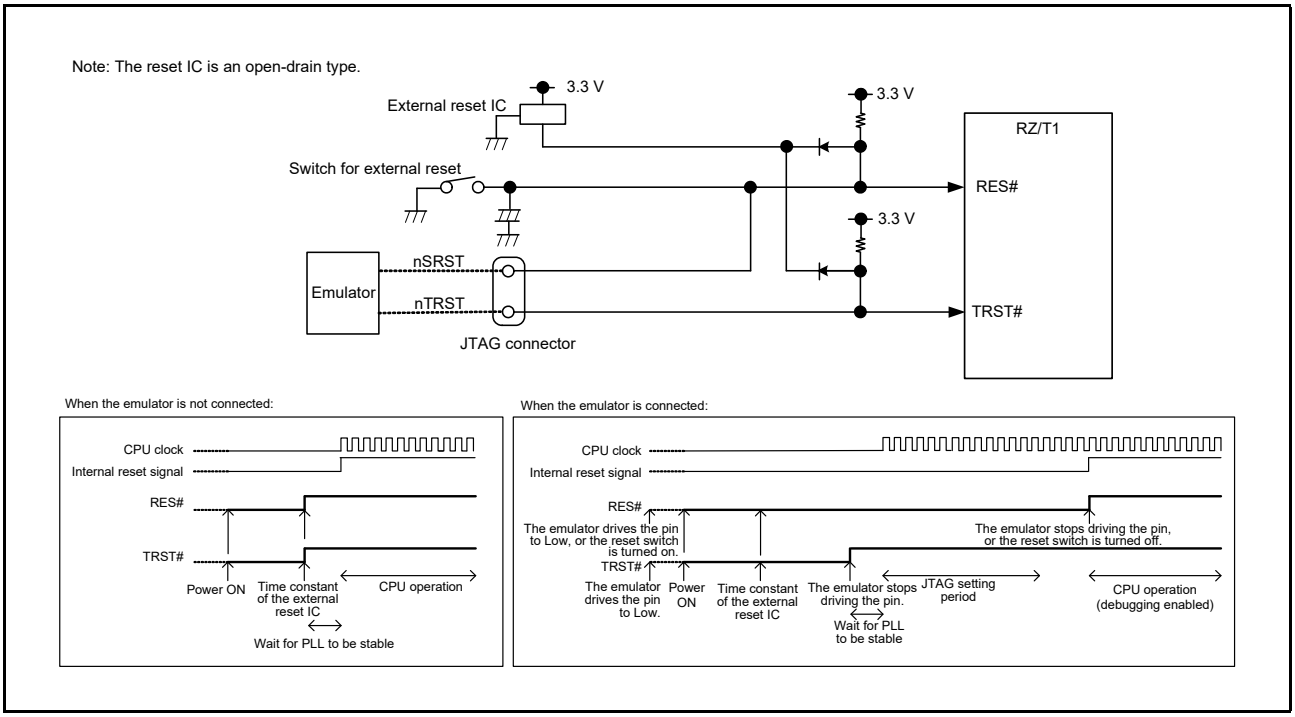

Figure 10.7 Example of Connection Circuit of an Emulator That Cannot Drive the nTRST Output to High

10.3.5.2 Example Connection of the Emulator That Can Drive the nTRST Output to High

Figure 10.8 shows an example of connection circuit when an emulator that can drive the nTRST output to High is used. The TRST# pin (High or Low) is controlled by the emulator. To perform debugging settings before CPU startup, follow the timing chart when the emulator is connected (see Figure 10.8).

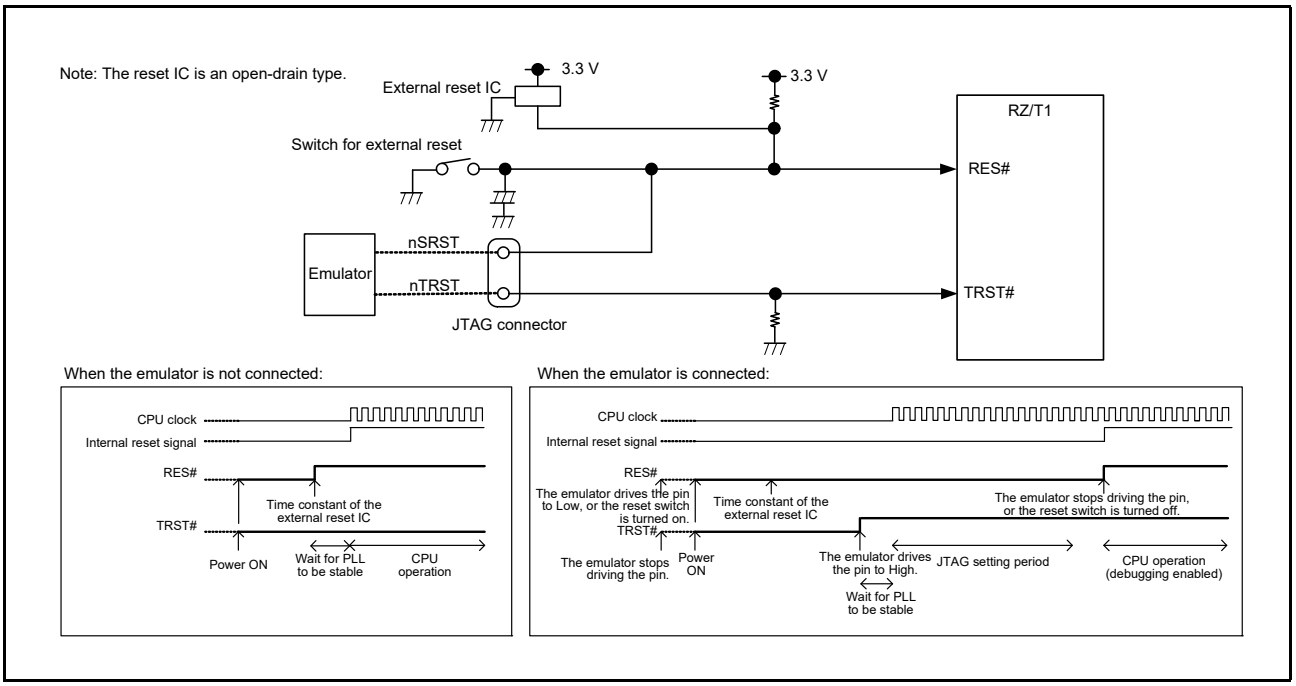

Figure 10.8 Example of Connection Circuit of an Emulator That Can Drive the nTRST Output to High

10.3.6 Handling of JTAG Pins When No Emulator Is Connected

If no emulator is connected, pin handling is required according to Table 10.9.

Table 10.9 Handling of JTAG Pins When No Emulator Is Connected

Pin Name	Handling
TCK	Pull down the pin.
TMS	Pull up the pin.
TDI	Pull up the pin (except when the port is used as a general-purpose port).
TDO	Open the pin (except when the port is used as a general-purpose port).
TRST#	Pull down the pin, or let the signal same as that on the RES# pin input.

10.3.7 Noise Reduction of the TRST# Pin

Analog delay noise reduction is performed for the TRST# pin. This measure against noise can remove noise that is within 100 ns at minimum.

10.3.8 Available Trace Functions

Table 10.10 lists the trace functions that are available via the respective debugging ports (trace port interface, SWV, and SWD or JTAG).

Table 10.10 Available Trace Functions

CPU Core	Debugging Port	Trace Functions
Cortex-R4 (CR4)	Trace Port interface	Full instruction tracing through the ETM of the Cortex-R4 Software tracing through the ITM among the CoreSight macrocells
	SWV	Only software tracing through the ITM among the CoreSight macrocells
	SWD/JTAG	The same information as for the trace port interface can be acquired via the ETB.
Cortex-M3 (CM3) (only for products incorporating an R-IN engine)	Trace Port interface	Full instruction tracing through the ETM of the Cortex-M3 Data tracing by the DWT through the ITM of the Cortex-M3 Software tracing through the ITM of the Cortex-M3
	SWV	Only software tracing through the ITM among the CoreSight macrocells
	SWD/JTAG	The same information as for the trace port interface can be acquired via the ETB.

When using software tracing through the ITM among the CoreSight macrocells, access the ITM by software from the CPU. For the address range of the ITM within the CoreSight registers, see Table 10.7.

10.4 Usage Note

10.4.1 SWV Interface

Due to the connection configuration in CoreSight, the ITM (including functions, such as watch point) output dedicated to Cortex-M3 (for products incorporating an R-IN engine) cannot be retrieved via the SWV (Serial Wire Viewer) interface. If you want to retrieve this output signal, use the trace port interface or the JTAG or SWD interface via ETB.

10.4.2 Access to the Main Bus

Access to the main bus by the DAP is via either the Cortex-R4 or Cortex-M3. When access is to be through the Cortex-M3, the setting of software reset register 2 (SWRR2) will have to be changed to release the Cortex-M3 from the reset state beforehand.
For details on software reset register 2, see section 6, Reset.

10.4.3 ROM Table

When using the ROM table to search for all debugging components including the Cortex-M3, search both the ROM table 1, which is connected to AP1 of the DAP, and ROM table 2, which is connected to the PPB via AP3.

11. Register Write Protection Function

11.1 Overview

The register write protection function protects important registers from being overwritten in case a program runs out of control. The registers to be protected are set with the protect register (PRCR).

Table 11.1 shows the correspondence between the PRCR register bits and the registers to be protected.

Table 11.1 Correspondence between PRCR Register Bits and Registers to be Protected

PRCR Register	Registers to be Protected
PRC0 bit	• Registers related to the clock generation circuit: SCKCR, SCKCR2, DSCR, PLL1CR, PLL1CR2, LOCOCR, OSTDCR
PRC1 bit	• Registers related to the low-power consumption functions: MSTPCRA, MSTPCRB, MSTPCRC, MSTPCRD, MSTPCRE, MSTPCRF • Reset-related registers: RSTSR0, SWRR1, SWRR2, MRCTLC
PRC3 bit	• ATCM wait control register SYTATCMWAIT

11.2 Register Descriptions

11.2.1 Protect Register (PRCR)

The PRCR register controls writing to the protected registers.

Address(es): A00B 0B00h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	PRKEY[7:0]								—	—	—	—	PRC3	—	PRC1	PRC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	PRC0	Protect 0	Enables writing to the registers related to the clock generation circuit. 0: Write disabled 1: Write enabled	R/W
b1	PRC1	Protect 1	Enables writing to the registers related to low-power consumption functions and reset. 0: Write disabled 1: Write enabled	R/W
b2	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b3	PRC3	Protect 3	Enables writing to the ATCM wait control register. 0: Write disabled 1: Write enabled	R/W
b7 to 4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b15 to b8	PRKEY[7:0]	PRC Key Code	These bits control permission and prohibition of writing to the PRCR register. To modify the PRCR register, write A5h to PRKEY[7:0]. When a value other than A5h is written to these bits, writing to the PRCR register has no effect.	R/(W)*1
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. The value written to these bits is not retained. These bits are always read as 00h.

PRCi Bits (Protect i) (i = 0, 1, 3)

These bits enable or disable writing to the corresponding registers to be protected.

Setting the PRCi bits to 1 and 0 enables and disables writing to the corresponding registers to be protected, respectively.

12. Interrupt Controller (ICUA)

12.1 Overview

Two types of interrupt controller, the vector interrupt controller (VIC) for the Cortex-R4 and the nested-type vector interrupt controller (NVIC) for the Cortex-M3 (for products incorporating an R-IN Engine) are provided. The interrupt controllers accept interrupt requests from peripheral modules, external pins including those from the Ethernet PHY, and the external DMA request pins. An interrupt accepted by the interrupt controller is set either as an interrupt for conveying to the CPU (the Cortex-R4 or Cortex-M3 (for products incorporating an R-IN engine)) or as an activating trigger signal for the DMAC.

Table 12.1 lists interrupt specifications, and Figure 12.1 and Figure 12.2 are block diagrams of the interrupt controller.

Table 12.1 Specifications of Interrupt Controller

Item		Description
Interrupts	Interrupt contact destinations	• Cortex-R4 • Two DMAC units (unit 0: 16ch., unit 1: 16ch.) • Cortex-M3 (for products incorporating an R-IN engine)
	Peripheral function interrupts	Interrupts from peripheral modules*1 Interrupt detection: Edge detection/level detection
	External pin interrupts	Interrupts from pins Ethernet PHY0 to 2, IRQ0 to IRQ15 Number of sources: 19 Interrupt detection: Low level/falling edge/rising edge/rising and falling edges. One of these detection methods can be set for each source. Digital noise filter function: Supported
	Interrupts between the CPUs (for products incorporating an R-IN engine)	Mutual interrupts between Cortex-R4 and Cortex-M3 by software interrupts Number of sources: 1
	Interrupt priority level	For interrupts to the CPU, the priority level is set in 16 levels by the register.*2
	DMAC control	According to the interrupt source, DMAC can be activated. Switches interrupts from peripheral modules to DMA transfer completion interrupts.*3
	External DMA request	External DMA request pins (DREQ0 to DREQ2) can output DACK0 to DACK2, TEND0 to TEND2 according to DMA transfer to an external bus, and the request number. Number of sources: 3 Digital noise filter function: Supported
Non-maskable interrupts	NMI pin interrupts	Interrupts from the NMI pin Interrupt detection: Falling edge/rising edge Digital noise filter function: Supported
	For Cortex-R4	The following sources can be allocated as the non-maskable high-speed interrupt (FIQ) source. • Non-maskable interrupts from ECM (Error Control Module) • Non-maskable interrupts from the NMI pin
	For Cortex-M3 (for products incorporating an R-IN engine)	Allocate the following source to NMI input of NVIC. • Error interrupts of WDT for CM3 when a down-counter underflow occurs, or when a refresh error occurs
Restoration from the sleep status		Restoration due to non-maskable interrupt and all unmasked interrupt sources

Note 1. According to interrupt contact destinations, interrupt sources differ. For details on activation sources, see Table 12.3, Cortex-R4/DMAC Interrupt Vector Table and Table 12.6, CM3 Interrupt Vector Table.

Note 2. The 16 priority levels are valid for all sources with CR4 (VIC) vector numbers 1 to 255, and CM3 (for products incorporating an R-IN engine) (NVIC) vector numbers 1 to 127. Interrupt sources with CR4 (VIC) vector numbers 256 and later have priority lower than sources for vector numbers 1 to 255. For details, see section 12.4.6.1, Restrictions on VIC Priority Levels.

Note 3. When an interrupt signal is selected as the source for activating the DMAC, generation of the interrupt signal activates the DMAC but branching to interrupt handling does not proceed at this time. The DMAC generates a transfer completion interrupt when it completes the data transfer. For details, see section 12.3.1, Selecting Interrupt Request Destinations.

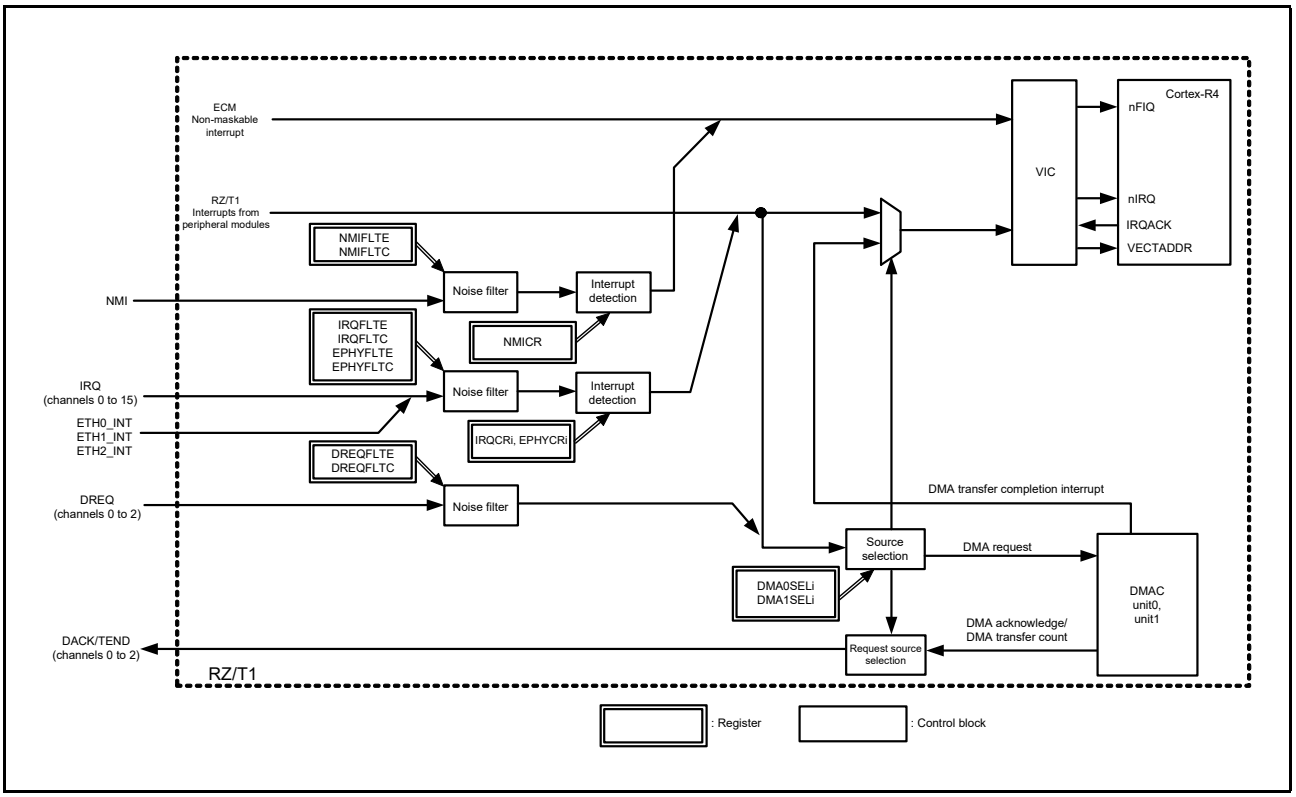

Figure 12.1 Block Diagram of Interrupt Controller

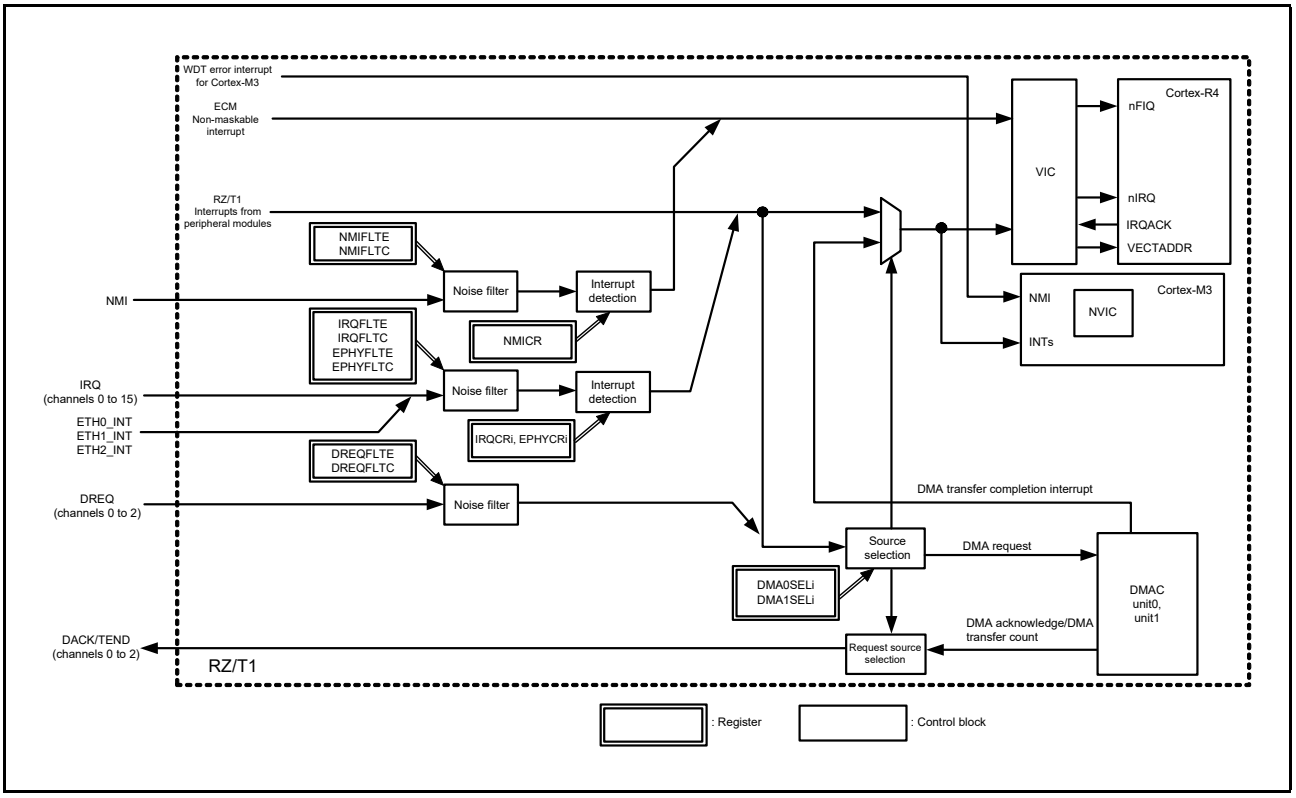

Figure 12.2 Block Diagram of Interrupt Controller (for products incorporating an R-IN engine)

Table 12.2 lists input/output pins that are used by interrupt controllers.

Table 12.2 Input/output Pins for Interrupt Controllers

Pin Name	I/O	Description
NMI	Input	Non-maskable interrupt request pin
IRQ0 to IRQ15	Input	Maskable interrupt request pin
ETH0_INT	Input	Ethernet PHY0 interrupt request pin
ETH1_INT	Input	Ethernet PHY1 interrupt request pin
ETH2_INT	Input	Ethernet PHY2 interrupt request pin
DREQ0 to DREQ2	Input	External DMA request
DACK0 to DACK2	Output	External DMA acknowledgment
TEND0 to TEND2	Output	External DMA transfer completion

12.2 Register Descriptions

12.2.1 IRQ Control Register i (IRQCRi) (i = 0 to 15)

The IRQCRi register sets the method for detecting the external pin interrupt source (IRQ0 to IRQ15).

Address(es): ICU.IRQCR0 A009 4200h, ICU.IRQCR1 A009 4204h, ICU.IRQCR2 A009 4208h, ICU.IRQCR3 A009 420Ch, ICU.IRQCR4 A009 4210h, ICU.IRQCR5 A009 4214h, ICU.IRQCR6 A009 4218h, ICU.IRQCR7 A009 421Ch, ICU.IRQCR8 A009 4220h, ICU.IRQCR9 A009 4224h, ICU.IRQCR10 A009 4228h, ICU.IRQCR11 A009 422Ch, ICU.IRQCR12 A009 4230h, ICU.IRQCR13 A009 4234h, ICU.IRQCR14 A009 4238h, ICU.IRQCR15 A009 423Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	—	—	—	—	—	—	—	—	—	—	—	—	IRQMD[1:0]		—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b1, b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b3, b2	IRQMD[1:0]	IRQ Detection Sense Select	b3 b2 0 0: Low level 0 1: Falling edge 1 0: Rising edge 1 1: Rising and falling edges	R/W
b31 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

IRQMD[1:0] Bits (IRQ Detection Sense Select)

These bits set the method for detecting the external pin interrupt source (IRQ0 to IRQ15).

For details on the methods for detecting external pin interrupt sources, see section 12.3.3, External Pin Interrupts.

Note: The same detection method should be set to the PLSn register of the VIC.

12.2.2 IRQ Pin Digital Noise Filter Enable Register (IRQFLTE)

The IRQFLTE register sets whether to use the digital noise filter for the external pin interrupt source (IRQ0 to IRQ15).

Address(es): ICU.IRQFLTE A009 4240h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b14	FLTEN14	IRQ14 Digital Noise Filter Enable		R/W
b15	FLTEN15	IRQ15 Digital Noise Filter Enable		R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

FLTENi Bit (IRQi Digital Noise Filter Enable) (i = 0 to 15)

This bit enables the digital noise filter used for the external pin interrupt source (IRQ0 to IRQ15).

When this bit is set to 1, the digital noise filter is enabled. When it is cleared to 0, the digital noise filter function is disabled.

The IRQi pin level is sampled at the sampling clock cycle specified with the IRQFLTC.FCLKSELi[1:0] bits. When the sampled level matches three times, the output level from the digital filter changes.

For details on the digital noise filter, see section 12.3.2, Digital Noise Filter.

12.2.3 IRQ Pin Digital Noise Filter Setting Register (IRQFLTC)

The IRQFLTC register sets the digital noise filter sampling clock for external pin interrupt request pins (IRQ0 to IRQ15).

Address(es): ICU.IRQFLTC A009 4244h

b31, b30	FCLKSEL15[1:0]	IRQ15 Digital Noise Filter Sampling Clock Setting		R/W

FCLKSELi[1:0] Bits (IRQi Digital Noise Filter Sampling Clock Setting) (i = 0 to 15)

These bits select the digital noise filter sampling clock for external pin interrupt request pins (IRQ0 to IRQ15).

The sampling clock cycle can be selected from the PCLKB (every cycle), PCKLB/8 (once every eight cycles), PCKLB/32 (once every 32 cycles), and PCKLB/64 (once every 64 cycles).

For details on the digital noise filter, see section 12.3.2, Digital Noise Filter. Note that even if the digital noise filter is disabled, PCLKB of which interrupts are to be sampled does not stop.

12.2.4 Non-maskable Interrupt Status Register (NMISR)

The NMISR register monitors the status of non-maskable interrupt sources. Writing to this register is ignored.
For information on non-maskable interrupt requests from ECM, read ECMm error source status register m (ECMmESSTRm, m = 0 to 2) for ECM, and check the error source.
Before ending non-maskable interrupt handler processing, read the NMISR register, and check the occurrence status of other non-maskable interrupts. Make sure all bits of the NMISR register are cleared to 0 before ending the interrupt handler processing.

Address(es): ICU.NMISR A009 4248h

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	NMIST	NMI Status Flag	0: NMI pin interrupt is not requested. 1: NMI pin interrupt is requested.	R
b1	ECMST	ECM Error Status Flag	0: ECM non-maskable interrupt is not requested. 1: ECM non-maskable interrupt is requested.	R
b31 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R

NMIST Flag (NMI Status Flag)

This flag indicates whether NMI pin interrupts are requested.
The NMIST flag is read only, and it can be cleared to 0 with the NMICLR.NMICLR bit.
[Setting condition]

- When the edgeset for the NMICR.NMIMD bit is input for the NMI pin

[Clearing condition]

- When 1 is written to the NMICLR.NMICLR bit

ECMST Flag (ECM Error Status Flag)

This flag indicates whether ECM non-maskable interrupts are requested.
The ECMST flag is read only, and it can be cleared to 0 by the NMICLR.ECMCLR bit.
[Setting condition]

- When ECM non-maskable interrupts are generated

[Clearing condition]

- When 1 is written to the NMICLR.ECMCLR bit

12.2.5 Non-maskable Interrupt Status Clear Register (NMICLR)

The NMICLR register clears NMI or ECM non-maskable interrupt requests.

Address(es): ICU.NMICLR A009 424Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

NMIMD Bit (NMI Detection Setting)

This bit sets the method for detecting the NMI pin interrupt.

12.2.7 NMI Pin Digital Noise Filter Enable Register (NMIFLTE)

The NMIFLTE register sets whether to use the digital noise filter for NMI pin interrupts.

Address(es): ICU.NMIFLTE A009 4254h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit	Symbol	Bit Name	Description	R/W
b0	NFLTEN	NMI Digital Noise Filter Enable	0: Digital noise filter is disabled. 1: Digital noise filter is enabled.	R/W
b31 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

NFLTEN Bit (NMI Digital Noise Filter Enable)

This bit enables the digital noise filter used for NMI pin interrupts.

When this bit is set to 1, the digital noise filter is enabled. When it is cleared to 0, the digital noise filter function is disabled.

The NMI pin level is sampled at the sampling clock cycle specified with the NMIFLTC.NFCLKSEL[1:0] bits. When the sampled level matches three times, the output level from the digital noise filter changes.

For details on the digital noise filter, see section 12.3.2, Digital Noise Filter.

12.2.8 NMI Pin Digital Noise Filter Setting Register (NMIFLTC)

The NMIFLTC register sets the digital noise filter sampling clock for the NMI pin interrupt.

Address(es): ICU.NMIFLTC A009 4258h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b1, b0	NFCLKSEL[1:0]	NMI Digital Noise Filter Sampling Clock Setting	b1 b0 0 0: PCLKB 0 1: PCLKB/8 1 0: PCLKB/32 1 1: PCLKB/64	R/W
b31 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

NFCLKSEL[1:0] Bits (NMI Digital Noise Filter Sampling Clock Setting)

These bits set the digital noise filter sampling clock of the NMI pin interrupt.

The sampling clock cycle can be selected from the PCLKB (every cycle), PCKLB/8 (once every eight cycles), PCKLB/32 (once every 32 cycles), and PCKLB/64 (once every 64 cycles).

For details on the digital noise filter, see section 12.3.2, Digital Noise Filter. Note that if the digital noise filter is disabled, PCLKB of which interrupts are to be sampled does not stop.

12.2.9 Ethernet PHY Control Register i (EPHYCRi) (i = 0 to 2)

The EPHYCRi register sets the method for detecting the Ethernet PHY interrupt source (ETH0_INT/ETH1_INT/ETH2_INT).

Address(es): ICU.EPHYCR0 A009 425Ch, ICU.EPHYCR1 A009 4260h, ICU.EPHYCR2 A009 4264h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b3, b2	EPHYMD[1:0]	Ethernet PHY interrupt Detection Setting	b3 b2 0 0: Low level 0 1: Falling edge 1 0: Rising edge 1 1: Rising and falling edges	R/W
b31 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

EPHYMD[1:0] Bits (Ethernet PHY Interrupt Detection Setting)

These bits set the method for detecting the Ethernet PHY interrupt source (ETH0_INT/ETH1_INT/ETH2_INT). For details on the detection method of Ethernet PHY interrupt request, see section 12.3.3, External Pin Interrupts.

Note: Set the PLS register in the VIC to the same method of detection as is set in this register.

12.2.10 Ethernet PHY Interrupt Request Pin Digital Noise Filter Enable Register (EPHYFLTE)

The EPHYFLTE register enables the digital noise filter used for the Ethernet PHY interrupt source (ETH0_INT/ ETH1_INT/ETH2_INT).

Address(es): ICU.EPHYFLTE A009 4268h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	EFLTEN0	Ethernet PHY0 Interrupt Digital Noise Filter Enable	0: Digital noise filter is disabled. 1: Digital noise filter is enabled.	R/W
b1	EFLTEN1	Ethernet PHY1 Interrupt Digital Noise Filter Enable	0: Digital noise filter is disabled. 1: Digital noise filter is enabled.	R/W
b2	EFLTEN2	Ethernet PHY2 Interrupt Digital Noise Filter Enable	0: Digital noise filter is disabled. 1: Digital noise filter is enabled.	R/W
b31 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

EFLTENi Bit (Ethernet PHY Interrupt Digital Noise Filter Enable) (i = 0 to 2)

This bit enables the digital noise filter used for Ethernet PHY interrupt source (ETH0_INT/ETH1_INT/ETH2_INT). When this bit is set to 1, the digital noise filter is enabled. When it is cleared to 0, the digital noise filter function is disabled.

The ETH0_INT/ETH1_INT/ETH2_INT pin level is sampled at the sampling clock cycle specified with the EPHYFLTE.FLTENi[1:0] bits. When the sampled level matches three times, the output level from the digital noise filter changes.

For details on the digital noise filter, see section 12.3.2, Digital Noise Filter.

12.2.11 Ethernet PHY Interrupt Request Pin Digital Noise Filter Setting Register (EPHYFLTC)

The EPHYFLTC register sets the digital noise filter sampling clock for the Ethernet PHY interrupt request pin (ETH0_INT/ETH1_INT/ETH2_INT).

Address(es): ICU.EPHYFLTC A009 426Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b31 to b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

EFCLKSELi[1:0] Bits (Ethernet PHYi Interrupt Digital Noise Filter Sampling Clock Setting) (i = 0 to 2)

These bits select the digital noise filter sampling clock for Ethernet PHY interrupt request pin (ETH0_INT/ETH1_INT/ETH2_INT).

The sampling clock cycle can be selected from the PCLKB (every cycle), PCKLB/8 (once every eight cycles), PCKLB/32 (once every 32 cycles), and PCKLB/64 (once every 64 cycles).

For details on the digital noise filter, see section 12.3.2, Digital Noise Filter. Note that if the digital noise filter is disabled, PCLKB of which interrupts are to be sampled does not stop.

12.2.12 External DMA Request Pin Digital Noise Enable Register (DREQFLTE)

The DREQFLTE register sets the usage of the digital noise filter for external DMA request pin interrupt sources (DREQ0 to DREQ2).

Address(es): ICU.DREQFLTE A009 4270h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b0	DFLTEN0	DREQ0 Digital Noise Filter Enable	0: Digital noise filter is disabled. 1: Digital noise filter is enabled.	R/W
b1	DFLTEN1	DREQ1 Digital Noise Filter Enable	0: Digital noise filter is disabled. 1: Digital noise filter is enabled.	R/W
b2	DFLTEN2	DREQ2 Digital Noise Filter Enable	0: Digital noise filter is disabled. 1: Digital noise filter is enabled.	R/W
b31 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

DFLTENi Bit (DREQi Digital Noise Filter Enable) (i = 0 to 2)

This bit enables the digital noise filter used for external DMA request pin interrupt sources (DREQ0 to DREQ2).
When this bit is set to 1, the digital noise filter is enabled. When it is cleared to 0, the digital noise filter function is disabled.
The DREQi# pin level is sampled at the sampling clock cycle specified with the DREQFLTC.DFCLKSELi[1:0] bits. When the sampled level matches three times, the output level from the digital filter changes.
For details on the digital noise filter, see section 12.3.2, Digital Noise Filter.

12.2.13 External DMA Request Pin Digital Noise Setting Register (DREQFLTC)

The DREQFLTC register selects the digital noise filter sampling clock for external DMA request pins (DREQ0 to DREQ2).

Address(es): ICU.DREQFLTC A009 4274h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b5, b4	DFCLKSEL2 [1:0]	DREQ2 Digital Noise Filter Sampling Clock Setting		R/W
b31 to b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

DFCLKSELi[1:0] Bits (DREQi Digital Noise Filter Sampling Clock Setting) (i = 0 to 2)

These bits select the digital noise filter sampling clock for external DMA request pins (DREQ0 to DREQ2).

The sampling clock cycle can be selected from the PCLKB (every cycle), PCKLB/8 (once every eight cycles), PCKLB/32 (once every 32 cycles), and PCKLB/64 (once every 64 cycles).

For details on the digital noise filter, see section 12.3.2, Digital Noise Filter. Note that if the digital noise filter is disabled, PCLKB of which interrupts are to be sampled does not stop.

12.2.14 Interrupts between the CPUs Request Register (CPUINT) (only for products incorporating an R-IN engine)

The CPUINT register requests interrupts to each CPU when Cortex-R4 requests interrupts to Cortex-M3, or when Cortex-M3 requests interrupts to Cortex-R4.

Address(es): ICU.CPUINT A009 4290h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CR4INT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CM3INT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	CM3INT	Cortex-M3 Interrupt Request	1: Interrupts are requested to Cortex-M3. 0: Disabled (Interrupts are not requested). This bit is always read as 0.	R/W
b15 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b16	CR4INT	Cortex-R4 Interrupt Request	1: Interrupts are requested to Cortex-R4. 0: Disabled (Interrupts are not requested). This bit is always read as 0.	R/W
b31 to b17	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

CM3INT Bit (Cortex-M3 Interrupt Request)

This bit requests an interrupt to Cortex-M3.

When you want to request an interrupt to Cortex-M3, write 1. This interrupt request is assigned to Cortex-M3 interrupt vector number 1. If you write 0, no interrupt is performed. This bit is always read as 0.

CR4INT Bit (Cortex-R4 Interrupt Request)

This bit requests interrupt to Cortex-R4.

When you want to request an interrupt to Cortex-R4, write 1. This interrupt request is assigned to Cortex-R4 interrupt vector number 1. If you write 0, no interrupt is performed. This bit is always read as 0.

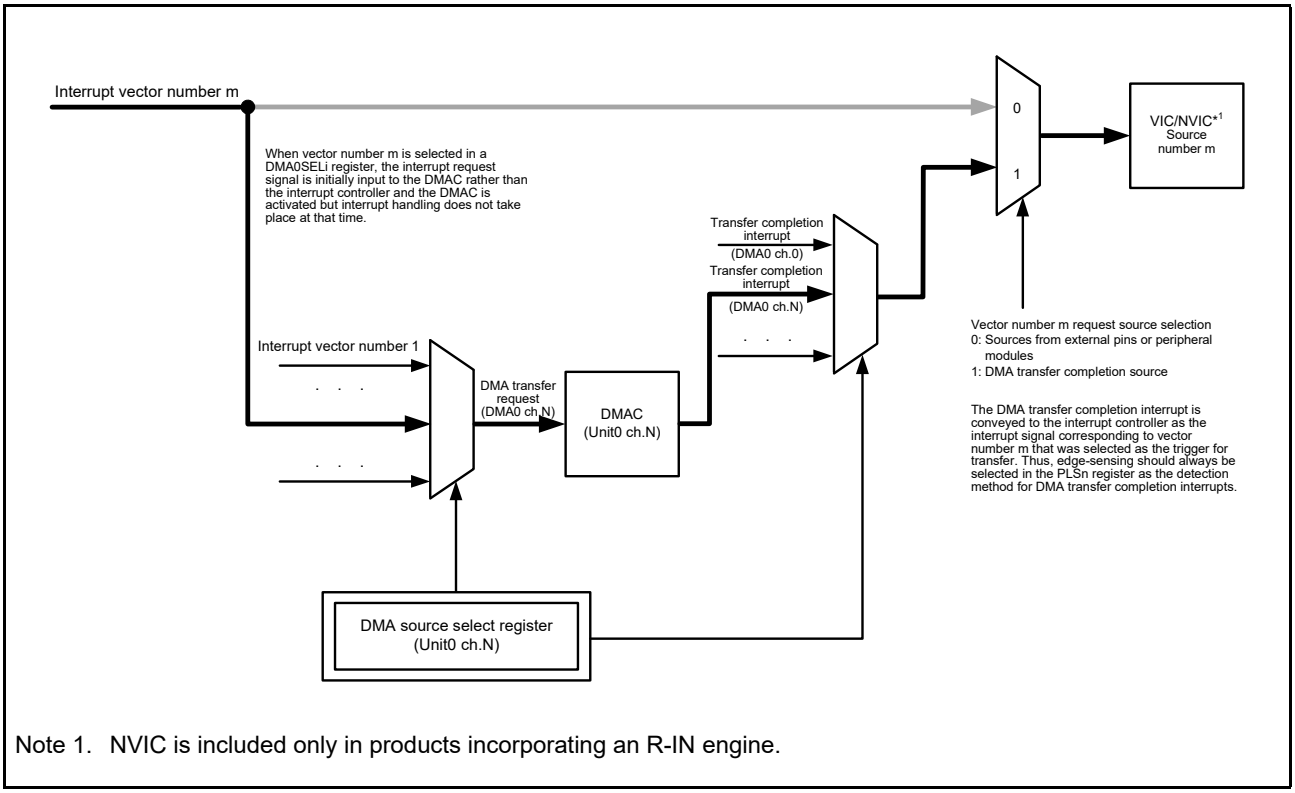
12.3 Operation

12.3.1 Selecting Interrupt Request Destinations

Table 12.3, Cortex-R4/DMAC Interrupt Vector Table, is a list of the requesting sources and indicates the source for which the CPU or DMAC is selectable as the destination. When the CPU is selected as the destination, the processing currently in progress branches to the interrupt handling routine in response to the interrupt request. When the DMAC is selected as the destination, DMA transfer starts in response to the interrupt request signal. In this case, a DMAC transfer completion interrupt is generated on completion of the transfer. Do not select interrupt request destinations that do not have the letter Y in the given request destination column in Table 12.3, Cortex-R4/DMAC Interrupt Vector Table.
Figure 12.3 shows the flow of selecting an interrupt source when vector number m is allocated to channel N of unit 0 as the DMA source. Vector numbers selected in the DMA source select register are not connected to an interrupt controller (VIC/NVIC)*1, but they are connected as DMA transfer requests to the corresponding channels of one of the DMACs. On completion of the DMA transfer, the transfer completion interrupt signal for the given channel of the DMAC is connected as the trigger for interrupt handling by the routine indicated by vector number m for the VIC/NVIC.
For example, when interrupt vector number 21 (compare match interrupt_ch.0 of CMT unit 0) is selected for IFC[7:0] of the DMAC unit 0 source select register 0 (DMA0SEL0), if this interrupt occurs, DMA transfer is requested on channel 0 of DMAC unit 0. After DMA transfer, if a DMA transfer completion interrupt is generated, the DMA transfer completion request for channel 0 of DMAC unit 0 is connected to the same interrupt vector number (21) for VIC/NVIC*1.
If vector number m is not selected by the source select register, interrupts from external pins and peripheral modules are connected to the interrupt controller VIC/NVIC*1 for the CPU (Figure 12.4).

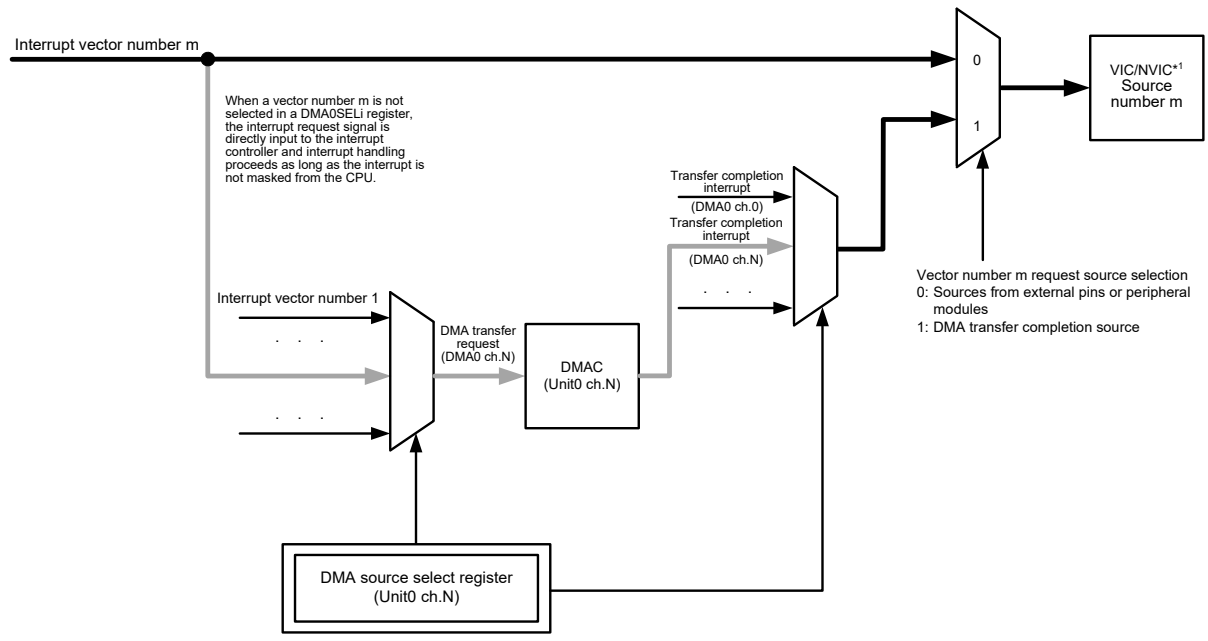
Note 1. NVIC is included only in products incorporating an R-IN engine.

Note: When the DMAC is selected as the destination for an interrupt request with vector number m, the DMA transfer completion interrupt signal is conveyed to the interrupt controller as the interrupt for vector number m on completion of the DMA transfer. This means that the detection type for an interrupt with vector number m whose destination is set as the DMAC should always be edge-sensing regardless of the vector number.



Note 1. NVIC is included only in products incorporating an R-IN engine.

Figure 12.3 DMAC as the Interrupt Request Destination



Note 1. NVIC is included only in products incorporating an R-IN engine.

Figure 12.4 CPU (Interrupt Controller) as the Interrupt Request Destination

12.3.2 Digital Noise Filter

The digital noise filter function is provided for the external interrupt request IRQi pins (i = 0 to 15), NMI pin interrupts, Ethernet PHY interrupt ETHn_INT pins (n = 0 to 2), and external DMA request DREQm pins (m = 0 to 2).
The digital noise filter samples input signals at the filter sampling clock (PCLKB) and pulses with levels that only match once or twice are removed.
To use the digital noise filter for the IRQi pins (IRQ0 to IRQ15), set the sampling clock cycle (PCLKB, PCLKB/8, PCLKB/32, or PCLKB/64) with the IRQFLTC.FCLKSELi[1:0] bits (IRQ0 to IRQ15), and set the IRQFLTE.FLTENi bits (IRQ0 to IRQ15) to 1.
To use the digital noise filter for the NMI pin interrupt, set the sampling clock cycle (PCLKB, PCLKB/8, PCLKB/32, or PCLKB/64) with the NMICR.NFCLKSEL[1:0] bits, and set the NMICR.NFLTEN bit to 1.
To use the digital noise filter for the Ethernet PHY interrupt ETHn_INT pins (n = 0 to 2), set the sampling clock cycle (PCLKB, PCLKB/8, PCLKB/32, or PCLKB/64) with the EPHYFLTC.FCLKSELn[1:0] bits (n = 0 to 2), and set the EPHYFLTE.FLTENn bits (n = 0 to 2) to 1.
To use the digital noise filter for the external DMA request DREQm pins (m = 0 to 2), set the sampling clock cycle (PCLKB, PCLKB/8, PCLKB/32, or PCLKB/64) with the DREQFLTC.DRmFCLKSEL[1:0] bits (m = 0 to 2), and set the DREQFLTE.DRmFLTEN bits (m = 0 to 2) to 1.
Figure 12.5 shows an example of digital noise filter operation.

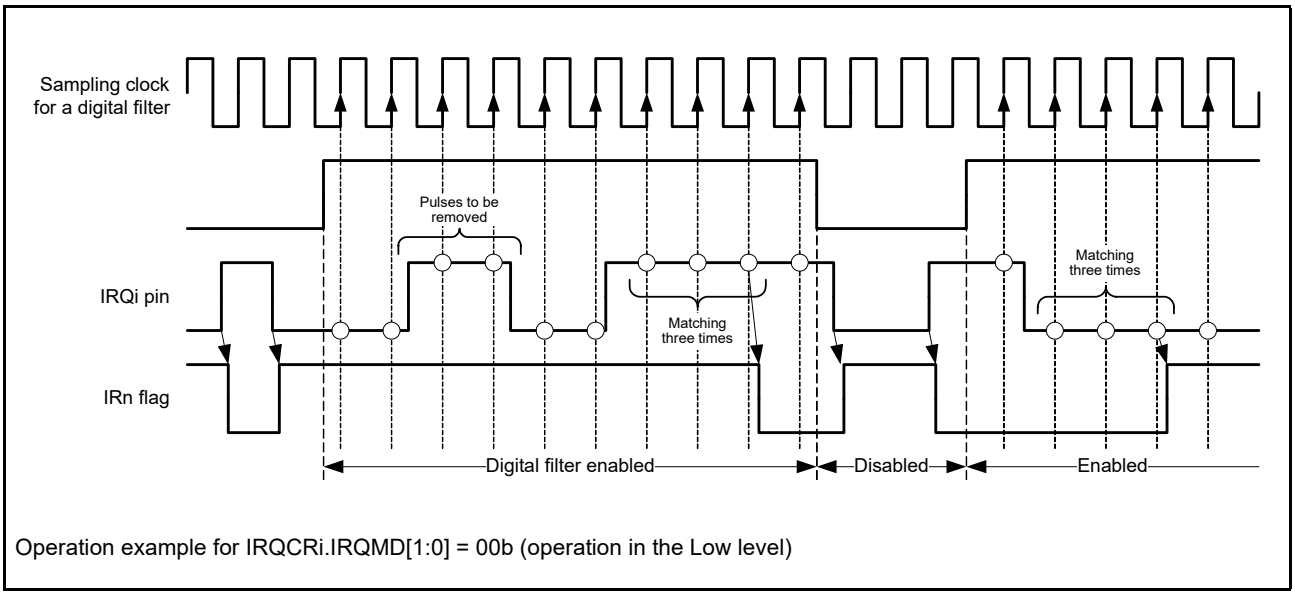


Figure 12.5 Digital Noise Filter Operation Example

12.3.3 External Pin Interrupts

The procedure for connecting an external pin interrupt to Cortex-R4 is shown below. For details on VIC, see section 12.4, Cortex-R4 Vector Interrupt Controller (VIC). To use the external pins at their falling edges or rising and falling edges, see section 12.6.1, Using “Falling-Edge” or “Rising and Falling Edges” Detection with the External Pin Interrupts.
For details on exception handing of Cortex-M3 (for products incorporating an R-IN engine), visit the following URL of Arm:
http://infocenter.arm.com/help/topic/com.arm.doc.set.cortexm/index.html

[For IRQ pins]

1. Clear the applicable IENn bit to 0 (set the IECn bit).
2. Clear the IRQFLTE.FLTENi bit to 0.*1
3. Set the digital noise filter sampling clock with the IRQFLTC.FCLKSEL[1:0] bits.*1
4. Set the Pmn I/O select bit in the port direction register (PDR) of the I/O port to 10b (input).
5. Set the I/O port (PmnPFS.ISEL bit).
6. Set the method of detection with the IRQCRi.IRQMD[1:0] bits.
7. Set the IRQFLTE.FLTENi bit to 1.*1
8. Set the applicable PICn register to 1 (when an edge is detected).
9. Set the applicable IENn bit to 1.

Note 1. This setting is only required when the digital noise filter is to be used.

[For ETH0_INT/ETH1_INT/ETH2_INT]

1. Set the applicable IENn bit to 0 (set the IECn bit).
2. Clear the EPHYFLTE.EFLTENi bit to 0.*1
3. Set the digital noise filter sampling clock with the EPHYFLTC.EFCLKSEL[1:0] bits.*1
4. Set the Pmn I/O select bit in the port direction register (PDR) of the I/O port to 10b (input).
5. Set the I/O port (the PmnPFS.PSEL[5:0] bits and PMR register).
6. Set the method of detection with the EPHYCRi.EPHYMD[1:0] bits.
7. Set the EPHYFLTE.EFLTENi bit to 1.*1
8. Set the applicable PICn register to 1 (when an edge is detected).
9. Set the applicable IENn bit to 1.

Note 1. This setting is only required when the digital noise filter is to be used.

12.3.4 NMI Pin Interrupts

Pins that can be used as NMI pins serve as general I/O ports after a reset. To use them as NMI pins, the following procedure is required.
Note that setting these pins to serve as general I/O ports after setting them to serve as the NMI pins is prohibited. To use the NMI pins at their falling edges, see section 12.6.2, Using Falling-Edge Detection with the NMI Pin.

1. Set the NMIFLTE.NFLTEN bit to 0.*1
2. Set the sampling clock of the digital noise filter with the NMIFLTC.NFCLKSEL[1:0] bits.*1
3. Set edge detection with the NMICR.NMIMD bit.
4. Set the NMICLR.NMICLR bit to 1 and clear the NMISR.NMIST flag to 0.
5. Set the NMIFLTE.NFLTEN bit to 1.*1
6. Set the P35 I/O select bit in the port direction register (PDR) of the I/O port to 10b (input).
7. Set the I/O port (P35PFS.ISEL bit) and confirm the setting.

Note 1. This setting is only required when the digital noise filter is to be used.

12.4 Cortex-R4 Vector Interrupt Controller (VIC)

12.4.1 Overview

The RZ/T1 has the vector interrupt controller (VIC) to control interrupts for Cortex-R4. Non-maskable interrupt requests from the NMI pin or ECM are treated as FIQ interrupts and are always accepted at high-speed. Interrupts from external pins other than the NMI pin and those from on-chip peripheral modules are accepted as IRQ interrupts (maskable interrupts). The vector addresses of the individual IRQ interrupt sources are stored in the interrupt address storage registers (VADn). When an IRQ interrupt occurs, the interrupt controller provides the Cortex-R4 with the address in VADn as the destination for branching, so the program counter directly branches to the address set in VADn.

12.4.2 Register Descriptions

12.4.2.1 IRQ Status Register n (IRQSn) (n = 0 to 9)

The IRQSn (n = 0 to 9) register indicates the interrupt status after IRQ interrupt mask. This register is enabled when an interrupt is enabled (IENn = 1). Interrupt status is not reflected when an interrupt is disabled (IENn = 0).
This register can only be read in 32-bit units.
Before completing the level interrupt, use the register to make sure no interrupt is requested. (See section 12.4.4.3, (2) IRQ Interrupt (Level interrupt)).

IRQi Flag (Interrupt Status Flag) (i = 256 to 300)

This flag indicates the interrupt status after interrupt mask by the IEN registers.

12.4.2.2 Interrupt Input Status Register n (RAISn) (n = 0 to 9)

The RAISn (n = 0 to 9) register indicates the interrupt input status before IRQ (maskable) interrupt mask. The interrupt status is reflected to this register regardless of the IENn register setting (interrupt enabled or disabled).
This register can only be read in 32-bit units. The states of an interrupt source can be confirmed while the interrupt is disabled (the corresponding bit in IENn is 0) by, for example, polling the source bit (see section 12.4.4.6, Handling IRQ Interrupt Source Conditions by Polling).

RAIi Flag (Interrupt Input Status Flag) (i = 256 to 300)

This flag indicates the interrupt request input status before interrupt mask.

12.4.2.3 Interrupt Enable Register n (IENn) (n = 0 to 9)

The IENn (n = 0 to 9) register enables or masks IRQ interrupts. When it is reset, all interrupt requests are masked. When a bit of this register is set to 1, it cannot be cleared to 0. To clear the bit to 0, use interrupt enable clear register n (IECn).

This register can only be read and written in 32-bit units.

b31 to b13	—	Reserved	These bits are always read as 0. When written, always write 0.	R/W

IENi Bit (Interrupt Request Enable) (i = 256 to 300)

This bit specifies interrupt request enable settings. When the bit is enabled, it cannot be masked with the IENn register. Perform interrupt mask with the IECn register.

12.4.2.4 Interrupt Enable Clear Register n (IECn) (n = 0 to 9)

The IECn (n = 0 to 9) register clears a bit of the IENn register, and masks (disables) the applicable interrupt request. This register can only be written in 32-bit units.

If the value of the IECn register is to be changed, do so while interrupts are disabled. To disable interrupts, set the I bit in the CPSR register of the Arm CPU to 1.

IECi Bit (Interrupt Request Clear) (i = 256 to 300)

This bit specifies settings for masking (disabling) interrupt requests. When 1 is set to a bit, the same bit of the IEN register is cleared to 0, and the interrupt request is masked (disabled).

12.4.2.5 Interrupt Detection Type Selection Register n (PLSn) (n = 0 to 9)

The PLSn (n = 0 to 9) register detects the edge or level for each interrupt input.
This register can only be read and written in 32-bit units.

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	PLS[255:224]	Interrupt Input Detection Type Selection	0: Detects the level. 1: Detects the edge.	R/W

PLSi Bit (Interrupt Input Detection Type Selection) (i = 192 to 255)

This bit selects the interrupt input detection type.

PLS[255:192] corresponds to vector numbers 255 to 192.

b31 to b13	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

PLSi Bit (Interrupt Input Detection Type Selection) (i = 256 to 300)

This bit selects the interrupt input detection type.

PLS[300:256] corresponds to vector numbers 300 to 256.

12.4.2.6 Edge Detection Bit Clear Register n (PICn) (n = 0 to 9)

If you detect an edge, the interrupt detection status is retained for each interrupt input bit (See section 12.4, Cortex-R4 Vector Interrupt Controller (VIC) and section 12.4.4.3, (3) IRQ Interrupt (Edge Interrupt)).
The PICn (n = 0 to 9) register clears the edge detection circuit for the interrupt input bit of which edge was detected to 0. This register can only be written in 32-bit units.

b12 to b0	PIC[300:288]	Edge Detection Clear	0: Nothing is changed. 1: Clears edge detection.	W
b31 to b13	—	Reserved	The write value should be 0.	W

PICi Bit (Edge Detection Clear) (i = 256 to 300)

For interrupt requests of which edges were detected, this bit clears the edge detection circuit for each interrupt request.

12.4.2.7 Interrupt Priority Level Mask Register 0 (PRLM0)

The PRLM0 register controls mask for interrupts to the interrupt priority level.
When a bit of this register is set to 1, it cannot be cleared to 0. To clear the bit to 0, use the interrupt priority level mask clear register 0 (PRLC0).
This register can only be read and written in 32-bit units.

Address(es): VIC.PRLM0 A001 01C0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	PRLM[15:0]	Interrupt Priority Level Setting	0: Nothing is changed. 1: Mask the same priority level as the corresponding bit number.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

PRLMi Bit (Interrupt Priority Level Setting) (i = 0 to 15)

This is an interrupt priority level setting bit. For the sources with vector numbers 1 to 255, this bit sets mask of interrupts for the interrupt priority level.
The bit position of the register equals to the applicable priority level. When a bit is set to 1, the same priority level as the corresponding bit number is masked.

12.4.2.8 Interrupt Priority Level Mask Register 1 (PRLM1)

The PRLM1 register controls mask for interrupts to the interrupt priority level.
When a bit of this register is set to 1, it cannot be cleared to 0. To clear the bit to 0, use the interrupt priority level mask clear register 1 (PRLC1).
This register can only be read and written in 32-bit units.

Address(es): VIC.PRLM1 A001 11C0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit	Symbol	Bit Name	Description	R/W
b15 to b0	PRLM[15:0]	Interrupt Priority Level Setting	0: Nothing is changed. 1: Mask the same priority level as the corresponding bit number (PRLMi) + 16.	R/W
b31 to b16	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

PRLMi Bit (Interrupt Priority Level Setting) (i = 0 to 15)

This is an interrupt priority level setting bit. For the sources with vector numbers 256 to 300, this bit sets mask of interrupts for the interrupt priority level.
When a bit is set to 1, the same priority level as the corresponding bit number (PRLMi) + 16 is masked.

12.4.2.9 Interrupt Priority Level Mask Clear Register 0 (PRLC0)

The PRLC0 register clears each bit of the PRLM0 register to 0.
This register can only be written in 32-bit units.

Address(es): VIC.PRLC0 A001 01C4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b31 to b16	—	Reserved	The write value should be 0.	W

PRLCi Bit (Interrupt Priority Level Clear) (i = 0 to 15)

This is an interrupt priority level clear bit. For the sources with vector numbers 1 to 255, this bit clears interrupt priority level mask register 0 (PRLM0) to 0.
Once a bit is set to 1, the bit corresponding to the set bit number is cleared to 0.

12.4.2.10 Interrupt Priority Level Mask Clear Register 1 (PRLC1)

The PRLC1 register clears each bit of the PRLM1 register to 0.
The PRLC1 register can only be written in 32-bit units.

Address(es): VIC.PRLC1 A001 11C4h

b31 to b16	—	Reserved	The write value should be 0.	W

PRLCi Bit (Interrupt Priority Level Clear) (i = 0 to 15)

This is an interrupt priority level clear bit. For the sources with vector numbers 256 to 300, this bit clears interrupt priority level mask register 1 (PRLM1) to 0.
Once the bit is set to 1, the bit corresponding to the set bit number is cleared to 0.

12.4.2.11 User Mode Enable Register 0 (UEN0)

This register is used to enable or disable access to the interrupt control register (VIC control registers except UEN0 and UEN1 registers) in privilege mode.
When a bus master cannot generate protection information correctly, set the UE bit to 1 to enable access to the interrupt control register in user mode. The initial value of the UE bit is 1 and access to the interrupt control register in user mode is enabled.
The register can be read in 32-bit units.
Unlike other registers, the register can be written in 32-bit units only in privilege mode.

Address VIC.UEN0 A001 01C8h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b31 to b1	—	Reserved	The write value should be 0.	W

Note 1. Write access to the register is only possible in privilege mode.

UE Bit (Interrupt Control Register Access Selection)

This bit enables or disables access to the interrupt control register for sources corresponding to vector numbers 1 to 255.

12.4.2.12 User Mode Enable Register 1 (UEN1)

This register is used to enable or disable access to the interrupt control register (VIC control registers except UEN0 and UEN1 registers) in privilege mode.

When a bus master cannot generate protection information correctly, set the UE bit to 1 to enable access to the interrupt control register in user mode. The initial value of the UE bit is 1 and access to the interrupt control register in user mode is enabled.

The register can be read in 32-bit units.

Unlike other registers, the register can be written in 32-bit units only in privilege mode.

Note 1. Write access to the register is only possible in privilege mode.

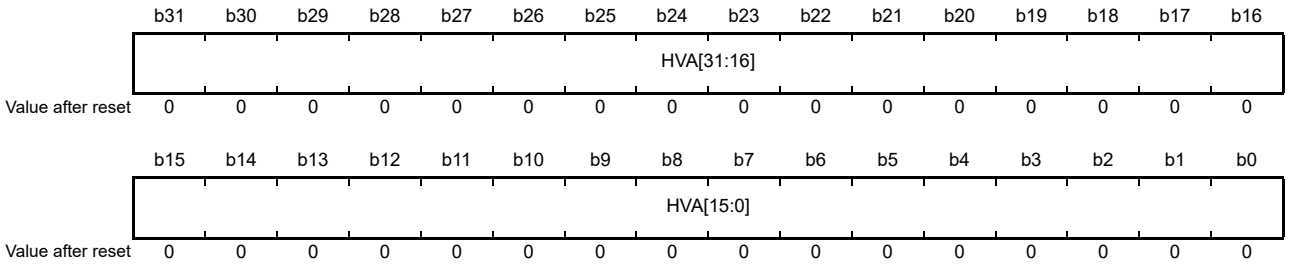
UE Bit (Interrupt Control Register Access Selection)

This bit enables or disables access to the interrupt control register for sources corresponding to vector numbers 256 to 300.

12.4.2.13 Interrupt Address Register (HVA0)

An arbitrary value must be written to the HVA0 register after being released from a reset in order to initialize the VIC. Also, an arbitrary value must be written to the HVA0 register at the end of an interrupt service routine (ISR). Writing to the HVA0 register causes the interrupt controller to recognize the completion of interrupt processing and clear the priority level of the stored interrupt. This leads to the processing of interrupts at the next priority level from that of the interrupt for which processing was just completed. The HVA0 register does not reflect values written to it.
Access to the register for any purpose other than initializing the VIC after it is released from a reset or ending interrupt processing is prohibited and attempting such access may result in incorrect interrupt operations.
This register can only be written in 32-bit units.

Address VIC.HVA0 A001 0200h



Bit	Symbol	Bit Name	Description	R/W
b31 to b0	HVA[31:0]	Interrupt Processing Ending Notification	These bits notify an end of interrupt processing (by writing an arbitrary value)	W

12.4.2.14 Interrupt Service Status Register n (ISSn) (n = 0 to 9)

The ISSn (n = 0 to 9) register indicates the service status of an IRQ interrupt.
This register stores information for which Cortex-R4 is executing or suspending an interrupt service routine (ISR).
This register can only be read in 32-bit units.

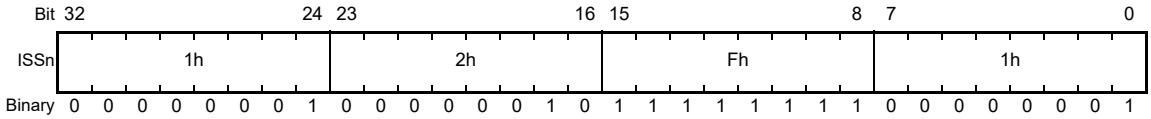
b31 to b13	—	Reserved	These bits are read as 0.	R

ISSi Bit (IRQ Interrupt Request Service Flag) (i = 256 to 300)

This flag indicates the service status of IRQ interrupt request from vector numbers 300 to 256.

For example, if multiple interrupts are requested to the interrupt controller, the ISSn register shows the following status:



The figure indicates interrupts from vector numbers 24, 17, 15 to 8, and 0. Interrupt service routines (ISR) are serviced in descending order of priority which is set with the PRLm register. When the value of the PRLm is the same, the priority level of an interrupt with a smaller vector number is higher. When ISR finishes, the applicable bit of the ISSn register is cleared to 0, and then ISR that has the next highest priority level starts. In addition, if another interrupt is requested during ISR, the interrupt is also applied to this register.

12.4.2.15 Interrupt Service Current Register n (ISCn) (n = 0 to 9)

The ISCn (n = 0 to 9) register indicates the IRQ interrupt register with the highest priority level among IRQ interrupts which is set to 1 with interrupt service status register n (ISSn).
This register can only be read in 32-bit units.

b31 to b13	—	Reserved	These bits are read as 0.	R

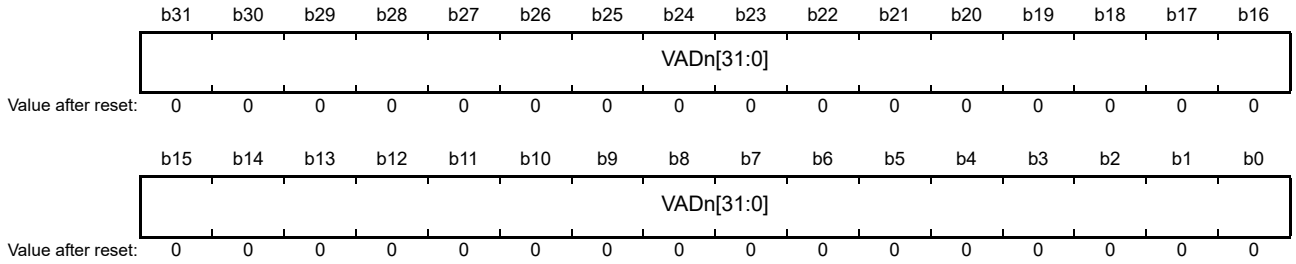
ISCi Bit (IRQ Interrupt Request Service Flag) (i = 256 to 300)

This flag indicates the service status of the IRQ interrupt request for interrupt service status register n (ISSn, n = 0 to 9).

12.4.2.16 Interrupt Address Store Register 0 (VADn) (n = 1 to 255)
Interrupt Address Store Register 1 (VADn) (n = 256 to 300)

The VADn (n = 1 to 300) register stores the vector address for each interrupt input.
This register can only be read and written in 32-bit units.

Address(es): VIC.VAD1 A001 0404h to VIC.VAD255 A001 07FCh
VIC.VAD256 A001 1400h to VIC.VAD300 A001 14B0h



Bit	Symbol	Bit Name	Description	R/W
b31 to b0	VADn[31:0]	Vector Address Store	VAD1 to VAD300 and vector numbers 1 to 300 are paired.	R/W

VADn[31:0] Bit (Vector Address Store) (n = 1 to 300)

This is a vector address store bit. VAD1 to VAD300 and bits of vector numbers 1 to 300 are paired.

- Connecting the CPU as the destination of interrupt requests
  Set the branch destination addresses of the interrupt handling routine to be run for interrupt requests n in these registers.
- Connecting a DMAC as the destination of interrupt requests
  The occurrence of interrupt requests n that have been set up to do so start DMA transfer. Set the branch destination addresses of the interrupt handling routines to be run for the DMA transfer completion interrupts in these registers.
  To connect a DMAC, set vector number n in the associated register as described in section 15.2.8, DMAC Unit 0 Source Select Register i (DMA0SELi) (i = 0 to 15), or section 15.2.9, DMAC Unit 1 Source Select Register i (DMA1SELi) (i = 0 to 15).

12.4.2.17 Interrupt Priority Level Store Register 0 (PRLn) (n = 1 to 255)

The PRLn (n = 1 to 255) register stores the interrupt priority level for each interrupt input.
This register can only be read and written in 32-bit units.

Address(es): VIC.PRL1 A001 0804h to VIC.PRL255 A001 0BFCh

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	PRL[3:0]	Interrupt Priority Level Store	The highest interrupt priority level is 0, and the lowest is 15.	R/W
b31 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

PRL[3:0] Bits (Interrupt Priority Level Store)

These bits store the interrupt priority level of vector numbers 1 to 255. The highest interrupt priority level is 0, and the lowest is 15.

12.4.2.18 Interrupt Priority Level Store Register 1 (PRLn) (n = 256 to 300)

The PRLn (n = 256 to 300) register stores the interrupt priority level for each interrupt input.
This register can only be read and written in 32-bit units.

Address(es): VIC.PRL256 A001 1800h to VIC.PRL300 A001 18B0h

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	PRL[3:0]	Interrupt Priority Level Store	The highest interrupt priority level is the value of PRLn+16. The highest is 16, and the lowest is 31.	R/W
b31 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

PRL[3:0] Bits (Interrupt Priority Level Store)

These bits store the interrupt priority level of vector numbers 256 to 300. The highest interrupt priority level is the value of PRLn+16. The highest is 16, and the lowest is 31.

12.4.2.19 Interrupt Level Control Register n (LVLCn) (n = 8, 9)

The LVLCn (n = 8, 9) register specifies the effective level for each interrupt input for the encoder I/F. Two bits are assigned for each interrupt input. High-level detection or low-level detection is specifiable.
This register can only be read and written in 32-bit units.

LVCi Bits (Interrupt Effective Level Specification) (i = 1290 to 1441)

These bits specify the effective level for detection of interrupts with vector numbers 129 to 144.

LVCm1	LVCm0	Effective Level Specification
0	0	Setting prohibited
0	1	High level
1	0	Low level
1	1	Setting prohibited

12.4.3 Vector Table

12.4.3.1 Interrupt Vector Table

Table 12.3 describes the vector table for interrupts to Cortex-R4 and DMAC. Instead of an interrupt source from peripheral modules, transfer completion sources of DMAC channels selected by the DMAC source select register are connected to the vector number selected by the DMAC source select register.

For the interrupt source for vector numbers 42 to 44, interrupt sources are different between Cortex-R4 and DMAC. For Cortex-R4, the CPU interrupt source of the USB (func) is connected. Use vector numbers 43 and 44 as the DMA transfer sources for the USB (func). For details, see section 12.3.1, Selecting Interrupt Request Destinations. For details on interrupts from the USB, see section 31, USB2.0HS Host Module (USBh) and section 32, USB 2.0 HS Function Module (USBf).

The source of an interrupt for the Cortex-R4 and the same source as the trigger for DMAC activation may be detected in different ways. The Ethernet switch DLR interrupt (vector number 46) is one example. For details, see section 15, DMA Transfer Request, and the notes on DMA transfer.

The following table explains the items of the Cortex-R4/DMAC interrupt vector table.

Item	Description
Vector number	Indicates the vector number of the IRQ interrupt source in VIC for Cortex-R4.
Request source	Indicates the name of the interrupt request source.
Source	Indicates the interrupt name.
Detection type	Indicates the detection type for interrupts from peripheral modules. To connect a transfer completion interrupt from DMAC, the edge must be selected.
CR4	“Y” indicates the interrupt source for Cortex-R4 (VIC).
DMAC	“Y” indicates the DMAC activation source.

Note: An error signal of each module is not input to the CPU directly, but to the error control module (ECM). The signal is merged into other errors and conveyed as an error detection source to the CPU. For details, see section 42, Error Control Module (ECM).

Table 12.3 Cortex-R4/DMAC Interrupt Vector Table (1 / 10)

Vector Number	Request Source	Source		Detection Type	CR4	DMAC*4
1	System (CR4)	INTCR4	Interrupts between the CPU (CR4) (only for products incorporating an R-IN engine)	Edge	Y	N
2		INTCTI	CTI (Cross Trigger Interface) interrupt	Edge	Y	N
3		FPUEX	FPU exception	Level	Y	N
4	External	IRQ0	IRQ pin interrupt 0	Level / Edge	Y	Y
5		IRQ1	IRQ pin interrupt 1	Level / Edge	Y	Y
6		IRQ2	IRQ pin interrupt 2	Level / Edge	Y	Y
7		IRQ3	IRQ pin interrupt 3	Level / Edge	Y	Y
8		IRQ4	IRQ pin interrupt 4	Level / Edge	Y	Y
9		IRQ5	IRQ pin interrupt 5	Level / Edge	Y	Y
10		IRQ6	IRQ pin interrupt 6	Level / Edge	Y	Y
11		IRQ7	IRQ pin interrupt 7	Level / Edge	Y	Y
12		IRQ8	IRQ pin interrupt 8	Level / Edge	Y	Y
13		IRQ9	IRQ pin interrupt 9	Level / Edge	Y	Y
14		IRQ10	IRQ pin interrupt 10	Level / Edge	Y	Y
15		IRQ11	IRQ pin interrupt 11	Level / Edge	Y	Y
16		IRQ12	IRQ pin interrupt 12	Level / Edge	Y	Y
17		IRQ13	IRQ pin interrupt 13	Level / Edge	Y	Y
18		IRQ14	IRQ pin interrupt 14	Level / Edge	Y	Y
19		IRQ15	IRQ pin interrupt 15	Level / Edge	Y	Y
20	ECM	ERRD	Error detection (maskable)	Edge	Y	N
21	CMT unit 0	CMI0	Compare match interrupt_ch0	Edge	Y	Y
22		CMI1	Compare match interrupt_ch1	Edge	Y	Y
23	CMT unit 1	CMI2	Compare match interrupt_ch0	Edge	Y	Y
24		CMI3	Compare match interrupt_ch1	Edge	Y	Y
25	CMTW unit 0	CMWI0	Compare match interrupt	Edge	Y	Y
26		IC0I0	Input capture 0 interrupt	Edge	Y	Y
27		IC1I0	Input capture 1 interrupt	Edge	Y	Y
28		OC0I0	Output compare 0 interrupt	Edge	Y	Y
29		OC1I0	Output compare 1 interrupt	Edge	Y	Y
30	CMTW unit 1	CMWI1	Compare match interrupt	Edge	Y	Y
31		IC0I1	Input capture 0 interrupt	Edge	Y	Y
32		IC1I1	Input capture 1 interrupt	Edge	Y	Y
33		OC0I1	Output compare 0 interrupt	Edge	Y	Y
34		OC1I1	Output compare 1 interrupt	Edge	Y	Y
35	ADC unit 0	S12ADI0	AD conversion completion interrupt	Edge	Y	Y
36		S12GBADI0	Group B AD conversion completion interrupt	Edge	Y	Y
37		S12CMPI0	Compare condition not met	Level	Y	N
38	ADC unit 1	S12ADI1	AD conversion completion interrupt	Edge	Y	Y
39		S12GBADI1	Group B AD conversion completion interrupt	Edge	Y	Y
40		S12CMPI1	Compare condition met	Level	Y	N

Table 12.3 Cortex-R4/DMAC Interrupt Vector Table (2 / 10)

Vector Number	Request Source	Source		Detection Type	CR4	DMAC*4
41	USB	USBHI	USB (Host) CPU interrupt	Level	Y	N
42		USBFI	USB (Host) CPU interrupt	Level / Edge	Y	N
43		USBFDR1	USB (Func) DMA request 1	Level	N*3	Y
44		USBFDR2	USB (Func) DMA request 2	Level	N*3	Y
45	Switch with IEEE1588	ETHSWI	Ethernet switch interrupt	Level / Edge*1	Y	Y
46		ETHSWDLRI	Ethernet switch DLR interrupt	Level / Edge*1	Y	Y
47		ETHSWSOI	Ethernet switch SYNCOUT interrupt	Edge	Y	Y
48	Ethernet PHY	ETHPHYI0	Ethernet PHY interrupt 0	Level / Edge	Y	Y
49		ETHPHYI1	Ethernet PHY interrupt 1	Level / Edge	Y	Y
50		ETHPHYI2 (only for products incorporating an EtherCAT (optional))	Ethernet PHY interrupt 2	Level / Edge	Y	Y
51	Ethernet MAC	ETHDMAIR	Ethernet MACDMA reception completed	Level / Edge*1	Y	Y
52		ETHDMAIT	Ethernet MACDMA transmission completed	Edge	Y	Y
53		ETHRFI	Reception frame normal interrupt	Level / Edge*1	Y	Y
54	MTU3a	TGIA6	ch6 input capture/compare match A interrupt	Edge	Y	Y
55		TGIB6	ch6 input capture/compare match B interrupt	Edge	Y	Y
56		TGIC6	ch6 input capture/compare match C interrupt	Edge	Y	Y
57		TGID6	ch6 input capture/compare match D interrupt	Edge	Y	Y*6
58		TCIV6	ch6 overflow interrupt	Edge	Y	N
59		TGIA7	ch7 input capture/compare match A interrupt	Edge	Y	Y
60		TGIB7	ch7 input capture/compare match B interrupt	Edge	Y	Y
61		TGIC7	ch7 input capture/compare match C interrupt	Edge	Y	Y
62		TGID7	ch7 input capture/compare match D interrupt	Edge	Y	Y
63		TCIV7	ch7 overflow/underflow interrupt	Edge	Y	Y

Table 12.3 Cortex-R4/DMAC Interrupt Vector Table (3 / 10)

Vector Number	Request Source	Source		Detection Type	CR4	DMAC*4
64	Ethernet MAC	ETHMMAI	Ethernet MII management access completion interrupt	Edge	Y	Y
65		ETHPPIT	Ethernet pause packet transmission completed	Edge	Y	Y
66		ETHIT	Ethernet transmission completed interrupt	Edge	Y	Y
67		ETHRFIV	RX FIFO overflow	Edge	Y	N
68		ETHTFIU	TX FIFO underflow	Edge	Y	N
69		ETHTFIE	TX-FIFO error interrupt	Level	Y	N
70		ETHRFE	Ethernet reception frame error	Level	Y	N
71		ETHLPIST	LPI start notification interrupt from the MII	Edge	Y	N
72		ETHLPIEND	LPI end notification interrupt from the MII	Edge	Y	N
73	EtherCAT slave (optional)	ETHCSI0	EtherCAT Sync0 interrupt	Level / Edge*2	Y	Y
74		ETHCSI1	EtherCAT Sync1 interrupt	Level / Edge*2	Y	Y
75		ETHCI	EtherCAT interrupt	Level / Edge*1	Y	Y
76		ETHCSOFI	EtherCAT SOF interrupt	Edge	Y	Y
77		ETHCEOFI	EtherCAT EOF interrupt	Edge	Y	Y
78		ETHCWDTI	EtherCAT WDT interrupt	Edge	Y	N
79		ETHCRSTI	EtherCAT RESET interrupt	Edge	Y	N
80	RSPI ch0	SPRI0	Reception buffer full	Edge	Y	Y
81		SPTI0	Transmission buffer empty	Edge	Y	Y
82		SPEI0	Mode fault error/overrun error/parity error	Level	Y	N
83		SPII0	RSPI idle	Level	Y	N
84	RSPI ch1	SPRI1	Reception buffer full	Edge	Y	Y
85		SPTI1	Transmission buffer empty	Edge	Y	Y
86		SPEI1	Mode fault error/overrun error/parity error	Level	Y	N
87		SPII1	RSPI idle	Level	Y	N
88	RSPI ch2	SPRI2	Reception buffer full	Edge	Y	Y
89		SPTI2	Transmission buffer empty	Edge	Y	Y
90		SPEI2	Mode fault error/overrun error/parity error	Level	Y	N
91		SPII2	RSPI idle	Level	Y	N
92	RSPI ch3	SPRI3	Reception buffer full	Edge	Y	Y
93		SPTI3	Transmission buffer empty	Edge	Y	Y
94		SPEI3	Mode fault error/overrun error/parity error	Level	Y	N
95		SPII3	RSPI idle	Level	Y	N
96	SCIFA ch0	BRIF0	Break/overrun/framing error/parity error	Level	Y	N
97		RXIF0	Reception FIFO data full (RDF)	Level	Y	Y
98		TXIF0	Transmission FIFO data empty (TDFE)	Level	Y	Y
99		DRIF0	Transmit end/reception data ready	Level	Y	N

Table 12.3 Cortex-R4/DMAC Interrupt Vector Table (4 / 10)

Vector Number	Request Source	Source		Detection Type	CR4	DMAC*4
100	SCIFA ch1	BRIF1	Break/overrun/framing error/parity error	Level	Y	N
101		RXIF1	Reception FIFO data full (RDF)	Level	Y	Y
102		TXIF1	Transmission FIFO data empty (TDFE)	Level	Y	Y
103		DRIF1	Transmit end/reception data ready	Level	Y	N
104	RSCAN	CANRFI	CAN reception FIFO	Level	Y	N
105		CANFIR0	CAN0 transmission and reception FIFO transmission completed	Level	Y	N
106		CANTI0	CAN0 transmission	Level	Y	N
107		CANFIR1	CAN1 transmission and reception FIFO transmission completed	Level	Y	N
108		CANTI1	CAN1 transmission	Level	Y	N
109	SCIFA ch2	BRIF2	Break/overrun/framing error/parity error	Level	Y	N
110		RXIF2	Reception FIFO data full (RDF)	Level	Y	Y
111		TXIF2	Transmission FIFO data empty (TDFE)	Level	Y	Y
112		DRIF2	Transmit end/reception data ready	Level	Y	N
113	SCIFA ch3	BRIF3	Break/overrun/framing error/parity error	Level	Y	N
114		RXIF3	Reception FIFO data full (RDF)	Level	Y	Y
115		TXIF3	Transmission FIFO data empty (TDFE)	Level	Y	Y
116		DRIF3	Transmit end/reception data ready	Level	Y	N
117	SCIFA ch4	BRIF4	Break/overrun/framing error/parity error	Level	Y	N
118		RXIF4	Reception FIFO data full (RDF)	Level	Y	Y
119		TXIF4	Transmission FIFO data empty (TDFE)	Level	Y	Y
120		DRIF4	Transmit end/reception data ready	Level	Y	N
121	RIIC ch0	TEI0	Data transmission completed (TEND)	Level	Y	N
122		RXI0	Data reception completed (RDRF)	Edge	Y	Y
123		TXI0	Transmission data empty (TDRE)	Edge	Y	Y
124	RIIC ch1	TEI1	Data transmission completed (TEND)	Level	Y	N
125		RXI1	Data reception completed (RDRF)	Edge	Y	Y
126		TXI1	Transmission data empty (TDRE)	Edge	Y	Y
127	SSI	SSIRXI	Reception data full interrupt	Edge	Y	N
128		SSITXI	Transmission data empty interrupt	Edge	Y	N

Table 12.3 Cortex-R4/DMAC Interrupt Vector Table (5 / 10)

Vector Number	Request Source	Source		Detection Type	CR4	DMAC*4
129	Encoder I/F	ENCINT0	Encoder I/F interrupt 1	Level*5	Y	N
130		ENCINT1	Encoder I/F interrupt 2	Level*5	Y	N

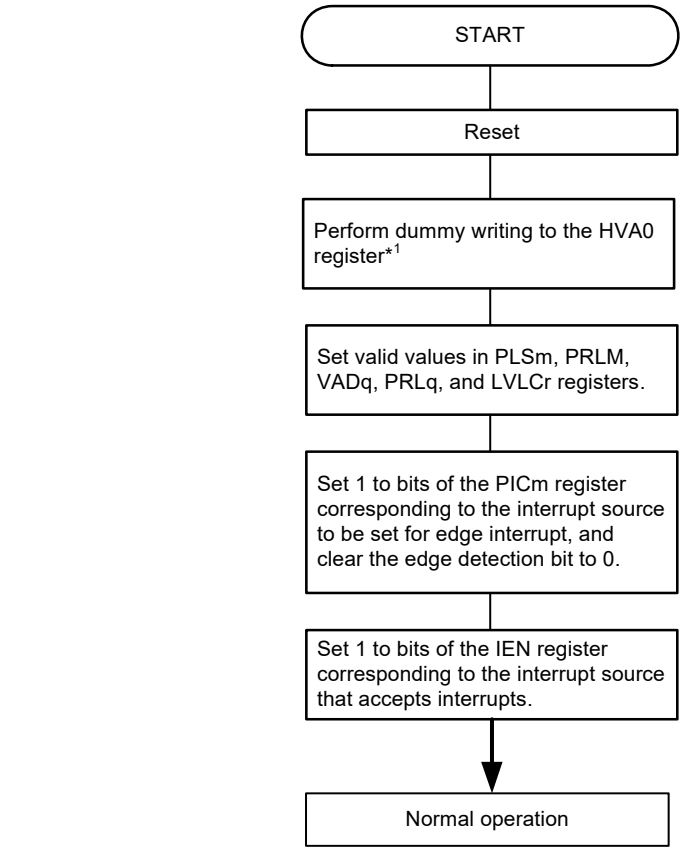
299	CMT unit 2	CMI4	Compare match interrupt_ch0	Edge	Y	N
300		CMI5	Compare match interrupt_ch1	Edge	Y	N

Note: Do not select the interrupt request destinations that do not have Y for the request destination.
Note 1. Select level detection when using this source to generate interrupts for the CPU and edge detection when using it as a trigger for DMA activation.
Note 2. Select the level or edge detection when using this source to generate interrupts for the CPU, and edge detection when using it as a trigger for DMA activation.
Note 3. Though an interrupt serving as a DMA activating source is not generated as an interrupt, the interrupt handling routine with the vector number of the DMA transfer completion interrupt is executed on completion of DMA transfer. For details, see section 12.3.1, Selecting Interrupt Request Destinations, and section 15.4.2, DMA Transfer Completion Interrupts.
Note 4. When connecting the DMAC transfer completion interrupt, always select the same edge as that selected by the setting of interrupt detection type selection register n (PLSn). For details, see section 12.4.4.3, (1) Specifying Interrupt Detection Types.
Note 5. The active sense of the signal must be specified. For details, see section 12.4.4.3, Detecting Interrupts.
Note 6. Interrupts are generated in response to requests for DMA transfer, but there are no interrupts on completion of transfer. Poll the END bit of the CHSTAT_n register to confirm the completion of DMA transfer.

12.4.4 Operation

12.4.4.1 Initializing Registers of VIC

Figure 12.6 shows the procedure for initializing registers of VIC.
When you canceled reset, registers are not ready to operate due to interrupt priority level settings of VIC, or other reasons. For this reason, you must initialize the registers after a reset release.



m = 0 to 9, q = 1 to 300, r = 8, 9
Note 1. For initializing the VIC, write this register once after being released from a reset . Also, write this register at the end of each interrupt handling routine. For details, see section 12.4.2.13, Interrupt Address Register (HVA0).

Figure 12.6 Initializing Registers of VIC

12.4.4.2 Procedure for Rewriting the PLS, LVLC, PRLM, VAD, and PRL Registers

To rewrite the following registers while VIC is in operation, finish all interrupt processing, and then disable interrupts. To disable interrupts, set 1 to the I bit of the CPSR register for Cortex-R4.

- PLS (Interrupt detection type selection register)
- PRLM (Interrupt priority level mask register)
- LVLC (Interrupt level control register)
- VAD (Interrupt address storage register)
- PRL (Interrupt priority level storage register)

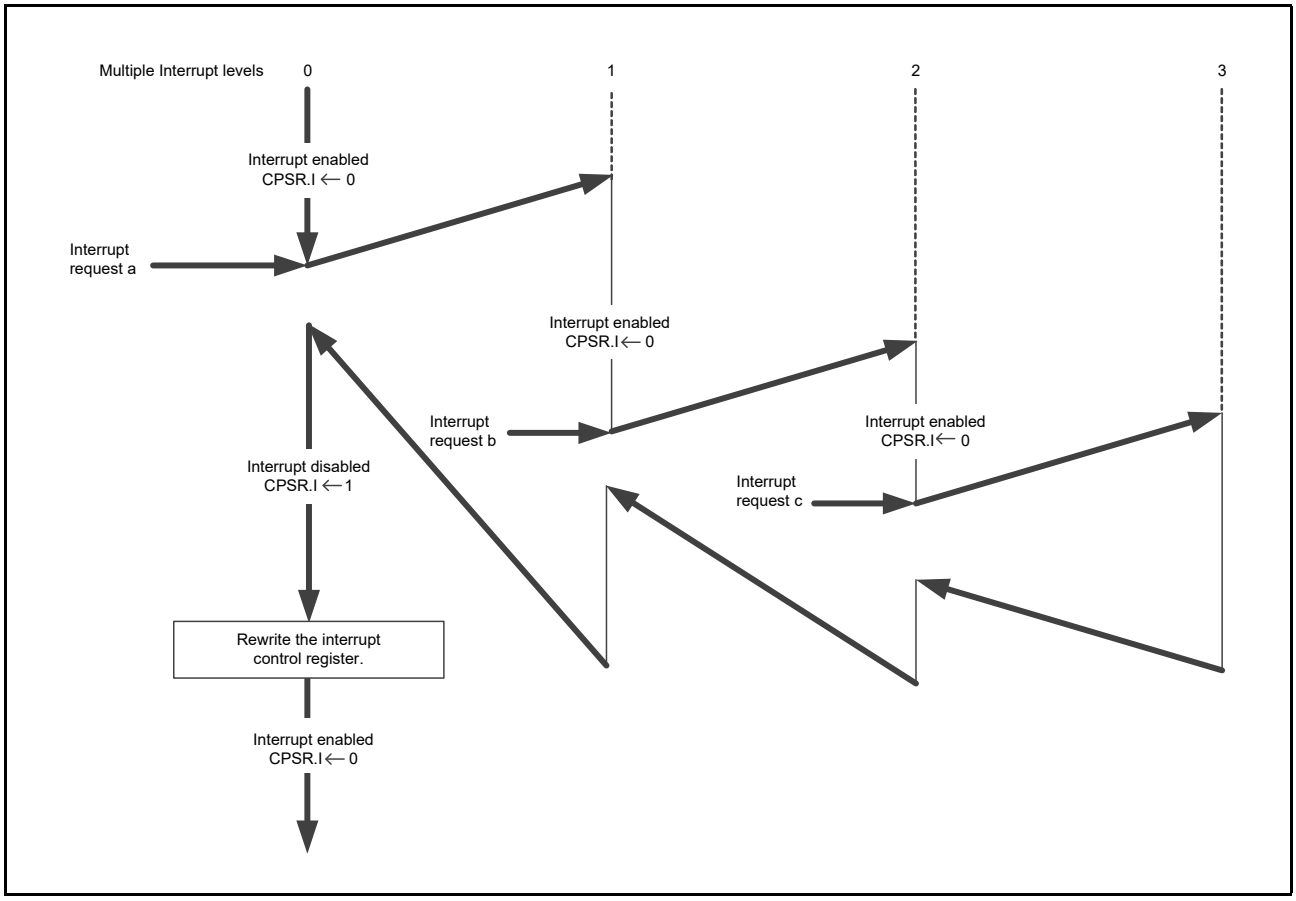


Figure 12.7 Period for Changing Register Settings

Follow the flow below to change register settings by using software.

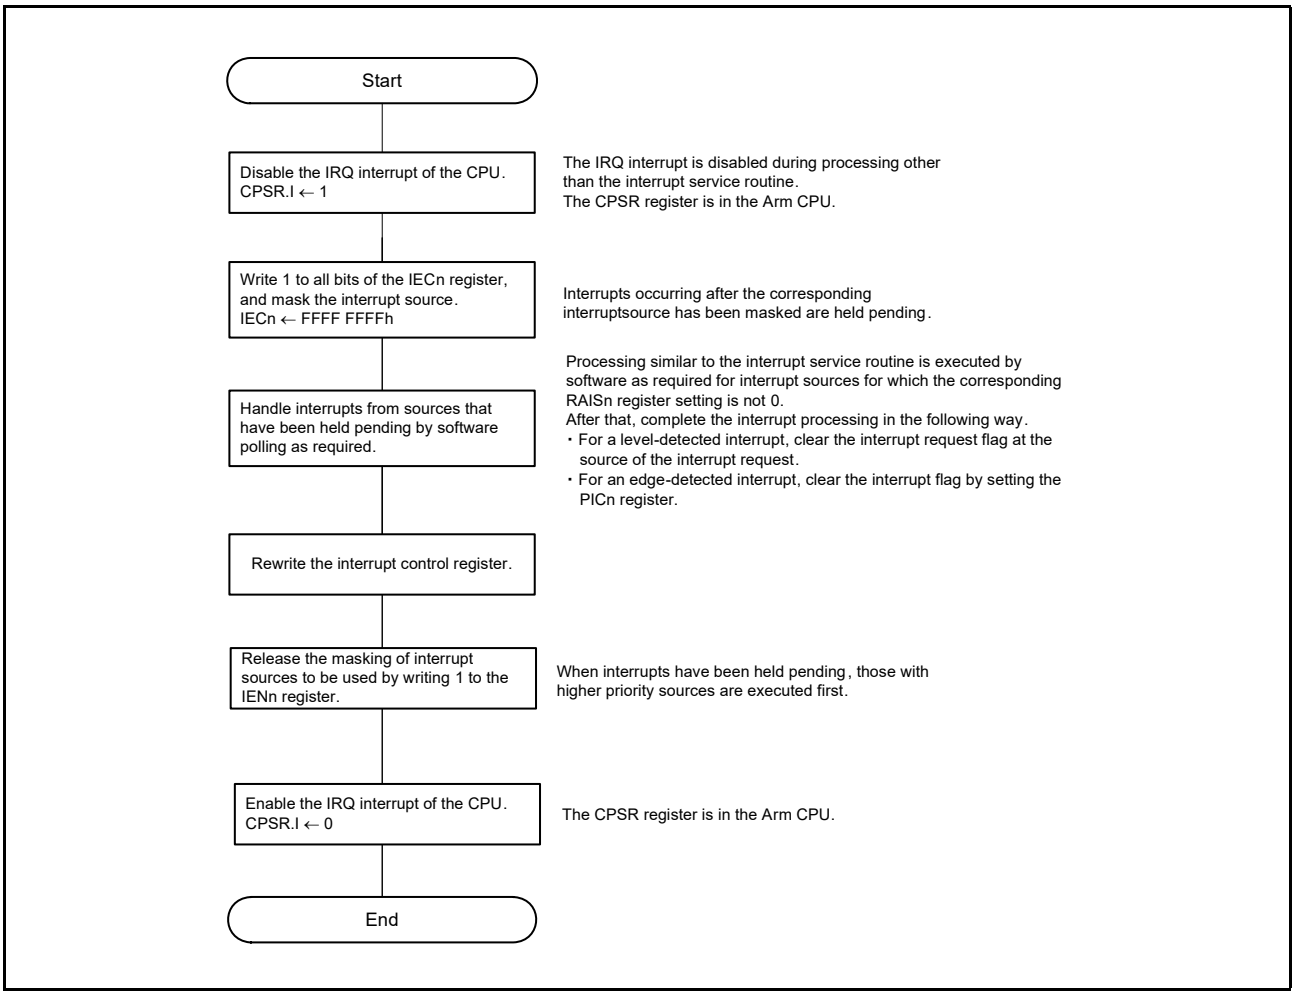

Figure 12.8 Register Rewrite Flow

12.4.4.3 Detecting Interrupts

(1) Specifying Interrupt Detection Types

When connecting external interrupts except interrupts from the NMI pin, and interrupts from on-chip peripheral modules to Cortex-R4, you must use VIC to select the edge or level detection with interrupt detection type selection register n (PLSn). You must also select the active sense of the signal in the corresponding interrupt level control register n (LVLCn). Table 12.4 lists settings of the interrupt detection type for VIC. When connecting transfer completion interrupt from DMAC, always select edge detection. For interrupt requests from the encoder interfaces, the type of detection and the active sense of interrupt signals have been specified for the individual modules, so set the given bits in the PLSn and LVLCn registers to match the specification.

Table 12.4 VIC Settings by Interrupt Detection Type

Interrupt Request Type	PLSm	LVCx1	LVCx0
Edge interrupt	1	Setting not required	Setting not required
Level interrupt	0	0/1	1/0

m: Interrupt vector number (0 to 300)
x: Interrupt vector number (129 to 144)

(2) IRQ Interrupt (Level interrupt)

Figure 12.9 shows level interrupt operation.

When you complete a level interrupt, stop interrupt output of the request source for the level interrupt. At that time, the applicable bit of IRQ status register n (IRQSn, n = 0 to 9) is cleared to 0. After that, make sure the interrupt is no longer requested. This operation is needed to prevent the same interrupt from being accepted after restoration because there is a delay before the interrupt output stop processing of the interrupt request source by the software is applied to the hardware. In addition, stop the interrupt output of the interrupt request source at the appropriate position of the service routine (ISR) according to the operation of the request source.

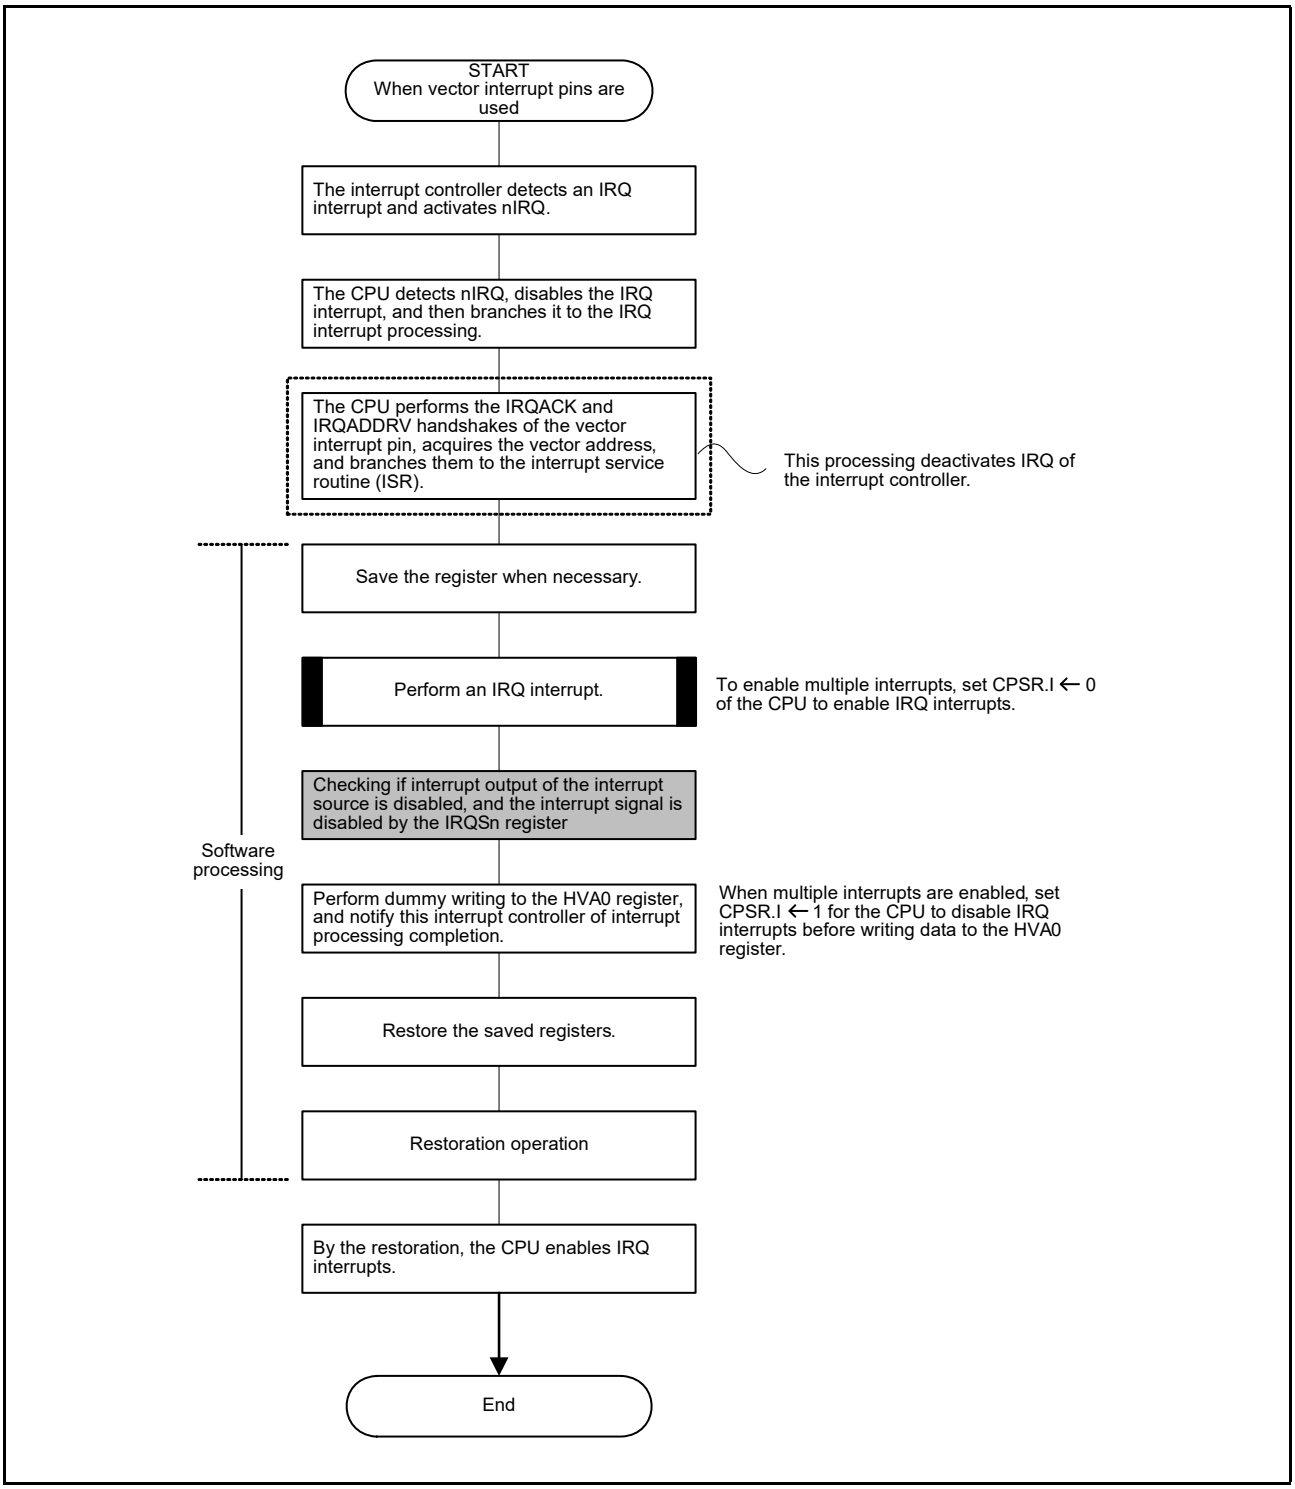

Figure 12.9 IRQ Interrupt Operation (Level Operations)

(3) IRQ Interrupt (Edge Interrupt)

Figure 12.10 shows edge interrupt operation.

Clear the edge interrupt request with edge detection bit clear register n (PICn, n = 0 to 9).

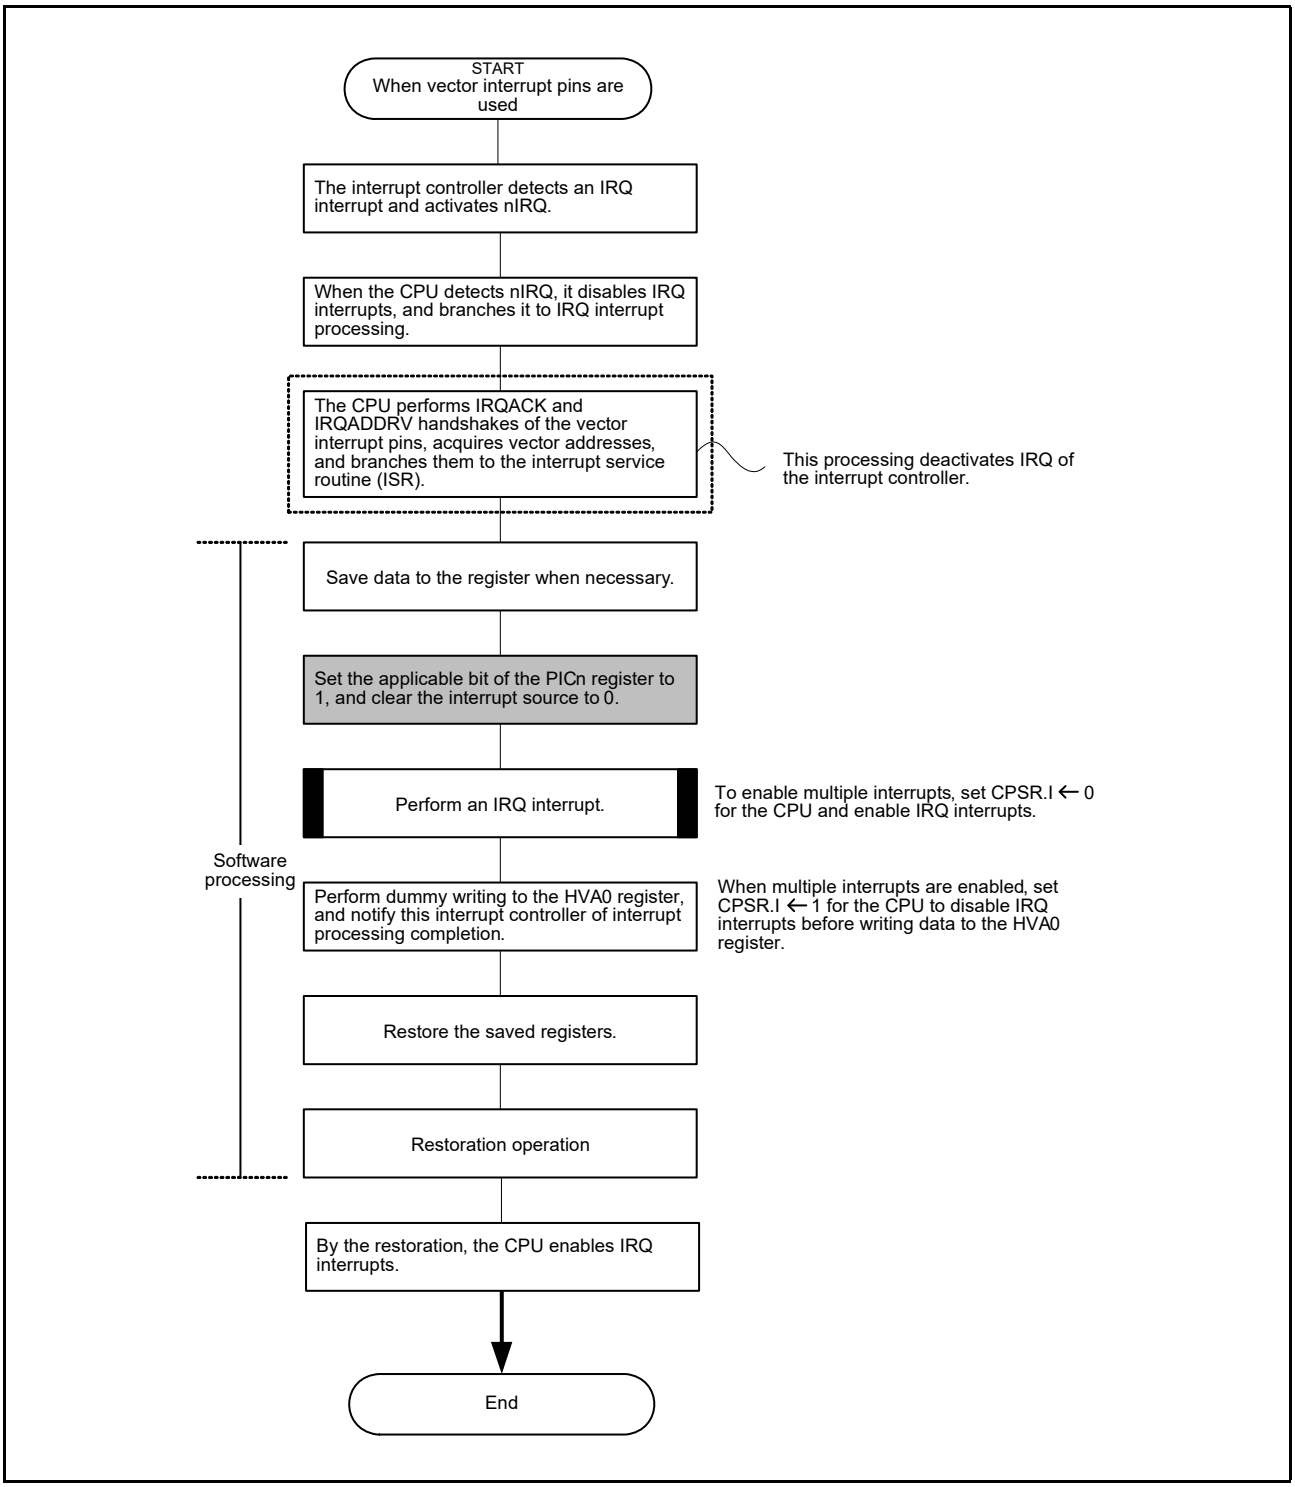

Figure 12.10 IRQ Interrupt Operation (Edge Interrupt)

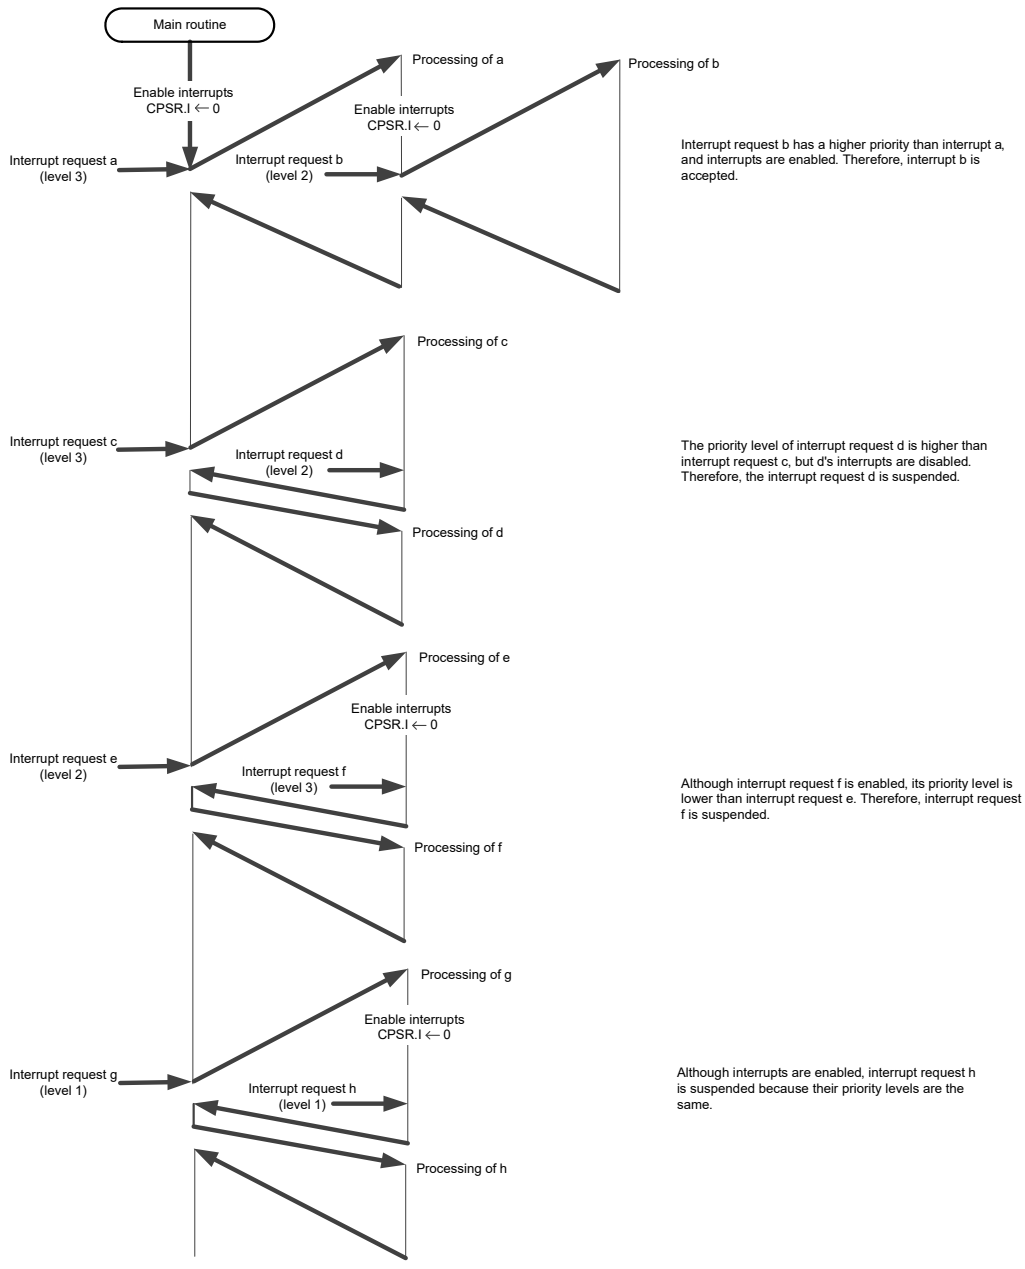
12.4.4.4 Priority Level for Interrupt Multiple Control

If an interrupt is being handled (only when interrupt multiple control is being performed), only an interrupt that has higher priority than the interrupt which is being serviced is accepted. At that time, interrupts with lower priority than the currently serviced interrupt are suspended.

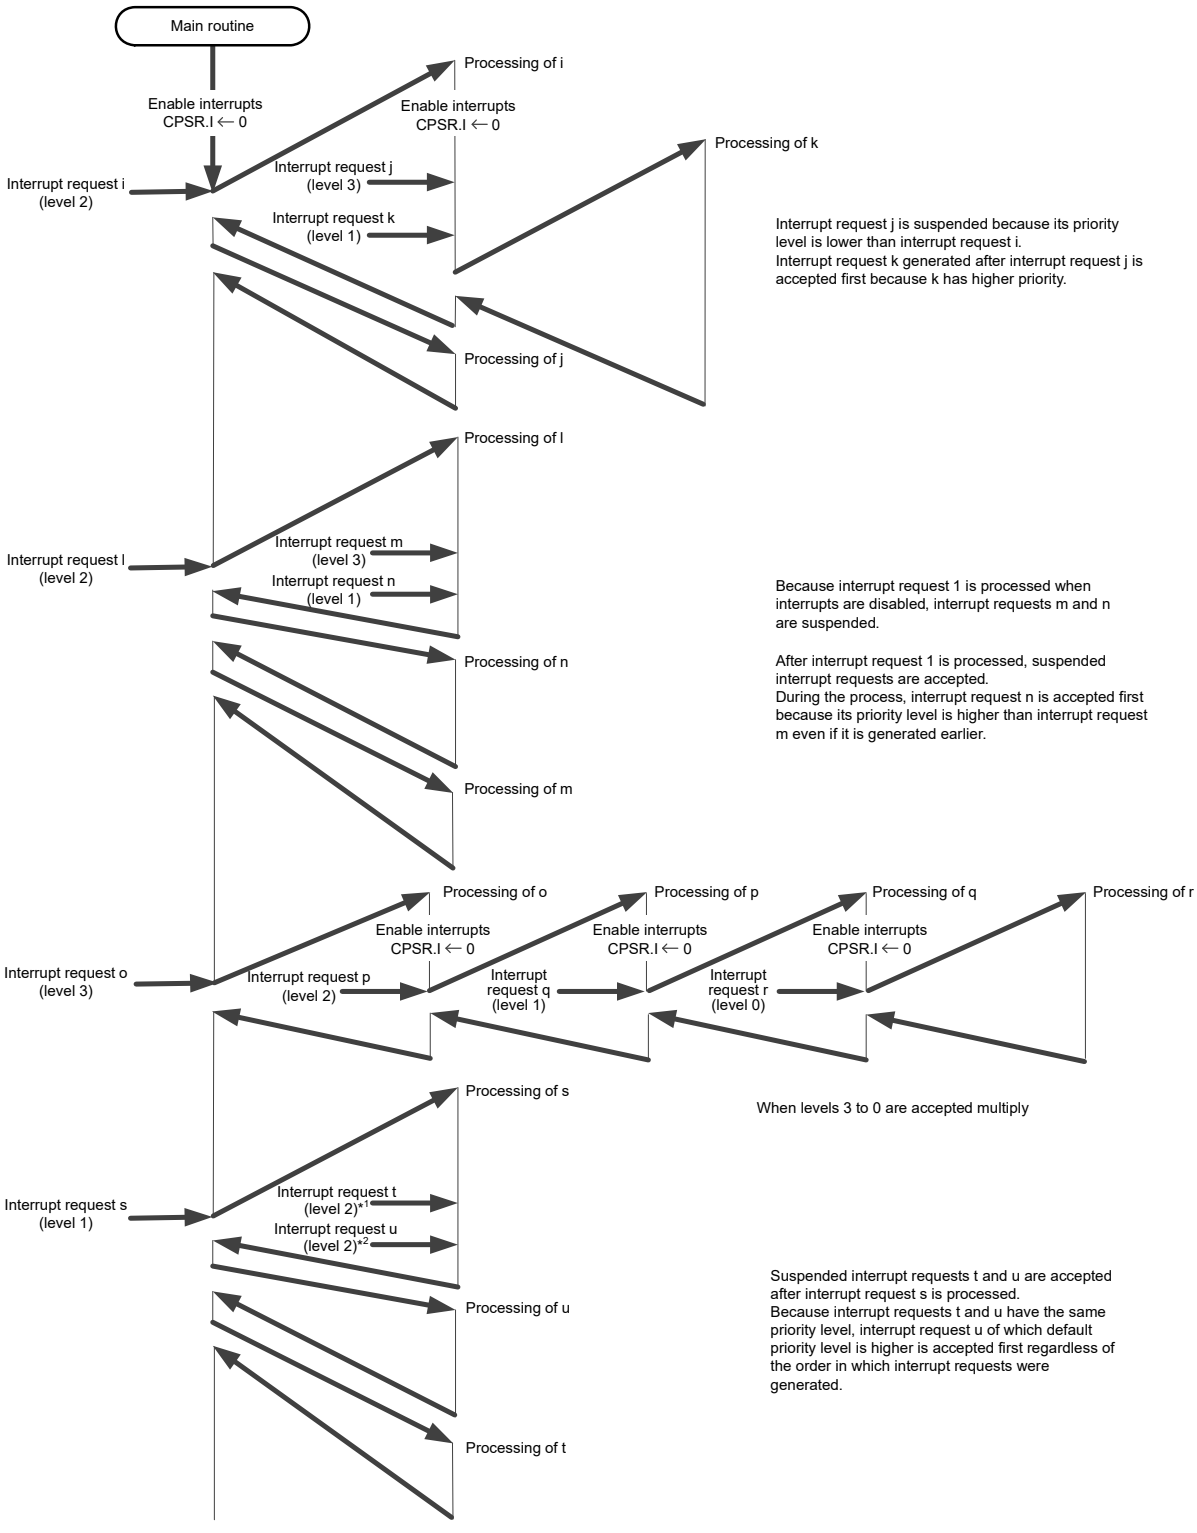
12.4.4.5 Handling Multiple Interrupts

Figure 12.11 provides an example of multiple interrupts that accept another interrupt when an interrupt is being handled.



a through u in the figure (including 2/2) are tentative names used to identify each interrupt request signal.
High/Low of the default priority level in the figure indicate the relative priority level between two interrupt request signals.
The priorities are higher for smaller vector numbers, which means, if the same value is set in two interrupts by the PRLm register, the one with smaller vector number takes priority.

Figure 12.11 Concept of Multiple Interrupts (1 / 2)



Note 1. The default priority level is low.
Note 2. The default priority level is high.
The priorities are higher for smaller vector numbers, which means, if the same value is set in two interrupts by the PRLm register, the one with smaller vector number takes priority.

Figure 12.11 Concept of Multiple Interrupts (2 / 2)

12.4.4.6 Handling IRQ Interrupt Source Conditions by Polling

Figure 12.12 shows the procedure for handling IRQ interrupt source conditions by polling the interrupt status registers (RAISn).

That is, source conditions for IRQ interrupts can be detected by checking the bits of the interrupt input status registers (RAISn). This is useful when interrupts are masked by settings in the interrupt enable registers (IENn). This enables interrupt processing without hardware forcing branches to the interrupt service routines (ISRs).

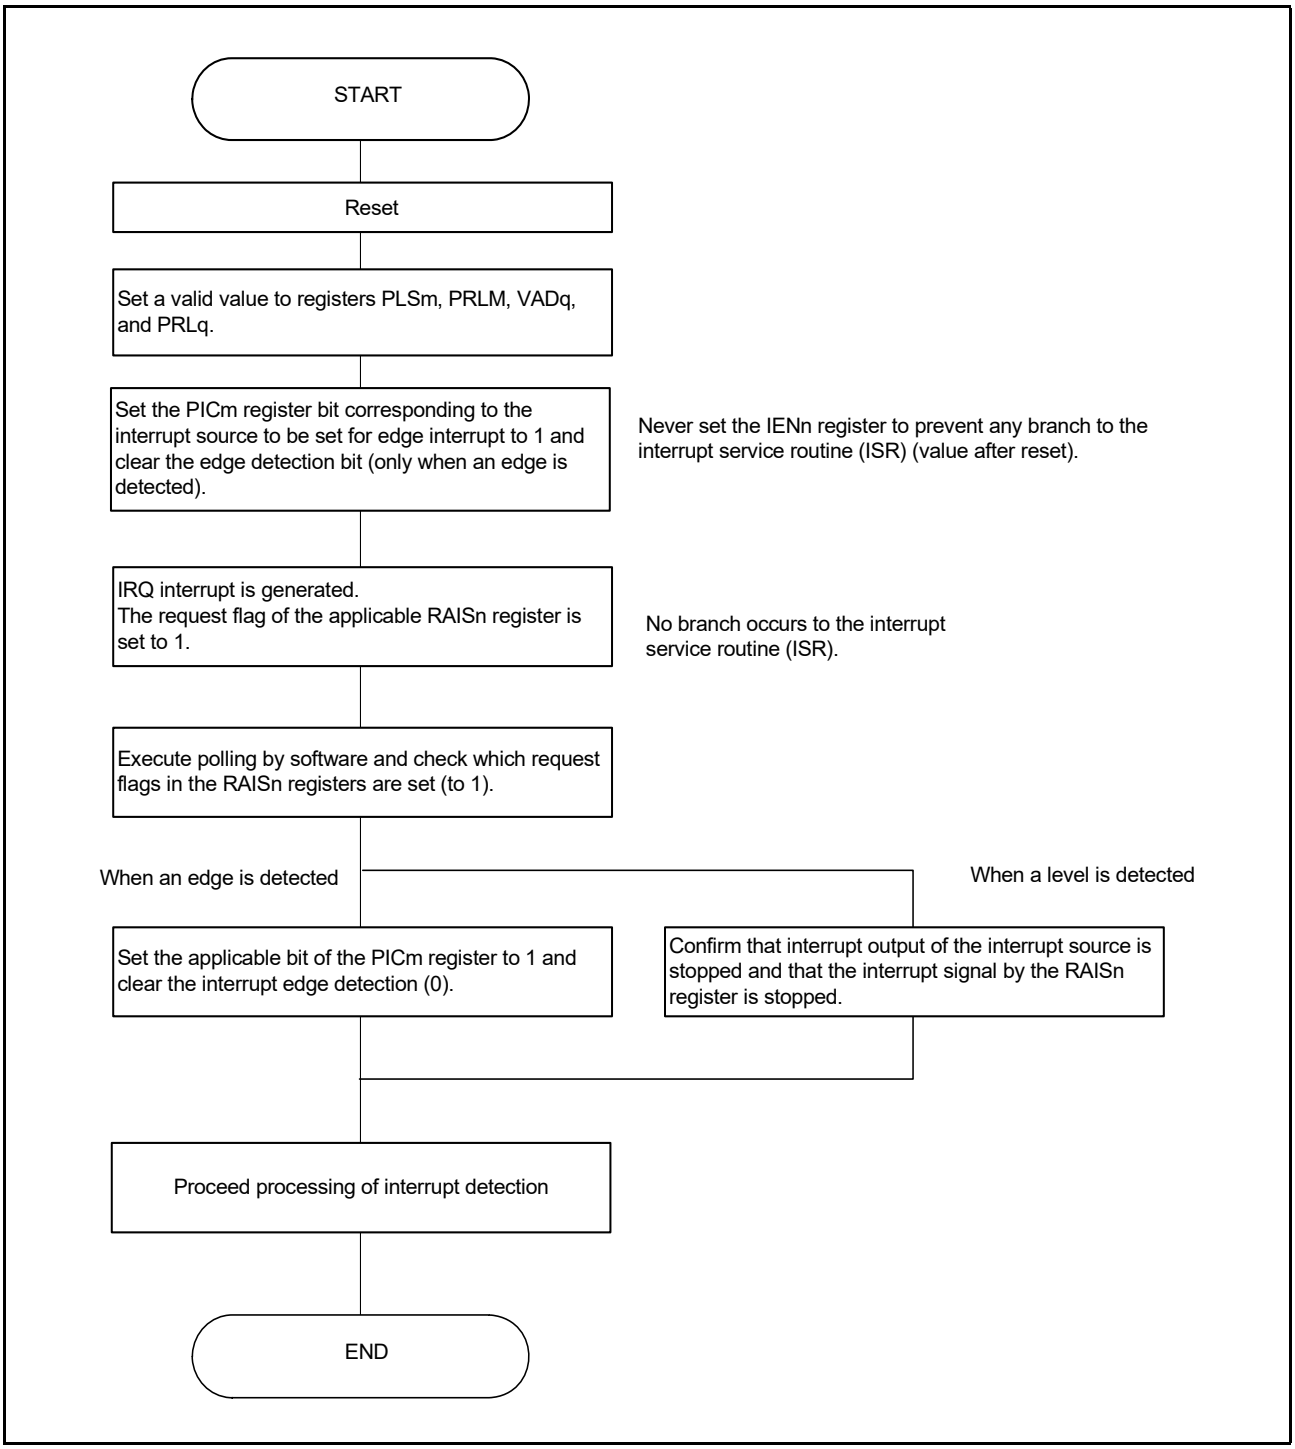


Figure 12.12 IRQ Interrupt Operation by Polling (Edge/Level Detection)

12.4.5 Return from Sleep Mode

If the interrupt controller is to return operation from sleep mode in response to an interrupt or non-maskable interrupt, make the following settings for the interrupt.

(1) The applicable interrupt request is enabled with the IENn bit.
(2) The DMAC source select register does not perform assignment to DMAC.

12.4.6 Usage Notes

12.4.6.1 Restrictions on VIC Priority Levels

VIC specifies the priority in 16 levels for each source with the interrupt priority level store register n (PRLn, n = 1 to 300). But lower priority levels are assigned to sources with vector numbers 256 and later compared to sources with vector numbers 1 to 255. Table 12.5 lists the relationship between vector numbers and priority levels.

Table 12.5 Relationship between Vector Numbers and Priority Levels

Vector Number	Priority Level*1
1 to 255	PRLn
256 to 300	PRLn + 16

n = 1 to 300
Note 1. The highest priority level is 0.

12.4.6.2 Notes on Accessing HVA0 Register

In cases of contention due to a vector interrupt being generated at the same time as writing to the HVA0 register, the AHB allows dummy-writing to the HVA0 register to proceed and blocks conveying of the IRQ interrupt to the CPU until a response to the write operation is returned so that processing to handle a new vector interrupt remains inactive over that time.
When writing to the HVA0 register, never fail to wait for the response indicating completion of the write operation before allowing IRQ interrupts to be sent to the CPU. Successful writing will be ensured by following the procedure illustrated in Figure 12.9 and executing a DMB instruction immediately after the write to the HVA0 register (as in the program example below).

- Program example

```
VIC.HVA0.LONG = 0x00000000;
asm(“dmb”);                    //DMB instruction
```

Note: The program format may vary according to the compiler. Confirm the applicable format for each compiler in the individual manuals.

12.4.6.3 Notes on Selecting Level Detection

When an interrupt request is set to level detection, do not cancel an interrupt request that was already generated except interrupt cancellation by the CPU. The correct vector address might not be output. For example, if level interrupt A is generated, the source for the output of interrupt A must be cleared by the service routine for interrupt A in a normal situation as shown in Figure 12.9 of section 12.4.4.3, Detecting Interrupts, but the source for the output of interrupt A may be transiently cleared if the service routine for another interrupt B has cleared or masked the source for the output of interrupt A.
When this interrupt controller accepts an interrupt, and the interrupt request is canceled before the CPU acquires the vector address, if another interrupt request is generated at the same time, 0000 0014h is output as the vector address. Therefore, to handle transitional cancellation of interrupt requests as mentioned above, it is recommended to use the return instruction only for 0000 0014h of the CPU (refer to the Example Program below).
In addition, if an interrupt request signal is transitionally withheld during the processing of an interrupt for which multiple interrupts are enabled, branching returns to the interrupt processing for which service is currently in progress. This interrupt handler writing to the HVA0 register causes the controller for this interrupt to recognize the completion of interrupt processing. Note that there is a gap between the actual interrupt source generating an interrupt request and the CPU recognizing the interrupt source.

- Example Program
  reserved_handler:
  subs pc, lr, #4 ; locate at 0000 0014h.

Note: The program format may differ for each complier. Confirm the applicable format for each in their manuals.

12.4.6.4 Notes when Rewriting the IECn Register

If the value of the IECn register is to be changed, do so while interrupts are disabled. To disable interrupts, set the I bit in the CPSR register of the Arm CPU to 1.

12.4.6.5 Notes on Vector Settings

In the specification of this product, use of the fixed vector by setting the SCTLR.[24]VE bit to 0 is prohibited. Only providing addresses from those of the VIC by setting SCTLR.[24]VE bit = 1 is possible. The addresses can be set by using the VADn registers (n: vector number).

12.5 Cortex-M3 Nested Vector Interrupt Controller (NVIC) (only for products incorporating an R-IN engine)

12.5.1 Overview

RZ/T1 uses NVIC embedded on Cortex-M3 as the interrupt controller of Cortex-M3. For details on the exceptional interrupt operations, visit the following URL of Arm:
http://infocenter.arm.com/help/topic/com.arm.doc.set.cortexm/index.html

12.5.2 Vector Table

12.5.2.1 Interrupt Vector Table for CM3

Table 12.6 lists the vector table for interrupts to Cortex-M3. Interrupts specific to RZ/T1 are allocated to exception handling number 16 or later for Cortex-M3.
The source of an interrupt for the Cortex-M3 and the same source as the trigger for DMAC activation may be detected in different ways. The Ethernet switch DLR interrupt (vector number 107) is one example. For details, see section 15.3.4, DMA Transfer Request, and the notes on DMA transfer.
The following table explains the items of the CM3 interrupt vector table.

Item	Description
Vector Number	Indicates the vector number for NVIC of Cortex-M3.
Request source	Indicates the name of the interrupt request source.
Source	Indicates the interrupt name.
Detection type	Indicates the detection type for interrupts from peripheral modules. To connect a transfer completion interrupt from DMAC, the edge must be selected.
DMAC	Y indicates the DMAC activation source.
DMAC setting vector number	When the DMAC activation source is selected, the vector number to be set for the DMAC source select register is listed.

Table 12.6 CM3 Interrupt Vector Table (1 / 4)

124	RAM	ETHRSE1	1-bit ECC error interrupt from the on-chip extended SRAM*1	Edge	N	—
125		ETHRSE2	2-bit ECC error interrupt from the on-chip extended SRAM*1	Edge	N	—
126	System	ETHCTO0	CTI trigger output signal 0	Edge	N	—
127		ETHCTO1	CTI trigger output signal 1	Edge	N	—

Note: Do not select the interrupt request destinations that do not have Y for the request destination.
Note 1. Only in products with extended on-chip SRAM
Note 2. Select level detection when using this source to generate interrupts for the CPU and edge detection when using it as a trigger for DMA activation.
Note 3. Select the level or edge detection when using this source to generate interrupts for the CPU, and edge detection when using it as a trigger for DMA activation.
Note 4. Interrupts are generated in response to requests for DMA transfer, but there are no interrupts on completion of transfer. Poll the END bit of the CHSTAT_n register to confirm the completion of DMA transfer.

12.6 Usage Notes

12.6.1 Using “Falling-Edge” or “Rising and Falling Edges” Detection with the External Pin Interrupts

Since the internal level on external pin interrupts after a reset is high, when external pin interrupts are used with low as the initial input level and the detection of “falling edge” or “rising and falling edges”, follow the procedure below.
Otherwise, follow the procedures shown in section 12.3.3, External Pin Interrupts.
In addition, make sure that a falling edge is not input to the external pin interrupts before these settings are completed.

[For IRQ pins]

1. Clear the applicable IENn bit to 0 (set the IECn bit).
2. Set the Pmn I/O select bit in the port direction register (PDR) of the I/O port to 10b (input).
3. Set and check (read) the I/O port (PmnPFS.ISEL bit).
4. Clear the IRQFLTE.FLTENi bit to 0.*1
5. Set the digital noise filter sampling clock with the IRQFLTC.FCLKSEL[1:0] bits.*1
6. Set the IRQFLTE.FLTENi bit to 1.*1
7. Select the edge for detection as “falling” or “rising and falling” by setting the IRQCRi.IRQMD[1:0] bits.
8. Set the applicable PICn register to 1 (when an edge is detected).
9. Set the applicable IENn bit to 1.

Note 1. Setting is required only when the digital filter is used.

[For ETH0_INT/ETH1_INT/ETH2_INT pins]

1. Set the applicable IENn bit to 0 (set the IECn bit).
2. Set the Pmn I/O select bit in the port direction register (PDR) of the I/O port to 10b (input).
3. Set the I/O port (the PmnPFS.PSEL[5:0] bits and PMR register), and check (read) the PmnPFS register.
4. Clear the EPHYFLTE.EFLTENi bit to 0.*1
5. Set the digital noise filter sampling clock with the EPHYFLTC.EFCLKSEL[1:0] bits.*1
6. Set the EPHYFLTE.EFLTENi bit to 1.*1
7. Select the edge for detection as “falling” or “rising and falling” by setting the EPHYCRi.EPHYMD[1:0] bits.
8. Set the applicable PICn register to 1 (when an edge is detected).
9. Set the applicable IENn bit to 1.

Note 1. Setting is required only when the digital filter is used.

12.6.2 Using Falling-Edge Detection with the NMI Pin

Since the internal level on the NMI pin after a reset is high, when the NMI pin is used with low as the initial input level and the detection of falling edges, follow the procedure below.
Otherwise, follow the procedure shown in section 12.3.4, NMI Pin Interrupts.
In addition, make sure that a falling edge is not input to the NMI pin before these settings are completed.

1. Select the edge for detection as rising by setting the NMICR.NMIMD bit to 1.
2. Set and check the I/O port pin (P35PFS.ISEL bit).
3. Clear the NMIFLTE.NFLTEN bit to 0.*1
4. Set the sampling clock cycle for the digital noise filter in the NMIFLTC.NFCLKSEL[1:0] bits.*1
5. Clear the NMICR.NMIMD bit to 0 (falling edge detection).
6. Set the NMICLR.NMICLR bit to 1, and clear the NMISR.NMIST flag to 0.
7. Set the NMIFLTE.NFLTEN bit to 1.*1
8. Set the P35 I/O select bit in the port direction register (PDR) of the I/O port to 10b (input).

Note 1. This setting is only required when the digital noise filter is to be used.

13. Internal Buses

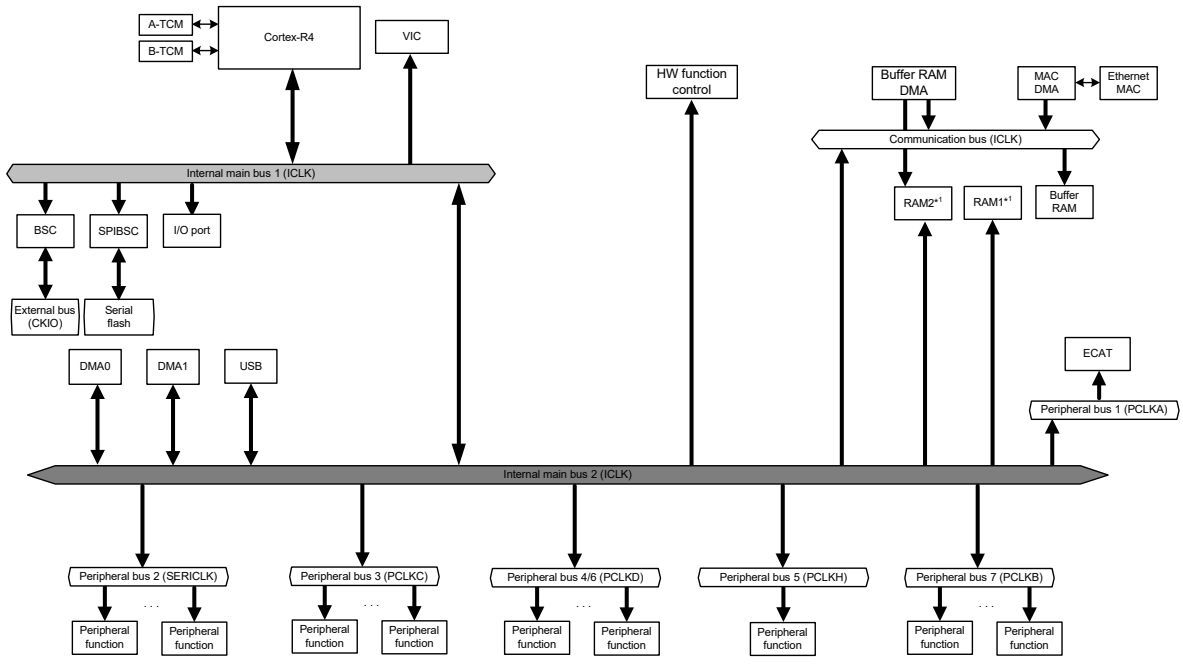
13.1 Overview

This product contains two internal memory buses, two memory buses, and multiple internal peripheral buses. Table 13.1 lists the specifications of internal buses and Figure 13.1 and Figure 13.2 show the internal bus configuration.

Table 13.1 Specifications of Internal Buses

Internal Bus Type		Description
Internal main bus	Internal main bus 1	• Operates in synchronization with ICLK • Bus protocol: AMBA AXI • Priority order decision: Round-robin
	Internal main bus 2	• Operates in synchronization with ICLK • Bus protocol: AMBA AHB • Priority order decision: Round-robin with fixed priority order (DMA0 with top priority)
Memory buses 1 and 2 (only for products incorporating an R-IN engine)		Operates in synchronization with ICLK
Buses for Ethernet (buses other than the communication bus are only included in products incorporating an R-IN engine)	Instruction bus	Operates in synchronization with ICLK
	Operand bus	Operates in synchronization with ICLK
	System bus	Operates in synchronization with ICLK
	Communication bus	Operates in synchronization with ICLK
	Local bus 1	Operates in synchronization with ICLK
	Local bus 2	Operates in synchronization with ICLK
Peripheral bus 1 (only for products incorporating an EtherCAT (optional))	ECAT	Operates in synchronization with PCLKA
Peripheral bus 2	SCIFA, RSPIa	Operates in synchronization with SERICLK
Peripheral bus 3	GPTa, MTU3a	Operates in synchronization with PCLKC
Peripheral bus 4	CAN, CRC, ECM, DSMIF	Operates in synchronization with PCLKD
Peripheral bus 5	ADC	Operates in synchronization with PCLKH
Peripheral bus 6	ELC, TPU, POE3, PPG, CMT, CMTW, WDTA, IWDTa, RIIC, SSI, DOC, temperature sensor	Operates in synchronization with PCLKD
Peripheral bus 7	Clock generation circuit, CLMA	Operates in synchronization with PCLKB
External bus		Operates in synchronization with CKIO
External serial flash bus		Operates in synchronization with ICLK

Note: Peripheral bus 4 is divided internally into (CAN, CRC, ECM), and DSMIF. Moreover, peripheral buses 5, 6, and 7 are on the same slave layer, and are connected with internal main bus 2. Therefore, in products incorporating an R-IN Engine, even in case of simultaneous access to the CAN or DSMIF modules by both CPU cores, there will be no waiting. However, since the ADC (peripheral bus 5) and TPUa (peripheral bus 6) are on the same slave layer, there will be some waiting in case of simultaneous access by both CPU cores.



Note 1. Optional function depending on the product

Figure 13.1 Bus Configuration

Note 2. Data RAM (also accessible by the Cortex-R4)

Figure 13.2 Internal Bus Configuration (for products incorporating an R-IN engine)

13.2 Internal Main Bus

Internal main buses 1 and 2 of this LSI both have a multiple-layer structure. If bus masters request to access different bus slaves respectively, multiple accesses are processed in parallel. If bus masters request to access the same bus slave, priority order decision is performed and accesses are processed sequentially according to the priority order.
Table 13.2 lists the connection between the bus master and the bus slave for internal main bus 1, and Table 13.3 lists the bus master-slave connection for internal main bus 2.

Table 13.2 Internal Main Bus 1: Connection between Bus Master and Bus Slave

14. Bus State Controller

The bus state controller outputs control signals for various types of memory and external devices that are connected to the external address space. The functions of this module enable this LSI to connect directly with SRAM, SDRAM, and other memory storage devices, and external devices.

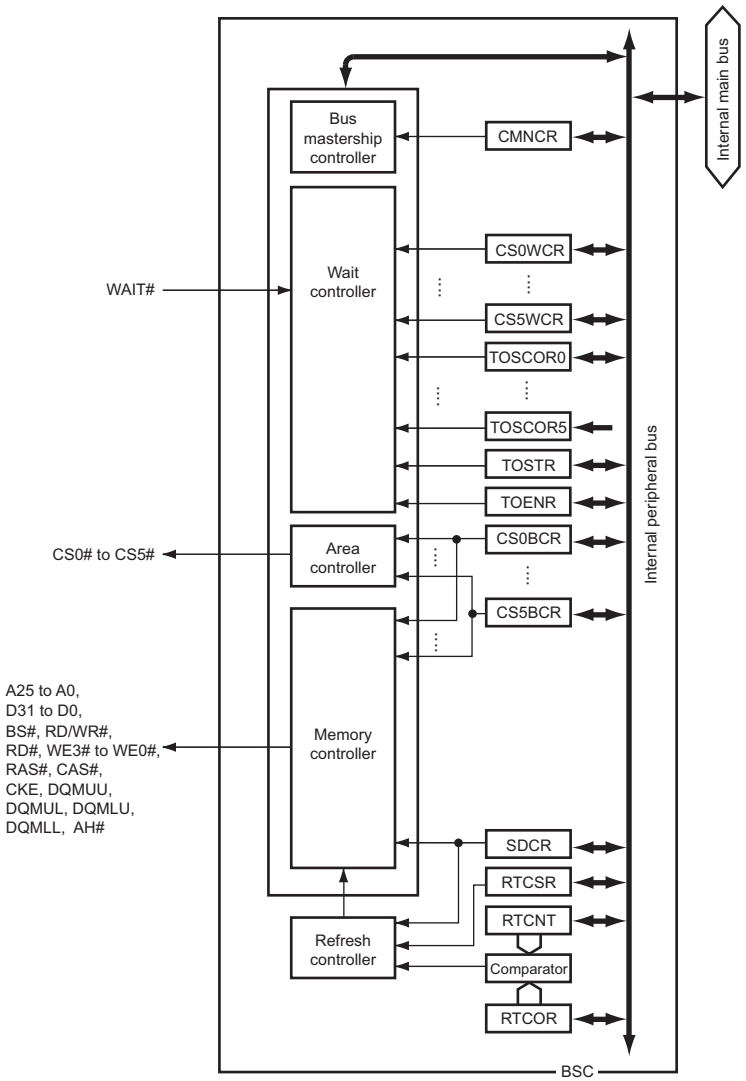
14.1 Features

Table 14.1 Bus State Controller Specifications

	Description
External address space	• A maximum of 64 Mbytes for each of areas CS0 to CS5. • Can specify the following for each CS space: SRAM interface, SRAM interface with byte selection, burst ROM (clocked synchronous or asynchronous), MPX-I/O, and SDRAM memory Data bus width (8, 16, or 32 bits) Insertion of wait cycles for each read access and write access. Can set independent idle cycles for the following five cases: Read-write (in same space/different spaces), read-read (in same space/different spaces), and the first cycle is a write access.
Various interfaces	SRAM interface Supports the interface that can directly connect to the SRAM.
	Burst ROM interface (clocked asynchronous) High-speed access to the ROM that has the page mode function.
	MPX-I/O interface Can directly connect to a peripheral LSI that needs an address/data multiplexing.
	SDRAM interface Can set the SDRAM in up to two areas.*1 Multiplex output for row address/column address. Efficient access by single read/single write. High-speed access in bank-active mode. Supports an auto-refresh and self-refresh. Supports a power-down mode. Issues MRS and EMRS commands.
	SRAM interface with byte selection Can connect directly to a SRAM with byte selection.
	Burst ROM interface (clocked synchronous) Can connect directly to a burst ROM of the clocked synchronous type.
Refresh function	Supports the auto-refresh and self-refresh functions. Specifies the refresh interval using the refresh counter and clock selection. Can execute concentrated refresh by specifying the refresh counts (1, 2, 4, 6, or 8). Usage as interval timer for refresh counter Generates an interrupt request at compare match.
External WAIT# pin	Detection of long wait state for access by the signal on the external WAIT# pin. A timeout detection condition is specifiable per CS space. Once timeout is detected, the external WAIT function is disabled and a timeout detection error request is issued.

Note 1. When connecting one SDRAM, set up the CS3 space for the SDRAM.

Figure 14.1 is a block diagram of the bus state controller.



CMNCR: Common control register*1
CSnWCR: CSn space wait control register (n = 0 to 5)
CSnBCR: CSn space bus control register (n = 0 to 5)
SDCR: SDRAM control register
RTCSR: Refresh timer control/status register
RTCNT: Refresh timer counter
RTCOR: Refresh time constant register
TOSCORn: Timeout cycle constant register (n = 0 to 5)
TOSTR: Timeout status register
TOENR: Timeout enable register

Note 1. For details of the CMNCR register, see section 15.2.11, Common Control Register (CMNCR).

Figure 14.1 Block Diagram of Bus State Controller

Table 14.2 lists the input/output pins of the bus state controller.

Table 14.2 Input/Output Pins of the Bus State Controller

Name	I/O	Function
A25 to A0	Output	Address output pins
D31 to D0	I/O	Data input/output pins
BS#	Output	Status signal output pin that indicates the start of the bus cycle
CS0# to CS5#	Output	Chip select signal output pins
RD/WR#	Output	Strobe signal output pin that indicates a read or write access Connect this pin to WE# pins when SDRAM or SRAM with byte selection is connected.
RD#	Output	Strobe signal output pin that indicates a read signal (read data output enable signal)
WE3#/DQMUU/AH#	Output	Write strobe signal output pin for D31 to D24 Connect this pin to the byte select pin when SRAM with byte selection is connected. Functions as the data mask enable signal output pin for D31 to D24 when SDRAM is connected. Functions as the address hold signal output pin when the MPX-I/O interface is used.
WE2#/DQMUL	Output	Write strobe signal output pin for D23 to D16 Connect this pin to the byte select pin when an SRAM with byte selection is connected. Functions as the data mask enable signal output pin for D23 to D16 when SDRAM is connected.
WE1#/DQMLU	Output	Write strobe signal output pin for D15 to D8 Connect this pin to the byte select pin when SRAM with byte selection is connected. Functions as the data mask enable signal output pin for D15 to D8 when SDRAM is connected.
WE0#/DQMLL	Output	Write strobe signal output pin for D7 to D0 Connect this pin to the byte select pin when SRAM with byte selection is connected. Functions as the data mask enable signal output pin for D7 to D0 when SDRAM is connected.
RAS#	Output	Low address strobe signal output pin for SDRAM. Connect this pin to RAS# pin of the SDRAM.
CAS#	Output	Column address strobe signal output pin for SDRAM. Connect this pin to CAS# pin of the SDRAM.
CKE	Output	Clock enable signal output pin for SDRAM. Connect this pin to CKE pin of the SDRAM.
WAIT#	Input	External wait control signal input pin used to insert a wait state into a bus cycle

14.2 Area Overview

14.2.1 Address Map

The kind of memory to be connected to the external address space and the data bus width are specified in each of CS0 to CS5 spaces. The address map for the external address space is listed below.

Table 14.3 Address Map

Internal Address	Space	Memory to be Connected
4000 0000h to 43FF FFFFh	CS0 mirror	SRAM interface, SRAM with byte selection, burst ROM (asynchronous or synchronous)
4400 0000h to 47FF FFFFh	CS1 mirror	SRAM interface, SRAM with byte selection
4800 0000h to 4BFF FFFFh	CS2 mirror	SRAM interface, SRAM with byte selection, SDRAM
4C00 0000h to 4FFF FFFFh	CS3 mirror	SRAM interface, SRAM with byte selection, SDRAM*1
5000 0000h to 53FF FFFFh	CS4 mirror	SRAM interface, SRAM with byte selection, burst ROM (asynchronous)
5400 0000h to 57FF FFFFh	CS5 mirror	SRAM interface, SRAM with byte selection, MPX-I/O
6000 0000h to 63FF FFFFh	CS0	SRAM interface, SRAM with byte selection, burst ROM (asynchronous or synchronous)
6400 0000h to 67FF FFFFh	CS1	SRAM interface, SRAM with byte selection
6800 0000h to 6BFF FFFFh	CS2	SRAM interface, SRAM with byte selection, SDRAM
6C00 0000h to 6FFF FFFFh	CS3	SRAM interface, SRAM with byte selection, SDRAM*1
7000 0000h to 73FF FFFFh	CS4	SRAM interface, SRAM with byte selection, burst ROM (asynchronous)
7400 0000h to 77FF FFFFh	CS5	SRAM interface, SRAM with byte selection, MPX-I/O

Note 1. When connecting one SDRAM, set up the CS3 space for the SDRAM.

14.2.2 Data Bus Width and Related Pin Setting for Each Area Depending on Boot Mode

The initial state of data bus width and settings of the pins related to this module depends on boot mode. For boot mode, refer to section 3, Operating Modes.

In 16-bit or 32-bit bus boot, the bus width of area 0 is automatically set to 16 or 32 bits, because this LSI is started up by the program stored in the ROM connected to area 0. For areas 1 to 5, the bus width and the memory to be connected can be changed by the program. Immediately after a power-on reset in these modes, some of the address and data-bus signals and the CS0# and RD# signals are automatically selected by default as the functions of the corresponding pins, since these signals are required to read ROM data from area 0. With the exception of these pins, the general purpose pin function is selected by default, and other required pin functions must be specified by software. Read access to area 0 is only permitted before the pin settings are completed.

In SPI boot modes, the state of areas 0 to 5 can be changed from the initial state by software, because the LSI is started by the program stored in the serial memory connected to the SPI space. Pin functions related to this module need to be set by software. Do not access external address spaces before the pin settings are completed.

Table 14.4 shows the initial state for individual boot modes and areas.

The sample access waveforms shown in this section include the pins such as BS#, RD/WR#, and WEn#. They are the waveforms when individual pin functions are enabled by the multi-function pin controller. For example, when 16-bit bus width is used in 32-bit bus boot mode, setting for pin A1 is needed. When 8-bit bus width is used, setting for pins A1 and A0 is also needed.

For details on pin function settings, see section 18, Multi-Function Pin Controller (MPC).

Table 14.4 Initial States for Individual Boot Modes and Areas

Boot Mode	Item	Area 0	Areas 1 to 5
16-bit bus boot	Data bus width	Fixed to 16 bits. Not changeable.	32 bits. Can be changed by program.
	Settings of pins related to this module	Pins A20 to A1, D15 to D0, CS0#, and RD# are set automatically. Other pins need to be set by program.	
32-bit bus boot	Data bus width	Fixed to 32 bits. Not changeable.	32 bits. Can be changed by program.
	Settings of pins related to this module	Pins A20 to A2, D31 to D0, CS0#, and RD# are set automatically. Other pins need to be set by program.	
SPI boot	Data bus width	32 bits. Can be changed by program.	
	Settings of pins related to this module	The initial value is the general I/O function. For external bus access, all the necessary pins need to be set by program.	

Note 1. In 16-bit bus boot or 32-bit bus boot, if an external memory that uses higher-order address lines than A21 is connected, the circuit board must include pull-down resistors for those address lines.

Note 2. The data-bus width may be limited by the type of memory in use. For details, see section 14.3.1, CSn Space Bus Control Register (CSnBCR) (n = 0 to 5).

14.3 Register Descriptions

14.3.1 CSn Space Bus Control Register (CSnBCR) (n = 0 to 5)

The CSnBCR register specifies the memory connected to each CS space, the number of idle cycles between bus cycles, and the bus width.

Do not access external memory for the corresponding area until CSnBCR initial setting and pin setting that are required for accessing the external memory are completed.

Idle cycles may be inserted even when they are not specified. For details, see section 14.4.10, Wait between Access Cycles.

Address(es): CS0BCR A000 2004h, CS1BCR A000 2008h, CS2BCR A000 200Ch, CS3BCR A000 2010h, CS4BCR A000 2014h, CS5BCR A000 2018h

	—	IWW[2:0]			IWRWD[2:0]			IWRWS[2:0]			IWRRD[2:0]			IWRRS[2:0]		
Value after reset:	0	0	1	1	0	1	1	0	1	1	0	1	1	0	1	1

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	TYPE[2:0]			—	BSZ[1:0]		—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	1	1*1	0*1	0	0	0	0	0	0	0	0	0

Note 1. In 16-bit bus boot mode, 10b is set to the BSZ[1:0] bits of the CS0BCR register after a reset. In SPI boot mode and 32-bit bus boot mode, 11b is set. The BSZ[1:0] bits of the CSnBCR register (n = 1 to 5) after a reset is 11b.

Bit	Symbol	Bit Name	Description	R/W
b8 to b0	—	Reserved	These bits are always read as 0. The write value should always be 0.	R/W
b10, b9	BSZ[1:0]	Data Bus Width Specification	Specify the data bus width of CS spaces. b10 b9 00: Reserved (setting prohibited) 01: 8-bit size 10: 16-bit size 11: 32-bit size For MPX-I/O, selects bus width by address Note 1. If area 5 is specified as MPX-I/O, setting these bits to 11b selects 8-bit or 16-bit bus width according to the address settings of the SZSEL bit in CS5WCR. Setting these bits to 01b or 10b selects the fixed bus with of 8-bit or 16-bit, respectively. Note 2. In 16-bit bus boot mode, 10b is automatically written to the BSZ[1:0] bits of the CS0BCR register. In 32-bit bus boot mode, 11b is automatically written. Note 3. If area 2 or area 3 is specified as SDRAM space, the bus width can be specified as either 16 bits or 32 bits. Note 4. If area 0 is specified as clocked synchronous burst ROM space, the bus width can be specified as either 16 bits or 32 bits.	R/W
b11	—	Reserved	This bit is always read as 1. The write value should always be 1.	R/W

Bit	Symbol	Bit Name	Description	R/W
b14 to b12	TYPE[2:0]	Memory Connected to a Space	Specify the type of memory connected to a CS space. b14 b12 000: Normal space 001: Burst ROM (clock asynchronous) 010: MPX-I/O 011: SRAM with byte selection 100: SDRAM 101: Reserved (setting prohibited) 110: Reserved (setting prohibited) 111: Burst ROM (clock synchronous) For details for memory type in each area, see Table 14.3. Note 1. When connecting the burst ROM to the CS0 space in 16-bit or 32-bit bus boot, change the CS0WCR register to the settings according to the burst ROM, and then set TYPE[2:0] to the burst ROM setting. In SPI boot mode, memory access should be performed after setting CS0BCR and CS0WCR. Note 2. Selecting SDRAM requires setting of the driving ability control register (DSCR) at the same time. For details, see section 17.3.6, Driving Ability Control Register (DSCR).	R/W
b15	—	Reserved	This bit is always read as 0. The write value should always be 0.	R/W
b18 to b16	IWRRS[2:0]	Idle State Insertion between Read-Read Cycles in the Same CS Space	Specify the number of idle cycles to be inserted after the access to an external memory that is connected to the CS space. The target cycle is a read-read cycle of which continuous access cycles are for the same CS space. b18 b16 000: No idle cycle inserted 001: 1 idle cycle inserted 010: 2 idle cycles inserted 011: 4 idle cycles inserted 100: 6 idle cycles inserted 101: 8 idle cycles inserted 110: 10 idle cycles inserted 111: 12 idle cycles inserted	R/W
b21 to b19	IWRRD[2:0]	Idle State Insertion between Read-Read Cycles in Different CS Spaces	Specify the number of idle cycles to be inserted after the access to an external memory that is connected to the CS space. The target cycle is a read-read cycle of which continuous access cycles switch between different CS spaces. b21 b19 000: No idle cycle inserted 001: 1 idle cycle inserted 010: 2 idle cycles inserted 011: 4 idle cycles inserted 100: 6 idle cycles inserted 101: 8 idle cycles inserted 110: 10 idle cycles inserted 111: 12 idle cycles inserted	R/W
b24 to b22	IWRWS[2:0]	Idle State Insertion between Read-Write Cycles in the Same CS Space	Specify the number of idle cycles to be inserted after the access to an external memory that is connected to the CS space. The target cycle is a read-write cycle of which continuous access cycles are for the same CS space. b24 b22 000: No idle cycle inserted 001: 1 idle cycle inserted 010: 2 idle cycles inserted 011: 4 idle cycles inserted 100: 6 idle cycles inserted 101: 8 idle cycles inserted 110: 10 idle cycles inserted 111: 12 idle cycles inserted	R/W

Bit	Symbol	Bit Name	Description	R/W
b27 to b25	IWRWD[2:0]	Idle State Insertion between Read-Write Cycles in Different CS Spaces	Specify the number of idle cycles to be inserted after the access to an external memory that is connected to the CS space. The target access cycle is a read-write one in which continuous access cycles switch between different CS spaces. b27 b25 000: No idle cycle inserted 001: 1 idle cycle inserted 010: 2 idle cycles inserted 011: 4 idle cycles inserted 100: 6 idle cycles inserted 101: 8 idle cycles inserted 110: 10 idle cycles inserted 111: 12 idle cycles inserted	R/W
b30 to b28	IWW[2:0]	Idle Cycles between Write-Read Cycles and Write-Write Cycles	These bits specify the number of idle cycles to be inserted after the access to an external memory that is connected to the CS space. The target access cycles are the write-read cycle and write-write cycle. b30 b28 000: No idle cycle inserted 001: 1 idle cycle inserted 010: 2 idle cycles inserted 011: 4 idle cycles inserted 100: 6 idle cycles inserted 101: 8 idle cycles inserted 110: 10 idle cycles inserted 111: 12 idle cycles inserted	R/W
b31	—	Reserved	This bit is always read as 0. The write value should always be 0.	R/W

14.3.2 CSn Space Wait Control Register (CSnWCR) (n = 0 to 5)

The CSnWCR register specifies various wait cycles for external memory access. The bit configuration of this register varies as shown below according to the memory type (TYPE2 to TYPE0) specified by the CSn space bus control register (CSnBCR). Specify CSnWCR before accessing the target area. Specify CSnBCR first, then specify CSnWCR.

(1) Normal Space, SRAM with Byte Selection, and MPX-I/O

- CS0WCR_0

Value after reset:	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b1, b0	HW[1:0]	Delay States from RD#, WEn# Negation to Address, CS0# Negation	Specify the number of delay states from RD# and WEn# inactive to address and CS0# inactive. b1 b0 00: 0.5 cycles 01: 1.5 cycles 10: 2.5 cycles 11: 3.5 cycles	R/W
b5 to b2	—	Reserved	These bits are always read as 0. The write value should always be 0.	R/W
b6	WM	External Wait Mask Specification	Specifies whether or not the external wait input is valid. The specification by this bit is valid even when the number of access wait cycle is 0. 0: External wait input is valid 1: External wait input is ignored	R/W
b10 to b7	WR[3:0]	Number of Access Waits	Specify the number of wait insertions that are necessary for read/write access. b10 b7 0000: No wait insertion 0001: 1 cycle 0010: 2 cycles 0011: 3 cycles 0100: 4 cycles 0101: 5 cycles 0110: 6 cycles 0111: 8 cycles 1000: 10 cycles 1001: 12 cycles 1010: 14 cycles 1011: 18 cycles 1100: 24 cycles 1101: Reserved (setting prohibited) 1110: Reserved (setting prohibited) 1111: Reserved (setting prohibited)	R/W
b12, b11	SW[1:0]	Number of Delay Cycles from Address, CSn# Assertion to RD#, WEn# Assertion	Specify the number of delay cycle states from address and CS0# active to RD# and WEn# active. b12 b11 00: 0.5 cycles 01: 1.5 cycles 10: 2.5 cycles 11: 3.5 cycles	R/W

Bit	Symbol	Bit Name	Description	R/W
b15 to b13	—	Reserved	These bits are always read as 0. The write value should always be 0.	R/W
b17, b16	—*1	Reserved	Set these bits to 0 when the interfaces for SRAM or for SRAM with byte selection are used.	R/W
b19, b18	—	Reserved	These bits are always read as 0. The write value should always be 0.	R/W
b20	BAS	SRAM with Byte Selection Byte Access Select	Specifies the WE# and RD/WR# signal timing when the SRAM interface with byte selection is used. 0: Activates the WEn# signal at the read/write timing and activates the RD/WR# signal during the write access cycle. 1: Activates the WEn# signal during the read/write access cycle and activates the RD/WR# signal at the write timing.	R/W
b21	—*1	Reserved	Set this bit to 0 when the interfaces for SRAM or for SRAM with byte selection are used.	R/W
b31 to b22	—	Reserved	These bits are always read as 0. The write value should always be 0.	R/W

Note 1. In 16-bit or 32-bit bus boot mode, to connect the burst ROM to the CS0 space and switch to burst ROM interface after activation, set the TYPE[2:0] bits in CS0BCR after setting the burst number by the bits 20 and 21 and the burst wait cycle number by the bits 16 and 17. (For details on individual bits, see (2) and (4) of this section.) Do not write 1 to the reserved bits other than above bits.

Bit	Symbol	Bit Name	Description	R/W
b12, b11	SW[1:0]	Number of Delay Cycles from Address, CS5# Assertion to RD#, WEn# Assertion	Specify the number of delay states from address and CS5# active to RD# and WEn# active when area 5 is specified as the SRAM interface or the SRAM interface with byte selection. When area 5 is specified as the MPX-I/O interface, these bits specify the number of delay states from the end of the address cycle (Ta3) to RD# and WEn# active. b12 b11 00: 0.5 states 01: 1.5 states 10: 2.5 states 11: 3.5 states	R/W
b15 to b13	—	Reserved	These bits are always read as 0. The write value should always be 0.	R/W
b18 to b16	WW[2:0]	Number of Write Access Waits	Specify the number of wait insertions that are necessary for write access. b18 b16 000: The same as WR[3:0] setting (number of read access waits) 001: No wait insertion 010: 1 wait 011: 2 waits 100: 3 waits 101: 4 waits 110: 5 waits 111: 6 waits	R/W
b19	—	Reserved	This bit is always read as 0. The write value should always be 0.	R/W
b20	MPXW	MPX-I/O Interface Address Cycle Wait	Specifies the address cycle wait for MPX-I/O interface. This bit setting is valid only when area 5 is specified as MPX-I/O. 0: Inserts no wait cycle 1: Inserts 1 wait cycle	R/W
	BAS	SRAM with Byte Selection Byte Access Select	Specifies the WEn# and RD/WR# signal timing when the SRAM interface with byte selection is used. This bit setting is valid only when area 5 is specified as SRAM with byte selection. 0: Activates the WEn# signal at the read timing and activates the RD/WR# signal during the write access cycle. 1: Activates the WEn# signal during the read access cycle and activates the RD/WR# signal at the write timing.	R/W
b21	SZSEL	MPX-I/O Interface Bus Width Specification	Specifies an address to select the bus width when the BSZ[1:0] of the CS5BCR register are specified as 11b. This bit is valid only when area 5 is specified as MPX-I/O. 0: Selects the bus width by address A14 1: Selects the bus width by address A21 The relationship between the SZSEL bit and bus width selected by A14 or A21 are summarized below.	R/W
b31 to b22	—	Reserved	These bits are always read as 0. The write value should always be 0.	R/W

SZSEL	A14	A21	Bus Width
0	0	Not affected	8 bits
0	1	Not affected	16 bits
1	Not affected	0	8 bits
1	Not affected	1	16 bits

Value after reset:	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0	0

Note 1. If both areas 2 and 3 are specified as SDRAM, WTRP[1:0], WTRCD[1:0], TRWL[1:0], and WTRC[1:0] bit settings are used in both areas in common.

Bit	Symbol	Bit Name	Description	R/W
b1, b0	WTRC[1:0]*1	Number of Idle States from REF Command/Self-Refresh Release to ACTV/REF/MRS Command	Specify the number of minimum idle cycles in the periods shown below. • From the issuance of the REF command until the issuance of the ACTV/REF/MRS command • From releasing self-refresh until the issuance of the ACTV/REF/MRS command. The setting for areas 2 and 3 is common. b1 b0 00: 2 states 01: 3 states 10: 5 states 11: 8 states	R/W
b2	—	Reserved	This bit is always read as 0. The write value should always be 0.	R/W
b4, b3	TRWL[1:0]*1	Number of Auto-Precharge Startup Wait Cycles	Specify the number of minimum auto-precharge startup wait cycles as shown below. • State number from the issuance of the WRITA command by this LSI until the completion of auto-precharge in the SDRAM. Equivalent to the state number from the issuance of the WRITA command until the issuance of the ACTV command. Confirm that how many states are required between the WRITA command receive in the SDRAM and the auto-precharge activation, referring to each SDRAM data sheet. And set the state number so as not to exceed the state number specified by this bit. • State number from the issuance of the WRIT command until the issuance of the PRE command. This is the case when accessing another low address in the same bank in bank active mode. The setting for areas 2 and 3 is common. b4 b3 00: No wait insertion 01: 1 state 10: 2 states 11: 3 states	R/W
b6, b5	—	Reserved	These bits are always read as 0. The write value should always be 0.	R/W
b8, b7	A3CL[1:0]	CAS Latency for Area 3	Specify the CAS latency for area 3. b8 b7 00: 1 01: 2 10: 3 11: 4	R/W
b9	—	Reserved	This bit is always read as 0. The write value should always be 0.	R/W

Bit	Symbol	Bit Name	Description	R/W
b11, b10	WTRCD [1:0]*1	Number of Waits between ACTV Command and READ(A)/WRIT(A) Command	Specify the minimum number of waits from issuing the ACTV command to issuing the READ(A)/WRIT(A) command. The setting for areas 2 and 3 is common. b11 b10 00: No wait insertion 01: 1 wait 10: 2 waits 11: 3 waits	R/W
b12	—	Reserved	This bit is always read as 0. The write value should always be 0.	R/W
b14, b13	WTRP[1:0]*1	Number of Auto-Precharge Completion Wait States	Specify the number of minimum precharge completion wait states as shown below. • From the start of auto-precharge and issuing of ACTV command for the same bank • From issuing of the PRE/PALL command to issuing of the ACTV command for the same bank • Till entering the power-down mode or deep power-down mode • From the issuing of PALL command to issuing REF command in auto refresh mode • From the issuing of PALL command to issuing SELF command in self refresh mode The setting for areas 2 and 3 is common. b14 b13 00: No wait insertion 01: 1 state 10: 2 states 11: 3 states	R/W
b31 to b15	—	Reserved	These bits are always read as 0. The write value should always be 0.	R/W

Note 1. If both areas 2 and 3 are specified as SDRAM, WTRP[1:0], WTRCD[1:0], TRWL[1:0], and WTRC[1:0] bit settings are used in both areas in common.
If only one area is connected to the SDRAM, specify area 3. In this case, specify area 2 as SRAM interface or SRAM with byte selection.

Value after reset:	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	—	Reserved	These bits are always read as 0. The write value should always be 0.	R/W
b6	WM	External Wait Mask Specification	Specifies whether or not the external wait input is valid. The specification by this bit is valid even when the number of access waits is 0. 0: External wait input is valid 1: External wait input is ignored	R/W
b10 to b7	W[3:0]	Number of Access Waits	Specify the number of waits to be inserted in the first access cycle. b10 b7 0000: No wait insertion 0001: 1 wait 0010: 2 waits 0011: 3 waits 0100: 4 waits 0101: 5 waits 0110: 6 waits 0111: 8 waits 1000: 10 waits 1001: 12 waits 1010: 14 waits 1011: 18 waits 1100: 24 waits 1101: Reserved (setting prohibited) 1110: Reserved (setting prohibited) 1111: Reserved (setting prohibited)	R/W
b15 to b11	—	Reserved	These bits are always read as 0. The write value should always be 0.	R/W
b17, b16	BW[1:0]	Number of Burst Wait Cycles	Specify the number of waits to be inserted between the second or subsequent access cycles in burst access. b17 b16 00: No wait insertion 01: 1 wait 10: 2 waits 11: 3 waits	R/W
b31 to b18	—	Reserved	These bits are always read as 0. The write value should always be 0.	R/W

14.3.3 SDRAM Control Register (SDCR)

The SDCR register specifies the method to refresh and access SDRAM, and the types of SDRAMs to be connected.

Address(es): A000 204Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	A2ROW[1:0]		—	A2COL[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	DEEP	—	RFSH	RMODE	PDOWN	BACTV	—	—	—	A3ROW[1:0]		—	A3COL[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b1, b0	A3COL[1:0]	Number of Bits of Column Address for Area 3	Specify the number of bits of the column address for area 3. b1 b0 00: 8 bits 01: 9 bits 10: 10 bits 11: Reserved (setting prohibited)	R/W
b2	—	Reserved	This bit is always read as 0. The write value should always be 0.	R/W
b4, b3	A3ROW[1:0]	Number of Bits of Row Address for Area 3	Specify the number of bits of the row address for area 3. b4 b3 00: 11 bits 01: 12 bits 10: 13 bits 11: Reserved (setting prohibited)	R/W
b7 to b5	—	Reserved	These bits are always read as 0. The write value should always be 0.	R/W
b8	BACTV	Bank Active Mode	Specifies to access whether in auto-precharge mode (using READA and WRITA commands) or in bank active mode (using READ and WRIT commands). 0: Auto-precharge mode (using READA and WRITA commands) 1: Bank active mode (using READ and WRIT commands) Note: Bank active mode can be set only for area 3. When both areas 2 and 3 are set to SDRAM, specify the auto-precharge mode.	R/W
b9	PDOWN	Power-Down Mode	Specifies whether the SDRAM will enter the power-down mode after the access to the SDRAM. With this bit being set to 1, after the SDRAM is accessed, the CKE signal is driven low and the SDRAM enters the power-down mode. 0: The SDRAM does not enter the power-down mode after being accessed. 1: The SDRAM enters the power-down mode after being accessed.	R/W
b10	RMODE	Refresh Mode	Specifies whether to perform auto-refresh or self-refresh when the RFSH bit is 1. When the RFSH bit is 1 and this bit is 1, self-refresh starts immediately. When the RFSH bit is 1 and this bit is 0, auto-refresh starts according to the contents that are set in registers RTCSR, RTCNT, and RTCOR. 0: Auto-refresh is performed 1: Self-refresh is performed	R/W

Bit	Symbol	Bit Name	Description	R/W
b11	RFSH	Refresh Control	Specifies the refresh control for the SDRAM. 0: No refresh 1: Refresh	R/W
b12	—	Reserved	This bit is always read as 0. The write value should always be 0.	R/W
b13	DEEP	Deep Power-Down Mode	This bit is valid for low-power SDRAM. If the RFSH or RMODE bit is set to 1 while this bit is set to 1, the deep power-down entry command is issued and the low-power SDRAM enters the deep power-down mode. 0: Self-refresh mode 1: Deep power-down mode	R/W
b15, b14	—	Reserved	These bits are always read as 0. The write value should always be 0.	R/W
b17, b16	A2COL[1:0]	Number of Bits of Column Address for Area 2	Specify the number of bits of column address for area 2. b17 b16 00: 8 bits 01: 9 bits 10: 10 bits 11: Reserved (setting prohibited)	R/W
b18	—	Reserved	This bit is always read as 0. The write value should always be 0.	R/W
b20, b19	A2ROW[1:0]	Number of Bits of Row Address for Area 2	Specify the number of bits of row address of the SDRAM connected to area 2. b20 b19 00: 11 bits 01: 12 bits 10: 13 bits 11: Reserved (setting prohibited)	R/W
b31 to b21	—	Reserved	These bits are always read as 0. The write value should always be 0.	R/W

14.3.4 Refresh Timer Control/Status Register (RTCSR)

The RTCSR register specifies various items about refresh for SDRAM.
When RTCSR is written, the upper 16 bits of the write data must be A55Ah to cancel write protection.
The phase of the clock for incrementing the count in the refresh timer counter (RTCNT) is adjusted only by a power-on reset. Note that there is an error in the time until the compare match flag is set for the first time after the timer is started with the CKS[2:0] bits being set to a value other than 000b.

Address(es): A000 2050h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	—	—	—	—	—	—	—	—	CMF	CMIE	CKS[2:0]			RRC[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	RRC[2:0]	Refresh Count	Specify the number of continuous refresh cycles, when the refresh request occurs after the coincidence of the values of the refresh timer counter (RTCNT) and the refresh time constant register (RTCOR). These bits can make the period of occurrence of refresh long. b2 b0 000: 1 time 001: 2 times 010: 4 times 011: 6 times 100: 8 times 101: Reserved (setting prohibited) 110: Reserved (setting prohibited) 111: Reserved (setting prohibited)	R/W
b5 to b3	CKS[2:0]	Clock Select	Select the clock input to count-up the refresh timer counter (RTCNT). b5 b3 000: Stop the counting-up 001: CKIO/4 010: CKIO/16 011: CKIO/64 100: CKIO/256 101: CKIO/1024 110: CKIO/2048 111: CKIO/4096	R/W
b6	CMIE	Compare Match Interrupt Enable	Enables or disables CMF interrupt requests when the CMF bit in RTCSR is set to 1. 0: Disables CMF interrupt requests. 1: Enables CMF interrupt requests.	R/W
b7	CMF	Compare Match Flag	Indicates that a compare match occurs between the refresh timer counter (RTCNT) and refresh time constant register (RTCOR). This bit is set or cleared in the following conditions. 0: Clearing condition: When 0 is written in CMF after reading out RTCSR during CMF = 1. 1: Setting condition: When the condition RTCNT = RTCOR is satisfied.	R/W
b31 to b8	—	Reserved	These bits are always read as 0. The write value should always be 0.	R/W

14.3.5 Refresh Timer Counter (RTCNT)

RTCNT is an 8-bit counter that increments using the clock selected by bits CKS[2:0] in RTCSR. When RTCNT matches RTCOR, RTCNT is cleared to 0. The value in RTCNT returns to 0 after counting up to 255. When the RTCNT is written, the upper 16 bits of the write data must be A55Ah to cancel write protection.

Address(es): A000 2054h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0			8-Bit Counter	R/W
b31 to b8	—	Reserved	These bits are always read as 0. The write value should always be 0.	R/W

14.3.6 Refresh Time Constant Register (RTCOR)

RTCOR is an 8-bit register. When RTCOR matches RTCNT, the CMF bit in RTCSR is set to 1 and RTCNT is cleared to 0.

When the RFSH bit in SDCR is 1, a memory refresh request is issued by this matching signal. This request is maintained until the refresh operation is performed. If the request is not processed when the next matching occurs, the previous request is ignored.

When the CMIE bit in RTCSR is set to 1, an interrupt request (BSCCMI) is issued by this matching signal. The request continues to be output until the CMF bit in RTCSR is cleared. Clearing the CMF bit only affects the interrupt request and does not clear the refresh request. Therefore, a combination of refresh request and interval timer interrupt can be specified so that the number of refresh requests are counted by using timer interrupts while refresh is performed periodically.

When RTCOR is written, the upper 16 bits of the write data must be A55Ah to cancel write protection.

Address(es): A000 2058h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

b7 to b0			8-Bit Register	R/W
b31 to b8	—	Reserved	These bits are always read as 0. The write value should always be 0.	R/W

14.3.7 Timeout Cycle Constant Register (TOSCORn) (n = 0 to 5)

TOSCORn is a 16-bit register the value of which is effective when the WM bit in the CSn space wait control register (CSnWCR) is 0 and the corresponding bit in the timeout enable register (TOENR) is 1. When the number of cycles of waiting due to the signal on the external wait input pin matches the setting of TOSCORn, the wait state is forcibly interrupted (external wait input is disabled) to end the cycle of access, the timeout status flag for the corresponding space in the timeout status register (TOSTR) is set, and a timeout detection error request from the external WAIT# pin is generated. The timeout detection error request is retained until the corresponding bit in the TOENR register is set to 0, or 0 is written to the timeout status flag for the corresponding space. Note that timeout detection is enabled even while the timeout status flag for the corresponding space in the TOSTR register is 1, and the wait state is forcibly interrupted (external wait input is disabled) to end the cycle of access in response to a further timeout.

Address(es): TOSCOR0: A000 2060h, TOSCOR1: A000 2064h, TOSCOR2: A000 2068h, TOSCOR3: A000 206Ch, TOSCOR4: A000 2070h, TOSCOR5: A000 2074h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b15 to b0		16-Bit Register	When the number of external wait cycles matches the setting value of these bits, the timeout interrupt occurs and the wait state is forcibly interrupted to end the cycle of access. 0000h: 65536 (number of external wait cycles) 0001h: 1 : FFFFh: 65535	R/W
b31 to b16	—	Reserved	These bits are always read as 0. The write value should always be 0.	R/W

14.3.8 Timeout Status Register (TOSTR)

This register is used for status of the external wait input. When the WM bit in the CSn space wait control register (CSnWCR) is 0 and the corresponding bit in the timeout enable register (TOENR) is 1 and the number of waits in response to the signal on the external wait input matches the setting of TOSCORn, the timeout status flag for the corresponding space is set and a timeout detection error request is generated. The only writable value for the timeout status flags is 0, which clears the flag. Writing 1 to a flag is ignored.

Address(es): A000 2080h

Bit	Symbol	Bit Name	Description	R/W
b0	CS0TOSTF	CS0 Space Timeout Status Flag	Status flag that indicates that the number of cycles of waiting due to the input on the external wait pin during access to the CS0 space has matched the setting of the CS0 space timeout cycle constant register (TOSCOR0). This bit is set or cleared in the following conditions. 0: Clearing condition When 0 is written in CS0TOSTF. 1: Setting condition When the WM bit in the CS0 space wait control register (CS0WCR) is 0 and the CS0TOEN bit in the timeout enable register (TOENR) is 1, the number of cycles of waiting due to the input on the external wait pin during access to the CS0 space has matched the setting of the TOSCOR0 register.	R/W
b1	CS1TOSTF	CS1 Space Timeout Status Flag	Status flag that indicates that the number of cycles of waiting due to the input on the external wait pin during access to the CS1 space has matched the setting of the CS1 space timeout cycle constant register (TOSCOR1). For the condition to set or clear this bit, refer to the description of CS0TOSTF.	R/W
b2	CS2TOSTF	CS2 Space Timeout Status Flag	Status flag that indicates that the number of cycles of waiting due to the input on the external wait pin during access to the CS2 space has matched the setting of the CS2 space timeout cycle constant register (TOSCOR2). For the condition to set or clear this bit, refer to the description of CS0TOSTF.	R/W
b3	CS3TOSTF	CS3 Space Timeout Status Flag	Status flag that indicates that the number of cycles of waiting due to the input on the external wait pin during access to the CS3 space has matched the setting of the CS3 space timeout cycle constant register (TOSCOR3). For the condition to set or clear this bit, refer to the description of CS0TOSTF.	R/W
b4	CS4TOSTF	CS4 Space Timeout Status Flag	Status flag that indicates that the number of cycles of waiting due to the input on the external wait pin during access to the CS4 space has matched the setting of the CS4 space timeout cycle constant register (TOSCOR4). For the condition to set or clear this bit, refer to the description of CS0TOSTF.	R/W

Bit	Symbol	Bit Name	Description	R/W
b5	CS5TOSTF	CS5 Space Timeout Status Flag	Status flag that indicates that the number of cycles of waiting due to the input on the external wait pin during access to the CS5 space has matched the setting of the CS5 space timeout cycle constant register (TOSCOR5). For the condition to set or clear this bit, refer to the description of CS0TOSTF.	R/W
b31 to b6	—	Reserved	These bits are always read as 0. The write value should always be 0.	R/W

14.3.9 Timeout Enable Register (TOENR)

This register is used to enable or disable timeout detection function for each space.

Address(es): A000 2084h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit	Symbol	Bit Name	Description	R/W
b0	CS0TOEN	CS0 Space Timeout Detection Enable	Specifies enabling or disabling the detection of timeout for waiting in the CS0 space. 0: The timeout detection is disabled. 1: The timeout detection is enabled.	R/W
b1	CS1TOEN	CS1 Space Timeout Detection Enable	Specifies enabling or disabling the detection of timeout for waiting in the CS1 space. 0: The timeout detection is disabled. 1: The timeout detection is enabled.	R/W
b2	CS2TOEN	CS2 Space Timeout Detection Enable	Specifies enabling or disabling the detection of timeout for waiting in the CS2 space. 0: The timeout detection is disabled. 1: The timeout detection is enabled.	R/W
b3	CS3TOEN	CS3 Space Timeout Detection Enable	Specifies enabling or disabling the detection of timeout for waiting in the CS3 space. 0: The timeout detection is disabled. 1: The timeout detection is enabled.	R/W
b4	CS4TOEN	CS4 Space Timeout Detection Enable	Specifies enabling or disabling the detection of timeout for waiting in the CS4 space. 0: The timeout detection is disabled. 1: The timeout detection is enabled.	R/W
b5	CS5TOEN	CS5 Space Timeout Detection Enable	Specifies enabling or disabling the detection of timeout for waiting in the CS5 space. 0: The timeout detection is disabled. 1: The timeout detection is enabled.	R/W
b31 to b6	—	Reserved	These bits are always read as 0. The write value should always be 0.	R/W

14.3.10 CKIO Control Register (CKIOSET)

This register should be left at its initial value. If the setting is to be changed, set the CKIOSET[3:0] bits to 0h.
The procedure for writing to CKIOSET is shown below. Execute the following access operations consecutively.
Write 1 byte with any value to register CKIOKEY.
Write 1 byte with any value to register CKIOKEY.
Write 0000 0000h to the CKIOSET[3:0] bits.

Address(es): A000 2C0Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	CKIOSET[3:0]		Set the CKIOSET[3:0] bits to 0h (the value after reset).	R/W
b31 to b4	—	Reserved	When writing, always write 0.	R/W

14.3.11 CKIOSET Protection Register (CKIOKEY)

This register is a protection register of the CKIOSET register. For how to access to CKIOSET, see section 14.3.10.

Address(es): A000 2CFCh

	b7	b6	b5	b4	b3	b2	b1	b0
	CKIOKEY[7:0]							
Value after reset:	0	0	0	0	1	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	CKIOKEY[7:0]		CKIOSET protection register	W

14.4 Operation

14.4.1 Access Size and Data Alignment

This LSI supports little endian, in which the least significant byte (LSB) is that in the direction of the 0th address.
Data bus width can be selected from 8 bits, 16 bits, and 32 bits for the normal memory and SRAM with byte selection.
Data bus width can be selected from 16 bits and 32 bits for SDRAM. For MPX-I/O, the data bus width is fixed to either 8 or 16 bits, or made selectable as 8 bits or 16 bits by one of the address lines.
Data bus width varies depending on boot mode. For details, refer to section 14.2.2, Data Bus Width and Related Pin Setting for Each Area Depending on Boot Mode.
Data alignment is performed in accordance with the data bus width selected for the device. This also means that four read operations are required to read 32-bit data from a byte-width device. In this LSI, data alignment and conversion of data length is performed automatically between the respective interfaces.
Table 14.5 to Table 14.7 show the relationship between device data width and access unit.

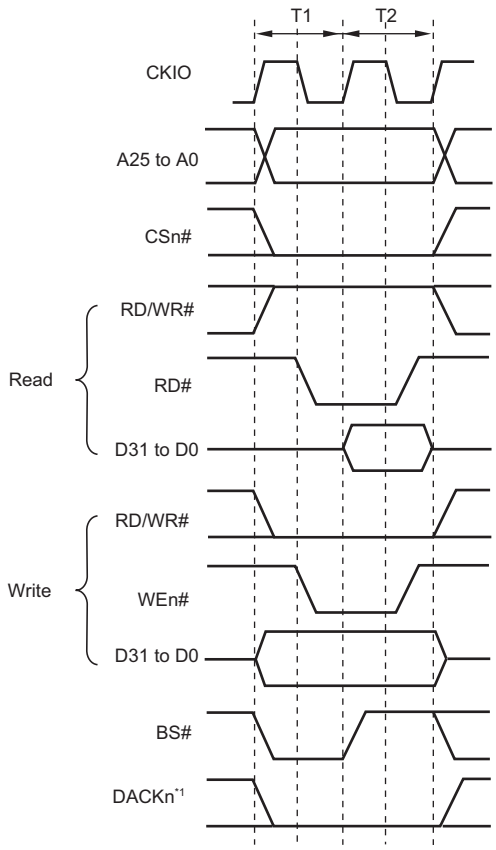
14.4.2 SRAM Interface

(1) Basic Timing

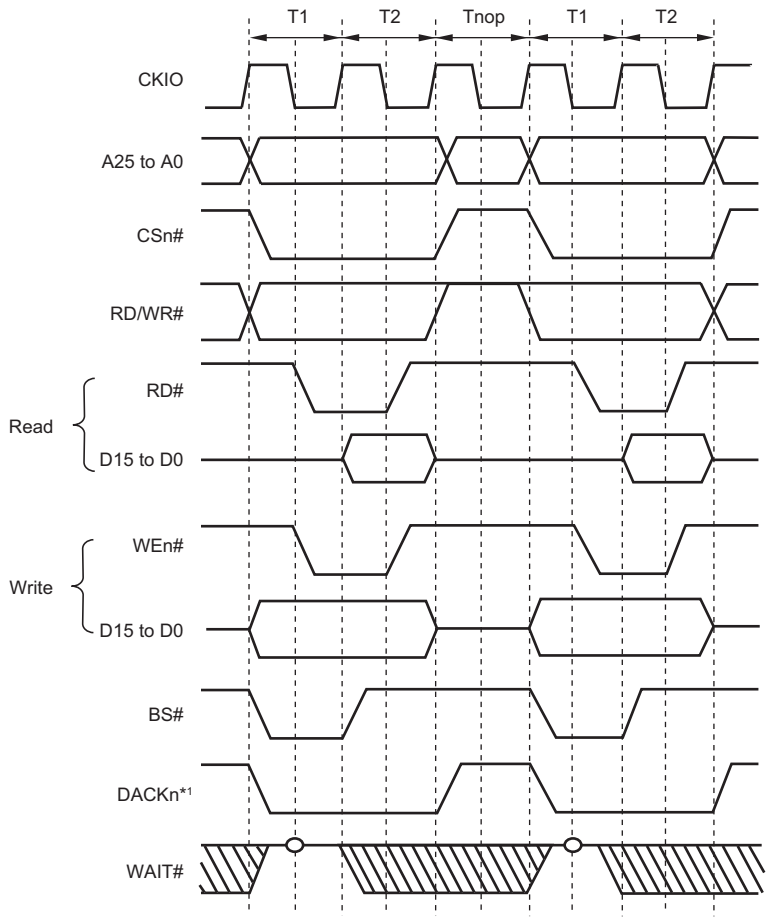
For access to an SRAM interface, this LSI uses strobe signal output in consideration of the fact that mainly static RAM will be directly connected. When using SRAM with a byte-selection pin, see section 14.4.8, SRAM Interface with Byte Selection. Figure 14.2 shows the basic timings of SRAM interface access. A no-wait normal access is completed in two cycles. The BS# signal is activated for one state to indicate the start of a bus cycle.



Note 1. The waveform for DACKn is when active low is specified.

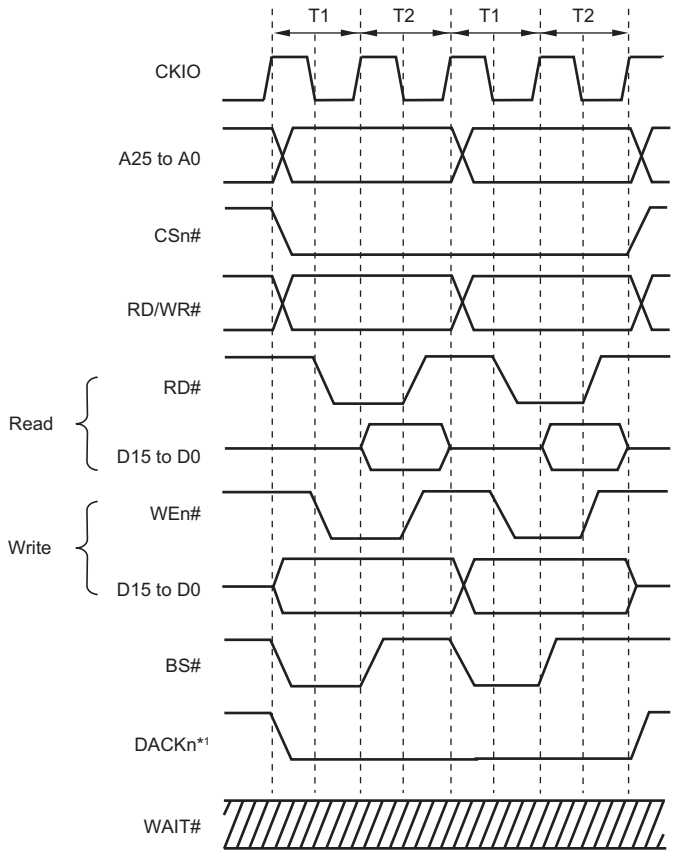
Figure 14.2 SRAM Interface Basic Access Timing (Access Wait 0)

There is no access size specification when reading. The correct access start address is output in the least significant bit of the address, but since there is no access size specification, 32 bits are always read in case of a 32-bit device. 16 bits are always read in case of a 16-bit device. When writing, only the WEn# signal for the byte to be written is activated.
It is necessary to output the data that has been read using RD# when a buffer is established in the data bus. The RD/WR# signal is in a read state (high output) when no access has been carried out. Therefore, care must be taken when controlling the external data buffer with this signal, to avoid output collision.
Figure 14.3 and Figure 14.4 show the basic timings in continuous access to the SRAM interface. If the WM bit in CSnWCR is cleared to 0, a Tnop cycle is inserted after the CSn space access to sample the external wait (Figure 14.3). If the WM bit in CSnWCR is set to 1, external waits are ignored and no Tnop cycle is inserted (Figure 14.4).



Note 1. The waveform for DACKn is when active low is specified.

Figure 14.3 Continuous Access to the SRAM Interface (1)
Bus Width = 16 Bits, 32-Bit Access, CSnWCR.WM Bit = 0 (Access Wait = 0, Cycle Wait = 0)



Note 1. The waveform for DACKn is when active low is specified.

Figure 14.4 Continuous Access to the SRAM Interface (2)
Bus Width = 16 Bits, 32-Bit Access, CSnWCR.WM Bit = 1 (Access Wait = 0, Cycle Wait = 0)

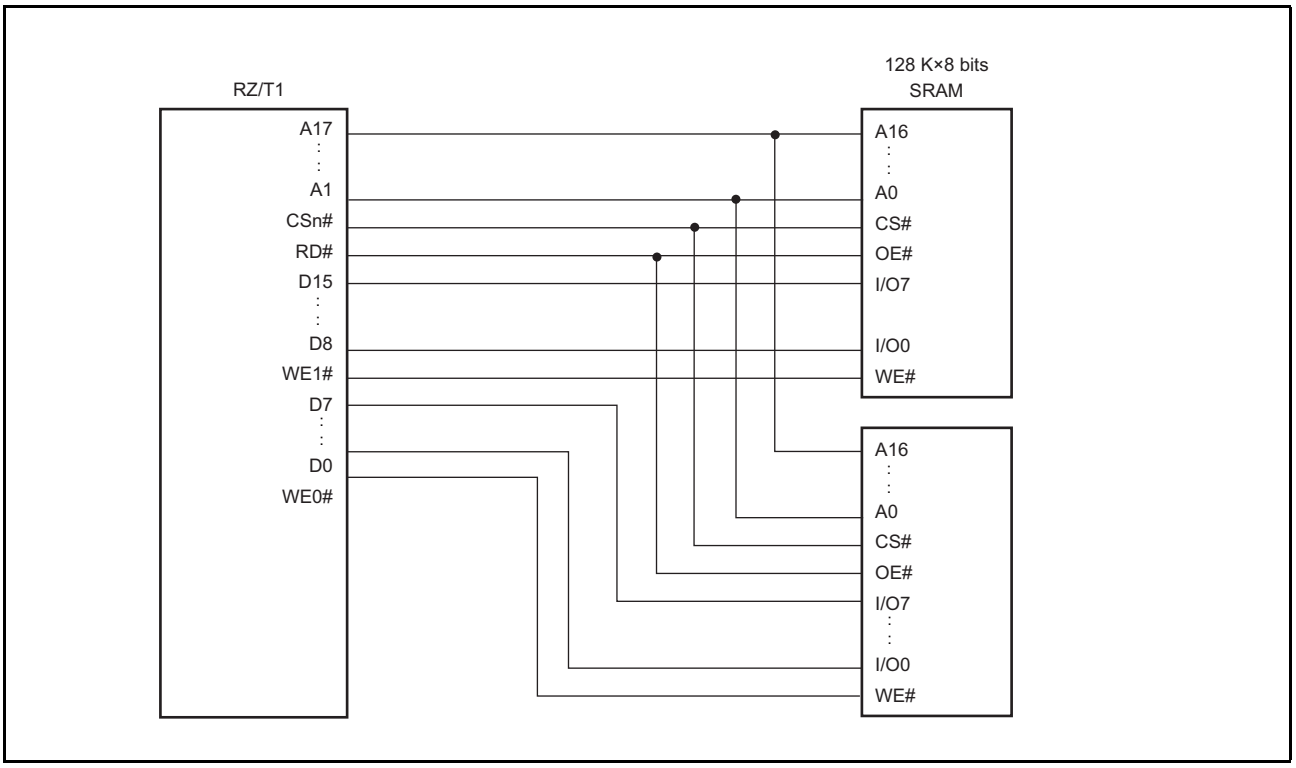

Figure 14.6 Example of 16-Bit Data-Width SRAM Connection

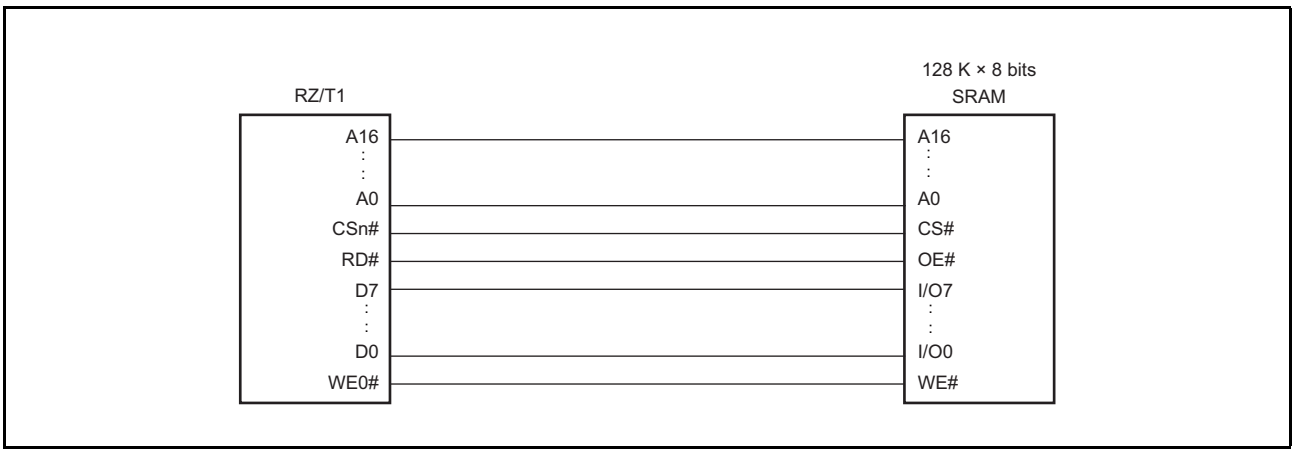

Figure 14.7 Example of 8-Bit Data-Width SRAM Connection

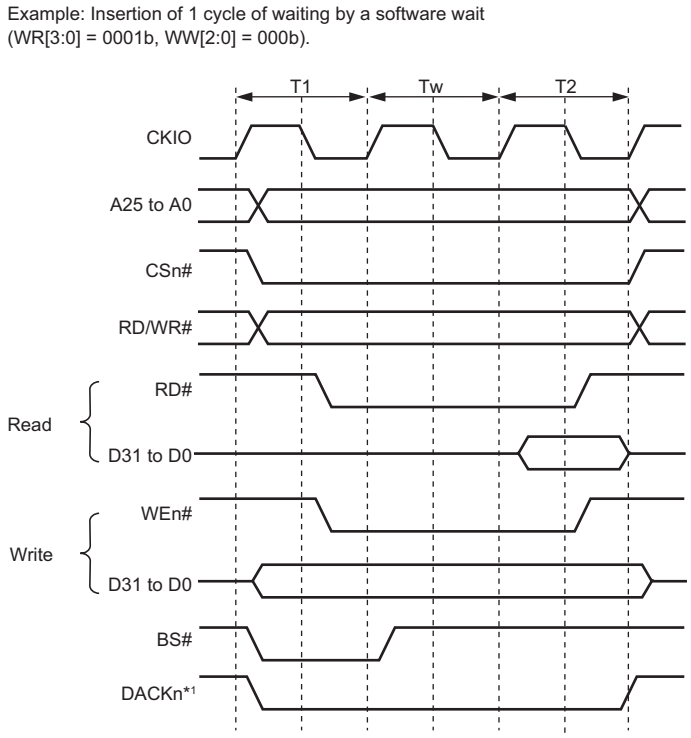
14.4.3 Access Wait Control

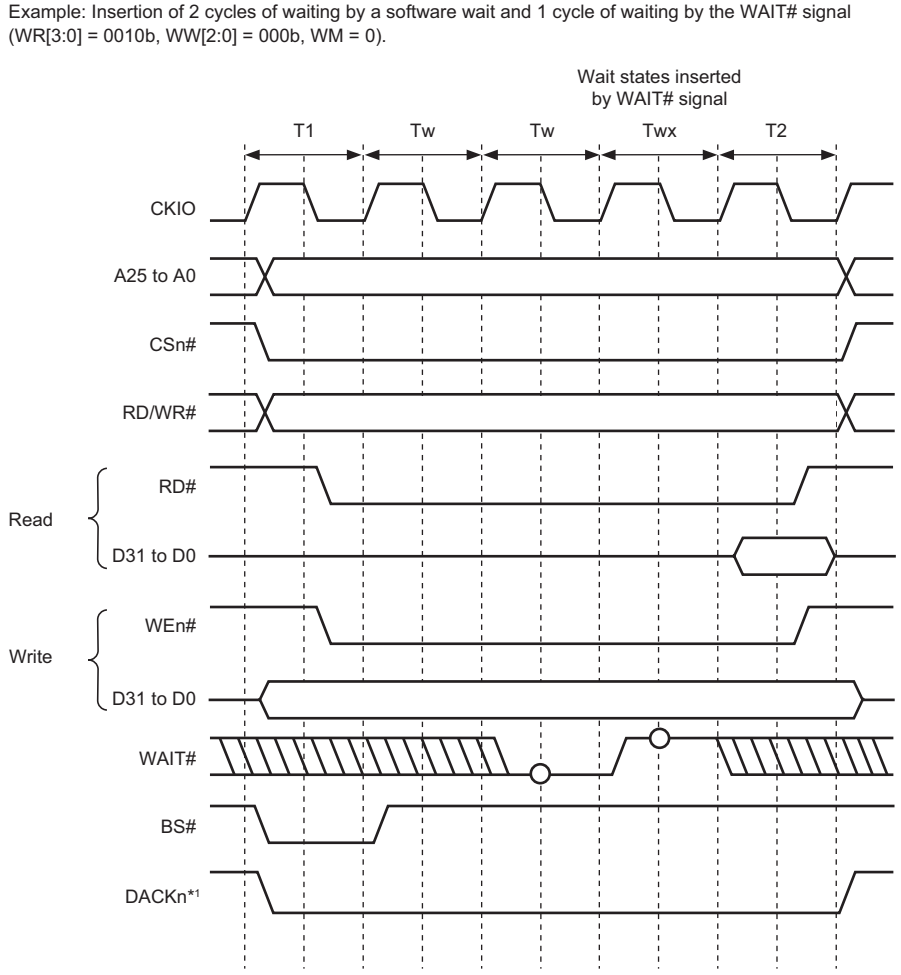
Wait insertion on a SRAM interface access can be controlled by the settings of bits WR3 to WR0 in CSnWCR. It is possible for areas 1, 4, and 5 to insert waits independently in read access and in write access. Areas 0, 2, and 3 have common access wait for read cycle and write cycle. The specified number of Tw states are inserted as waits in a SRAM interface access shown in Figure 14.8.



Note 1. The waveform for DACKn is when active low is specified.

Figure 14.8 Wait Timing for SRAM Interface Access (Software Wait Only)

When the WM bit in the CSnWCR register is cleared to 0, the signal on the external WAIT# pin is also sampled. WAIT# pin sampling is shown in Figure 14.9. Two waits are specified as software waits. The WAIT# signal is sampled on the falling edge of the CKIO signal at the transition from the T1 or Tw cycle to the T2 cycle.

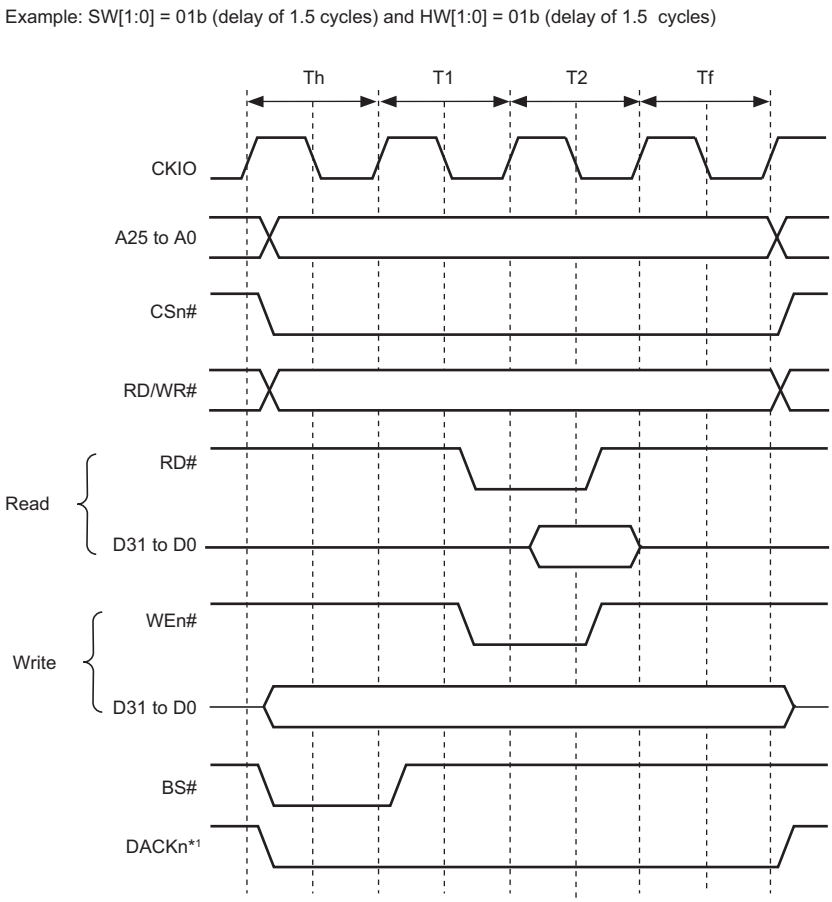


Note 1. The waveform for DACKn is when active low is specified.

Figure 14.9 Wait Cycle Timing for SRAM Interface Access (Wait Cycle Insertion Using WAIT# Signal)

14.4.4 CSn# Assert Period Expansion

The number of states from CSn# active to RD#, WEn# active can be specified by setting bits SW1 and SW0 in CSnWCR. The number of states from the inactive state of the RD# and WEn# signals to the inactive state of the CSn# signal can be specified by setting bits HW1 and HW0. Therefore, a flexible interface to an external device can be obtained. Figure 14.10 shows an example. A Th state and a Tf state are added before and after an ordinary cycle, respectively. In these states, the RD# and WEn# signals are not activated, while other signals are activated. The data output is prolonged to the Tf cycle, and this prolongation is useful for devices with slow writing operations.



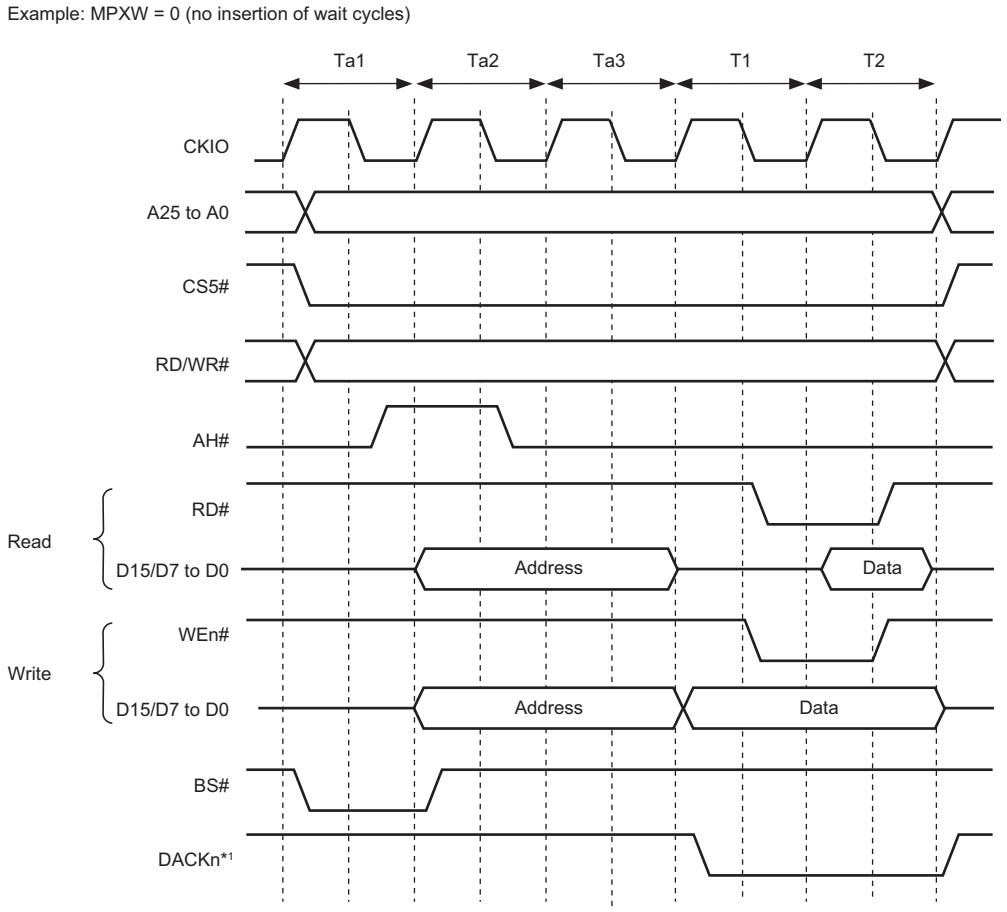
Note 1. The waveform for DACKn is when active low is specified.

Figure 14.10 Active Period Expansion for the CSn Signal

Note: For the CS2 and CS3 spaces, the active period cannot be extended.

14.4.5 MPX-I/O Interface

Access timing for the MPX space is shown below. In the MPX space, CS5#, AH#, RD#, and WEn# signals control the accessing. The basic access for the MPX space consists of 2 cycles of address output followed by an access to an SRAM interface. The bus width for the address output cycle or the data input/output cycle is fixed to 8 bits or 16 bits. Alternatively, it can be 8 bits or 16 bits depending on the address to be accessed.
Output of the addresses D15 to D0 or D7 to D0 is performed from state Ta2 to state Ta3. Because state Ta1 has a high-impedance state, collisions of addresses and data can be avoided without inserting idle cycles, even in continuous access cycles. Address output is increased to 3 cycles by setting the MPXW bit in the CS5WCR register to 1.
The RD/WR# signal is output at the same time as the CS5# signal; it is high in the read cycle and low in the write cycle. The data cycle is the same as that in an SRAM interface access.
Delay cycles specified in the SW[1:0] bits of the CSnWCR register are inserted between the Ta3 state and the T1 state. Delay cycles specified in the HW[1:0] bits are added after the T2 state.
Timing charts are shown in Figure 14.11 to Figure 14.14.



Note 1. The waveform for DACKn is when active low is specified.

Figure 14.11 Access Timing for MPX Space (1) (Address Cycle No Wait, Data Cycle No Wait)

14.4.6 SDRAM Interface

(1) SDRAM Direct Connection

The SDRAM that can be connected to this LSI is a product that has 11/12/13 bits of row address, 8/9/10 bits of column address, 4 or less banks, and uses the A10 pin for setting precharge mode in read and write command cycles.
The control signals for direct connection of SDRAM are RAS#, CAS#, RD/WR#, DQMUU, DQMUL, DQMLU, DQMLL, CKE, CS2#, and CS3#. All the signals other than CS2# and CS3# are common to all areas, and signals other than CKE are valid only when CS2# or CS3# is asserted. SDRAM can be connected to up to 2 spaces. The data bus width of the area that is connected to SDRAM is 16 bits or 32 bits.
Commands for SDRAM can be specified by RAS#, CAS#, RD/WR#, and specific address signals. These commands supports:

- NOP
- Auto-refresh (REF)
- Self-refresh (SELF)
- All banks pre-charge (PALL)
- Specified bank pre-charge (PRE)
- Bank active (ACTV)
- Read (READ)
- Read with pre-charge (READA)
- Write (WRIT)
- Write with pre-charge (WRITA)
- Write mode register (MRS, EMRS)

The byte to be accessed is specified by DQMUU, DQMUL, DQMLU, and DQMLL. Reading or writing is performed for a byte whose corresponding DQMxx is low. For details on the relationship between DQMxx and the byte to be accessed, see section 14.4.1, Access Size and Data Alignment (x = UU, UL, LU, LL).

Figure 14.15 and Figure 14.16 show examples of the connection of the SDRAM with this LSI.

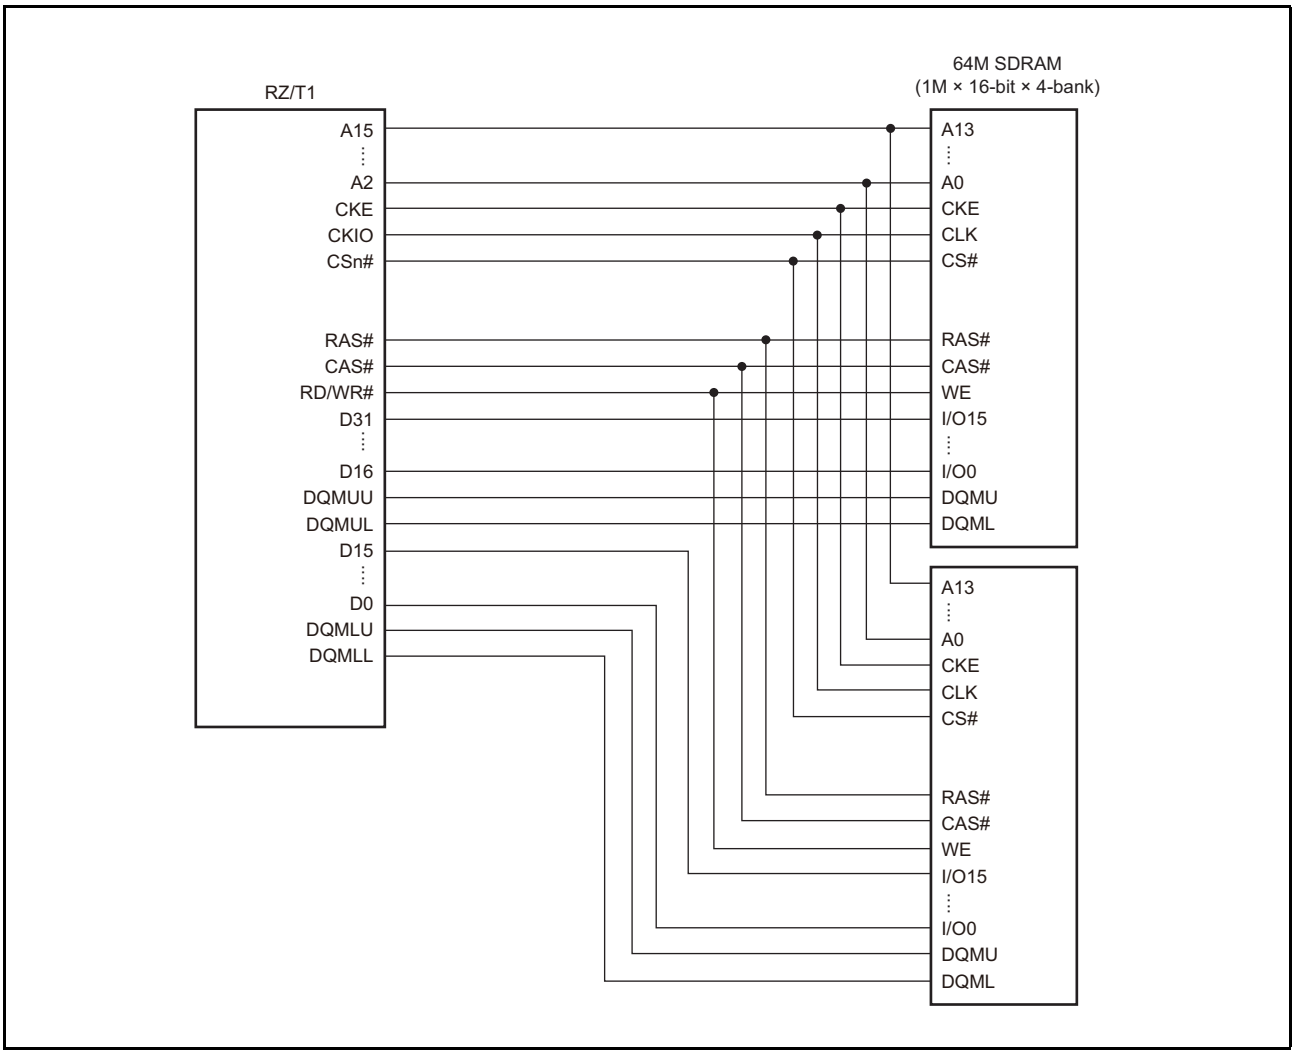

Figure 14.15 Example of 32-Bit Data Width SDRAM Connection

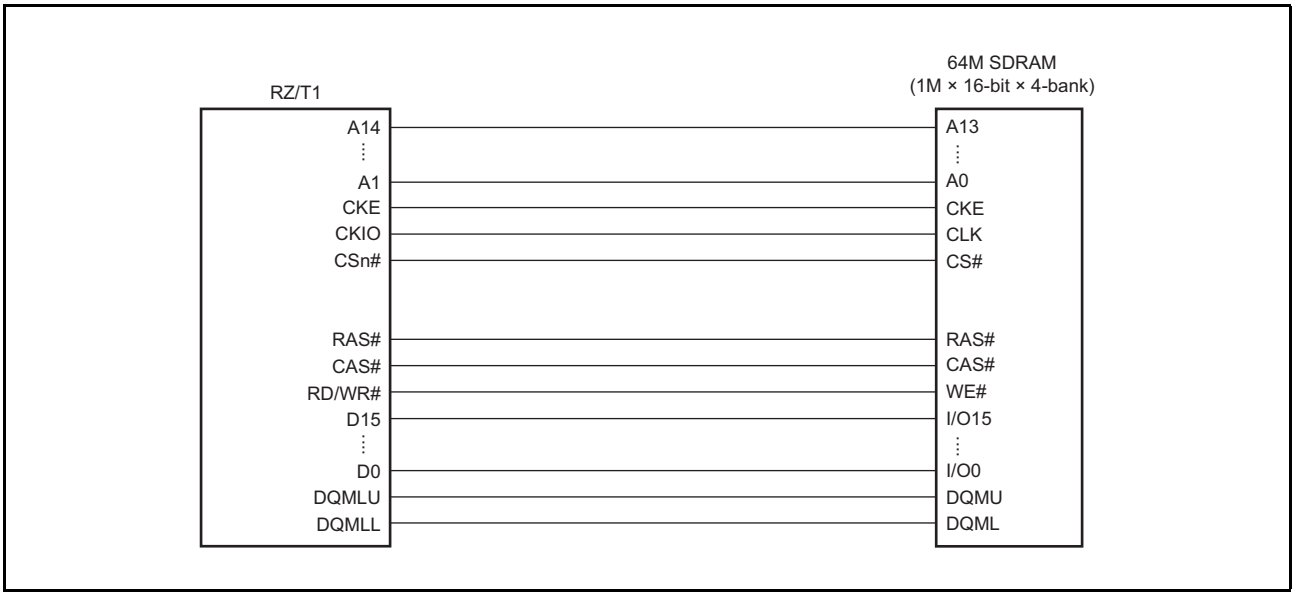

Figure 14.16 Example of 16-Bit Data Width SDRAM Connection

(2) Address Multiplexing

An address multiplexing is specified so that SDRAM can be connected without external multiplexing circuitry according to the setting of bits BSZ[1:0] in CSnBCR and bits A2ROW[1:0], A2COL[1:0], A3ROW[1:0], and A3COL[1:0] in SDCR. Table 14.8 to Table 14.13 show the relationship between the settings of bits BSZ[1:0], A2ROW[1:0], A2COL[1:0], A3ROW[1:0], and A3COL[1:0] and the bits output at the address pins. Do not specify those bits in the manner other than this table, otherwise the operation of this LSI is not guaranteed. A25 to A18 are not multiplexed and the original values of address are always output at these pins.

When the data bus width is 16 bits (BSZ1 and BSZ0 = 10b), A0 of SDRAM specifies a 16-bit address. Therefore, connect this A0 pin of SDRAM to the A1 pin of this LSI; the A1 pin of SDRAM to the A2 pin of the LSI, and so on.

When the data bus width is 32 bits (BSZ1 and BSZ0 = 11b), A0 of SDRAM specifies a 32-bit address. Therefore, connect this A0 pin of SDRAM to the A2 pin of this LSI; the A1 pin of SDRAM to the A3 pin of the LSI, and so on.

(3) Burst Read

A burst read occurs in the following cases with this LSI.

- Access size in reading is larger than data bus width.
- 16-, 32-, or 64-byte transfer

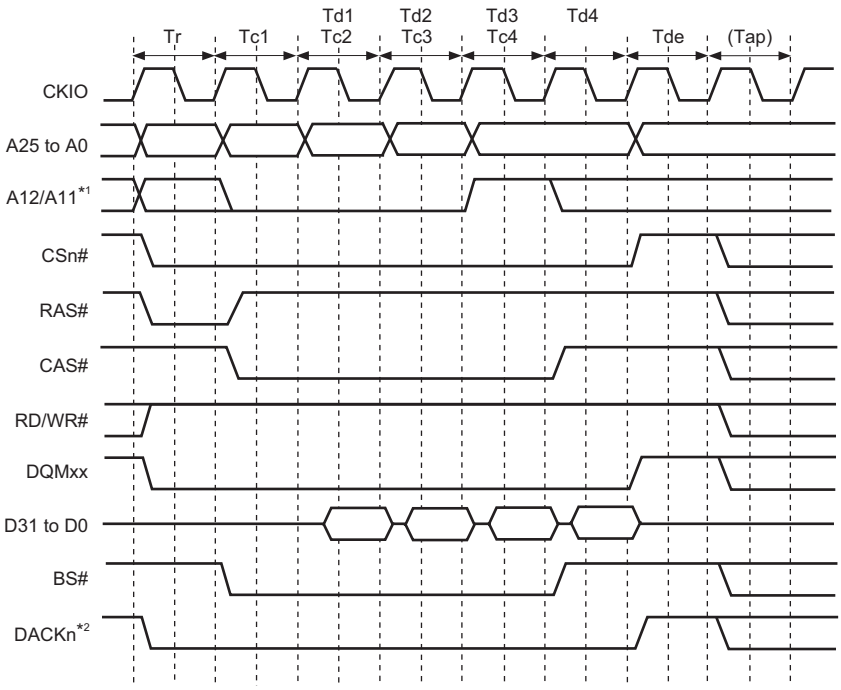
This LSI always accesses the SDRAM with burst length 1. For example, read access of burst length 1 is performed consecutively 8 times to read 16-byte continuous data from the SDRAM that is connected to a 16-bit data bus. This access is called the burst read with the burst number 8. Table 14.14 shows the relationship between the access size and the number of bursts.

Table 14.14 Relationship between Access Size and Number of Bursts

Bus Width	Access Size	Number of Bursts
16 bits	8 bits	1
	16 bits	1
	32 bits	2
	16 bytes	8
	32 bytes	16
	64 bytes	32
32 bits	8 bits	1
	16 bits	1
	32 bits	1
	16 bytes	4
	32 bytes	8
	64 bytes	16

Figure 14.17 and Figure 14.18 show timing charts in burst read. In burst read, an ACTV command is output in the Tr cycle, the READ command is issued in the Tc1, Tc2, and Tc3 cycles, the READA command is issued in the Tc4 cycle, and the read data is received at the rising edge of the external clock (CKIO) in the Td1 to Td4 cycles. The Tap cycle is used to wait for the completion of an auto-precharge induced by the READA command in the SDRAM. In the Tap cycle, a new command will not be issued to the same bank. However, access to another CS space or another bank in the same SDRAM space is enabled. The number of Tap cycles is specified by the WTRP1 and WTRP0 bits in CS3WCR.

In this LSI, wait cycles can be inserted by specifying each bit in CS3WCR to connect the SDRAM in variable frequencies. Figure 14.18 shows an example in which wait cycles are inserted. The number of states from the Tr state where the ACTV command is output to the Tc1 state where the READ command is output can be specified using the WTRCD1 and WTRCD0 bits in the CS3WCR register. If the WTRCD1 and WTRCD0 bits specify one wait or more, a Trw state where the NOP command is issued is inserted between the Tr state and Tc1 state. The number of states from the Tc1 state where the READ command is output to the Td1 state where the read data is latched can be specified for the CS2 and CS3 spaces independently, using the A2CL1 and A2CL0 bits in the CS2WCR register or the A3CL1 and A3CL0 bits in the CS3WCR register. The number of states from Tc1 to Td1 corresponds to the SDRAM CAS latency. The CAS latency for the SDRAM is normally defined as up to three. However, the CAS latency in this LSI can be specified as 1 to 4. This CAS latency can be achieved by connecting a latch circuit between this LSI and the SDRAM.
A Tde state is an idle state required to transfer the read data into this LSI and occurs once for every burst read or every single read.



Note 1. Address pin to be connected to pin A10 of SDRAM.
Note 2. The waveform for DACKn is when active low is specified.

Figure 14.17 Burst Read Basic Timing (CAS Latency 1, Auto Pre-Charge)

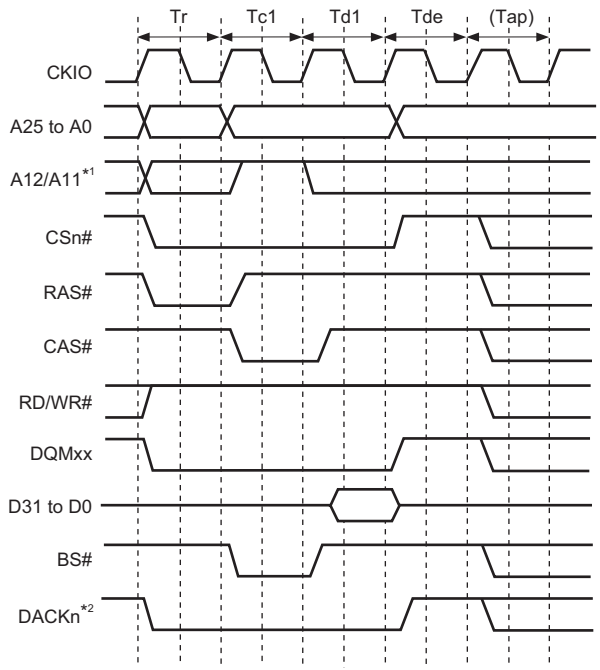
Note 2. The waveform for DACKn is when active low is specified.

Figure 14.18 Burst Read Wait Specification Timing (CAS Latency 2, WTRCD[1:0] = 1 Cycle, Auto Pre-Charge)

(4) Single Read

A read access ends in one cycle when the data bus width is larger than or equal to the access size. A read access that ends in one cycle is called single read.

Figure 14.19 shows the single read basic timing.



Note 1. Address pin to be connected to pin A10 of SDRAM.
Note 2. The waveform for DACKn is when active low is specified.

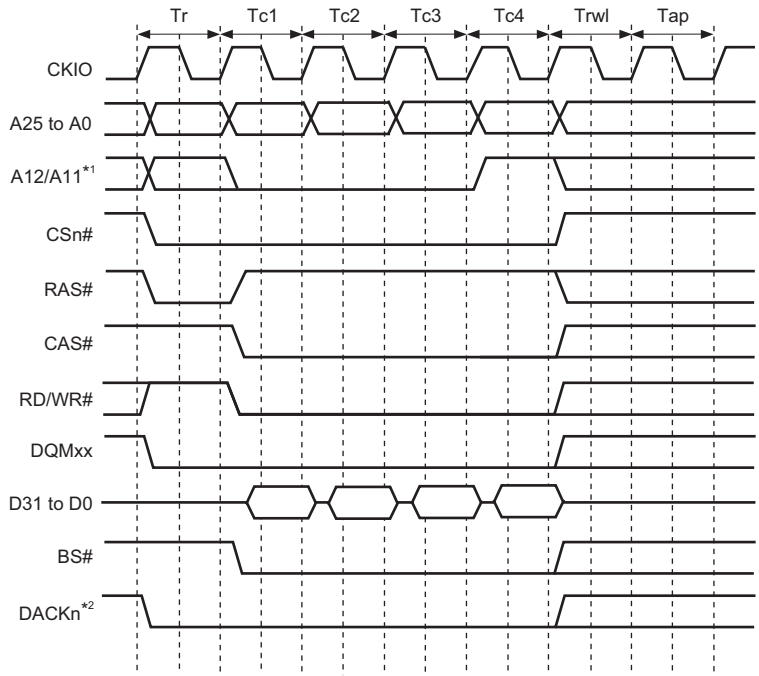
Figure 14.19 Basic Timing for Single Read (CAS Latency 1, Auto Pre-Charge)

(5) Burst Write

A burst write occurs in the following cases in this LSI.

- Access size in writing is larger than data bus width.
- 16-, 32-, or 64-byte transfer

This LSI always accesses SDRAM with burst length 1. For example, write access of burst length 1 is performed continuously 8 times to write 16-byte continuous data to the SDRAM that is connected to a 16-bit data bus. This access is called burst write with the burst number 8. The relationship between the access size and the number of bursts is shown in Table 14.14. Figure 14.20 shows a timing chart for burst writes. In burst write, an ACTV command is output in the Tr state, the WRIT command is issued in the Tc1, Tc2, and Tc3 states, and the WRITA command is issued to execute an auto-precharge in the Tc4 state. In the write cycle, the write data is output simultaneously with the write command. After the write command with the auto-precharge is output, the Trw1 state that waits for the auto-precharge initiation is followed by the Tap state that waits for completion of the auto-precharge induced by the WRITA command in the SDRAM. Between the Trwl and the Tap states, a new command will not be issued to the same bank. However, access to another CS space or another bank in the same SDRAM space is enabled. The number of Trw1 states is specified by the TRWL1 and TRWL0 bits in the CS3WCR register. The number of Tap states is specified by the WTRP1 and WTRP0 bits in the CS3WCR register.

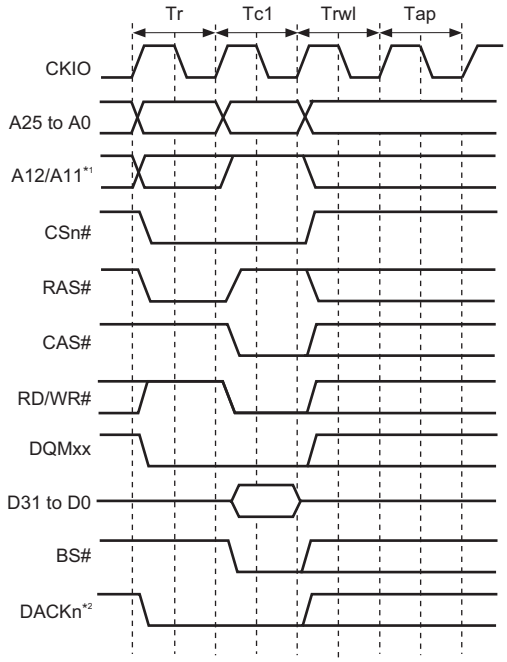


Note 1. Address pin to be connected to pin A10 of SDRAM.
Note 2. The waveform for DACKn is when active low is specified.

Figure 14.20 Basic Timing for Burst Write (Auto Pre-Charge)

(6) Single Write

A write access ends in one cycle when the data bus width is larger than or equal to the access size. A write access that ends in one cycle is called single write. Figure 14.21 shows the basic timing of single-write operation.



Note 1. Address pin to be connected to pin A10 of SDRAM.
Note 2. The waveform for DACKn is when active low is specified.

Figure 14.21 Single Write Basic Timing (Auto-Precharge)

(7) Bank Active

The SDRAM bank function can be used to support high-speed access to the same row address. When the BACTV bit in SDCR is 1, access is performed using commands without auto-precharge (READ or WRIT). This function is called bank-active function. This function is valid only for area 3. When area 3 is set to bank-active mode, area 2 should be set to normal space or SRAM with byte selection. When areas 2 and 3 are both set to SDRAM, auto precharge mode must be set.

When the bank-active function is used, precharging is not performed when the access ends. When accessing the same row address in the same bank, it is possible to issue the READ or WRIT command immediately, without issuing an ACTV command. As SDRAM is internally divided into several banks, it is possible to activate one row address in each bank. If the next access is to a different row address, a PRE command is first issued to precharge the relevant bank, then when precharging is completed, the access is performed by issuing an ACTV command followed by a READ or WRIT command. If this is followed by an access to a different row address, the access time will be longer because of the precharging performed after the access request is received. The number of states between issuance of the PRE command and the ACTV command is determined by the WTRP1 and WTPR0 bits in CS3WCR.

In a write, when an auto-precharge is performed, a command cannot be issued to the same bank for a period of Trwl + Tap states after issuance of the WRITA command. When bank active mode is used, READ or WRIT commands can be issued successively if the row address is the same. The number of cycles can thus be reduced by Trwl + Tap states for each write.

There is a limit on tRAS, the time for placing each bank in the active state. If there is no guarantee that there will not be a cache hit and another row address will be accessed within the period in which this value is maintained by program execution, it is necessary to set auto-refresh and set the refresh cycle to no more than the maximum value of tRAS.

A burst read cycle without auto-precharge is shown in Figure 14.22, a burst read cycle for the same row address in Figure 14.23, and a burst read cycle for different row addresses in Figure 14.24. Similarly, a single write cycle without auto-precharge is shown in Figure 14.25, a single write cycle for the same row address in Figure 14.26, and a single write cycle for different row addresses in Figure 14.27.

In Figure 14.23, a Tnop state in which no operation is performed is inserted before the Tc state that issues the READ command. The Tnop state is inserted to maintain latency 2 for the DQMxx signal that specifies the read byte in the data read from the SDRAM. If the CAS latency is specified as two or more, the Tnop state is not inserted because latency 2 can be maintained even if the DQMxx signal is activated after the Tc state.

When bank active mode is set, if only access cycles to the respective banks in the area 3 space are considered, as long as access cycles to the same row address continue, the operation starts with the cycle in Figure 14.22 or Figure 14.25, followed by repetition of the cycle in Figure 14.23 or Figure 14.26. An access to a different area during this time has no effect. If there is an access to a different row address in the bank active state, the bus cycle in Figure 14.24 or Figure 14.27 is executed instead of that in Figure 14.23 or Figure 14.26. In bank active mode, too, all banks become inactive after a refresh cycle.

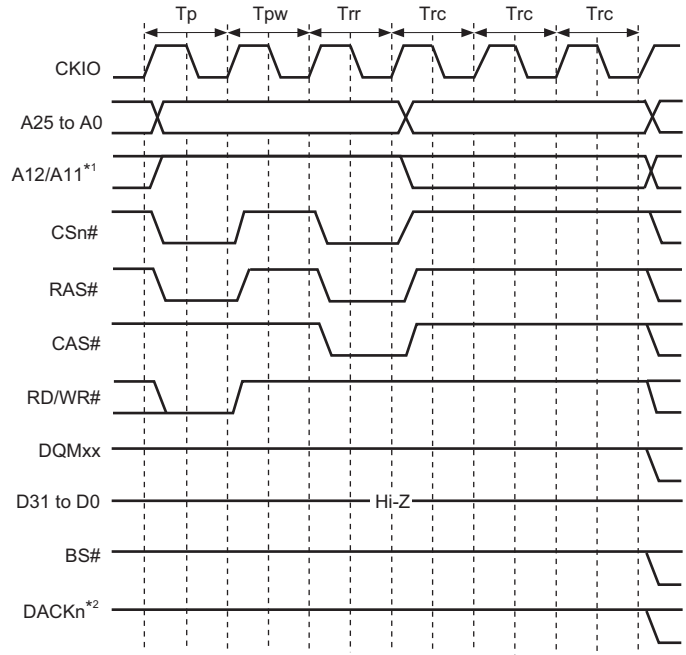
(8) Refreshing

This module has a function for controlling SDRAM refreshing. Auto-refreshing can be performed by clearing the RMODE bit to 0 and setting the RFSH bit to 1 in SDCR. A continuous refreshing can be performed by setting the RRC2 to RRC0 bits in the RTCSR register. If SDRAM is not accessed for a long period, self-refresh mode, in which the power consumption for data retention is low, can be activated by setting both the RMODE bit and the RFSH bit to 1.

(a) Auto-refreshing

Refreshing is performed at intervals determined by the input clock selected by bits CKS2 to CKS0 in RTCSR, and the value set by in RTCOR. The value of bits CKS2 to CKS0 in RTCOR should be set so as to satisfy the refresh interval stipulation for the SDRAM used. First make the settings for RTCOR, RTCNT, and the RMODE and RFSH bits in SDCR, and then make the CKS2 to CKS0 and RRC2 to RRC0 settings. When the clock is selected by bits CKS2 to CKS0, RTCNT starts counting up from the value at that time. The RTCNT value is constantly compared with the RTCOR value, and if the two values are the same, a refresh request is generated and an auto-refresh is performed for the number of times specified by the RRC2 to RRC0. At the same time, RTCNT is cleared to zero and the count-up is restarted.
Figure 14.28 shows the auto-refresh cycle timing. After starting the auto refreshing, PALL command is issued in the Tp state to make all the banks to pre-charged state from active state when some bank is being pre-charged. Then REF command is issued in the Trr state after inserting idle states of which number is specified by the WTRP1 and WTRP0 bits in CS3WCR. A new command is not issued for the duration of the number of states specified by the WTRC1 and WTRC0 bits in CS3WCR after the Trr state. The WTRC1 and WTRC0 bits must be set so as to satisfy the SDRAM refreshing cycle time stipulation (tRC). An idle state is inserted between the Tp state and Trr state when the setting value of the WTRP1 and WTRP0 bits in CS3WCR is longer than or equal to 1 state.



Note 1. Address pin to be connected to pin A10 of SDRAM.
Note 2. The waveform for DACKn is when active low is specified.

Figure 14.28 Auto-Refresh Timing

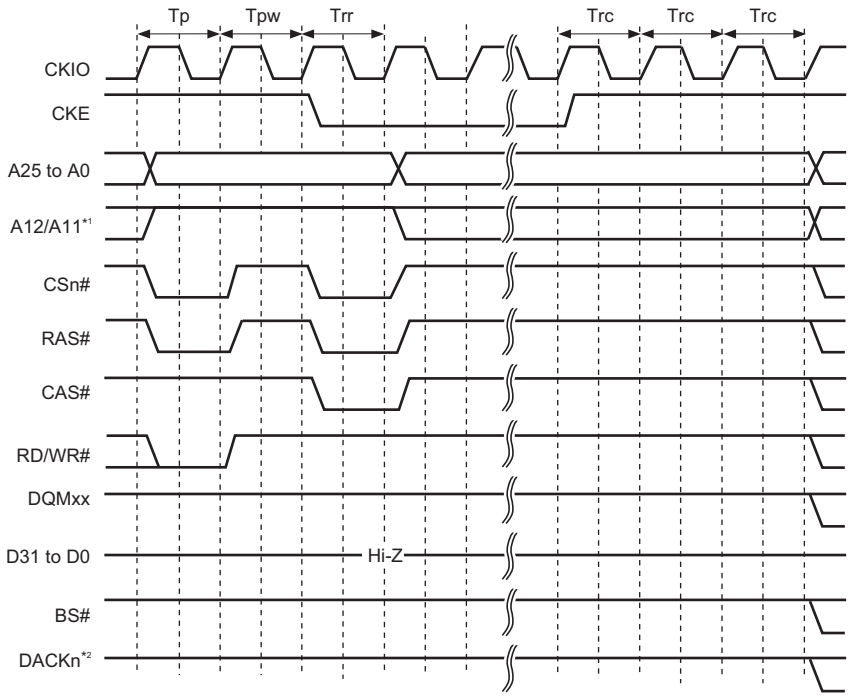
(b) Self-refreshing

Self-refresh mode is a kind of standby mode, in which the refresh timing and refresh addresses are generated within the SDRAM. This LSI enters self-refreshing by setting both the RMODE bit and the RFSH bit in SDCR to 1. After starting the self-refreshing, PALL command is issued in Tp state after the completion of the pre-charging bank. A SELF command is then issued after inserting idle states of which number is specified by the WTRP1 and WTRP0 bits in CS3WSR. SDRAM cannot be accessed while in the self-refresh state. Clearing the RMODE bit to 0 clears the self-refresh mode. After self-refresh mode has been cleared, command issuance is disabled for the number of states specified by the WTRC1 and WTRC0 bits in CS3WCR.

Self-refresh timing is shown in Figure 14.29. Settings must be made so that self-refresh clearing and data retention are performed correctly, and auto-refreshing is performed at the correct intervals. When self-refreshing is activated from the state in which auto-refreshing is set, auto-refreshing is restarted if the RFSH bit is set to 1 and the RMODE bit is cleared to 0 when self-refresh mode is cleared. If the transition from clearing of self-refresh mode to the start of auto-refreshing takes time, this time should be taken into consideration when setting the initial value of RTCNT. Making the RTCNT value 1 less than the RTCOR value will enable refreshing to be started immediately.

After self-refreshing has been set, the self-refresh state continues even if the chip standby state is entered using this LSI standby function, and is maintained even after recovery from standby mode due to an interrupt.

In case of a power-on reset, the bus state controller's registers are initialized, and therefore the self-refresh state is cleared.



Note 1. Address pin to be connected to pin A10 of SDRAM.
Note 2. The waveform for DACKn is when active low is specified.

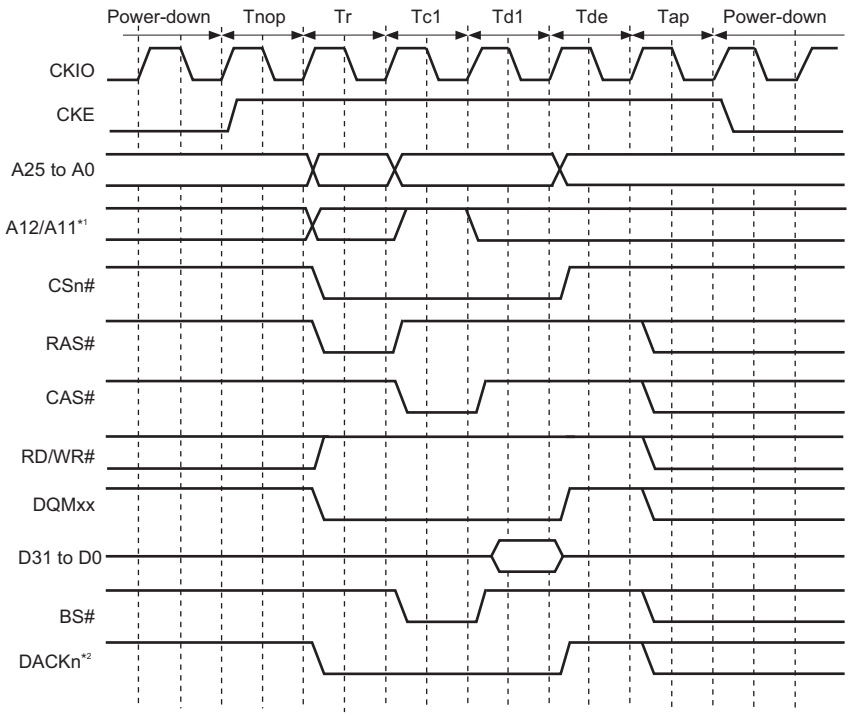
Figure 14.29 Self-Refresh Timing

(9) Relationship between Refresh Requests and Bus Cycles

If a refresh request occurs during bus cycle execution, the refresh cycle must wait for the bus cycle to be completed. If a new refresh request occurs while waiting for the previous refresh request, the previous refresh request is deleted. To refresh correctly, a bus cycle longer than the refresh interval must be prevented from occurring.

(10) Power-Down Mode

If the PDOWN bit in SDCR is set to 1 and the CKE signal is set to the low level after the access to the SDRAM, the SDRAM can enter the power-down mode. This power-down mode can effectively lower the power consumption in the non-access cycle. However, please note that if an access occurs in power-down mode, a state of overhead occurs because a state is needed to activate the CKE in order to cancel the power-down mode.
Figure 14.30 shows the access timing in power-down mode.



Note 1. Address pin to be connected to pin A10 of SDRAM.
Note 2. The waveform for DACKn is when active low is specified.

Figure 14.30 Power-Down Mode Access Timing

(11) Power-On Sequence

In order to use SDRAM, mode setting must first be made for SDRAM after the pose interval specified for the SDRAM to be used after powering on. The pose interval should be obtained by a power-on reset generating circuit or software.
To perform SDRAM initialization correctly, the registers of this module must first be set, followed by a write to the SDRAM mode register. In SDRAM mode register setting, the address signal value at that time is latched by a combination of the CSn#, RAS#, CAS#, and RD/WR# signals. If the value to be set is X, the bus state controller provides for value X to be written to the SDRAM mode register by performing a 16-bit write to address A000 3000h + X for area 2 SDRAM, and to address A000 4000h + X for area 3 SDRAM. In this operation the data is ignored, but the mode write is performed as a byte-size access. To set burst read/single write or burst read/burst write (CAS latency 2 to 3, wrap type = sequential, and burst length 1) supported by this LSI, arbitrary data is written in 16 bits to the access addresses shown in Table 14.15. In this time 0 is output at the external address pins of A12 or later.

Table 14.15 Access Address in SDRAM Mode Register Write

- Setting for Area 2
  Burst read/single write (burst length 1):

Data Bus Width	CAS Latency	Access Address	External Address Pin
16 bits	2	A000 3440h	0000440h
	3	A000 3460h	0000460h
32 bits	2	A000 3880h	0000880h
	3	A000 38C0h	00008C0h

Burst read/burst write (burst length 1):

Data Bus Width	CAS Latency	Access Address	External Address Pin
16 bits	2	A000 3040h	0000040h
	3	A000 3060h	0000060h
32 bits	2	A000 3080h	0000080h
	3	A000 30C0h	00000C0h

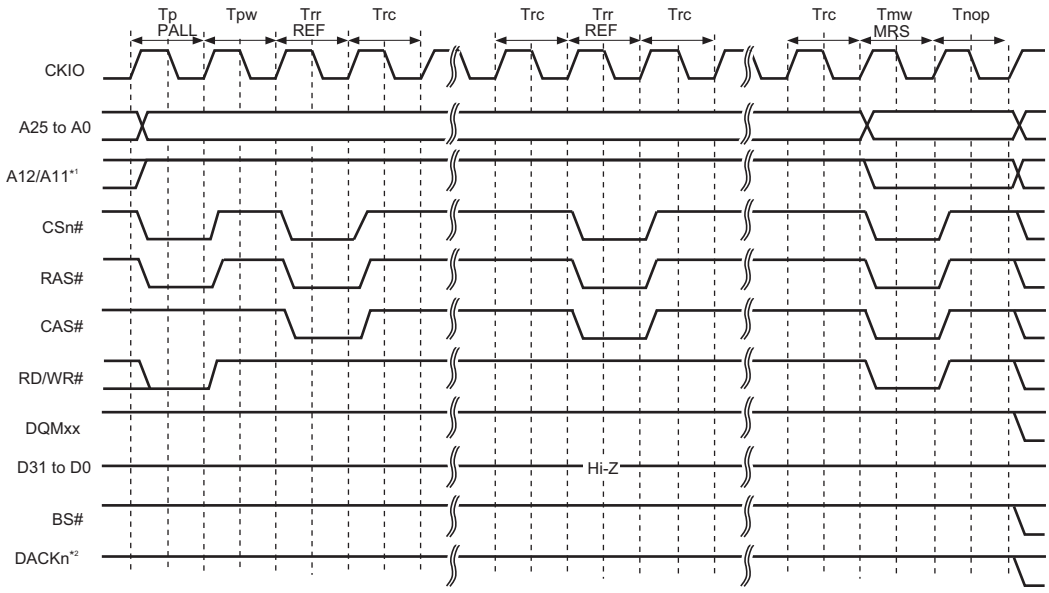
- Setting for Area 3
  Burst read/single write (burst length 1):

Data Bus Width	CAS Latency	Access Address	External Address Pin
16 bits	2	A000 4440h	0000440h
	3	A000 4460h	0000460h
32 bits	2	A000 4880h	0000880h
	3	A000 48C0h	00008C0h

Burst read/burst write (burst length 1):

Data Bus Width	CAS Latency	Access Address	External Address Pin
16 bits	2	A000 4040h	0000040h
	3	A000 4060h	0000060h
32 bits	2	A000 4080h	0000080h
	3	A000 40C0h	00000C0h

Mode register setting timing is shown in Figure 14.31. A PALL command (all bank pre-charge command) is firstly issued. A REF command (auto refresh command) is then issued 8 times. An MRS command (mode register write command) is finally issued. Idle states, of which number is specified by the WTRP1 and WTRP0 bits in CS3WCR, are inserted between the PALL and the first REF. Idle states, of which number is specified by the WTRC1 and WTRC0 bits in CS3WCR, are inserted between REF and REF, and between the 8th REF and MRS. One or more idle states are inserted between the MRS and a command to be issued next.
It is necessary to keep idle time of certain cycles for SDRAM before issuing PALL command after power-on. Refer to the manual of the SDRAM for the idle time to be needed. When the pulse width of the reset signal is longer than the idle time, mode register setting can be started immediately after the reset, but care should be taken when the pulse width of the reset signal is shorter than the idle time.



Note 1. Address pin to be connected to pin A10 of SDRAM.
Note 2. The waveform for DACKn is when active low is specified.

Figure 14.31 SDRAM Mode Write Timing (Based on JEDEC)

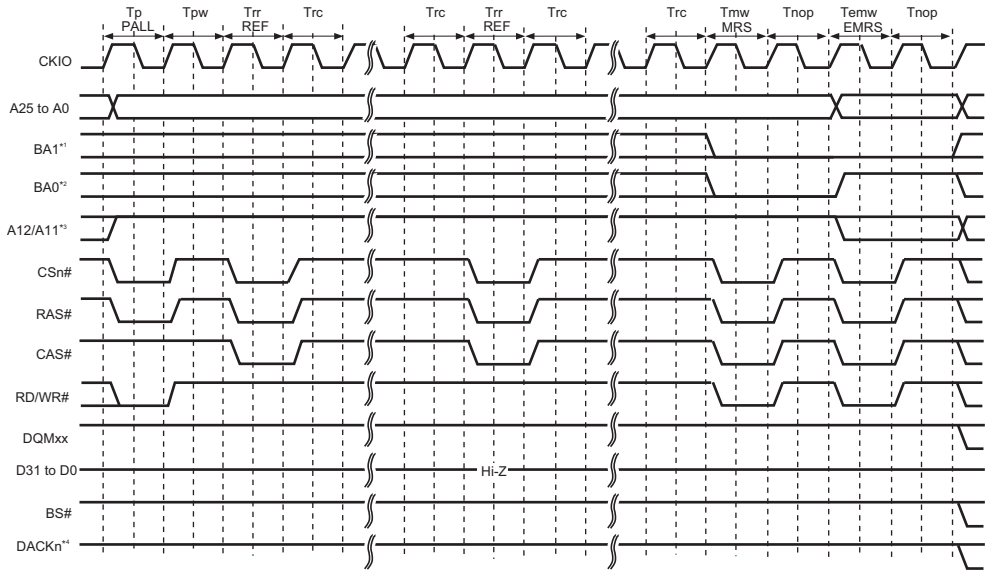
(12) Low-Power SDRAM

The low-power SDRAM can be accessed using the same protocol as the normal SDRAM.
The differences between the low-power SDRAM and normal SDRAM are that partial refresh takes place that puts only a part of the SDRAM in the self-refresh state during the self-refresh function, and that power consumption is low during refresh under user conditions such as the operating temperature. The partial refresh is effective in systems in which the data in a work area other than the specific area can be lost without severe repercussions. For details, please refer to the Data Sheet for the low-power SDRAM to be used.

The low-power SDRAM supports the extension mode register in addition to the mode registers as the normal SDRAM. This LSI supports issuing of the extension mode register write command (EMRS).
The EMRS command is issued according to Table 14.16. For example, if data 0YYY YYYYh is written to address A000 4XX0h in 32 bits, the commands are issued to the CS3 space in the following sequence: PALL -> REF × 8 -> MRS -> EMRS. In this case, the MRS and EMRS issue addresses are 0000XX0h and YYYYYYYh, respectively. If data 1YYY YYYYh is written to address A000 4XX0h in 32 bits, the commands are issued to the CS3 space in the following sequence: PALL -> MRS -> EMRS.

Table 14.16 Output Addresses when EMRS Command Is Issued

Command to be Issued	Access Address	Access Data	Write Access Size	MRS Command Issue Address	EMRS Command Issue Address
CS2 MRS	A000 3XX0h	**** ****h	16 bits	0000XX0h	-------h
CS3 MRS	A000 4XX0h	**** ****h	16 bits	0000XX0h	-------h
CS2 MRS + EMRS (with refresh)	A000 3XX0h	0YYY YYYYh	32 bits	0000XX0h	YYYYYYYh
CS3 MRS + EMRS (with refresh)	A000 4XX0h	0YYY YYYYh	32 bits	0000XX0h	YYYYYYYh
CS2 MRS + EMRS (without refresh)	A000 3XX0h	1YYY YYYYh	32 bits	0000XX0h	YYYYYYYh
CS3 MRS + EMRS (without refresh)	A000 4XX0h	1YYY YYYYh	32 bits	0000XX0h	YYYYYYYh

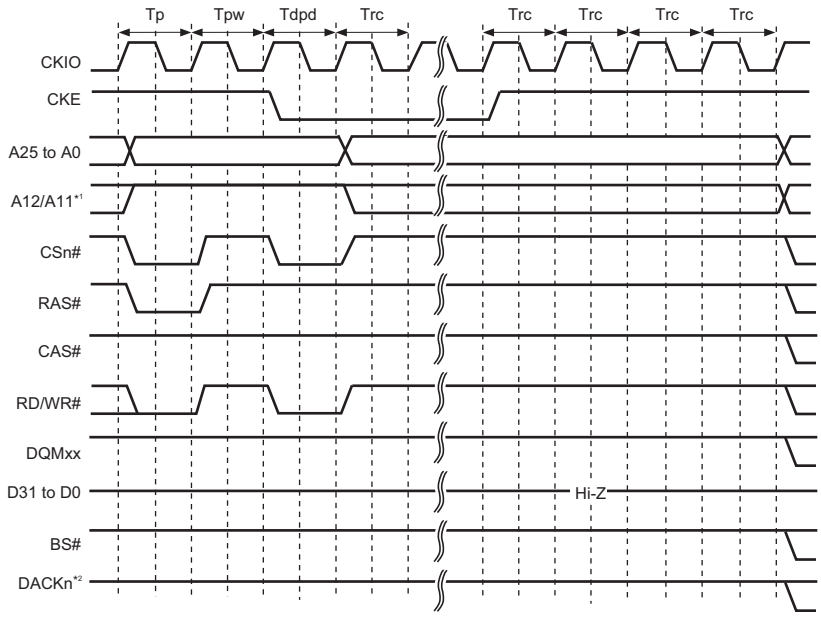


Note 1. Address pin to be connected to pin BA1 of SDRAM.
Note 2. Address pin to be connected to pin BA0 of SDRAM.
Note 3. Address pin to be connected to pin A10 of SDRAM.
Note 4. The waveform for DACKn is when active low is specified.

Figure 14.32 EMRS Command Issue Timing

- Deep power-down mode
  The low-power SDRAM supports the deep power-down mode as a low-power consumption mode. In the partial self-refresh function, self-refresh is performed on a specific area. In the deep power-down mode, self-refresh will not be performed on any memory area. This mode is effective in systems where all of the system memory areas are used as work areas.

If the RMODE bit in the SDCR is set to 1 while the DEEP and RFSH bits in the SDCR register are set to 1, the low-power SDRAM enters the deep power-down mode. If the RMODE bit is cleared to 0, the CKE signal is pulled high to cancel the deep power-down mode. Before executing an access after returning from the deep power-down mode, the power-up sequence must be re-executed.



Note 1. Address pin to be connected to pin A10 of SDRAM.
Note 2. The waveform for DACKn is when active low is specified.

Figure 14.33 Deep Power-Down Mode Transition Timing

14.4.7 Burst ROM (Clocked Asynchronous) Interface

The burst ROM (clocked asynchronous) interface is used to access a memory with a high-speed read function using a method of address switching called the burst mode or page mode. In a burst ROM (clocked asynchronous) interface, basically the same access as the SRAM interface is performed, but the 2nd and subsequent access cycles are performed only by changing the address, without inactivating the RD# signal at the end of the 1st cycle. In the 2nd and subsequent access cycles, addresses are changed at the falling edge of the CKIO signal.

For the 1st access cycle, the number of waits specified by the W3 to W0 bits in the CSnWCR register is inserted. For the 2nd and subsequent access cycles, the number of wait cycles specified by the BW1 and BW0 bits in the CSnWCR register is inserted.

In the access to the burst ROM (clocked asynchronous), the BS# signal is activated only to the first access cycle. An external wait input is valid only to the first access cycle.

In the single access or write access that does not perform the burst operation in the burst ROM (clocked asynchronous) interface, access timing is same as an SRAM interface.

Table 14.17 lists a relationship between bus width, access size, and the number of bursts. Figure 14.34 shows a timing chart.

Table 14.17 Relationship between Bus Width, Access Size, and Number of Bursts

Bus Width	Access Size	CSnWCR.BST[1:0] Bits	Number of Bursts	Access Count
8 bits	8 bits	Not affected	1	1
	16 bits	Not affected	2	1
	32 bits	Not affected	4	1
	16 bytes	00	16	1
		01	4	4
	32 bytes	00	16	2

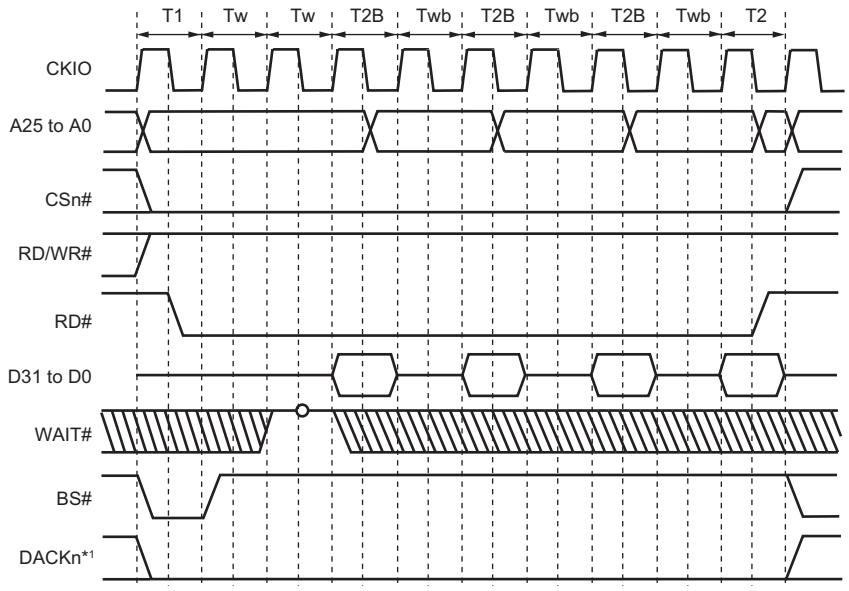
Note 1. When the bus width is 16 bits, the access size is 16 bits or more, and the BST[1:0] bits in CSnWCR are 10b, the number of bursts and access count depend on the access start address. At address xxx0h or xxx8h, 4-4 burst access is performed (burst numbers: 4,4 for a total of 2 rounds of access). At address xxx4h or xxxCh, 2-4-2 burst access is performed (burst numbers: 2, 4, 2 for a total of 3 rounds of access).



Note 1. The waveform for DACKn is when active low is specified.

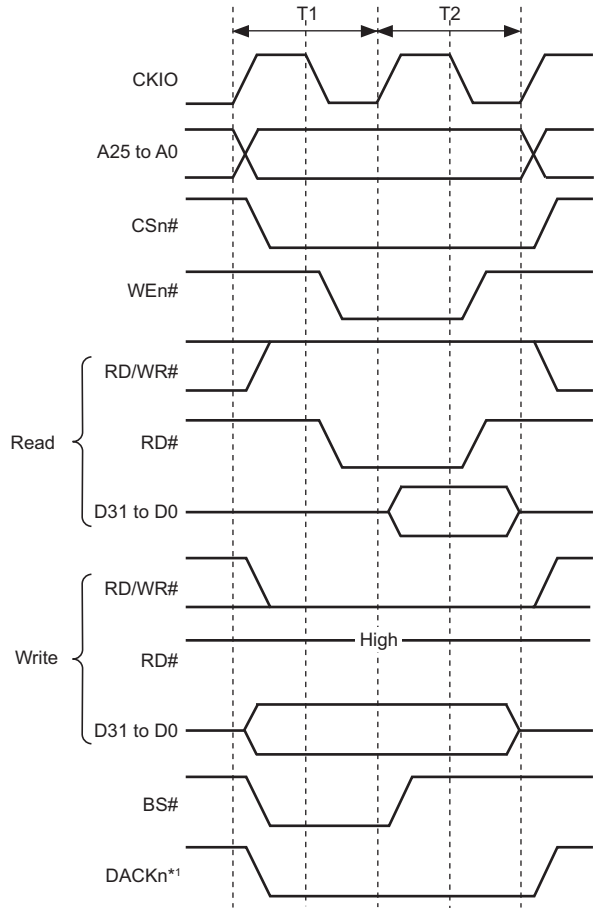
Figure 14.34 Burst ROM Access Timing (Clocked Asynchronous) (Bus Width = 32 Bits, 16-Byte Transfer (Number of Burst 4), Wait Cycles Inserted in First Access = 2, Wait Cycles Inserted in Second and Subsequent Access Cycles = 1)

14.4.8 SRAM Interface with Byte Selection

The SRAM interface with byte selection is a memory interface that outputs the byte selection signal (WEn#) in both read and write bus cycles. This interface has 16-bit data pins and accesses SRAMs having upper and lower byte selection pins, such as UB# and LB#.

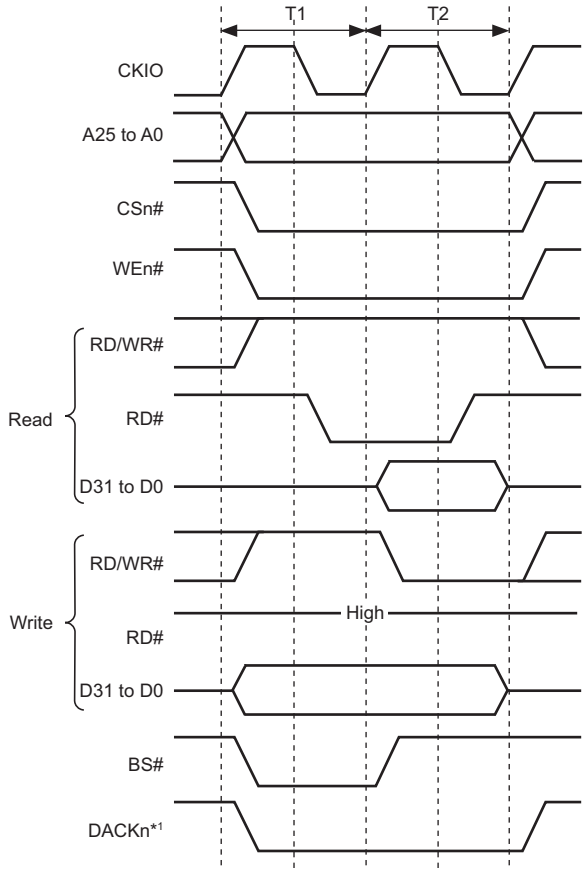
When the BAS bit in CSnWCR is cleared to 0 (value after reset), the write access timing of the SRAM interface with byte selection is the same as that for the SRAM interface. While in read access of a byte-selection SRAM interface, the byte-selection signal is output from the WEn# pin, which is different from that for the SRAM interface. The basic access timing is shown in Figure 14.35. In write access, data is written to the memory according to the timing of the byte-selection pin (WEn#). For details, please refer to the Data Sheet for the corresponding memory.

If the BAS bit in CSnWCR is set to 1, the WEn# pin and RD/WR# pin timings change. Figure 14.36 shows the basic access timing. In write access, data is written to the memory according to the timing of the write enable pin (RD/WR#). The data hold of write data at the timing of RD/WR# inactive must be acquired by setting the HW1 and HW0 bits in the CSnWCR register. Figure 14.37 shows the access timing when a software wait is specified.



Note 1. The waveform for DACKn is when active low is specified.

Figure 14.35 Basic Access Timing for SRAM with Byte Selection (BAS = 0)



Note 1. The waveform for DACKn is when active low is specified.

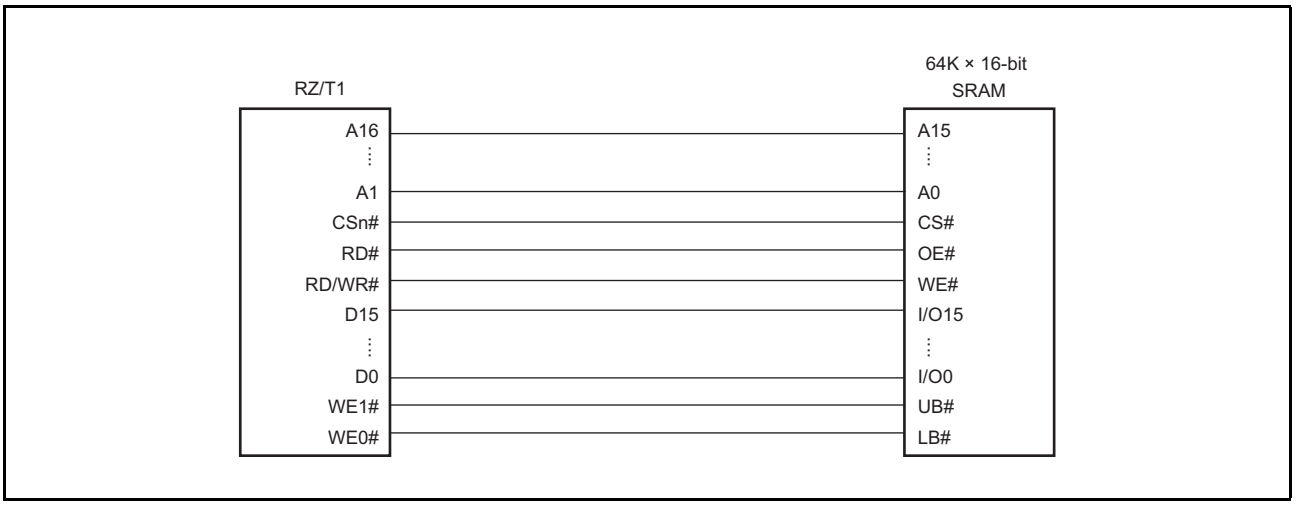

Figure 14.39 Example of Connection with 16-Bit Data-Width SRAM with Byte Selection

14.4.9 Burst ROM (Clocked Synchronous) Interface

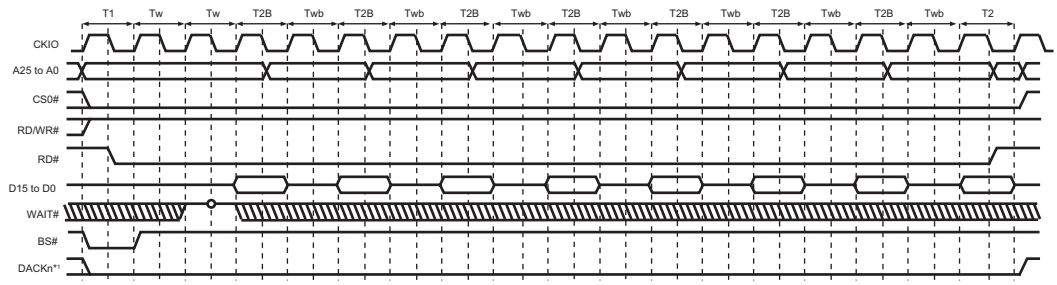
The burst ROM (clocked synchronous) interface is supported to access a ROM with a synchronous burst function at high speed. The burst ROM interface accesses the burst ROM in the same way as an SRAM interface. This interface is valid only for area 0.

In the first access cycle, wait cycles are inserted. In this case, the number of wait cycles to be inserted is specified by the W3 to W0 bits in CS0WCR. In the second and subsequent cycles, the number of wait cycles to be inserted is specified by the BW1 and BW0 bits in CS0WCR.

While the burst ROM (clocked synchronous) is accessed, the BS# signal is activated only for the first access cycle and an external wait input is also valid for the first access cycle.

When the bus width is 16 bits, the burst length must be specified as 8. When the bus width is 32 bits, the burst length must be specified as 4. The burst ROM interface does not support the 8-bit bus width for the burst ROM.

The burst ROM interface performs burst operations for all read access. For example, in a 32-bit access over a 16-bit bus, valid 16-bit data is read two times and invalid 16-bit data is read six times. These invalid data read cycles increase the memory access time and degrade the program execution speed and DMA transfer speed. To prevent this problem, it is recommended using a read in a 16-byte or more access size. The burst ROM interface performs write access in the same way as SRAM interface access.



Note 1. The waveform for DACKn is when active low is specified.

Figure 14.40 Burst ROM Access Timing (Clocked Synchronous) (Burst Length = 8, Wait Cycles Inserted in First Access = 2, Wait Cycles Inserted in Second and Subsequent Access Cycles = 1)

14.4.10 Wait between Access Cycles

As the operating frequency of LSIs becomes higher, the off-operation of the output data buffer for devices with slow access speed often collides with the data output for the next cycle. As a result of these collisions, the reliability of the device might be lowered or malfunctions might occur. Data collisions can be avoided by inserting idle (wait) cycles between continuous access cycles.
The number of idle states between access cycles can be set by the WM bit in CSnWCR, bits IWW2 to IWW0, IWRWD2 to IWRWD0, IWRWS2 to IWRWS0, IWRRD2 to IWRRD0, and IWRRS2 to IWRRS 0 in CSnBCR. The conditions for setting the idle cycles between access cycles are shown below.

1. Continuous access cycles are write-read or write-write
2. Continuous access cycles are read-write for different spaces
3. Continuous access cycles are read-write for the same space
4. Continuous access cycles are read-read for different spaces
5. Continuous access cycles are read-read for the same space

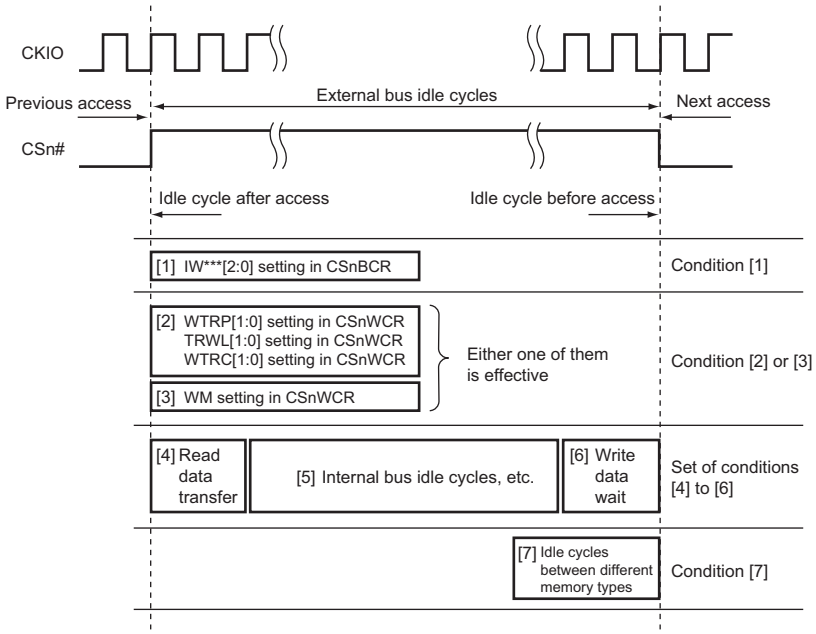
For the specification of the number of idle cycles between access cycles described above, refer to the description of each register.

Besides the idle states between access cycles specified by the registers, idle cycles must be inserted to interface with the internal bus or to obtain the minimum pulse width for a multiplexed pin (WEn#). The following gives detailed information about the idle cycles and describes how to estimate the number of idle cycles.
The number of idle cycles on the external bus from the inactive state of the CSn# signal to the active state of CSn# is described below.
There are seven conditions that determine the number of idle cycles on the external bus as shown in Table 14.18. The effects of these conditions are shown in Figure 14.41.

Table 14.18 Conditions for Determining Number of Idle Cycles

No.	Condition	Description	Range	Note
[1]	IW***[2:0] in CSnBCR	These bits specify the number of idle cycles for access. The number of idle cycles can be specified independently for each combination of the previous and next cycles. For example, in the case where reading CS1 space followed by reading other CS space, the bits IWRRD[2:0] in CS1BCR should be set to 100b to specify six or more idle cycles. This condition is effective only for access states other than single address transfer and generates idle states after the access is completed.	0 to 12	Do not set 0 for the number of idle cycles between memory types which are not allowed to be accessed successively.
[2]	SDRAM-related bits in CSnWCR	These bits specify precharge completion and startup wait states and idle states between commands for SDRAM access. This condition is effective only for SDRAM access and generates idle states after the access is completed	0 to 3	Specify these bits in accordance with the specification of the target SDRAM.
[3]	WM in CSnWCR	This bit enables or disables external WAIT# pin input for the memory types other than SDRAM. When this bit is cleared to 0 (external WAIT# enabled), one idle state is inserted to check the external WAIT# pin input after the access is completed. When this bit is set to 1 (disabled), no idle state is generated.	0 or 1	
[4]	Read data transfer cycle	One idle state is inserted after a read access is completed. This idle state is not generated for the first or middle cycles in divided access cycles. This is neither generated when the HW[1:0] bits in CSnWCR are not 00b.	0 or 1	One idle state is always inserted during a read cycle with SDRAM.
[5]	Internal bus idle cycles, etc.	External bus access requests from the CPU or the direct memory access controller (DMA) and their results are passed through the internal bus. The external bus enters idle state during internal bus idle cycles or while a bus other than the external bus is being accessed. This condition is not effective for divided access cycles, which are generated by the bus state controller when the access size is larger than the external data bus width.	0 or larger	The number of internal bus idle cycles may not become 0 depending on the CPU: internal bus: CKIO
[6]	Write data wait cycles	During write access, a write cycle is executed on the external bus only after the write data becomes ready. This write data wait period generates idle cycles before the write cycle. Note that when the previous cycle is a write cycle and the internal bus idle cycles are shorter than the previous write cycle, write data can be prepared in parallel with the previous write cycle and therefore, no idle cycle is generated (write buffer effect).	0 or 1	For write → write or write → read access cycles, successive access cycles without idle cycles may be available due to the write buffer effect described in the left column. If successive access cycles without idle cycles are not allowed, specify the minimum number of idle cycles between access cycles through the CSnBCR register.
[7]	Idle cycles between different memory types	To ensure the minimum pulse width on the multi-use pins, idle cycles may be inserted before access after memories are switched. For some memory types, idle cycles are inserted even when memory types are not switched.	0 to 2	The number of idle cycles depends on the target memory types. See Table 14.19.

In the above conditions, a total of four conditions, that is, condition [1], condition [2] or [3] (either one is effective), a set of conditions [4] to [6] (these are generated successively, and therefore the sum of them should be taken as one set of idle cycles), and condition [7] are generated at the same time. The maximum number of idle cycles among these four conditions become the number of idle cycles on the external bus. To ensure the minimum idle cycles, be sure to make register settings for condition [1].



Note: A total of four conditions (condition [1], condition [2] or [3], a set of conditions [4] to [6], and condition [7]) generate idle cycle at the same time. Accordingly, the maximum number of cycles among these four conditions become the number of idle cycles.

Figure 14.41 Idle Cycle Conditions

Table 14.19 Number of Idle Cycles Inserted between Access Cycles to Different Memory Types

	Next Cycle						
Previous Cycle	**SRAM**	**Burst ROM (Asynchronous)**	**MPX-I/O**	**Byte SRAM (BAS = 0)**	**Byte SRAM (BAS = 1)**	**SDRAM**	**Burst ROM (Synchronous)**
SRAM	0	0	1	0	0/1*1	0/1*1	0
Burst ROM (asynchronous)	0	0	1	0	0/1*1	0/1*1	0
MPX-I/O	1	1	0	1	1	1	1
Byte SRAM (BAS = 0)	0	0	1	0	0/1*1	0/1*1	0
Byte SRAM (BAS = 1)	0/1*1	0/1*1	1/2*1	0/1*1	0	0	0/1*1
SDRAM	1	1	2	1	0	0	1
Burst ROM (synchronous)	0	0	1	0	1	1	0

Note 1. The number of idle cycles depends on the setting of the CSnWCR.HW[1:0] bits in the previous cycle. When HW[1:0] ≠ 00b, the number of idle cycles is the value on the left; when HM[1:0] = 00b, the number of idle cycles is the value on the right. If the CSnWCR.HW[1:0] bits were for a CSn space that does not exist in the previous cycle, the number of idle cycles is the value on the right.

14.4.11 Others

(1) Reset

This module can be initialized completely only at reset of the entire chip (pin reset, software reset, and ECM reset). When reset of the entire chip occurs, all signals are inactivated and data output buffers are turned off regardless of the bus cycle state after the internal reset is synchronized with the internal clock. All control registers are initialized. In the chip standby state, control registers of the bus state controller are not initialized.

(2) Caution on Write Buffer

Since the bus state controller incorporates a one-stage write buffer, it can execute an access via the internal bus before the previous external bus cycle is completed in a write cycle. If the on-chip module is read or written after the external low-speed memory is written, the on-chip module can be accessed before the completion of the external low-speed memory write cycle.

In read cycles, the CPU is placed in the wait state until read operation has been completed. To continue the process after the data write to the device has been completed, perform a dummy read to the same address to check for completion of the write before the next process to be executed.

The write buffer of the bus state controller functions in the same way for an access by a bus master other than the CPU such as the direct memory access controller (DMA). Accordingly, to perform DMA transfers, the next read cycle is initiated before the previous write cycle is completed. Note, however, that if both the DMA source and destination addresses exist in external memory space, the next read cycle will not be initiated until the previous write cycle is completed.

Changing the registers in this module while the write buffer is operating may disrupt correct write access. Therefore, do not change the registers in this module immediately after a write access. If this change becomes necessary, do it after executing a dummy read of the write data.

15. DMA Controller (DMACAa)

This LSI contains DMAC (Direct Memory Access Controller) consisting of two units, DMAC0 and DMAC1. DMAC transfers data without using the CPU. When a transfer is requested, DMAC transfers data stored at the transfer source address to the transfer destination address.

15.1 Overview

Table 15.1 lists specifications of DMAC.

Table 15.1 Specifications of DMAC

Item		Description	
		DMAC0	**DMAC1**
Number of channels		16 channels	16 channels
Address space		4 Gbytes	
DMAC activation source		External request (DREQ)/external interrupts (IRQ) On-chip peripheral module requests/software requests*1	
Channel priority		• Selectable from fixed priority or round-robin for channels 0 to 7 and for channels 8 to 15. • Round-robin arbitration between channels 0 to 7 and channels 8 to 15	
Transfer data unit		8, 16, 32, 128, 256, and 512 bits	8, 16, 32, and 128 bits
Maximum transfer size		$2^{32} - 1$ bytes	
Transfer mode	Single transfer	Performs DMA transfer for each DMA transfer request.	
	Block transfer	Performs DMA transfer of the specified size for a single DMAC activation request.	
DMA mode	Register mode	• DMA transfer setting value: Control register value within the DMA controller • DMA transfer to the source/destination specified by a register	
	Link mode	• DMA transfer setting value: Descriptors in the internal RAM or an external memory. • Various DMA transfers specified by descriptors can be performed (responsiveness: register mode > link mode).	
Interval function		The DMA transfer interval can be specified (bus occupation ratio can be adjusted).	
Skip function		• For the area to be accessed by DMA transfer, the continuous access size and the discrete access size (skip) can be set separately. • After the size of data specified for the continuous access is transferred, the specified number of addresses to be accessed next can be skipped.	
Suspending function		Current DMA transfer can be paused.	
Buffer flush function		When DMAC is stopped forcibly, data in the buffer can be flushed.	
Interrupt request		Each channel has the following interrupt requests: • Transfer completion: Indicates completion of transfer of the specified size; each channel has this source. • Transfer error: Indicates a bus error; total of two sources, one for unit 0 and the other for unit 1.	

Note 1. A software request is output as a source of an on-chip peripheral module request from the interrupt controller. For how to set a software request, see section 12, Interrupt Controller (ICUA).

Table 15.2 lists the input/output pins of the DMAC.

Table 15.2 Pin Configuration of the DMAC

Pin Name	I/O	Description
DREQ0	Input	DMA transfer request input from an external device to DMAC0
DREQ1	Input	DMA transfer request input from an external device to DMAC0
DREQ2	Input	DMA transfer request input from an external device to DMAC1
DACK0	Output	Output of DMAC transfer request acceptance from DMAC0 to an external device
DACK1	Output	Output of DMAC transfer request acceptance from DMAC0 to an external device
DACK2	Output	Output of DMAC transfer request acceptance from DMAC1 to an external device
TEND0	Output	Output of transfer completion from DMAC0 to an external device
TEND1	Output	Output of transfer completion from DMAC0 to an external device
TEND2	Output	Output of transfer completion from DMAC1 to an external device

Note: For details on active levels from DACK0 to DACK2, and TEND0 to TEND2, see section 15.2.11, Common Control Register (CMNCR) and section 15.3.5, DMA Acknowledge Output/DMA Transaction Completion Output Function.

15.2 Register Descriptions

15.2.1 Next Source Address Register n (N0SA_n_N, N0SA_n_W, N1SA_n_N, N1SA_n_W)

The N0SA_n and N1SA_n registers set the DMA transfer source address of DMA channel n (n = 15 to 0).
The N0SA_n register is for Next0 Register Set, and the N1SA_n register is for Next1 Register Set.
In write-only mode (CHCFG_n register WONLY = 1), this register is used to set writing data.

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	WD[31:0] (Write-only mode)	Write Data	Sets write data for write-only mode.	R/W

Note: During link mode transfer, descriptor read data is set to the N0SA_n_W register automatically.

15.2.2 Next Destination Address Register n (N0DA_n and N1DA_n)

The N0DA_n and N1DA_n registers set the DMA transfer destination address of DMA channel n (n = 15 to 0).
The N0DA_n register is for Next0 Register Set, and the N1DA_n register is for the Next1 Register Set.

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	DA[31:0]	Destination Address	Sets the start address of the DMA transfer destination.	R/W

Note: During link mode transfer, descriptor read data is set to the N0DA_n register automatically.

15.2.3 Next Transaction Byte Register n (N0TB_n and N1TB_n)

The N0TB_n and N1TB_n registers set the total number of transfer bytes of DMA channel n (n = 15 to 0).
The N0TB_n register is for Next0 Register Set, and the N1TB_n register is for Next1 Register Set.

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	TB[31:0]	Transaction Byte	Sets the total number of transfer bytes. Note 1. Do not start DMA transfer when 0 is set.	R/W

Note: During link mode transfer, descriptor read data is set to the N0TB_n register automatically.

15.2.4 Current Source Address Register (CRSA_n)

The CRSA_n register is a register that indicates the DMA transfer source address of DMA channel n (n = 15 to 0).

During DMA transfer, the value is incremented automatically (fixed when the SAD bit in the CHCFG_n register = 1, and not fixed when the WONLY bit in the CHCFG_n register = 1).

Address(es): DMAC0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	CRSA[31:0]	Current Source Address	Indicates the read address of the next DMA transfer.	R

The value after a reset is loaded from the following registers:

In register mode:
Loads the transfer source address from the Next0/1 register.

In link mode:
Loads the transfer source address from the descriptor read data (The hardware inputs descriptor read data to the N0SA_n register automatically, and loads it to the CRSA_n register when transfer starts).

The value is incremented when reading data from the transfer source is completed.

Read this register after DMA stops (when the TACT bit in the CHSTAT_n register = 0). (Handle the value during DMA operation as a reference value.)

15.2.5 Current Destination Address Register (CRDA_n)

The CRDA_n register indicates the DMA transfer destination address of DMA channel n (n = 15 to 0).
During DMA transfer, the value is incremented automatically (fixed when the DAD bit in the CHCFG_n register = 1).

Address(es): DMAC0

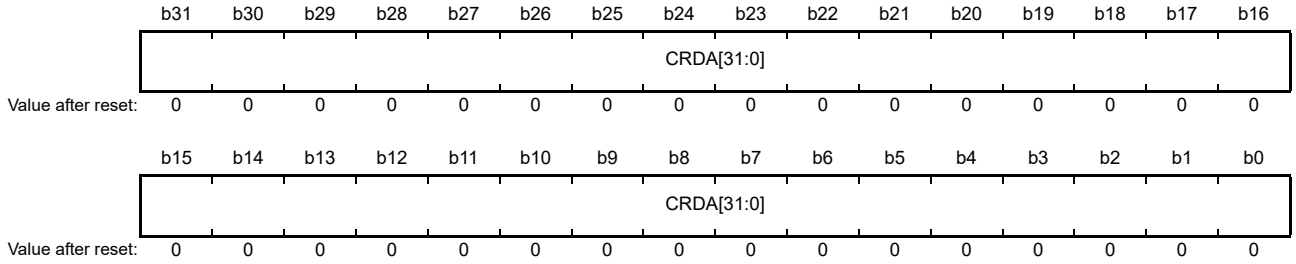
CRDA_12: A006 351Ch, CRDA_13: A006 355Ch, CRDA_14: A006 359Ch, CRDA_15: A006 35DCh



Bit	Symbol	Bit Name	Description	R/W
b31 to b0	CRDA[31:0]	Current Destination Address	Indicates the write address of the next DMA transfer.	R

The value after a reset is loaded from the following registers:

In register mode:
Loads the transfer destination address from the Next0/1 register.

In link mode:
Loads the transfer destination address from the descriptor read data (The hardware inputs the descriptor read data to the N0DA_n register automatically, and loads it to the CRDA_n register when transfer starts).

The value is incremented when writing data to the transfer destination completes.

Read this register after DMA stops (when the TACT bit in the CHSTAT_n register = 0). (Handle the value during DMA operation as a reference value.)

15.2.6 Current Transaction Byte Register (CRTB_n)

The CRTB_n register indicates the total number of transfer bytes of DMA channel n (n = 15 to 0). The value is cleared to 0 when transfer completes.
During DMA transfer, the value is decremented automatically.

Address(es): DMAC0
CRTB_0: A006 2020h, CRTB_1: A006 2060h, CRTB_2: A006 20A0h, CRTB_3: A006 20E0h,

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	CRTB[31:0]	Current Transaction Byte	Indicates the remaining number of transfer bytes that is currently performed.	R

The value after a reset is loaded from the following registers:

In register mode:
Loads the number of transfer bytes from the Next0/1 register.

In link mode:
Loads the number of transfer bytes from descriptor read data (The hardware inputs the descriptor read data to the N0TB_n register automatically, and loads it to the CRTB_n register when transfer starts).

The value is decremented when writing data to the transfer destination completes.

Read this register after DMA stops (when the TACT bit in the CHSTAT_n register = 0). (Handle the value during DMA operation as a reference value.)

15.2.7 Channel Status Register n (CHSTAT_n)

The CHSTAT_n register indicates the status of DMA channel n (n = 15 to 0).

Address(es): DMAC0
CHSTAT_0: A006 2024h, CHSTAT_1: A006 2064h, CHSTAT_2: A006 20A4h, CHSTAT_3: A006 20E4h,

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	EN	DMA Activation Enable	Indicates the status of operation enable/disable of DMA channel n. 0: Operation is disabled. 1: Operation is enabled. [Setting condition] • Writes 1 to the SETEN bit in the CHCTRL_n register. [Clearing conditions] When any of the following conditions is met: • Writes 1 to the CLREN bit in the CHCTRL_n register. • When a bus error was reported during transfer • When all DMA transfers complete in register mode (transfers complete when the REN bit in the CHCFG_n register = 0) • In link mode, when DMA transfer (write back when WBD = 0) of the last descriptor (LE = 1) completes • When reading the descriptor in link mode stopped (when LV = 0, and DRRP in the CHCFG_n register = 0)	R

Bit	Symbol	Bit Name	Description	R/W
b1	RQST	DMA Transfer Request	This bit indicates that the transfer request is accepted. 0: The DMA transfer request is not accepted. 1: The DMA transfer request is accepted. [Setting condition] • The transfer request is accepted. [Clearing conditions] When any of the following conditions is met: • Writes 1 to the SWRST bit in the CHCTRL_n register. • Writes 1 to the CLRRQ bit in the CHCTRL_n register. • In single transfer (the TM bit in the CHCFG_n register = 0) mode, the transfer specified in the REQD bit in the CHCFG_n register is performed • When all DMA transfers complete in register mode (transfer completes when the REN bit in the CHCFG_n register = 0) • In link mode, DMA transfer of the last descriptor (LE = 1) completes • In link mode, reading the descriptor is disabled (when LV = 0, and DRRP in the CHCFG_n register = 0) • In link mode, the DEM bit in the CHCFG_n register = 0, and DMA transfer completes. • When a buss error was reported to the master interface	R
b2	TACT	DMAC Operating Status	This bit indicates that DMAC is running. This bit is used to make sure the channel stops completely. For details, see section 15.3.9, DMA Transfer Status. 0: DMA in Channel_n stops. 1: DMA in Channel_n is running. [Setting condition] • Write 1 to the SETEN bit in the CHCTRL_n register (Reading the descriptor starts, or the DMA request is being waited). [Clearing condition] • When the internal state is idling (the EN bit in the CHSTAT_n register is cleared to 0, and all DMA transfer completes).	R
b3	SUS	Suspend	This bit indicates that the channel is suspended. For details, see section 15.3.10, Suspending a Transfer. 0: Channel_n is not suspended. 1: Channel_n is suspended. [Setting condition] • Writes 1 to the SETSUS bit in the CHCTRL_n register during DMA transfer of Channel_n, and the internal state is changed to the suspended state. [Clearing conditions] When any of the following conditions is met: • Writes 1 to the CLRSUS bit in the CHCTRL_n register. • Writes 1 to the CLREN bit in the CHCTRL_n register. • Condition for clearing the EN bit in the CHSTAT_n register	R

Bit	Symbol	Bit Name	Description	R/W
b4	ER	DMA Error	This bit indicates that a DMA error interrupt is generated as a result of the bus error during DMA transfer. 0: No bus error occurred. 1: A bus error occurred. [Setting condition] • A buss error is reported to the bus cycle [Clearing condition] • Writes 1 to the SWRST bit in the CHCTRL_n register.	R
b5	END	DMA Transfer Completion Interrupt	This bit indicates that DMA transfer completes, and a DMA interrupt is generated. 0: DMA transfer is not completed. 1: DMA transfer is completed. [Setting conditions] When any of the following conditions is met: • The following conditions being met while the DEM bit in the CHCFG_n register = 0 (1) When a transfer for the total number of transfer bytes loaded to the CRTB register completes in register mode (2) When a transfer for the total number of transfer bytes loaded to the CRTB register completes in link mode while the WBD bit in the header of the descriptor is 1 (3) Completion of descriptor write-back in link mode while the WBD bit in the header of the descriptor is 0 • In link mode, the descriptor is read, LV of header = 0, and DRRP in the CHCFG_n register = 0, and DIM = 0. [Clearing conditions] When any of the following conditions is met: • Writes 1 to the CLREND bit in the CHCTRL_n register. • Writes 1 to the SWRST bit in the CHCTRL_n register.	R
b6	—	Reserved	This bit is always read as 0.	R
b7	SR	Next Register Select	In register mode, indicates the selected register set. 0: Next0 Register Set 1: Next1 Register Set [Setting condition] • Set 1 to the RSEL bit in the CHCFG_n register. [Clearing condition] • Clears the RSEL bit in the CHCFG_n register to 0.	R

Bit	Symbol	Bit Name	Description	R/W
b8	DL	Descriptor Load	Indicates that the descriptor is being read. In addition, if a bus error is reported while the descriptor is being read, 1 is retained. 0: The descriptor is not being read. 1: (When ER = 0) The descriptor is being read in link mode. (When ER = 1) A buss error occurred while the descriptor is being read in link mode. [Setting condition] • Reading the descriptor in link mode is started [Clearing conditions] When any of the following conditions is met: • Reading the descriptor in link mode completes with the OK response. • Writes 1 to the SWRST bit in the CHCTRL_n register. (If 1 is retained for the bus error, it can be cleared to 0 only by the SWRST bit.)	R
b9	DW	Descriptor Write Back	Indicates that the descriptor is being written back. In addition, if a bus error is reported while the descriptor is written back, 1 is retained. 0: Header is not written back in link mode. 1: (The ER bit in the CHSTAT_n register = 0) Header is written back in link mode. (The ER bit in the CHSTAT_n register = 1) A buss error occurred when header is written back in link mode. [Setting condition] • Writing back of header in link mode started. [Clearing conditions] • Writing back of header in link mode completes with the OK response. • Writes 1 to the SWRST bit in the CHCTRL_n register (If 1 is retained due to the buss error, it can be cleared to 0 only by the SWRST bit).	R
b10	DER	Descriptor Error	Indicates that the read descriptor is invalid (LV = 0). (Does not depend on the value of the DIM bit in the CHCFG_n register.) 0: No descriptor error occurred. 1: Descriptor error occurred. [Setting condition] • In link mode, the DRRP bit in the CHCFG_n register = 0, and the read descriptor's LV is 0. [Clearing conditions] When any of the following conditions is met: • Writes 1 to the CLRDE bit in the CHCTRL_n register. • Writes 1 to the SWRST bit in the CHCTRL_n register.	R
b11	MODE	DMA Mode	This bit indicates DMA mode. Indicates the setting value of the DMS bit in the CHCFG_n register. 0: Register mode 1: Link mode	R
b15 to b12	—	Reserved	These bits are always read as 0.	R

Bit	Symbol	Bit Name	Description	R/W
b16	INTM	Interrupt Request Mask	Indicates the temporary mask status of DMA interrupt output. 1: Temporary mask status 0: The temporary mask status is cleared. [Setting condition] • Writes 1 to the SETINTM bit in the CHCTRL_n register. [Clearing conditions] When any of the following conditions is met: • Writes 1 to the CLRINTM bit in the CHCTRL_n register. • Writes 1 to the SWRST bit in the CHCTRL_n register.	R
b17	DMARQM	DMA Activation Request Mask	Indicates the temporary mask status of the DMA request. 1: Temporary mask status 0: Temporary mask status is cleared. [Setting condition] • Sets 1 to the SETDMARQM bit in the CHCTRL_n register. [Clearing conditions] When any of the following conditions is met: • Writes 1 to the CLRDMARQM bit in the CHCTRL_n register. • Writes 1 to the SWRST bit in the CHCTRL_n register.	R
b18	SWPRQ	Forced Ejection Request	Indicates the forced ejection request status. Indicates the software forced ejection request (a request activated by the SETSSWPRQ bit in the CHCTRL_n register). 1: Forced ejection is requested. 0: Forced ejection is not requested. [Setting condition] • Sets 1 to the SETSSWPRQ bit in the CHCTRL_n register. [Clearing conditions] When any of the following conditions is met: • The amount of data in the buffer becomes 0 because of forced ejection. • Writes 1 to the SWRST bit in the CHCTRL_n register.	R
b23 to b19	—	Reserved	These bits are always read as 0.	R
b31 to b24	DNUM	Amount of Data in the Buffer	These bits indicate the amount of valid data in the buffer. Read data from the DMA transfer source, and indicate the amount of data that is not written to the transfer destination (in bytes). [Increment condition] • When DMA read transfer completes [Decrement condition] • When DMA write transfer completes [Clearing conditions] When any of the following conditions is met: • Condition for clearing the EN bit • Writes 1 to the SWRST bit in the CHCTRL_n register.	R

Note 1. Handle the transfer when the ER bit in the CHSTAT_n register is set to 1 as invalid.
Note 2. To suspend DMA transfer, mask or clear the transfer request, or clear the EN bit in the CHSTAT_n register. See section 15.3.11, Aborting a Transfer for the procedure).
Note 3. To request a transfer by software, make sure that the previously requested DMA transfer operation completes (by checking Current Register), set the DMREQ bit in the DMAC software activation register (DMASTG), and then activate DMA.

15.2.8 DMAC Unit 0 Source Select Register i (DMA0SELi) (i = 0 to 15)

The DMA0SELi register selects the activation trigger source of channel i (i = 0 to 15) for DMAC unit 0. For details on numbers that are selected by this source selection, see the vector numbers listed in Table 12.3, Cortex-R4/DMAC Interrupt Vector Table. In addition, do not set the same source for multiple DMA0SELi and DMA1SELi registers. If the same source is set, the operation of this LSI cannot be guaranteed.

Address(es): DMA0.DMA0SEL0 A009 4000h, DMA0.DMA0SEL1 A009 4004h, DMA0.DMA0SEL2 A009 4008h, DMA0.DMA0SEL3 A009 400Ch, DMA0.DMA0SEL4 A009 4010h, DMA0.DMA0SEL5 A009 4014h, DMA0.DMA0SEL6 A009 4018h, DMA0.DMA0SEL7 A009 401Ch, DMA0.DMA0SEL8 A009 4020h, DMA0.DMA0SEL9 A009 4024h, DMA0.DMA0SEL10 A009 4028h, DMA0.DMA0SEL11 A009 402Ch, DMA0.DMA0SEL12 A009 4030h, DMA0.DMA0SEL13 A009 4034h, DMA0.DMA0SEL14 A009 4038h, DMA0.DMA0SEL15 A009 403Ch

b31 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

15.2.9 DMAC Unit 1 Source Select Register i (DMA1SELi) (i = 0 to 15)

The DMA1SELi register selects the activation trigger source of channel i (i = 0 to 15) for DMAC unit 1. For details on numbers that are selected for this source selection, see the vector numbers listed in Table 12.3, Cortex-R4/DMAC Interrupt Vector Table. In addition, do not set the same source for multiple DMA0SELi and DMA1SELi registers. If the same source is set, the operation cannot be guaranteed.

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	DMREQ0	DMA Unit 0 Software Activation	0: DMA transfer is not requested. 1: DMA transfer is requested.	W
b1	DMREQ1	DMA Unit 1 Software Activation	0: DMA transfer is not requested. 1: DMA transfer is requested.	W
b31 to b2	—	Reserved	The write value should be 0.	W

DMREQ0, DMREQ1 Bits (DMA Unit 0/1 Software Activation)

DMA transfer is requested if you select DMA activation by software for the DMA0SELi register and the DMA1SELi register (i = 0 to 15), and then write 1 to DMREQ0 and DMREQ1 bits.

These bits are write only. These bits are read as 0.

15.2.11 Common Control Register (CMNCR)

CMNCR is a 32-bit register that controls the common items for each area.

Address(es): A000 2000h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	—	Reserved	These bits are always read as 0. The write value should always be 0.	R/W
b4, b3	—	Reserved	This bit is always read as 1. The write value should always be 1.	R/W
b8 to b5	—	Reserved	These bits are always read as 0. The write value should always be 0.	R/W
b10, b9	DPRTY[1:0]	DMA Burst Transfer Priority	Specify the priority for a refresh request during DMA burst transfer. 0x: Accepts a refresh request during DMA burst transfer. 10: Does not accept a refresh request during DMA burst transfer. 11: Reserved (setting prohibited)	R/W
b11	—	Reserved	This bit is always read as 0. The write value should always be 0.	R/W
b12	—	Reserved	This bit is always read as 1. The write value should always be 1.	R/W
b23 to b13	—	Reserved	These bits are always read as 0. The write value should always be 0.	R/W
b24	AL0	Acknowledge Level	Specifies the active level of the DACK0 signal. 0: Active-low output from DACK0 1: Active-high output from DACK0	R/W
b25	AL1	Acknowledge Level	Specifies the active level of the DACK1 signal. 0: Active-low output from DACK1 1: Active-high output from DACK1	R/W
b26	AL2	Acknowledge Level	Specifies the active level of the DACK2 signal. 0: Active-low output from DACK2 1: Active-high output from DACK2	R/W
b27	—	Reserved	This bit is always read as 0. The write value should always be 0.	R/W
b28	TL0	Transfer End Level	Specifies the active level of the TEND0 signal. 0: Active-low output from TEND0 1: Active-high output from TEND0	R/W
b29	TL1	Transfer End Level	Specifies the active level of the TEND1 signal. 0: Active-low output from TEND1 1: Active-high output from TEND1	R/W
b30	TL2	Transfer End Level	Specifies the active level of the TEND2 signal. 0: Active-low output from TEND2 1: Active-high output from TEND2	R/W
b31	—	Reserved	This bit is always read as 0. The write value should always be 0.	R/W

15.2.12 Channel Control Register n (CHCTRL_n)

The CHCTRL_n register controls DMA transfer of DMA channel n (n = 15 to 0).
This register is used to activate each function, and it does not retain the written value. These bits are always read as 0. Only resources for channel n are masked temporary for forced ejection request and DMA transfer request inputs by the CLRDMARQM and SETDMARQM bits.

Address(es): DMAC0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	SETSSWPRQ	—	SETREN	—	—	CLRSUS	SETSUS	CLRDE	—	CLRENDD	CLRRQ	SWRST	—	CLREN	SETEN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	SETEN	DMA Activation Enable	Enables DMA transfer of DMA channel n. When this bit is set with the SWRST bit, clearing by the SWRST bit takes precedence, and a transfer does not start. This bit is always read as 0. 1: DMA transfer is enabled (The EN bit in the CHSTAT_n register is set). 0: Operation is not affected. Note: For resetting the DMA register, stop the ongoing DMA transfer by setting the CLREN bit and then set the SETEN bit.	R/W
b1	CLREN	DMA Activation Enable Clear	Clears the EN bit in the CHSTAT_n register (For details, see section 15.3.11, Aborting a Transfer). This bit is always read as 0. 1: DMA transfer is disabled (The EN bit in the CHSTAT_n register is cleared). 0: Operation is not affected.	R/W
b2	—	Reserved	This bit is always read as 0. The write value should be 0.	R/W
b3	SWRST	Software Reset	Clears each bit in the CHSTAT_n register (For details on the bit to be cleared, see descriptions of the applicable bit). Set this bit to 0 when the EN bit and the TACT bit are cleared to 0. This bit is always read as 0. 1: Clears each bit in the CHSTAT_n register. 0: Operation is not affected.	R/W
b4	CLRRQ	DMA Transfer Request Clear	Clears the RQST bit in the CHSTAT_n register to 0. This bit is always read as 0. 1: Clears the RQST bit in the CHSTAT_n register. 0: Operation is not affected.	R/W
b5	CLREND	END Clear	Clears the END bit in the CHSTAT_n register to 0. This bit is always read as 0. 1: Clears the END bit. 0: Operation is not affected.	R/W
b6	—	Reserved	This bit is always read as 0. The write value should be 0.	R/W

Bit	Symbol	Bit Name	Description	R/W
b7	CLRDE	DER Clear	Clears the descriptor error bit (DER) in the CHSTAT_n register to 0. This bit is always read as 0. 1: Clears the DER bit. 0: Operation is not affected.	R/W
b8	SETSUS	Suspend Request	If 1 is set to this bit when the EN bit in the CHSTAT_n register is 1, the current DMA transfer is suspended. This bit is always read as 0. 1: Suspends the current DMA transfer. 0: Operation is not affected.	R/W
b9	CLRSUS	Suspend Clear	If 1 is set to this bit when the SUS bit in the CHSTAT_n register is 1, the temporary suspend status is cleared. This bit is always read as 0. 1: Clears the temporary suspend status of the current DMA transfer. 0: Operation is not affected.	R/W
b11, b10	—	Reserved	These bits are always read as 0. The write value should be 0.	R/W
b12	SETREN	REN Set Enable	Sets the register set enable bit (REN) in the CHCFG_n register. This bit is always read as 0. 1: Sets the REN bit in the CHCFG_n register. 0: Operation is not affected.	R/W
b13	—	Reserved	This bit is always read as 0. The write value should be 0.	R/W
b14	SETSSWPRQ	Software Forced Ejection Request	Forcibly ejects data in the buffer to the transfer destination (See section 15.3.6, Forced Ejection Request). This bit is always read as 0. 1: Writes data in the buffer, which is not written, to the transfer destination. 0: Operation is not affected. Requests a hardware request on the destination side (when the RFQD bit in the CHCFGn register (n = 0 to 15) = 1), forced ejection cannot be used (disabled by the hardware).	R/W
b15	—	Reserved	This bit is always read as 0. The write value should be 0.	R/W
b16	SETINTM	Interrupt Request Mask	Masks DMA transfer completion interrupt output temporary. Besides, the INTM bit in the CHSTATn register is set to 1. This bit is always read as 0. 1: Masks a DMA transfer completion interrupt temporary. 0: Operation is not affected.	R/W
b17	CLRINTM	Interrupt Request Mask Clear	Clears the mask status of DMA transfer completion interrupt output. Besides, the INTM bit in the CHSTATn register is cleared to 0. If the mask state is cleared when the LVINT bit in the DCTRL register = 1, and the END bit in the CHSTAT_n register = 1, DMA transfer completion interrupt is deactivated. (It is not activated when LVINT = 0.) This bit is always read as 0. 1: Clears the mask state set by the SETINTM bit. 0: Operation is not affected.	R/W
b18	SETDMARQM	DMA Activation Request Mask	Masks DMA transfer request input temporary. Besides, the DMARQM bit in the CHSTATn register is set to 1. This bit is always read as 0. 1: Masks DMA transfer request input. 0: Operation is not affected.	R/W
b19	CLRDMARQM	DMA Activation Request Mask Clear	Clears the mask state of DMA transfer request input. Besides, the DMARQM bit in the CHSTATn register is cleared to 0. This bit is always read as 0. 1: Clears the mask state set by the SETDMARQM bit. 0: Operation is not affected.	R/W
b31 to b20	—	Reserved	These bits are always read as 0. The write value should be 0.	R/W

15.2.13 Channel Configuration Register n (CHCFG_n)

The CHCFG_n register controls DMA transfer of DMA channel n (n = 15 to 0).

Specify the detection method depending on the DMA transfer source to be used. For details on the DMA request signals, see section 15.3.4.1, Specifying Detection Operation of DMA Transfer Requests for Each Source.

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	SEL[2:0]	Pin Select	Sets channels of DMAC. Set the following values so that the channels of CHCFG_n (n = 0 to 15) and the channel set by SEL become the same: For example, set 001b to the SEL bit in CHCFG_1. Similarly, set 001b to the SEL bit in CHCFG_1. DMAC0/1 b2 b0 000: Channel 0/8 001: Channel 1/9 010: Channel 2/10 011: Channel 3/11 100: Channel 4/12 101: Channel 5/13 110: Channel 6/14 111: Channel 7/15	R/W
b3	REQD	DMA Activation Request Source Select	Specifies the DMA transfer request input source (internal modules or external devices that require DACK). The timing when DACK/TEND become active is determined by the setting of this bit. 0: Requested by a transfer source module. DACK/TEND output is activated when it is read (a value after a reset). 1: Requested by a transfer destination module. DACK/TEND output is activated when it is written.	R/W
b4	LOEN	L Detection Enable	Specifies the detection method of the DMA request signal. When LVL = 0 LOEN = 1: If DMA transfer request input detects a falling edge, it is regarded as requested. LOEN = 0: If the DMA transfer request input falls, the request is not recognized (a value after a reset). When LVL = 1 LOEN = 1: If DMA transfer request input detects the Low level, it is regarded as requested. LOEN = 0: If the DMA transfer request input is the Low level, the request is not recognized (a value after a reset).	R/W

Bit	Symbol	Bit Name	Description	R/W
b5	HIEN	H Detection Enable	Specifies the detection method of the DMA request signal. When LVL = 0 HIEN = 1: If DMA transfer request input detects a rising edge, it is regarded as requested. HIEN = 0: If the DMA transfer request input rises, the request is not recognized (a value after a reset). When LVL = 1 HIEN = 1: If DMA transfer request input detects the High level, it is regarded as requested. HIEN = 0: If the DMA transfer request input is the High level, the request is not recognized (a value after a reset).	R/W
b6	LVL	Level Detection Enable	Specifies the detection method of the DMA request signal. 0: Detects the edge (a value after a reset). 1: Detects the level.	R/W
b7	—	Reserved	This bit is always read as 0. The write value should be 0.	R/W
b10 to b8	AM[2:0]	ACK Mode	Sets DACK/TEND output mode. b10 b8 000: Setting is prohibited (a value after a reset). At the initial setup, set a value other than 000b. 001: Level mode (Active until DMA transfer request input becomes inactive). 01x: Bus cycle mode (Active between DMA transfer cycles (Active if internal resources are the target)). 1xx: Masks DACK/TEND output. Note: For the conditions for outputting the DACK and TEND signals, see section 15.3.5, DMA Acknowledge Output/ DMA Transaction Completion Output Function.	R/W
b11	DRRP	Descriptor Reload Enable	Specifies the operation when LV of header = 0 while during descriptor read (see section 15.3.1.2, Link Mode (1) Operation flows in link mode). 0: Sets the DER bit in the CHSTAT_n register, and stops the operation (a value after a reset). 1: Continues reading the same descriptor until LV becomes 1. When LV becomes 1, DMA transfer using the descriptor value starts. The DSCITVL register controls the descriptor read interval.	R/W
b15 to b12	SDS[3:0]	Source Data Size	Sets the size of data in the transfer source to be transferred at a time. For a single transfer, the specified amount of data is transferred by a single request. For a block transfer, data is transferred as many times as the setting value × N times until the CRTB register is cleared to 0. For a transfer of 32 bits or more, 32 bits × N times burst transfers are performed. The SDS[3] bit switches between normal mode and skip mode. 0: Normal mode (a value after a reset). 1: Skip mode The SDS[2:0] bits set the transfer size. b14 b12 000: 8 bits (a value after a reset) 001: 16 bits 010: 32 bits 011: Setting is prohibited. 100: 128 bits*2 101: 256 bits (Can be set only for DMAC0) 110: 512 bits (Can be set only for DMAC0)*1 111: Setting is prohibited.	R/W

Bit	Symbol	Bit Name	Description	R/W
b19 to b16	DDS[3:0]	Destination Data Size	Sets the size of data in the transfer destination to be transferred at a time. The DDS[3] bit switches between normal mode and skip mode. 0: Normal mode (a value after a reset). 1: Skip mode The DDS[2:0] bits set the transfer size. b18 b16 000: 8 bits (a value after a reset) 001: 16 bits 010: 32 bits 011: Setting is prohibited. 100: 128 bits*2 101: 256 bits (Can be set only for DMAC0) 110: 512 bits (Can be set only for DMAC0)*1 111: Setting is prohibited.	R/W
b20	SAD	Source Address Count Direction	Sets the count direction of the transfer source address of DMA channel n. 0: Increment (a value after a reset) 1: Fixed To use SKIP mode on the transfer source, do not specify SAD = 1 (fixed). If SAD = 1 (fixed) is specified, the address of the transfer source should be aligned with a boundary of the size specified by the SDS[3:0] bits.	R/W
b21	DAD	Destination Address Count Direction	Sets the count direction of the transfer destination address of DMA channel n. 0: Increment (a value after a reset) 1: Fixed To use SKIP mode on the transfer destination, do not specify DAD = 1 (fixed). If DAD = 1 (fixed) is specified, the address of the transfer destination should be aligned with a boundary of the size specified by the DDS[3:0] bits.	R/W
b22	TM	Transfer Mode	Sets DMA transfer mode. 0: Single transfer mode (a value after a reset) 1: Block transfer mode	R/W
b23	WONLY	Write-Only Mode	Sets the write-only mode (see section 15.3.1.3, Write-Only Mode). 0: Normal mode (a value after a reset). 1: Write-only mode	R/W
b24	DEM	Transfer Completion Interrupt Mask	Masks DMA transfer completion interrupt detection. If this bit is set to 1 when DMA transfer completion interrupt is output, DMA transfer completion interrupt is not activated. Besides, the END bit in the CHSTAT_n register is not set. In register mode, the DEM bit is automatically cleared to 0. In link mode, it is not cleared. 0: Does not mask (a value after a reset). 1: Masks. [Clearing condition] DEM = 1, and DMA transfer completes.	R/W
b25	—	Reserved	This bit is always read as 0. The write value should be 0.	R/W
b26	DIM	Descriptor Interrupt Mask	Sets the DMA transfer completion interrupt mask if LV = 0 when header of the descriptor is read. 0: Does not mask a DMA transfer completion interrupt (a value after reset). 1: Masks a DMA transfer completion interrupt.	R/W

Bit	Symbol	Bit Name	Description	R/W
b27	SBE	Buffer Flush Enable	If the EN bit in the CHSTAT_n register is cleared to 0 during DMA transfer, selects whether to stop flushing (writing) data that is already read and stored in the buffer. Only when REQD = 0, flush mode can be used. 0: Stops transfer without flushing data in the buffer (a value after a reset). 1: Stops transfer after flushing data in the buffer.	R/W
b28	RSEL	Next Register Select	Selects the Next register set to be executed next. This bit is valid in register mode only. When RSW = 1, the value is reversed automatically (0 is reversed to 1, 1 is reversed to 0) after DMA transfer completes. 0: Executes Next0 Register Set (a value after a reset). 1: Executes Next1 Register Set. [Transition condition] RSW = 1, and DMA transfer completes.	R/W
b29	RSW	RSEL Reverse	When DMA transfer completes, the RSEL bit is automatically reversed (0 is reversed to 1, 1 is reversed to 0). This bit is valid in register mode only. 0: Does not reverse the RSEL bit when DMA transfer completes (a value after a reset). 1: Reverses the RSEL bit when DMA transfer completes.	R/W
b30	REN	Register Set Enable	When DMA transfer completes, performs DMA transfer of the Next register set selected by the RSEL bit accordingly. This bit is valid in register mode only. 0: Does not perform DMA transfer accordingly. 1: Performs DMA transfer accordingly. [Setting conditions] When any of the following conditions is met: • Writes 1 to this bit. • Writes 1 to the SETREN bit in the CHCTRL_n register. [Clearing conditions] • Writes 0 to this bit. • REN = 1, and DMA transfer completes. To reset the REN bit during DMA transfer, use the SETREN bit in the CHCTRL_n register. Also, reset the CHCFG_n.DEM bit to mask detection of DMA transfer completion interrupt.	R/W
b31	DMS	DMA Mode Select	Sets DMA mode. 0: Register mode (a value after a reset). 1: Link mode	R/W

Note 1. If the size is set to 512 bits, the address of the transfer source/destination should be aligned with 512-bit boundaries.
Note 2. If the size is set to 128 bits when DMAC1 is used, the address of the transfer source/destination should be aligned with 128-bit boundaries.

15.2.14 Channel Interval Register n (CHITVL_n)

The CHITVL_n register sets the DMA transfer interval of DMA channel n (n = 15 to 0).
For details, see section 15.3.7, Interval Count Function.

Address(es): DMAC0
CHITVL_0: A006 2030h, CHITVL_1: A006 2070h, CHITVL_2: A006 20B0h, CHITVL_3: A006 20F0h,
CHITVL_4: A006 2130h, CHITVL_5: A006 2170h, CHITVL_6: A006 21B0h, CHITVL_7: A006 21F0h,
CHITVL_8: A006 2430h, CHITVL_9: A006 2470h, CHITVL_10: A006 24B0h, CHITVL_11: A006 24F0h,
CHITVL_12: A006 2530h, CHITVL_13: A006 2570h, CHITVL_14: A006 25B0h, CHITVL_15: A006 25F0h

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	CRLA[31:0]	Current Link Address	Indicates the address of the descriptor which is being executed.	R

15.2.17 Source Continuous Register n (SCNT_n)

The SCNT_n register sets the space size for continuous access during read access to the DMA transfer source (n = 15 to 0).

Use this register together with the SSKP_n register (see Figure 15.1).

When setting this register, set the SDS[3] bit in the CHCFG_n register to 1.

Address(es): DMAC0
SCNT_0: A006 2200h, SCNT_1: A006 2220h, SCNT_2: A006 2240h, SCNT_3: A006 2260h,
SCNT_4: A006 2280h, SCNT_5: A006 22A0h, SCNT_6: A006 22C0h, SCNT_7: A006 22E0h,
SCNT_8: A006 2600h, SCNT_9: A006 2620h, SCNT_10: A006 2640h, SCNT_11: A006 2660h,
SCNT_12: A006 2680h, SCNT_13: A006 26A0h, SCNT_14: A006 26C0h, SCNT_15: A006 26E0h
DMAC1
SCNT_0: A006 3200h, SCNT_1: A006 3220h, SCNT_2: A006 3240h, SCNT_3: A006 3260h,
SCNT_4: A006 3280h, SCNT_5: A006 32A0h, SCNT_6: A006 32C0h, SCNT_7: A006 32E0h,
SCNT_8: A006 3600h, SCNT_9: A006 3620h, SCNT_10: A006 3640h, SCNT_11: A006 3660h,
SCNT_12: A006 3680h, SCNT_13: A006 36A0h, SCNT_14: A006 36C0h, SCNT_15: A006 36E0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	SCNT[31:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	SCNT[31:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	SCNT[31:0]	Source Continuous Access Size	Sets the size of the continuous access space during read access to the DMA transfer source in bytes.	R/W

When performing a skip transfer on the transfer source, do not set the SAD bit in the CHCFG_n register to 1 (fixed). In addition, do not perform a skip transfer when this register is set to 0000 0000h.

15.2.18 Source Skip Register n (SSKP_n)

The SSKP_n register sets the skip amount during read access to the DMA transfer source.
During read access to the DMA transfer source, after data of the size set by using the SCNT_n register is accessed, the next DMA transfer source address of the size set by using this register is skipped (n = 15 to 0).
Use this register together with the SCNT_n register (see Figure 15.1).
When setting this register, set the SDS[3] bit in the CHCFG_n register to 1.

Address(es): DMAC0
SSKP_0: A006 2204h, SSKP_1: A006 2224h, SSKP_2: A006 2244h, SSKP_3: A006 2264h,
SSKP_4: A006 2284h, SSKP_5: A006 22A4h, SSKP_6: A006 22C4h, SSKP_7: A006 22E4h,
SSKP_8: A006 2604h, SSKP_9: A006 2624h, SSKP_10: A006 2644h, SSKP_11: A006 2664h,

DMAC1
SSKP_0: A006 3204h, SSKP_1: A006 3224h, SSKP_2: A006 3244h, SSKP_3: A006 3264h,
SSKP_4: A006 3284h, SSKP_5: A006 32A4h, SSKP_6: A006 32C4h, SSKP_7: A006 32E4h,
SSKP_8: A006 3604h, SSKP_9: A006 3624h, SSKP_10: A006 3644h, SSKP_11: A006 3664h,
SSKP_12: A006 3684h, SSKP_13: A006 36A4h, SSKP_14: A006 36C4h, SSKP_15: A006 36E4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	SSKP[31:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	SSKP[31:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	SSKP[31:0]	Source Skip Size	Sets the skip amount during read access to the DMA transfer source in bytes.	R/W

When performing a skip transfer on the transfer source, do not set the SAD bit in the CHCFG_n register to 1 (fixed).

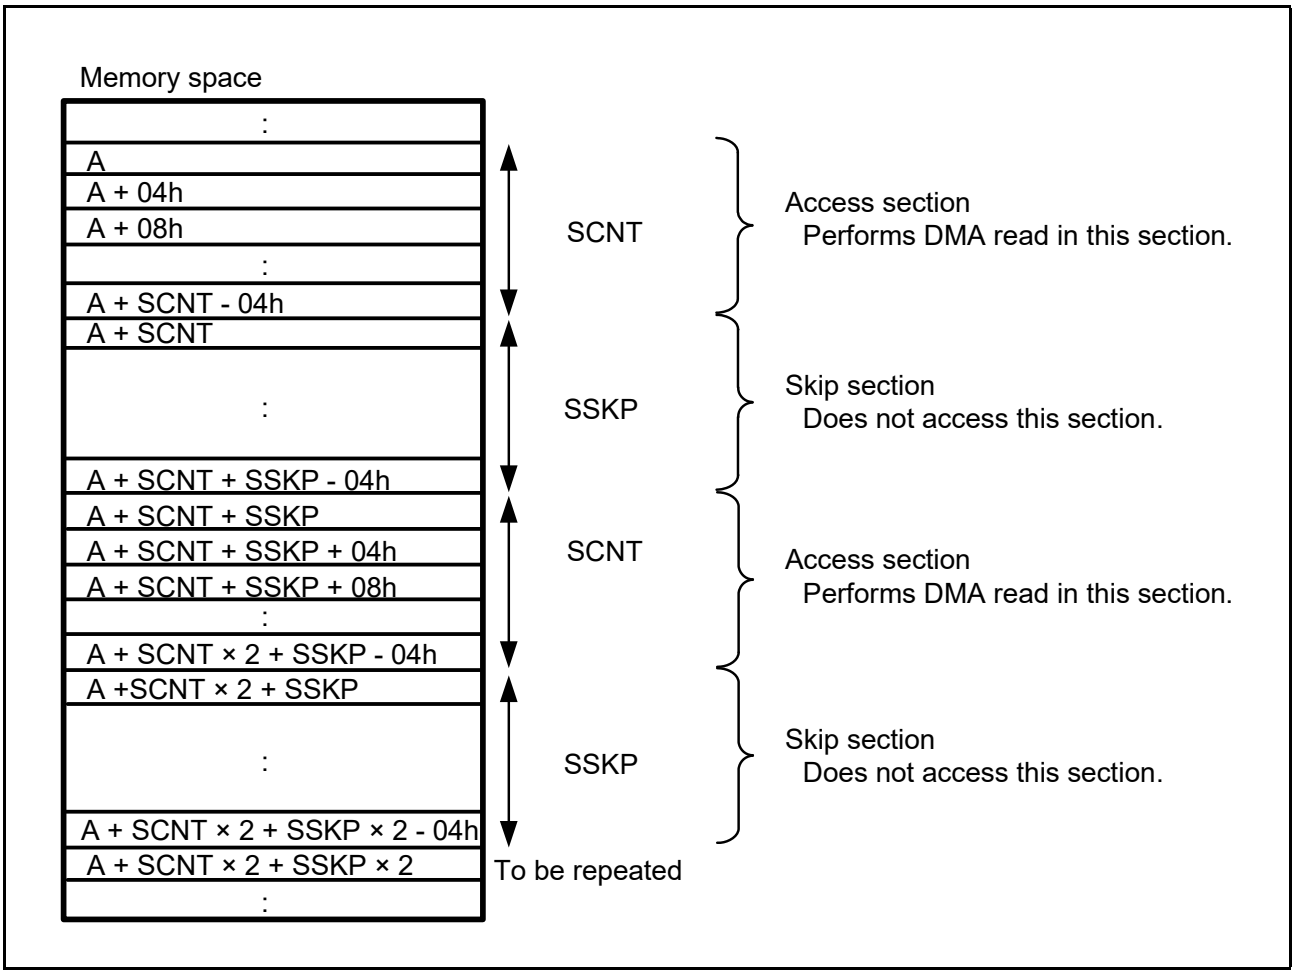

Figure 15.1 Relationship between SSKP and SCNT

Regardless of the source address and the setting value of the RDS field in the CHCFG_n register, the values for SCNT and SSKP can be set. DMAC accesses in the size set in the SDS field in the CHCFG_n register, and acquires the buffer of the valid data only.

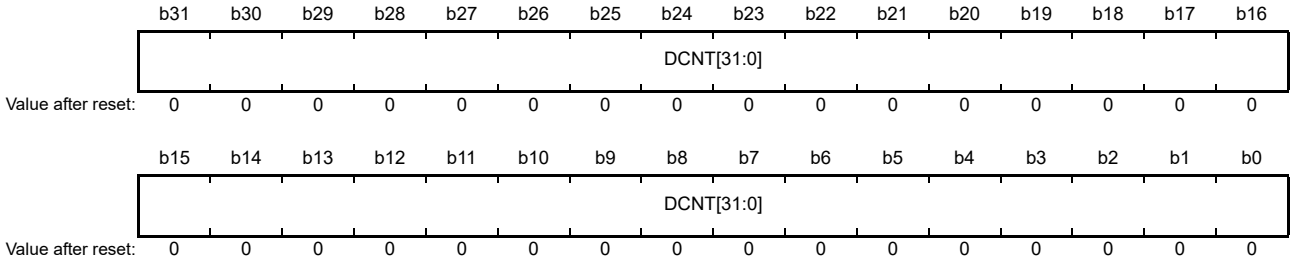
15.2.19 Destination Continuous Register n (DCNT_n)

The DCNT_n register sets the space size for continuous access during write access to the DMA transfer destination (n = 15 to 0).

Use this register together with the DSKP_n register (see Figure 15.2).

To set this register, set the DDS[3] bit in the CHCFG_n register to 1.

Address(es): DMAC0
DCNT_0: A006 2208h, DCNT_1: A006 2228h, DCNT_2: A006 2248h, DCNT_3: A006 2268h,
DCNT_4: A006 2288h, DCNT_5: A006 22A8h, DCNT_6: A006 22C8h, DCNT_7: A006 22E8h,
DCNT_8: A006 2608h, DCNT_9: A006 2628h, DCNT_10: A006 2648h, DCNT_11: A006 2668h,
DCNT_12: A006 2688h, DCNT_13: A006 26A8h, DCNT_14: A006 26C8h, DCNT_15: A006 26E8h
DMAC1
DCNT_0: A006 3208h, DCNT_1: A006 3228h, DCNT_2: A006 3248h, DCNT_3: A006 3268h,
DCNT_4: A006 3288h, DCNT_5: A006 32A8h, DCNT_6: A006 32C8h, DCNT_7: A006 32E8h,
DCNT_8: A006 3608h, DCNT_9: A006 3628h, DCNT_10: A006 3648h, DCNT_11: A006 3668h,
DCNT_12: A006 3688h, DCNT_13: A006 36A8h, DCNT_14: A006 36C8h, DCNT_15: A006 36E8h



Bit	Symbol	Bit Name	Description	R/W
b31 to b0	DCNT[31:0]	Destination Continuous Access Size	Sets the size of the continuous access space during write access to the DMA transfer destination in bytes.	R/W

When performing a skip transfer on the destination, do not set the DAD bit in the CHCFG_n register to 1 (fixed).

In addition, do not perform a skip transfer when this register is set to 0000 0000h.

15.2.20 Destination Skip Register n (DSKP_n)

The DSKP_n register sets the skip amount during write access to the DMA transfer destination.
During write access to the DMA transfer destination, accesses data of the size set with the DCNT_n register, and then skips the number of the next DMA transfer destination addresses set with this register (n = 15 to 0).
Use this register together with the DCNT_n register (see Figure 15.2).
To set this register, set the DDS[3] bit in the CHCFG_n register to 1.

Address(es): DMAC0
DSKP_0: A006 220Ch, DSKP_1: A006 222Ch, DSKP_2: A006 224Ch, DSKP_3: A006 226Ch,

Bit	Symbol	Bit Name	Description	R/W
b31 to b0	DSKP[31:0]	Destination Skip Size	Sets the skip amount during write access to the DMA transfer destination in bytes.	R/W

To perform skip transfer on the destination, do not set the DAD bit in the CHCFG_n register to 1 (fixed).

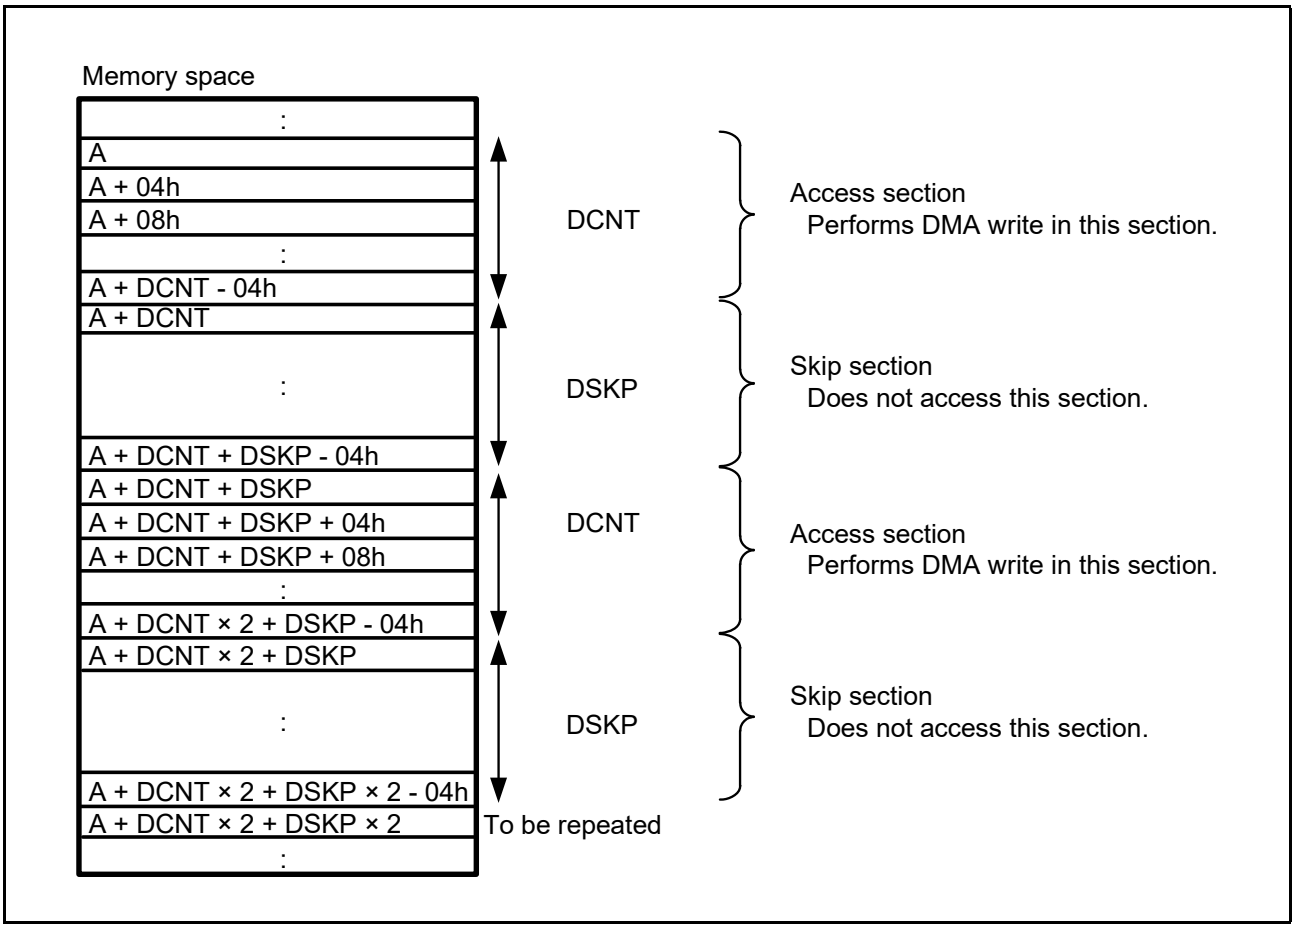

Figure 15.2 Relationship between DSKP and DCNT

Regardless of the destination address and the setting value of the DDS field in the CHCFG_n register, the values for DCNT and DSKP can be set. DMAC performs write access only to the specified space by the size equal to or smaller than the value set in the DDS field in the CHCFG_n register.

15.2.21 DMA Control Register (DCTRL_X (X = A or B))

The DCTRL_X register sets the arbitration between channels in all channels (DCTRL_A = channels 0 to 7, DCTRL_B = channels 8 to 15).

Address(es): DMAC0
DCTRL_A: A006 2300h, DCTRL_B: A006 2700h
DMAC1
DCTRL_A: A006 3300h, DCTRL_B: A006 3700h

Bit	Symbol	Bit Name	Description	R/W
b0	PR	Priority Control Select	Sets the transfer priority control mode (see section 15.3.3, DMA Channel Priority Control). 0: Fixed priority mode 1: Round-robin mode	R/W
b31 to b1	—	Reserved	These bits are always read as 0. The write value should always be 0.	R/W

15.2.22 Descriptor Interval Register n (DSCITVL_X (X = A or B))

The DSCITVL_X register sets the descriptor read interval in all channels (DSCITVL_A = channels 0 to 7, DSCITVL_B = channels 8 to 15).

By setting the DRRP bit in the CHCFG_n register to 1, the descriptor continues to read the descriptor until it reaches LV = 1. This register sets the read interval.

Address(es): DMAC0
DSCITVL_A: A006 2304h, DSCITVL_B: A006 2704h
DMAC1
DSCITVL_A: A006 3304h, DSCITVL_B: A006 3704h

b7 to b0	—	Reserved	These bits are always read as 0. The write value should be 0.	R/W
b15 to b8	DITVL	Descriptor Interval	Sets the descriptor read interval. The descriptor is read again in the interval of (DITVL × 256) cycles. The descriptor read interval will be (the set value in the DITVL bit × 256 × ICLK) cycles.	R/W
b31 to b16	—	Reserved	These bits are always read as 0. The write value should be 0.	R/W

15.2.23 DMA Status EN Register (DST_EN_X (X = A or B))

The DST_EN_X register indicates the status for the EN bit of all channels (DST_EN_A = channels 0 to 7, DST_EN_B = channels 8 to 15).

Writing data to this register does not change the value of each bit.

Address(es): DMAC0
DST_EN_A: A006 2310h, DST_EN_B: A006 2710h
DMAC1
DST_EN_A: A006 3310h, DST_EN_B: A006 3710h

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	SUS0/8	Channel 0/8SUS	Indicates the status for the SUS bit of DMA channel 0/8.	R
b1	SUS1/9	Channel 1/9SUS	Indicates the status for the SUS bit of DMA channel 1/9.	R
b2	SUS2/10	Channel 2/10SUS	Indicates the status for the SUS bit of DMA channel 2/10.	R
b3	SUS3/11	Channel 3/11SUS	Indicates the status for the SUS bit of DMA channel 3/11.	R
b4	SUS4/12	Channel 4/12SUS	Indicates the status for the SUS bit of DMA channel 4/12.	R
b5	SUS5/13	Channel 5/13SUS	Indicates the status for the SUS bit of DMA channel 5/13.	R
b6	SUS6/14	Channel 6/14SUS	Indicates the status for the SUS bit of DMA channel 6/14.	R
b7	SUS7/15	Channel 7/15SUS	Indicates the status for the SUS bit of DMA channel 7/15.	R
b31 to b8	—	Reserved	These bits are always read as 0.	R

15.3 Operation

15.3.1 DMA Mode

With the DMS bit in the CHCFG_n register, DMA mode can be switched between register mode and link mode.

Table 15.3 DMA Mode Setting

DMS (CHCFG_n)	Description	Applications
0	Register mode	With the values set for the next register set, performs a DMA transfer.
1	Link mode	Accesses the descriptor area, and performs a DMA transfer with the value set for the descriptor. Repeats descriptor read and DMA transfer unless you set the descriptor or use the control register to stop them.

15.3.1.1 Register Mode

In register mode, you can perform a DMA transfer with the value set in the internal register.
You can set two sets (Next0 Register Set and Next1 Register Set) of transfer source addresses, the transfer destination addresses, and the numbers of transfer bytes. You can select the next register set to perform a transfer, or transfer two next register sets successively.

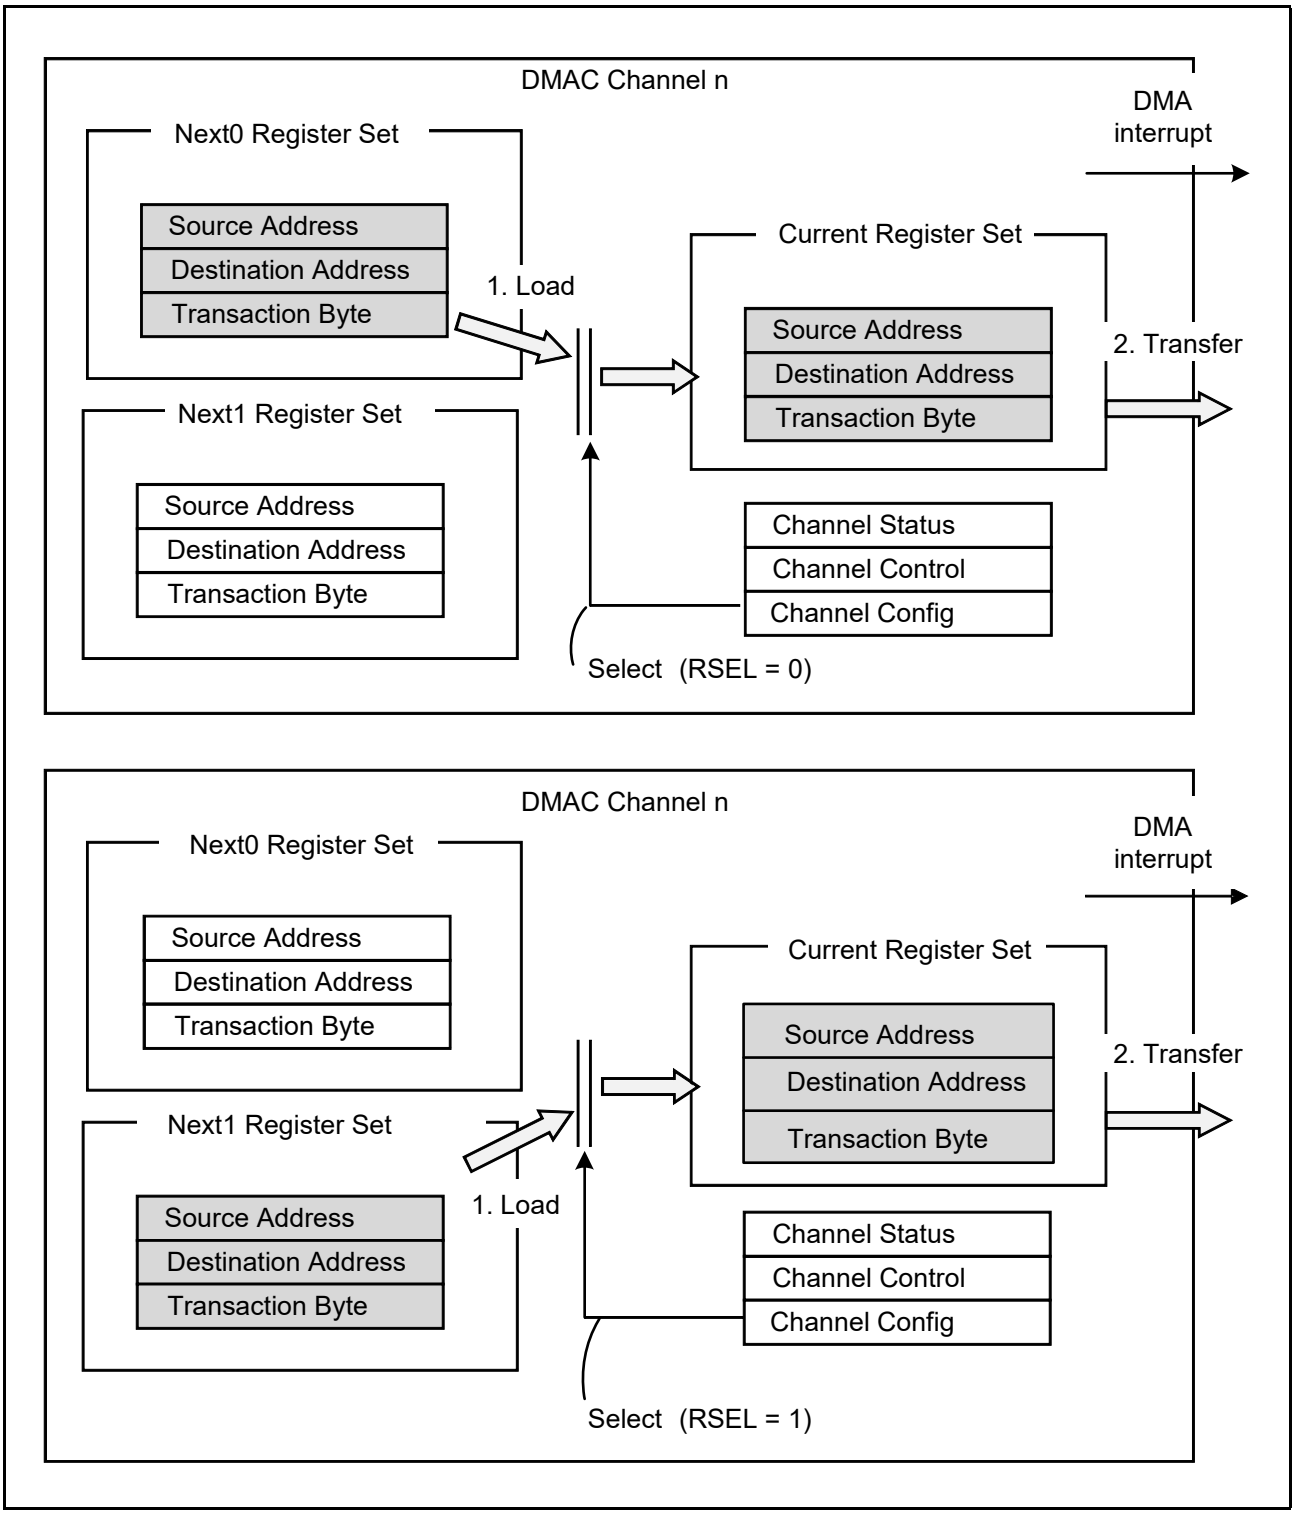

Figure 15.3 Overview of Register Normal Mode

Figure 15.3 illustrates operation when Next0 Register Set is executed (above), and when Next1 Register Set is executed (below).

(1) Operation Flow in Register Mode

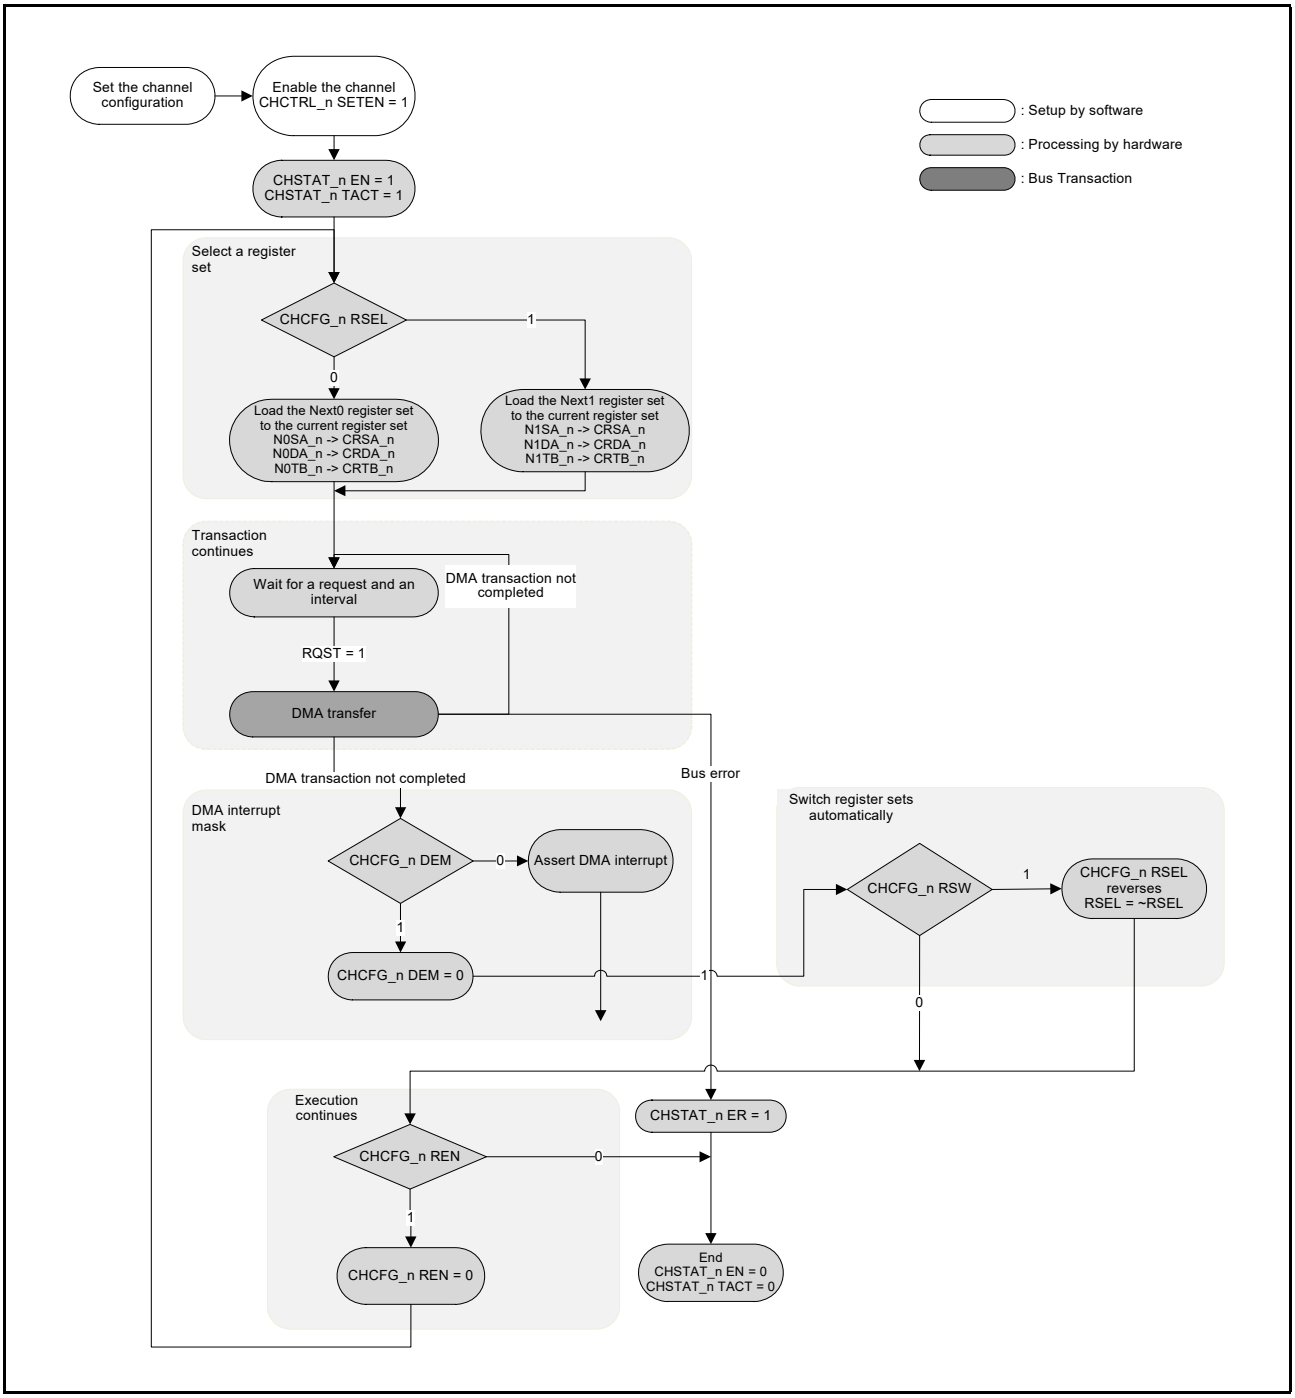

Figure 15.4 Register Mode Flow

<Register Mode Flow Description>

1. Channel Setting
   Set Next0 or Next1 Register Set (the transfer destination address, the transfer source address, and the total number of transfer bytes).
   In addition, use setting registers CHCTRL_n or CHCFG_n for each channel to set detection method of the DMA transfer request, output mode of the DACK/TEND signal, and the amount of data for a transfer.
2. Selecting the register set
   When 1 is written to the SETEN bit in the CHCTRL_n register, the EN bit and the TACT bit in the CHSTAT_n register are set to 1, and the setting value of the next register set selected by the RSEL bit in the CHCFG_n register is loaded to the current register set.
3. DMA Transfer
   According to the set value, a DMA transfer is performed. For details on the transfer, see from section 15.3.2, Transfer Mode to section 15.3.11, Aborting a Transfer.
4. DMA Transfer Completion Mask
   According to the value set for the DEM bit in the CHCFG_n register, the DMA transfer completion interrupt is masked. When DEM = 1, the DMA transfer completion interrupt is masked. Besides, immediately after the DMA transfer completion interrupt conditions are satisfied, the DEM bit is cleared to 0 automatically.
5. Switching Register Sets Automatically
   According to the value set for the RSW bit in the CHCFG_n register, the register set is switched to the other next register set.
6. Successive Execution
   According to the value set for the REN bit in the CHCFG_n register, DMA transfers are performed successively. When REN = 0, the EN bit and the TACT bit in the CHSTAT_n register are cleared to 0, and DMAC stops operation. When REN = 1, the DMA transfer is continued. Besides, immediately after the conditions for performing DMA transfer again are satisfied with the REN bit, the REN bit is cleared to 0 automatically.

(2) Setting the Register Mode

- Register mode settings
  Select the register set to execute.

Table 15.4 Register Mode Settings

DMS (CHCFG_n)	RSEL (CHCFG_n)	Description
0	0	Executes Next0 Register Set.
	1	Executes Next1 Register Set.

- DMA transfer completion interrupt mask settings
  DMA transfer completion interrupts can be masked.

Table 15.5 DMA Transfer Completion Interrupt Mask Settings

DEM (CHCFG_n)	Description
0	When a DMA transfer completes, the DMA transfer completion interrupt is generated.
1	Even if a DMA transfer completes, no DMA transfer completion interrupt is generated. When a DMA transfer completes, the DEM bit is cleared to 0 automatically.

- Settings for executing register sets automatically
  After a DMA transfer, another DMA transfer can be performed successively.

Table 15.6 Settings for Automatic Execution of Register Sets

REN (CHCFG_n)	Operation	Remarks
0	When a DMA transfer of the register set set for the RSEL bit completes, the EN bit is cleared to 0, and the DMA operation ends.	Set this value if you want to perform a DMA transfer once.
1	After a DMA transfer completes, a DMA transfer is performed for the register set that was selected to be performed successively. When the successive transfer is performed, the REN bit is cleared to 0.	Set this register if you want to perform register sets successively.

- Settings for switching register sets automatically
  When a DMA transfer completes, the register set can be switched to the next register set.

Table 15.7 Settings for Switching Register Sets Automatically

RSW (CHCFG_n)	Operation	Remarks
0	When a DMA transfer completes, register sets are not switched.	Set this value when you want to use one register set only.
1	When a DMA transfer completes, the RSEL bit is reversed automatically, and the other register set is selected.	Set this value if you want to switch register sets.

(3) Register Mode Setting Examples

- Using the Next0 register set only

Table 15.8 Register Mode Setting Example 1

DMS (CHCFG_n)	RSEL (CHCFG_n)	DEM (CHCFG_n)	RSW (CHCFG_n)	REN (CHCFG_n)
0 (register mode)	0 (Next0)	0 (Do not mask)	0 (Do not switch)	0 (Continuous execution not in progress)

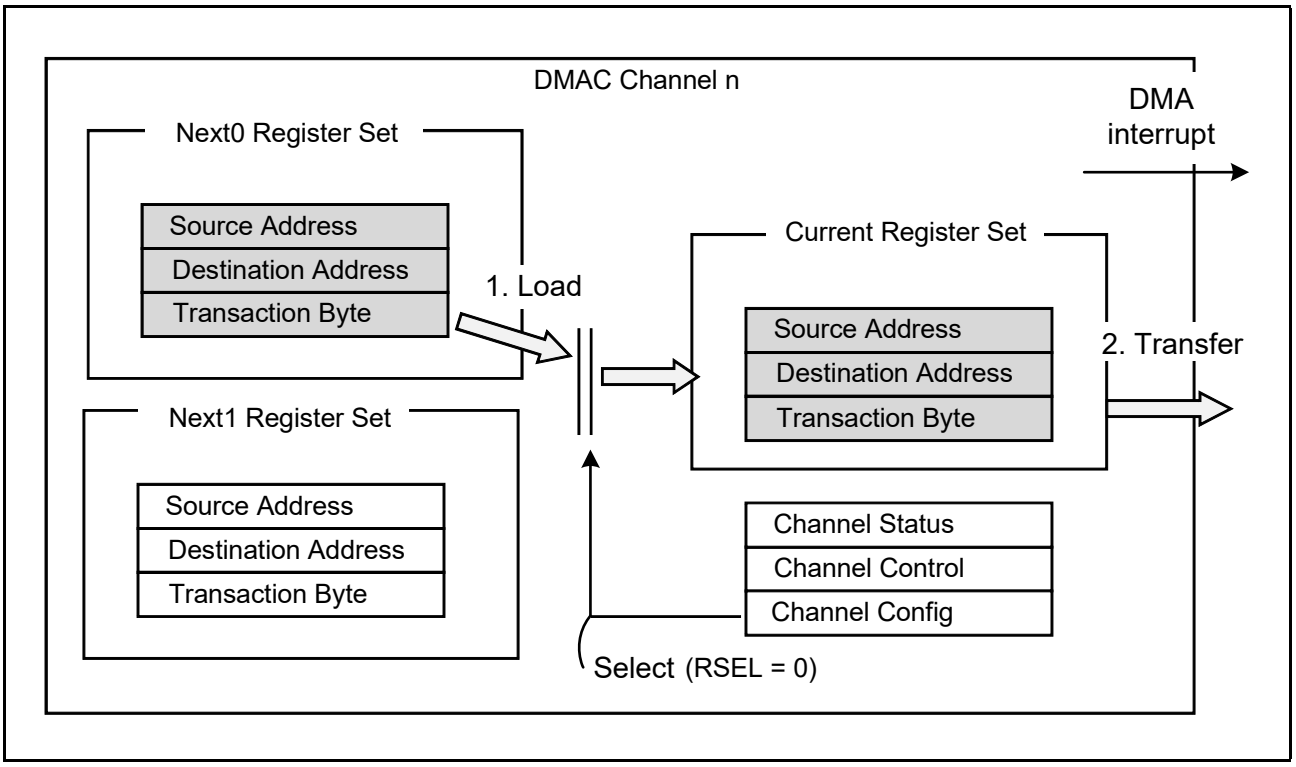

Figure 15.5 Register Mode Setting Example 1

1. Writing 1 to the SETEN bit in the CHCTRL_n register sets 1 to the EN bit in the CHSTAT_n register, and loads Next0 Register Set to the current register set.
2. According to the values set for the current register set and the channel register set, a DMA transfer is performed.
3. Because the DEM bit in the CHCFG_n register is 0, a DMA transfer completion interrupt is generated when a DMA transfer completes.
4. Because the REN bit in the CHCFG_n register is 0, the EN bit in the CHSTAT_n register is cleared to 0, and the operation ends.

- Using two register sets successively

Table 15.9 Register Mode Setting Example 2

DMS (CHCFG_n)	RSEL (CHCFG_n)	DEM (CHCFG_n)	RSW (CHCFG_n)	REN (CHCFG_n)
0 (Register mode)	0 (Next0)	1 (Mask)	1 (Switch)	1 (Continuous execution not in progress)

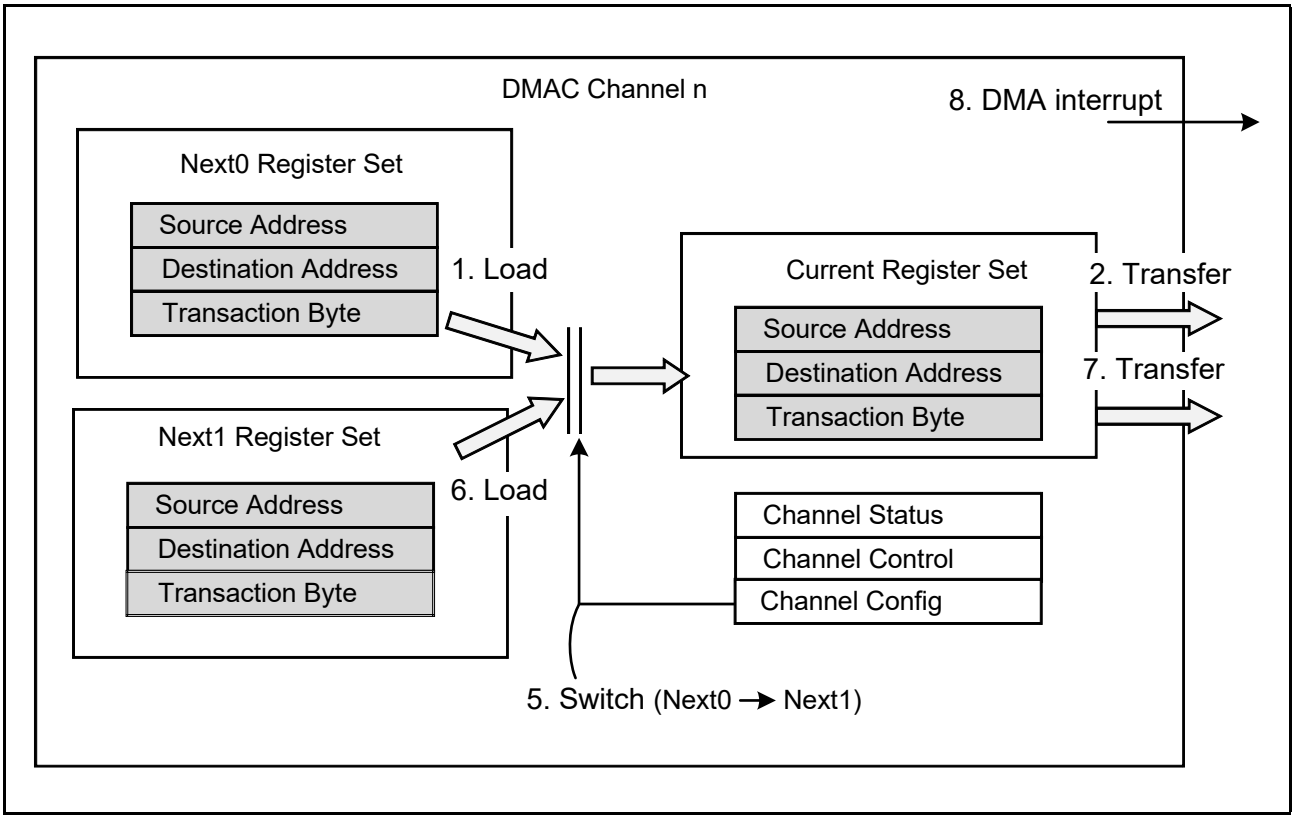

Figure 15.6 Register Mode Setting Example 2

1. Writing 1 to the SETEN bit in the CHCTRL_n register sets 1 to the EN bit in the CHSTAT_n register, and loads Next0 Register Set to the current register set.
2. According to the values set for the current register set and the channel register set, a DMA transfer is performed.
3. Because the DEM bit in the CHCFG_n register is 1, when the DMA transfer completes, no DMA transfer completion interrupt is generated. In addition, the DEM bit is cleared to 0 automatically.
4. Because the REN bit in the CHCFG_n register is 1, DMA transfers are performed successively. In addition, the REN bit is cleared to 0.
5. Because the RSW bit in the CHCFG_n register is 1, the register set to be executed next is switched (RSEL = 0 -> 1).
6. Loads Next1 Register Set to Current Register Set.
7. According to the values for Current Register Set and Channel Register Set, DMA transfers are performed.
8. Because the DEM bit in the CHCFG_n register is 0, a DMA transfer completion interrupt is generated when a DMA transfer completes.
9. Because the REN bit in the CHCFG_n register is 0, the EN bit in the CHSTAT_n register is cleared to 0 automatically.

15.3.1.2 Link Mode

In link mode, a DMA transfer is performed by reading a descriptor in the memory area outside the DMAC as the setting value. Within DMAC, each channel has the next link address (NXLA_n) register and the current link address (CRLA_n) register. Each of them is used to set the address of the descriptor to be executed next, and to indicate the descriptor address of the current DMA transfer respectively.

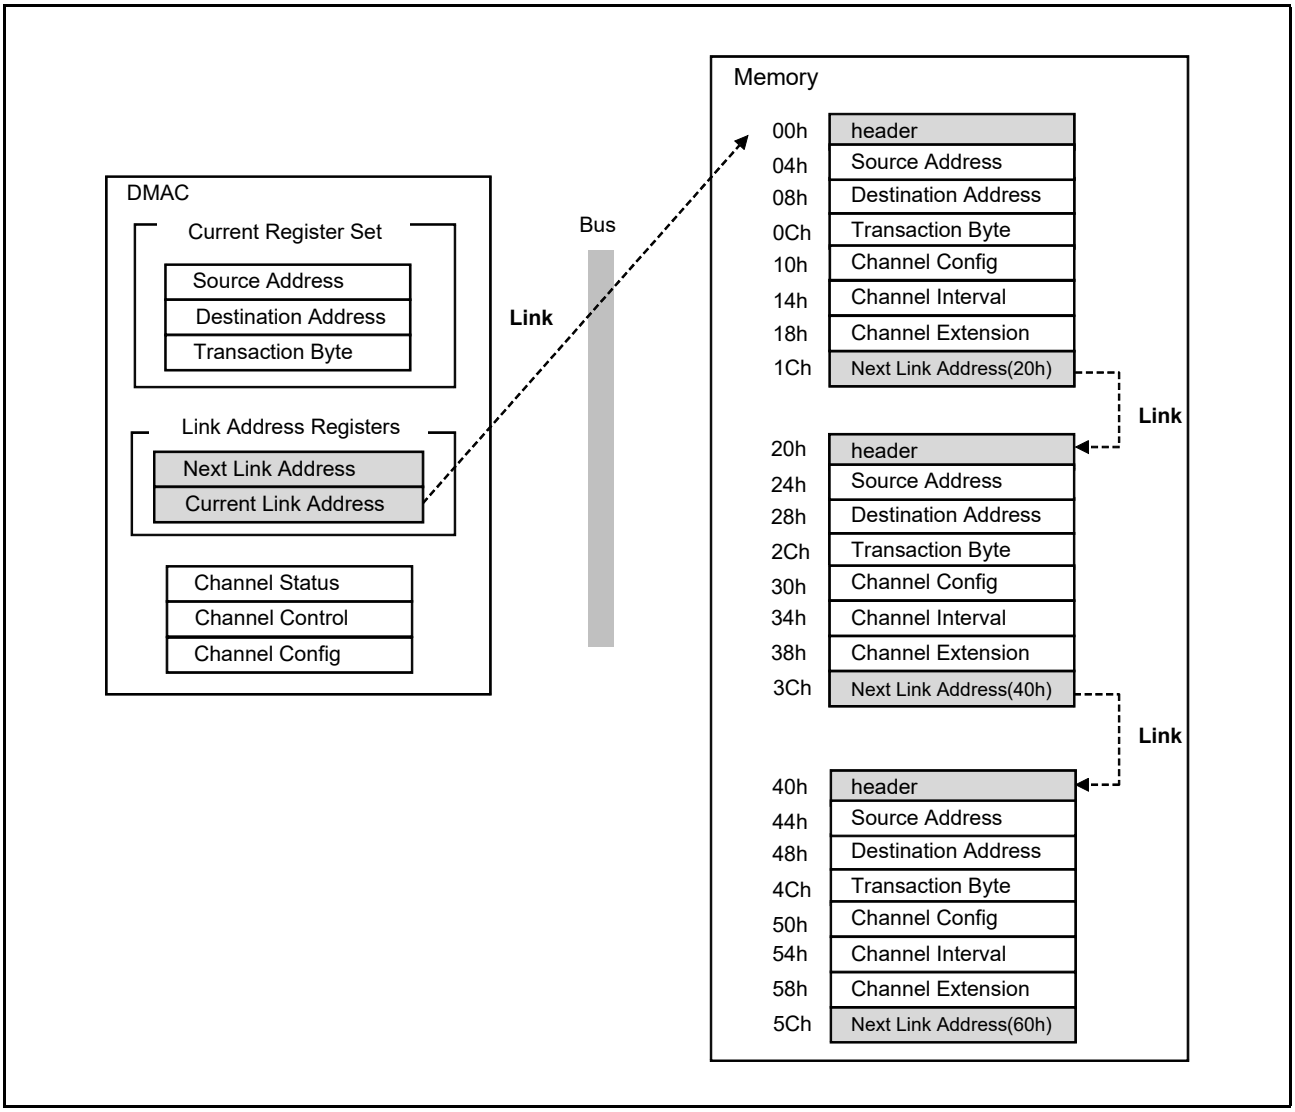

Figure 15.7 Link Mode Overview

(1) Operation flows in link mode

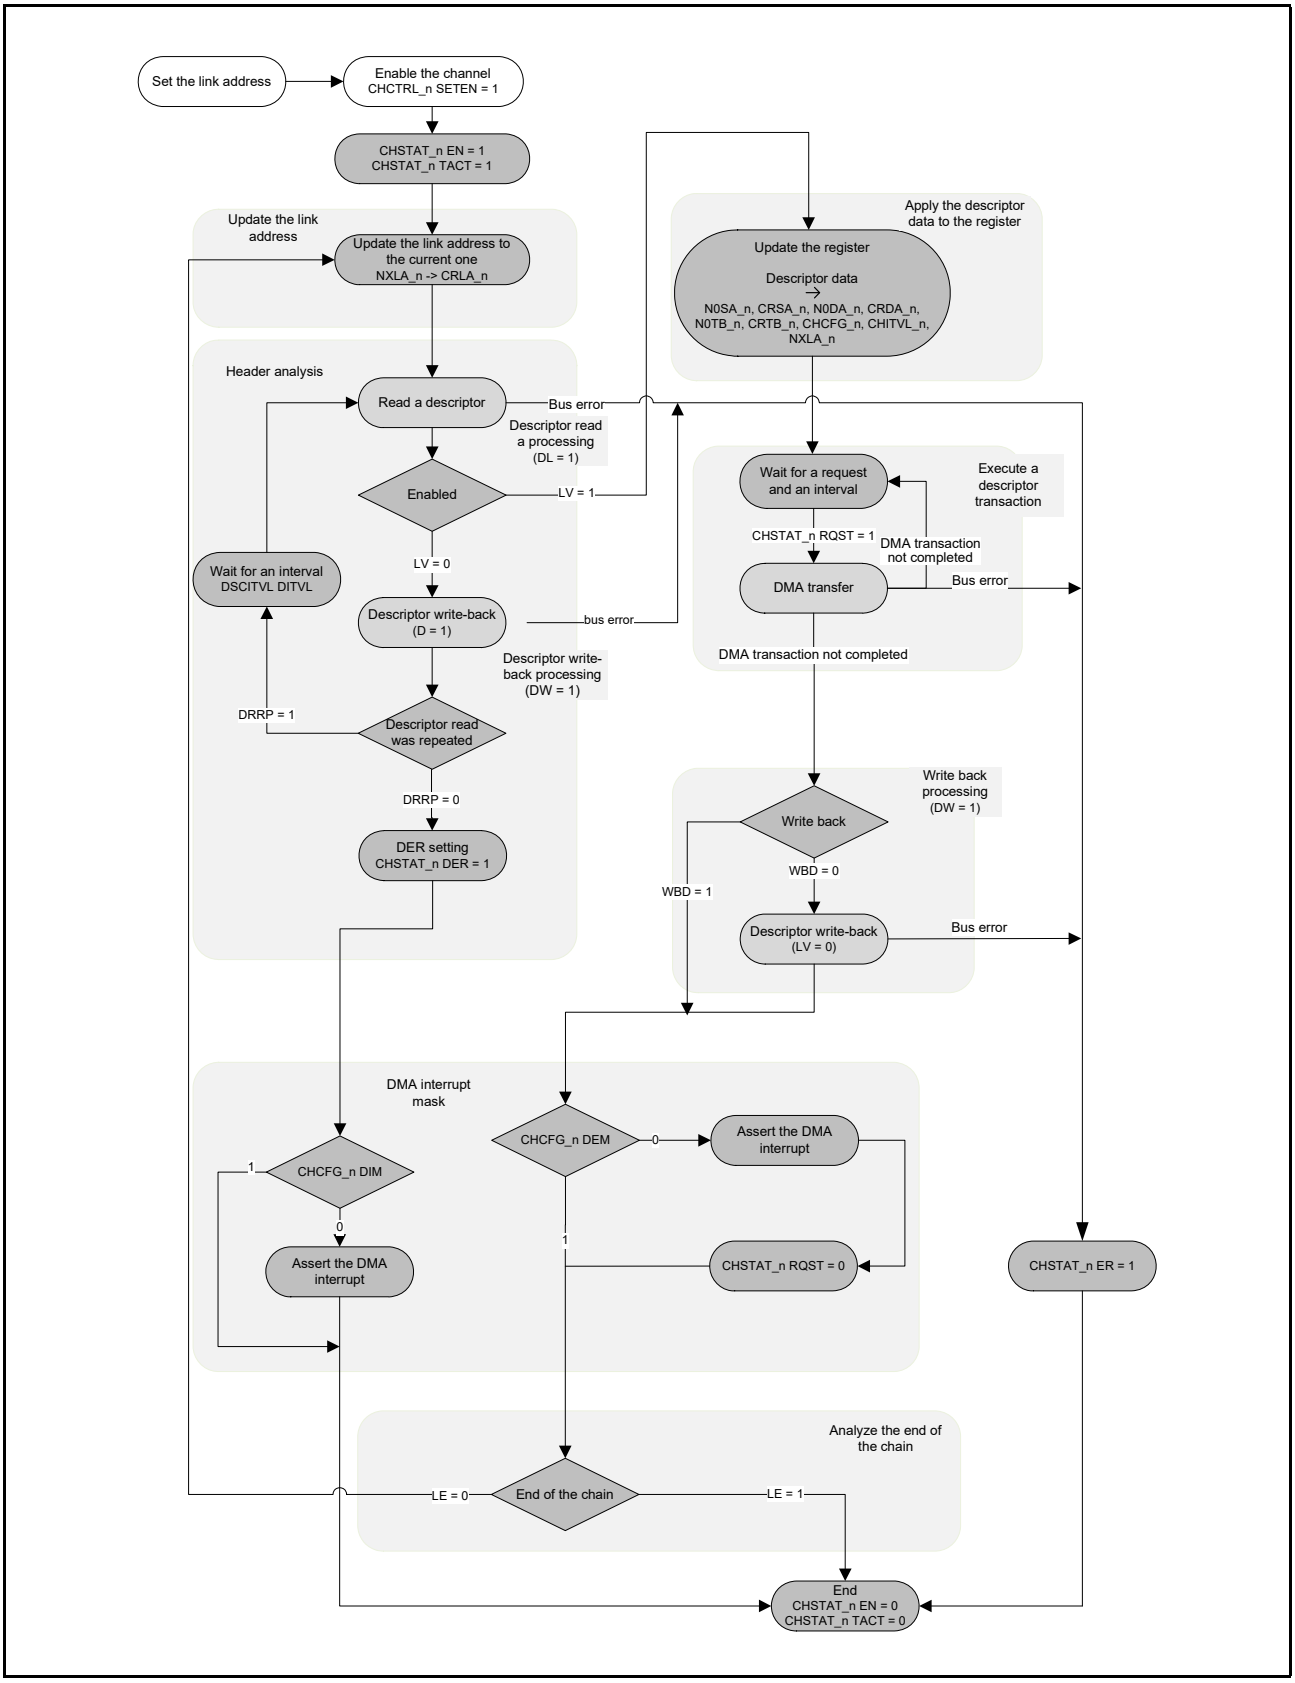

Figure 15.8 Link Mode Operation Flow

<Description of Link Mode Operation Flow>

1. Channel Setting
   Set the start address of the link destination in the NXLA_n register.
2. Updating the Link Address
   Writing 1 to the SETEN bit in the CHCTRL_n register sets 1 to the EN bit and the TACT bit in the CHSTAT_n register, and loads the link address set for the NXLA_n register to the CRLA_n register.
3. Descriptor Read and Header Judgment
   DMAC starts reading a descriptor, and checks the header contents. When LV = 0, 1 is written back to the D bit of header. After that, when the DRRP bit in the CHCFG_n register = 1, the same descriptor is read again after the number of cycles set in the DSCITVL register elapsed. When DRRP =0, DER in the CHSTAT_n register =1. This indicates the end state (the EN bit in the CHSTAT_n register = 0, and TACT = 0). At that time, if the DIM bit in the CHCFG_n register is 0, a DMA transfer completion interrupt is generated.
4. Descriptor Error
   When LV = 1, the read descriptor data is loaded to the current register set, and the channel register set. In addition, the next link destination is loaded to the NXLA_n register.
5. DMA Transfer
   According to the set value, a DMA transfer is performed. For details on the transfer, see from section 15.3.2, Transfer Mode to section 15.3.11, Aborting a Transfer.
6. Writing back of Header
   When WBD of header = 0, DMAC writes LV = 0 back to the header area.
7. DMA Interrupt Mask
   When the DEM bit in the CHCFG_n register is 0, a DMA transfer completion interrupt is generated.
8. Link End Judgment
   When LE of header = 1, the EN bit and the TACT bit in the CHSTAT_n register are cleared to 0, and DMAC stops operation. When LE = 0, the current register set is updated, and the next descriptor read is started.

(2) Register Settings

- Link mode settings
  When using link mode, set the DMS bit in the CHCFG_n register to 1.

Table 15.10 Link Mode Settings

DMS (CHCFG_n)	Description
1	Operates in link mode. This bit cannot be changed by using a descriptor.

- LINK address settings
  As registers that indicate the link destination, the next link address (NXLA_n) register, and the current link address (CRLA_n) register are available.
  To start link mode, set the link destination in the NXLA_n register.
  The NXLA_n register is updated to the next link after a descriptor is read. In addition, the CRLA_n register indicates the link address of the currently executed descriptor.

Table 15.11 Link Address Register Set

Register	Description
NXLA_n	Sets and indicates the next link destination. Before starting link mode, set the address of the link destination for this register.
CRLA_n	Indicates the currently executed link destination. This register is read-only.

(3) Descriptor settings

DMAC supports multiple descriptor formats.
To switch formats, use the DSCFM field of bits[31:28] in the first word (header) of a descriptor.
The following table describes the relationship between the value of the DSCFM bit and the descriptor format.

Table 15.12 Descriptor Format

DSCFM	Descriptor Size	Next Link Address	Channel Interval	Channel Config	Transaction Size	Destination Address	Source Address	Header
3	Four words	Y	— (reload)	— (reload)	— (header)	Y	Y	Y (with STS)
1	Eight words	Y	Y	Y	Y	Y	Y	Y (without STS)
Other than above	Setting prohibited							

Table 15.13 Description of activation in Table 15.12 Descriptor Format

Field	Availability	Description	Remarks
Header	Y (with STS)	Indicates the STS field of [15:0] for header is enabled. The value set in the STS field is used as the total number of transfer bytes (transaction size).	—
	Y (without STS)	The STS field of [15:0] for header is disabled. Use the transaction size of the descriptor as the total number of transfer bytes.	
Source Address	Y	Specifies the source address.	—
Destination Address	Y	Specifies the destination address.	—
Transaction Size	Y	Specifies the transaction size.	—
	— (header)	Omits the transaction size. Use the value set in the STS field of header as the total number of transfer bytes (transaction size).	Because the STS field is 16 bits, the maximum size you can set is 65,535 bytes.
Channel Config Channel Interval	Y	Specifies Channel Config and Channel Interval.	—
	— (reload)	Omits Channel Config and Channel Interval. Inherits the previous setting values (values of the CHCFG_n and CHITVL_n registers at that time).	—
Next Link Address	Y	Specifies the next descriptor address (next link address) that is read after a DMA transfer of this descriptor.	—

DMAC interprets data obtained through descriptor read in order. If a value less than eight words is specified in the DSCFM field, place descriptor data marked with Y in Table 15.12, Descriptor Format on memory.

Table 15.14 Descriptor Placement Example

	Address (Link Address + N)							
DSCFM	+1Ch	+18h	+14h	+10h	+0Ch	+08h	+04h	+00h
3h	—	—	—	—	Next Link Address	Destination Address	Source Address	Header
1h	Next Link Address	—	Interval	Config	Transaction Byte	Destination Address	Source Address	Header

- Header
  As shown below, header indicates descriptor states.
  This area is read by DMAC before starting a DMA transfer in link mode. In addition, after the DMA transfer, the transfer status is written back by DMAC.

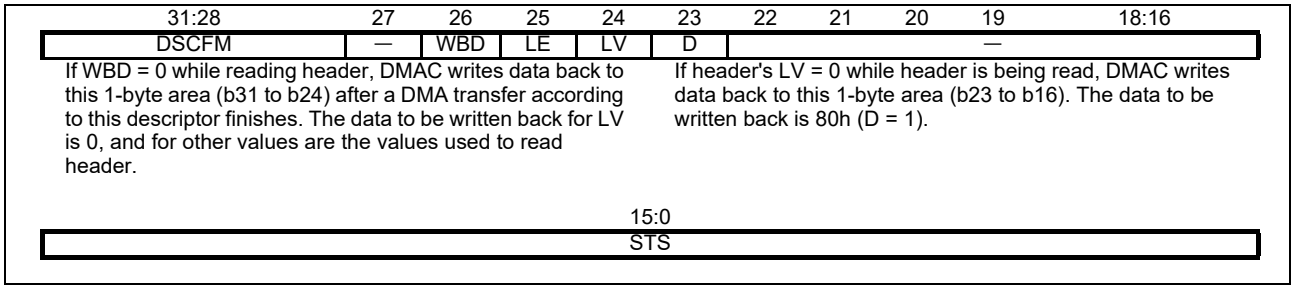

Figure 15.9 Header Area

Table 15.15 Header Area

Bit Position	Bit Name	Description
b15 to b0	STS	When DSCFM = 3, sets the transaction size in bytes. The maximum transfer bytes that can be set is 65,535 bytes. When DSCFM = 3, do not set 0 to the STS bit. If 0 is set, the operation is not guaranteed.
b22 to b16	—	A reserved area. Set 0.
b23	D	Indicates an access error of a descriptor. When LV = 0 while a descriptor is being read, DMAC writes 1 back to this bit. 0: No descriptor error 1: LV = 0 during descriptor read.
b24	LV	Indicates that this descriptor is enabled. When WBD = 0, DMAC writes 0 after the DMA transfer written in the descriptor. Set 1 when setting header. 0: The descriptor is disabled. 1: The descriptor is enabled.
b25	LE	Indicates that the link ends during DMA transfer of this descriptor. To indicate the end of the link, set this bit to 1. 0: The link continues. 1: The link ends.
b26	WBD	Masks write back execution of the LV bit. When this bit is 1, DMAC does not perform write-back operation. 0: The LV bit is written back to 0. 1: The LV bit is not written back.
b27	—	A reserved area. Set 0.
b31 to b28	DSCFM	Specifies the descriptor format (descriptor length, and combination). For details, see Table 15.12.

If you add a descriptor during DMA transfer completion processing (writing back to the descriptor), access of the CPU to set the LV bit to 1, and the access of DMAC to write 1 back to the D bit might conflict. Because of this, the data that was written first is overwritten with the data that was written later.
To avoid this problem, the byte lane of the D bit and the byte lane of the LV bit are placed differently. DMAC uses the byte write method for writing back the D bit. Therefore, to set LV = 1, also use the byte write method.

- Setting descriptors other than header
  Data in descriptors except header has the same specifications as an on-chip register. For details on the on-chip register specifications, see section 15.2, Register Descriptions.
  For descriptor setting examples, see section 15.5.4, Setting Example 4 (Link Mode).

- Descriptor areas and DMA transfer areas
  The following figure provides an overview of the descriptor area and the DMA transfer area to which DMAC accesses.

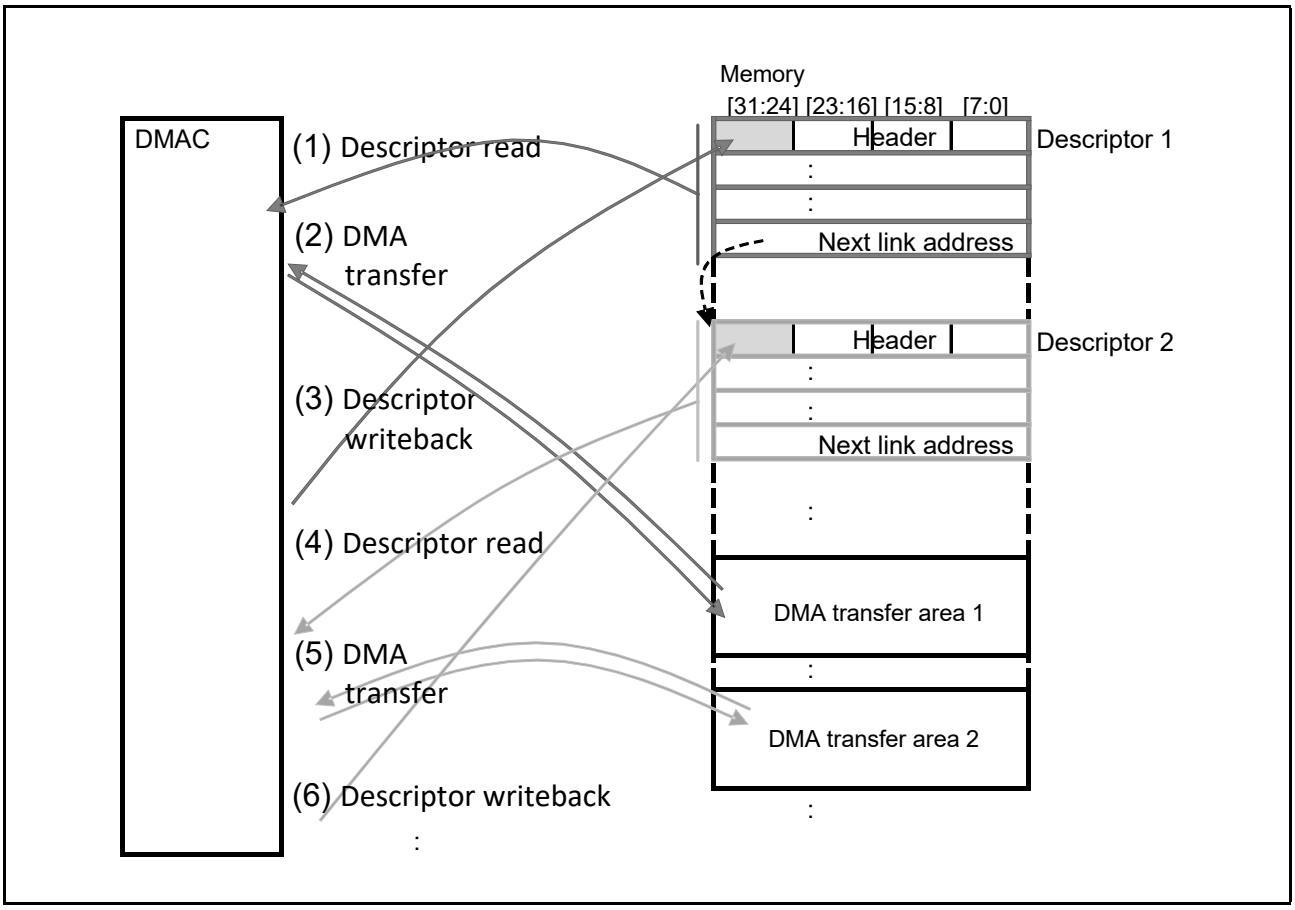

Figure 15.10 Header Area

(1) Descriptor read
Loads the value set for the on-chip NXLA_n register to the CRLA_n register, and then reads the descriptor from the memory space (descriptor 1) indicated by the CRLA_n register.

(2) DMA transfer
When the LV bit in header is 1, performs a DMA transfer according to the descriptor information.

(3) Descriptor write-back
After the DMA transfer for the set number of bytes, if the WBD bit in header is 0, the LV bit writes 0 and other fields writes the value read in step 1 as data back to header[31:24] of descriptor1 in bytes.

(4) Descriptor read
If the LE bit in header of the descriptor which was read previously (step 1) is 0, reads the next descriptor from the address (descriptor 2) indicated by the next link address in the descriptor.

(5) DMA transfer
When the LV bit in header is 1, performs a DMA transfer according to the descriptor information.

(6) Descriptor write-back
After the DMA transfer for the set number of bytes, if the WBD bit in header is 0, the LV bit writes 0 and other fields writes the value read in step 4 as data back to header[31:24] of descriptor2 in bytes.

Hereafter, repeats steps (4) through (6).

When LE of the header is 1 and WBD = 0, DMA transfer proceeds in accord with the descriptor settings, and 0 is written back to the LV bit of the header, after which operation ends.

When header's LE = 1, and WBD = 1, performs a DMA transfer with the setting, and ends the operation (no write-back is performed).

When header's LV = 0, writes 1 back to the D bit of header. And then, if the DRRP bit in the CHCFG_n register = 1, the descriptor is read again after the interval specified in the DITVL field in the DSCITVL_n register. When DRRP = 0, the operation stops.

- Notes on descriptors
  - In link mode, settings can be changed by reading a descriptor, but the timing for changing settings and for a hardware request cannot be synchronized. Because of this, if you want to issue a hardware request (DREQn pin input, and an external interrupt), set the AM, LVL, HIEN, LOEN, and SEL bits in the CHCFG_n register to 1 before setting the SETEN bit in the CHCTRL_n register. Besides, do not change these bits you set in a descriptor.

  - In a descriptor, the settings of the DMS field in the CHCFG_n register cannot be changed (always link mode). In addition, settings of the REN, RSW, and RSEL fields in the CHCFG_n register can be changed in the descriptor, but that does not affect the operation.

  - DMAC references the DSCFM field and the LV bit of header to determine if the descriptor is enabled or disabled. Therefore, initialize (DSCFM = 1 or 3, and LV = 1) the memory area equivalent to the LV bit of the DSCFM field before DMAC accesses it.

  - If you want to set the next descriptor on the memory while reading the transfer settings of DMA (during descriptor read), writes 1 to the LV bit after setting the descriptors after header (source address, destination address, ...next link address). This is to avoid DMA transfer using descriptor values (source address, destination address, and so on) before the setting if descriptor settings by the CPU and descriptor read of DMAC conflict, and DMAC's descriptor read interrupts descriptor settings by the CPU.

  - If you want to keep the information written back to the D bit of header, perform byte access to write 1 to the LV bit of header.

(4) LINK configuration examples

In link mode, descriptors can be configured as in the following figure.

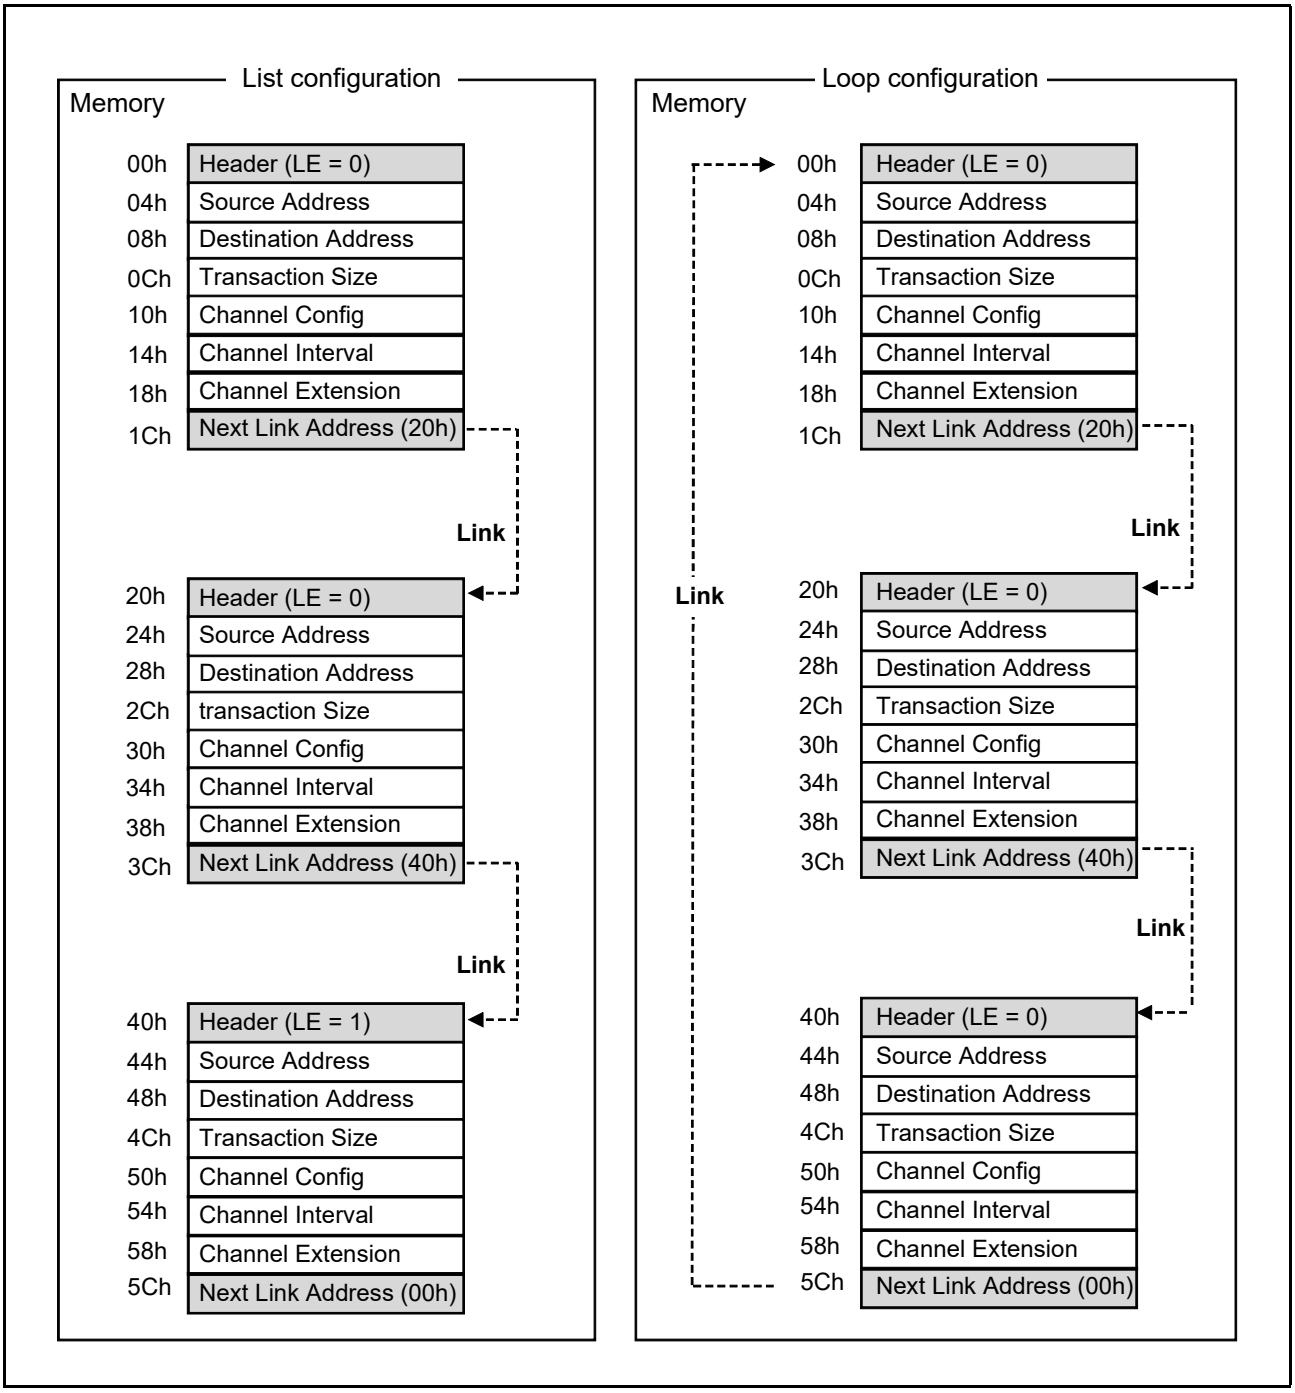

Figure 15.11 Header Area

- List configuration
  Setting 1 to the LE bit in header of the last descriptor ends the link.

- Loop configuration
  Setting the link destination of the last descriptor to the address of the previous descriptor configures the descriptors in a loop. To end the loop, change the LE bit of header to 1 before DMAC reads a descriptor, or follow the procedure to pause a transfer.

15.3.1.3 Write-Only Mode

Setting 1 to the WONLY bit in the CHCFG_n register falls in write-only mode.

Table 15.16 Write-Only Mode Settings

WONLY (CHCFG_n)	Mode	Description
0	Normal Mode	Performs a DMA transfer with the values set for the next register set
1	Write-Only Mode	Performs DMA write transfers only without performing DMA read transfers.

In write-only mode, read operation for DMA transfers is not performed (descriptor read is performed as same as in normal mode). In register mode, use the value set for the NxSA_n register (x = 0 when RSEL = 0, and x = 1 when RSEL = 1) as the write data. In link mode, use the value in the SA field of a descriptor as write data.
Use this mode for initializing a memory area.

15.3.2 Transfer Mode

Single transfer mode and block transfer mode are supported.
When selecting mode, use the TM bit in the CHCFG_n register for each channel.

Table 15.17 Basic Transfer Settings

Transfer Mode	TM (CHCFG_n)	Description
Single transfer	0	For one DMA request, performs a DMA transfer.
Block transfer	1	For one DMA request, performs transfers until a DMA transfer completes.

15.3.2.1 Single Transfer Mode

When a DMA transfer request is accepted, performs a DMA transfer on the side (transfer source or transfer destination) indicated by the REQD bit in the CHCFG_n register to activate DACK. Every time a transfer request is accepted, transfer proceeds. This operation is repeated until it reaches the transfer size loaded from the N0TB_n or N1TB_n register to the CRTB_n register (arbitration between channels is performed for each DMA transfer).
The DACK output timing differs depending on the setting for the REQD bit in the CHCFG_n register, or settings for the transfer size (DDS[2:0] and SDS[2:0] in the CHCFG_n register) bit setting. For details, see section 15.3.8, Differences in Operation According to the Transfer Data Size.
The TEND signal is activated when DACK output of the last DMA transfer is activated.

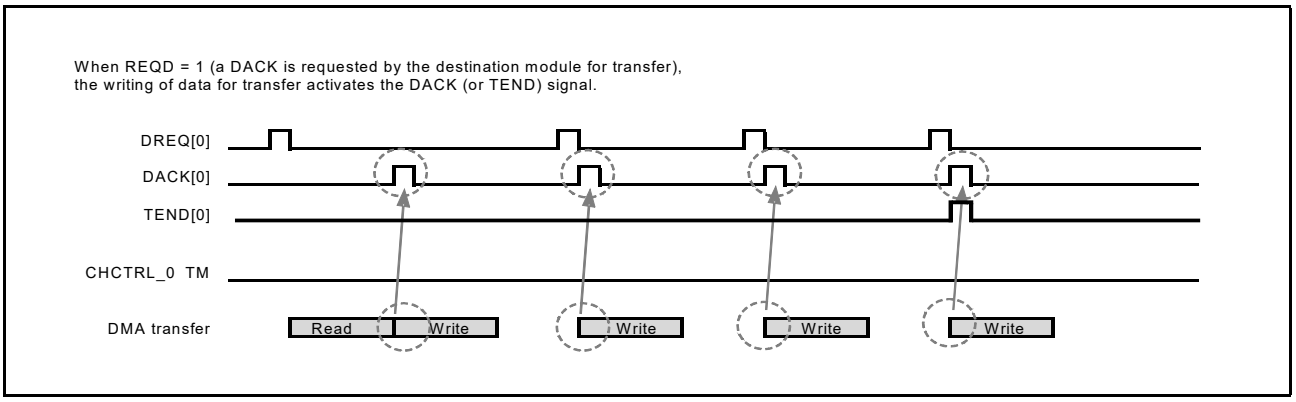

Figure 15.12 Single Transfer Mode (REQD = 1, SDS > DDS)

15.3.2.2 Block Transfer Mode

Once a DMA transfer request is accepted, the transfer continues until transfer of the number of bytes loaded from the N0TB_n or N1TB_n register to the DMA transfer byte register (CRTB_n register) is completed (DMA transfer completion; arbitration between channels is performed for each DMA transfer).
The TEND signal is activated when DACK output of the last DMA transfer is activated.

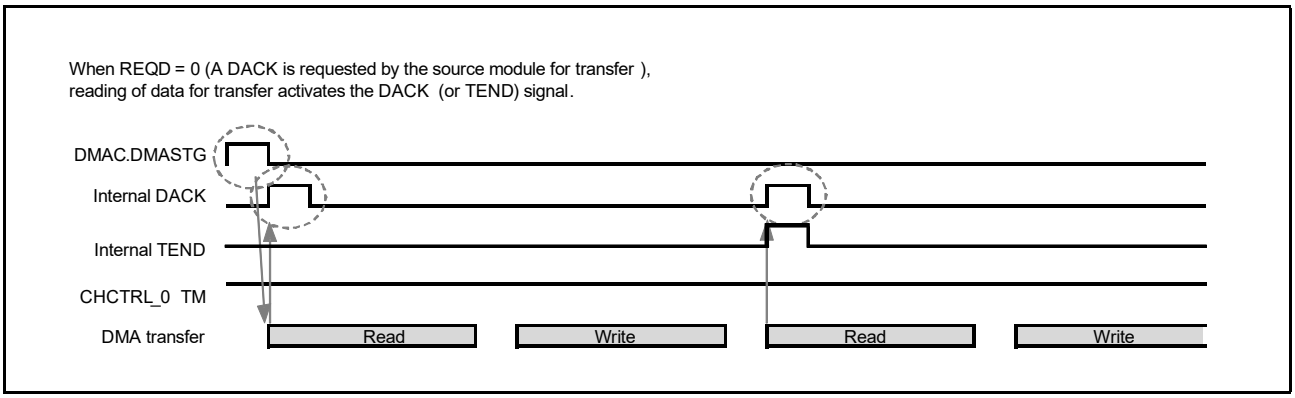

Figure 15.13 Block Transfer Mode (REQD = 0, SDS = DDS)

Note: If the interrupt source is DMAC.DMASTG, DACK and TEND are only active as internal signals and not output from the external pins. For details, see section 15.3.5, DMA Acknowledge Output/DMA Transaction Completion Output Function.

15.3.3 DMA Channel Priority Control

As an arbitration method between channels, fixed priority mode and round-robin mode are supported. To select mode, use the PR bit in the DCTRL register. When the PR bit is 0, fixed priority mode is selected. When the PR bit is set to 1, round-robin mode is selected.

Table 15.18 Priority Control Settings

Transfer Mode	PR (DCTRL)	Description	Applications
Fixed Priority	0	Channels 0 to 7, channels 8 to 15 are fixed priority mode. CH0 (CH8) > CH1 (CH9) > CH2 (CH10) > CH3 (CH11) > CH4 (CH12) > CH5 (CH13) > CH6 (CH14) > CH7 (CH15)	Select this mode if channels have priority.
Round-Robin	1	Controls requests in round-robin mode.	Select this mode if you want to execute requests equally.

15.3.3.1 Fixed Priority Mode

In fixed priority mode, the priority levels are fixed within the group of channels 0 to 7 and within the group of channels 8 to 15. In addition, the priority levels between the group of channels 0 to 7 and the group of channels 8 to 15 are in round-robin mode.
The priority levels immediately after a reset and transfer through DMA channel 0 are shown in Figure 15.14.

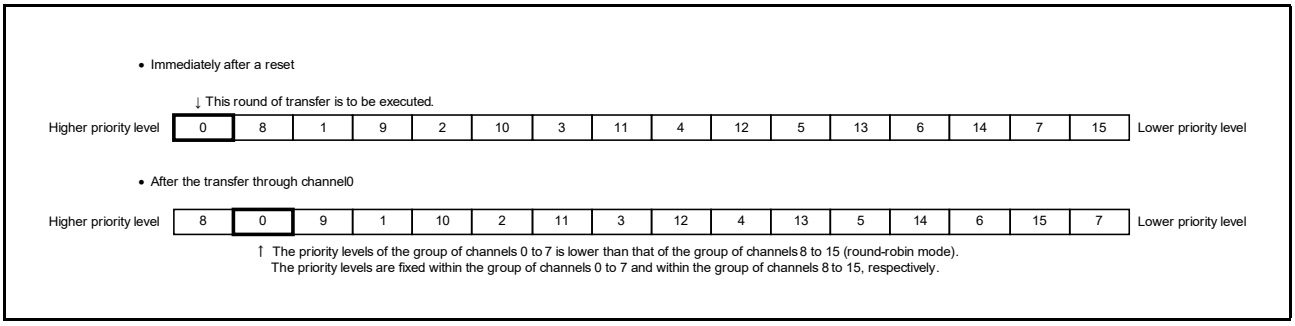

Figure 15.14 Priority Levels Immediately after a Reset and Transfer through DMA Channel 0

If DMA transfer requests are generated on multiple channels simultaneously, a DMA transfer request with a smaller channel number takes precedence.

The following figure provides an example when a DMA transfer is performed in fixed priority mode, if another DMA transfer with higher priority is requested.

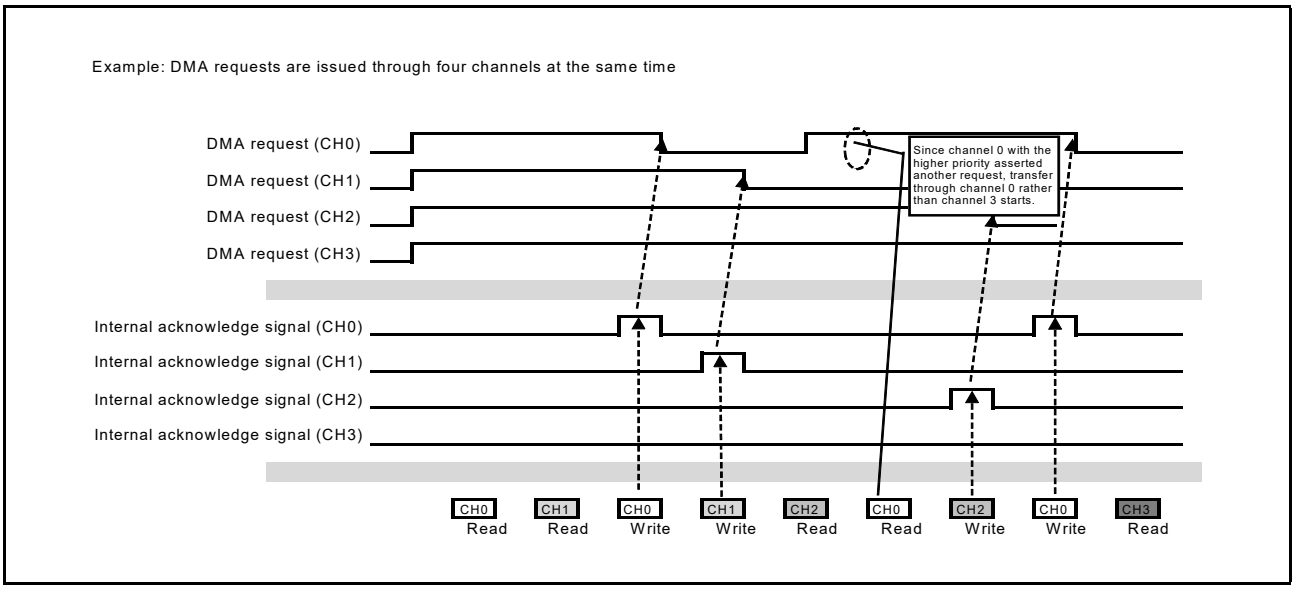

Figure 15.15 Fixed Priority Mode (Number of Channels Is 4, and REQD = 1)

Note: Channel 0 is handled with the highest priority, but the transfer with the next highest priority is performed because bus arbitration is performed after reading data from the transfer source of channel 0 finishes (Another read operation might interrupt the operation between reading data from and writing data to the same channel).

15.3.3.2 Round-Robin Mode

In round-robin mode, priority is changed every time a transfer of a channel is accepted so that the lowest priority is given to the channel in which the last transfer is performed.
The priority levels immediately after a reset and transfer through DMA channel 2 are shown in Figure 15.16.

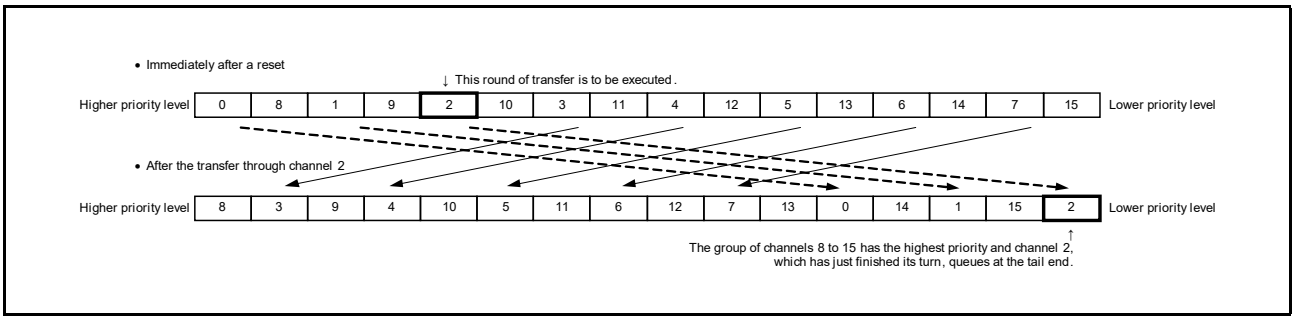

Figure 15.16 Priority Levels Immediately after a Reset and Transfer through DMA Channel 2

The following figure provides an example of a DMA transfer in round-robin mode.

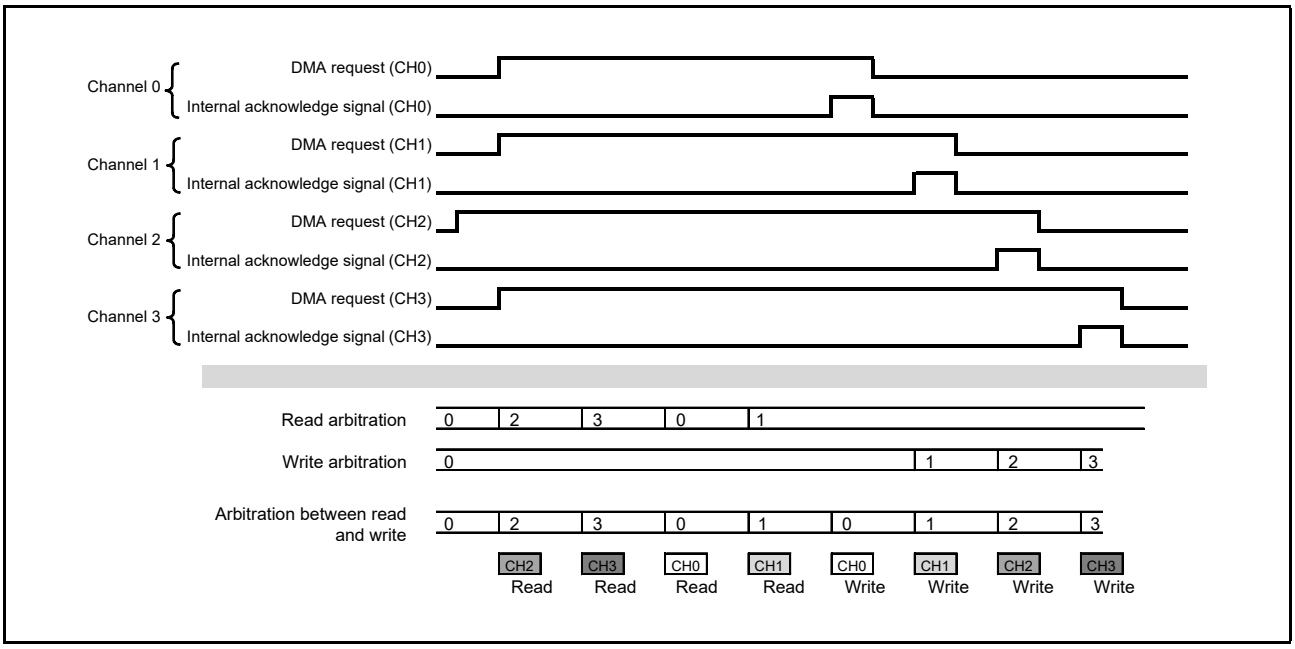

Figure 15.17 Round-Robin Mode (Number of Channels is 4, and REQD = 1)

Note: Within DMAC, arbitration between read channels, and arbitration between write channels are performed. As a result of those arbitrations, further arbitration is performed, and a bus access is issued.

15.3.4 DMA Transfer Request

DMA activation requests have four types including software requests, external requests, on-chip peripheral module requests, and external interrupts.
Select the transfer request source for an external request, on-chip peripheral module request, external interrupt, and software request with the DMAmSELn (m = 0 or 1, n = 0 to 15) register.
For details on the DMAmSELn (m = 0 or 1, n = 0 to 15) register, see section 15.2.8, DMAC Unit 0 Source Select Register i (DMA0SELi) (i = 0 to 15), and section 15.2.9, DMAC Unit 1 Source Select Register i (DMA1SELi) (i = 0 to 15).

15.3.4.1 Specifying Detection Operation of DMA Transfer Requests for Each Source

Detection methods for DMA transfer requests of external requests, on-chip peripheral module requests, external interrupts, and software requests might be specified according to sources.
For each DMA transfer source, set the LVL, HIEN, and LOEN bits in the CHCFG_n register according to Table 15.19, Table 15.20, and Table 15.21.
For details on edge detection operation, see Figure 15.18 and Figure 15.19. For information about level detection operation, see Figure 15.20 and Figure 15.21.

Table 15.19 Detection Operation Specification for Each Source of DMA Transfer Requests

DMA Transfer Request Source	Detection Operation Specification of DMA Transfer Requests	DMA Acknowledge Signal Specification
External request	Detects the rising edge. Detects the falling edge. Detects the high level. Detects the low level.	Depends on specifications of the DMA transfer request source.
On-chip peripheral module request	Depends on specifications of the DMA transfer request source. (See Table 15.21.)	Bus cycle mode
External interrupt	Detects the rising edge. Detects the high level.	Bus cycle mode
Software request	Detects the rising edge.	Bus cycle mode

Table 15.20 Method of Detecting DMA Transfer Request Signals

Mode	LVL (CHCFG_n)	HIEN (CHCFG_n)	LOEN (CHCFG_n)	Description
Edge detection	0	0	0	Disables detection.
			1	Detects the falling edge.
		1	0	Detects the rising edge.
			1	Setting prohibited
Level detection	1	0	0	Disables detection.
			1	Detects the low level.
		1	0	Detects the high level.
			1	Setting prohibited

Note 1. Set the LVL, HIEN, and LOEN bits of the external interrupt (IRQ0 to IRQ15) as follows.
For the setting of the IRQCRi (i = 0 to 15) register, see section 12.3.1, Selecting Interrupt Request Destinations.
LVL: Set according to the edge/level setting of the IRQCRi register.
HIEN: Set to 1 regardless of the detection level of the IRQCRi register.
LOEN: Set to 0 regardless of the detection level of the IRQCRi register.
Note 2. If the DACK/TEND signal is not used, specify any setting.
Note 3. Whether the DACK/TEND signal is used or not, make sure these bits are set to “010”.
Note 4. Interrupts are generated in response to requests for DMA transfer, but there are no interrupts on completion of transfer. Poll the END bit of the CHSTAT_n register to confirm the completion of DMA transfer.

Remarks: CHCFG_n register setting values
TM Bit
0: Single transfer
1: Block transfer
AM bit
001: DACK level output
010: DACK bus cycle output
100: Masks DACK output.
LVL bit
0: Detects the edge of a DMA request.
1: Detects the level of a DMA request.
REQD bit
0: DACK output during read operation.
1: DACK output during write operation.

Note: Instead of an interrupt source from peripheral modules, transfer completion sources of DMAC channels selected by the DMAC source select register are connected to the vector number selected by the DMAC source select register.
Note: Be sure to select edge detection with the PLSn register as the transfer completed interrupt detection type for the DMAC.

15.3.4.2 Edge Detection

Setting the LVL bit in the CHCFG_n register to 0 detects the edge.
Setting the HIEN bit in the CHCFG_n register to 1 detects the rising edge, and setting the LOEN bit in the CHCFG_n register to 1 detects the falling edge.
For DMA requests by the DREQn signal, request the next DMA transfer when the DACK or TEND signal is activated.

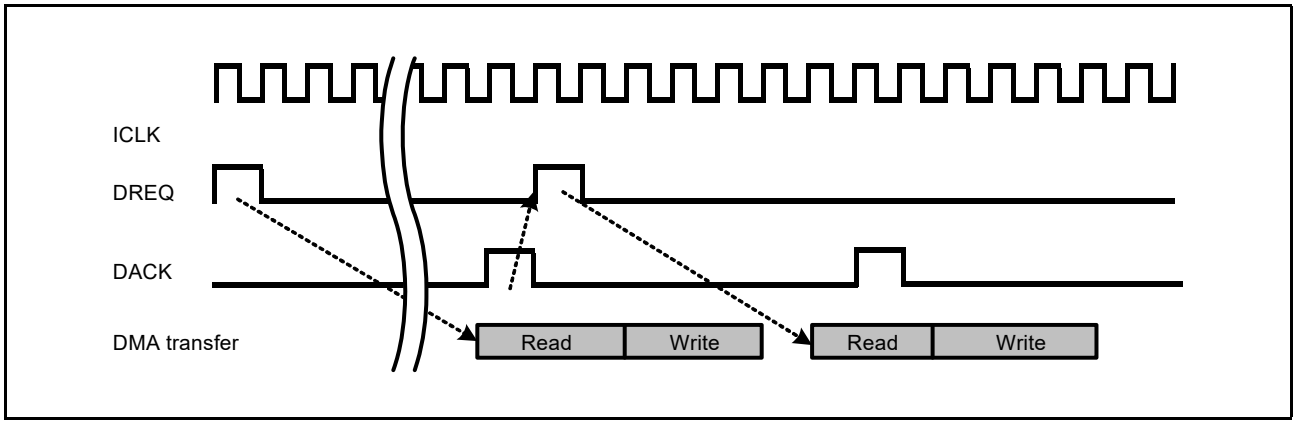

Figure 15.18 Edge Detection Timing (Rising Edge (HIEN = 1), DACK Output is Active during Reading (REQD = 0))

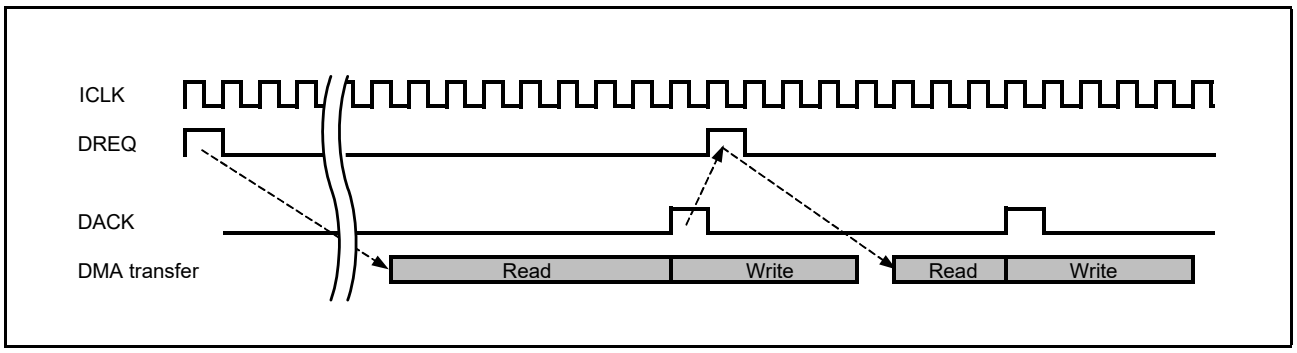

Figure 15.19 Edge Detection Timing (Rising Edge (HIEN = 1), DACK Output is Active during Writing (REQD = 1))

15.3.4.3 Level Detection

Setting the LVL bit in the CHCFG_n register to 1 detects the level.
If a DMA transfer request is active (according to HIEN or LOEN settings) for two consecutive clocks (ICLK) or more, it is recognized as a DMA request.

If the DACK/TEND signal output is set to level mode, the DACK/TEND signal output remains in the high level until the DMA transfer request is deactivated.
If you want to request the next DMA transfer, wait until the DACK/TEND signal is deactivated.

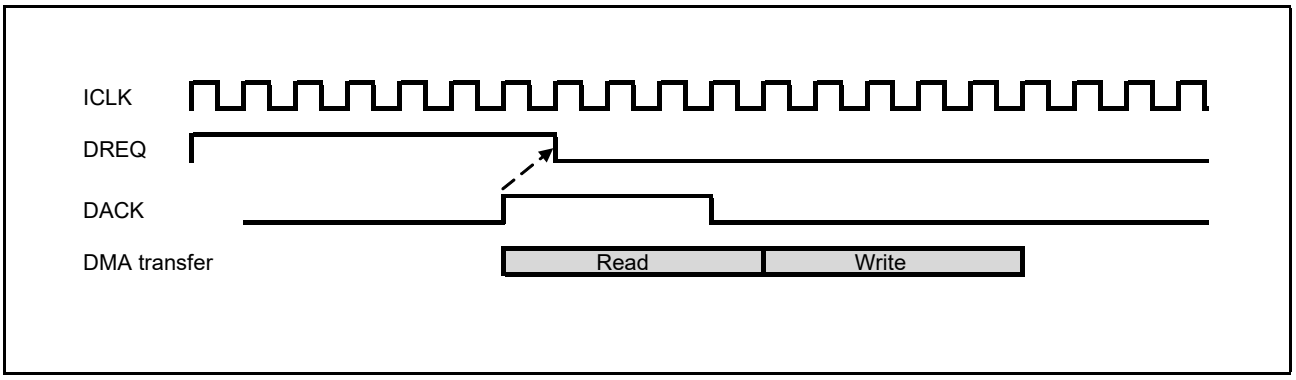

Figure 15.20 Level Detection Timing (High-Level Detection (HIEN = 1), DACK Output is Active during Reading (REQD = 0))

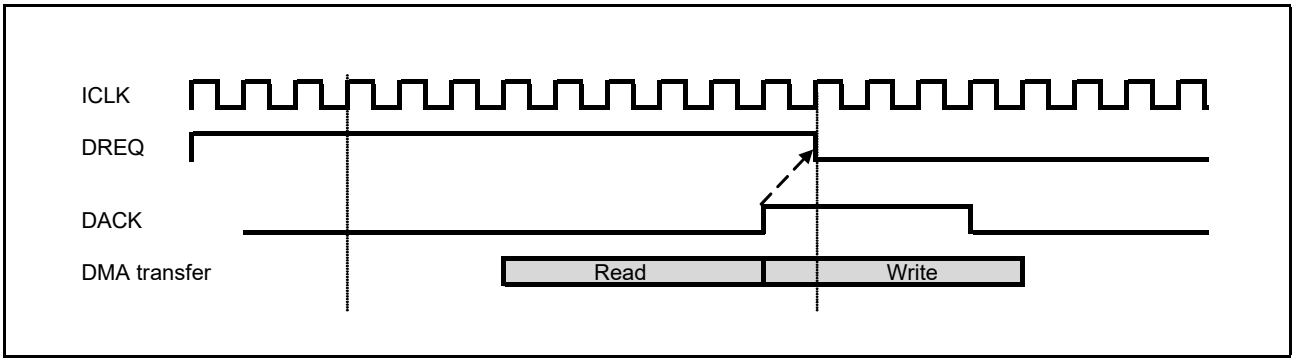

Figure 15.21 Level Detection Timing (High-Level Detection (HIEN = 1), DACK Output is Active during Writing (REQD = 1))

15.3.5 DMA Acknowledge Output/DMA Transaction Completion Output Function

As a reception response signal for a DMA transfer request, the DMA acknowledge signal (DACK) is output.
The DMA transfer completion signal (TEND) is output when the DACK signal for the last DMA transfer is output.
If you use the DREQn signal for a DMA transfer request, use DACKn as the DMA acknowledge signal, and use TENDn as the DMA transaction completion output signal.
Set the output mode of the DACKn and TENDn signals with the AM2 to AM0 bits of the channel configuration register (CHCFGn). Level output and bus cycle output are supported.
The outputs of DACK and TEND signals on the DACKn and TENDn pins are active only when the conditions given below are met. To use the DACKn and TENDn pins, make appropriate settings for the MPC.P#nPFS.PSEL (# = 0-9 and A-R, n = 0-7) bits and the port mode register (PMR) to use those pins as “peripheral functions”.
The conditions:

- The DREQn pin is set as the source for the DMA transfer request.
- The source and destination of the DMA transfer are set as follows:
  - DMA is set to be transferred from an external address space (CSn) to any destination while the CHCFG_n.REQD bit is set to 0 (requested from the source of transfer)
  - DMA is set to be transferred to an external address space (CSn) from any source while the CHCFG_n.REQD bit is set to 1 (requested from the destination of transfer)

The outputs on the pins are not active for the cases other than above. However, the internal signals become active according to the setting of the AM[2:0] bits.

Transfer Requested From	Source for DMA Transfer	Transferred From	Transferred To	CHCFG_n		External Pins Used for Outputting an Active Signal	
				AM[2:0]	REQD	DACK Signal	TEND Signal
Request from outside	DREQ0	External bus	Anywhere	001/010	0	DACK0	TEND0
		Anywhere	External bus		1	DACK0	TEND0
		Internal	Anywhere		0	—	—
		Anywhere	Internal bus		1	—	—
	DREQ1	External bus	Anywhere	001/010	0	DACK1	TEND1
		Anywhere	External bus		1	DACK1	TEND1
		Internal	Anywhere		0	—	—
		Anywhere	Internal bus		1	—	—
	DREQ2	External bus	Anywhere	001/010	0	DACK2	TEND2
		Anywhere	External bus		1	DACK2	TEND2
		Internal	Anywhere		0	—	—
		Anywhere	Internal bus		1	—	—
Other than above	Other than above	Anywhere	Anywhere	Any value	Any value	—	—

—: The outputs on the pin are always inactive. Inactive signal level is obtained by inverting the active level set by the bits which specify the acknowledge levels and transfer-end levels.
External bus refers to the CS0 to CS5 spaces and internal bus refers to the address spaces other than the external bus.

15.3.5.1 Specifying Mode of Acknowledge Signals/DMA Transaction Completion Signals for Each Source of DMA Transfer Requests

For the DMA acknowledge signal and DMA transaction completion signal, output mode might be specified according to the source.
For each DMA transfer request source, specify the correct operation with the AM[2:0] bits of the channel configuration register (CHCFGn) according to Table 15.19, Table 15.21, and Table 15.22.

For details on level output operation, see Figure 15.22, DACK/TEND Output Timing (AM[2:0] = 001, REQD = 0) and Figure 15.23, DACK/TEND Output Timing (AM[2:0] = 001, REQD = 1). For details on bus cycle output operation, see Figure 15.24, Bus Cycle Output Timing (REQD = 0) and Figure 15.25, Bus Cycle Output Timing (REQD = 1).

Table 15.22 DACKn/TENDn Pin Output Settings

Mode	AM[2] (CHCFG_n)	AM[1:0] (CHCFG_n)	REQD (CHCFG_n)	Applications
Level	0	01	0 (Activated during read operation)	In level mode, activate DACK/TEND. DACK/TEND output remains active until the DMA transfer request is deactivated. The TEND signal is activated when the final DMA transfer is performed.
			1 (Activated during write operation)	
Bus cycle	0	10 11	0 (Activated during read operation)	The DACK/TEND signal remains active during a bus cycle. Use this mode if you want to activate the DACK/TEND signal until a bus cycle ends. The TEND signal is activated when the last DMA transfer is performed.
			1 (Activated during write operation)	
Mask	1	—	—	Set DACK/TEND output to inactive (fixed). Use this mode if you do not want to notify the connection destination of DACK/TEND output.

15.3.5.2 Level Output

By setting the AM field in the CHCFG_n register to 001, the mode is switched to level output.
DACK output remains active until the DMA transfer request is deactivated. In addition, if it is the last DMA transfer, the TEND signal is output (level output) at the same timing as the DACK output.

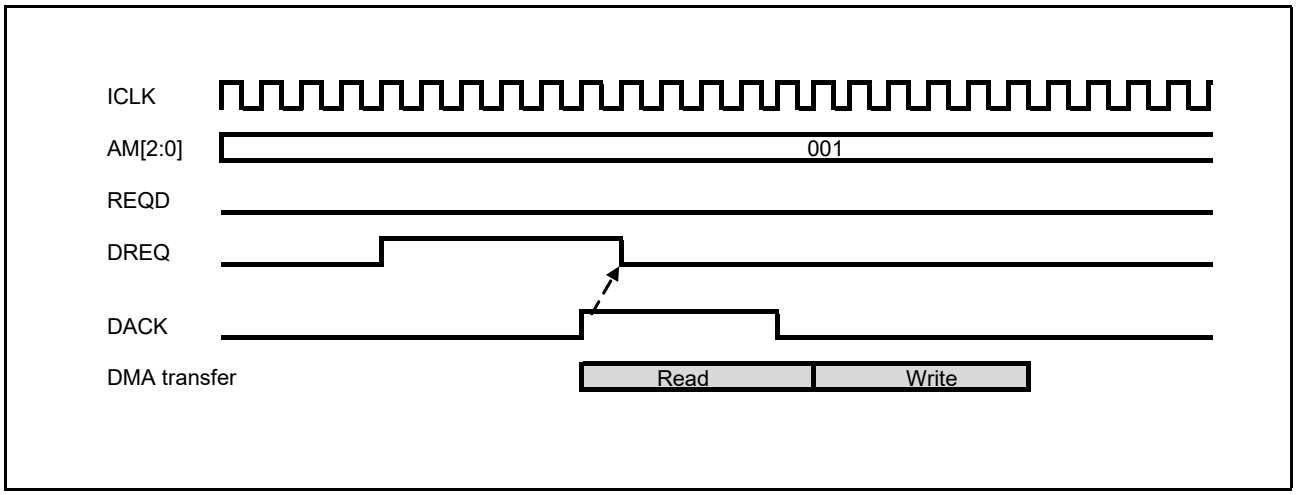

Figure 15.22 DACK/TEND Output Timing (AM[2:0] = 001, REQD = 0)

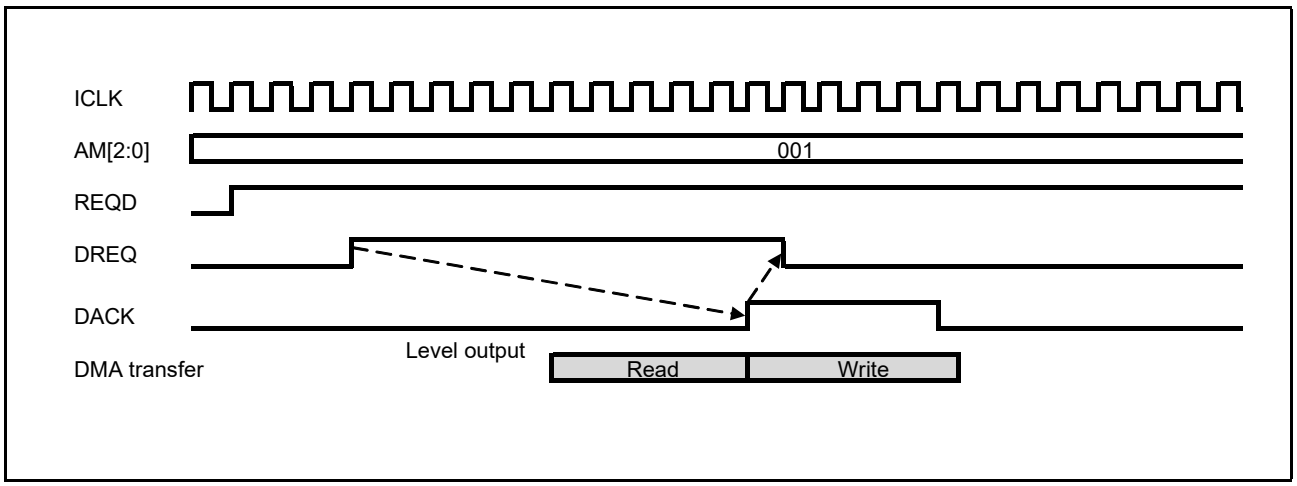

Figure 15.23 DACK/TEND Output Timing (AM[2:0] = 001, REQD = 1)

15.3.5.3 Bus Cycle Output

By setting the AM field in the CHCFG_n register to 010, the mode switches to bus cycle output. During a bus cycle, DACK output remains active. In addition, if it is the last DMA transfer, the TEND signal is output at the same timing as the DACK output during the bus cycle.
While the DACK/TEND signal is active, the DREQ signal is masked within the CPU. Therefore, if you set the DREQ signal to level detection, it is not necessary to deactivate the signal on the output side.

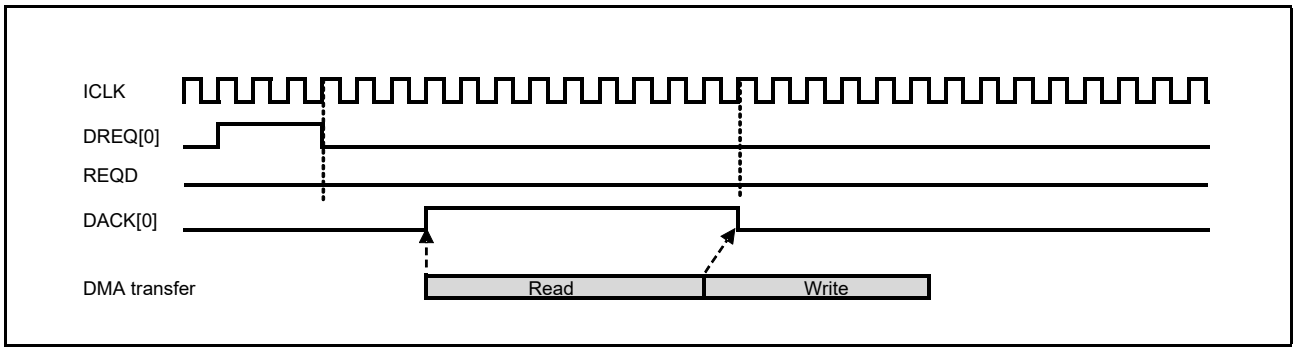

Figure 15.24 Bus Cycle Output Timing (REQD = 0)

- When the REQD bit in the CHCFG_n register = 0 (activated during read operation), DACK/TEND output remains active for the period from when a read request is output on a bus to when a cycle elapses after reading the last data.
- If DMA transfer request input is detected by level, DMA transfer request input is deactivated until the next cycle begins after a bus cycle ends.

The following signals trigger the rising and falling of DACK/TEND.

Rising: Starts a transfer.
Falling: Ends a transfer.

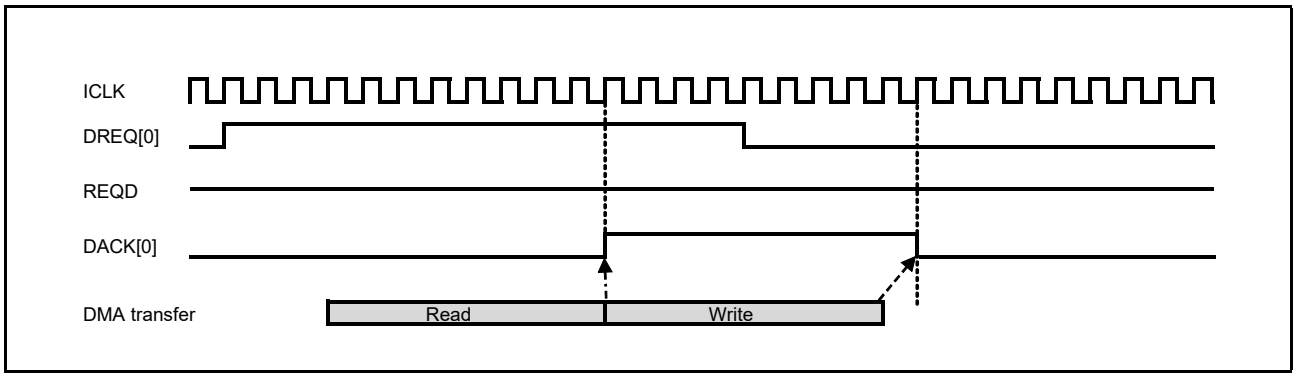

Figure 15.25 Bus Cycle Output Timing (REQD = 1)

- When the REQD bit in the CHCFG_n register = 1 (activated during write operation), the DACK/TEND signal remains active for the period from when a write request is output to when a clock (ICLK) elapses after responding to the last data.
- If DMA transfer request input is detected by level, DMA transfer request input is deactivated until the next cycle begins after a bus cycle ends.

The following signals trigger the rising and falling of DACK/TEND.

Rising: Starts a transfer.
Falling: Ends a transfer.

15.3.6 Forced Ejection Request

When a forced ejection request is input, data that is not yet transferred in a buffer is transferred to the DMA transfer destination address. After data is flushed, the DMA transfer resumes.

The following are notes on forced ejection requests:

- If a forced ejection request conflicts with DMA transfer request input, the forced ejection takes precedence, and then the DMA transfer is performed.

- For a system (the REQD bit in the CHCFG_n register = 1) in which the DMA transfer destination uses hardware requests through DMA transfer request input, the unit on the DMA transfer destination receives data even if the DMA transfer request is not activated. Therefore, a malfunction, such as buffer overflow, might occur. Because of this, when REQD =1, no forced ejection is performed by hardware.

- Differences from flush mode described in section 15.3.11.2, Aborting a Transfer (Buffer Flush: SBE = 1) (The EN bit is cleared to 0 when the SBE bit in the CHCFG_n register = 1).

Flush mode: DMAC stops operation after data in a buffer is written.
Forced ejection request: A DMA transfer continues after flush operation ends.

15.3.6.1 Software Forced Ejection Request

For software forced ejection requests, use the SETSSWPRQ bit in the CHCTRL_n register.
To request a forced ejection, set 1 to the SETSSWPRQ bit. DMAC outputs data in a buffer to the DMA transfer destination.

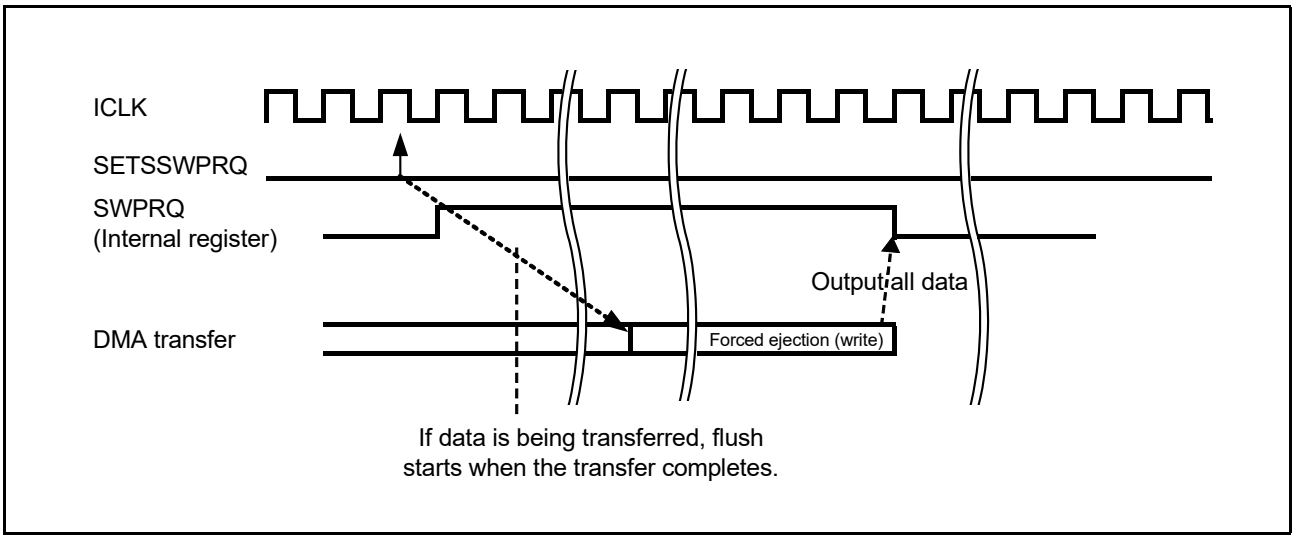

Figure 15.26 Software Forced Ejection Timing

15.3.7 Interval Count Function

By the setting for the ITVL field in the CHITVL_n register, the execution interval of DMA transfers can be adjusted. This function is used to avoid occupation of a bus by DMAC. Until the count value becomes 0, no DMA transfer for the next DMA request is performed.

The following figure provides an operation example.

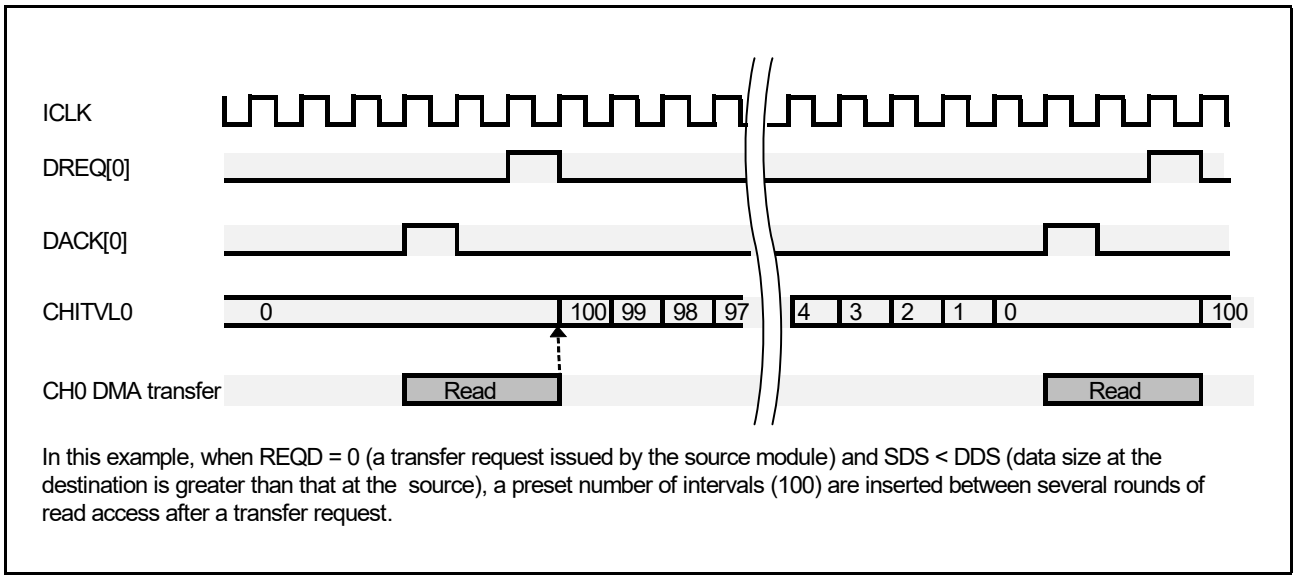

Figure 15.27 Interval Count (REQD = 0, SDS < DDS)

An interval is inserted after a transfer specified by the REQD bit in the CHCFG_n register.
The following figure shows the relationship between the setting values for the REQD, SDS, and DDS bits in the CHCFG_n register and the cycles to which intervals are applied.

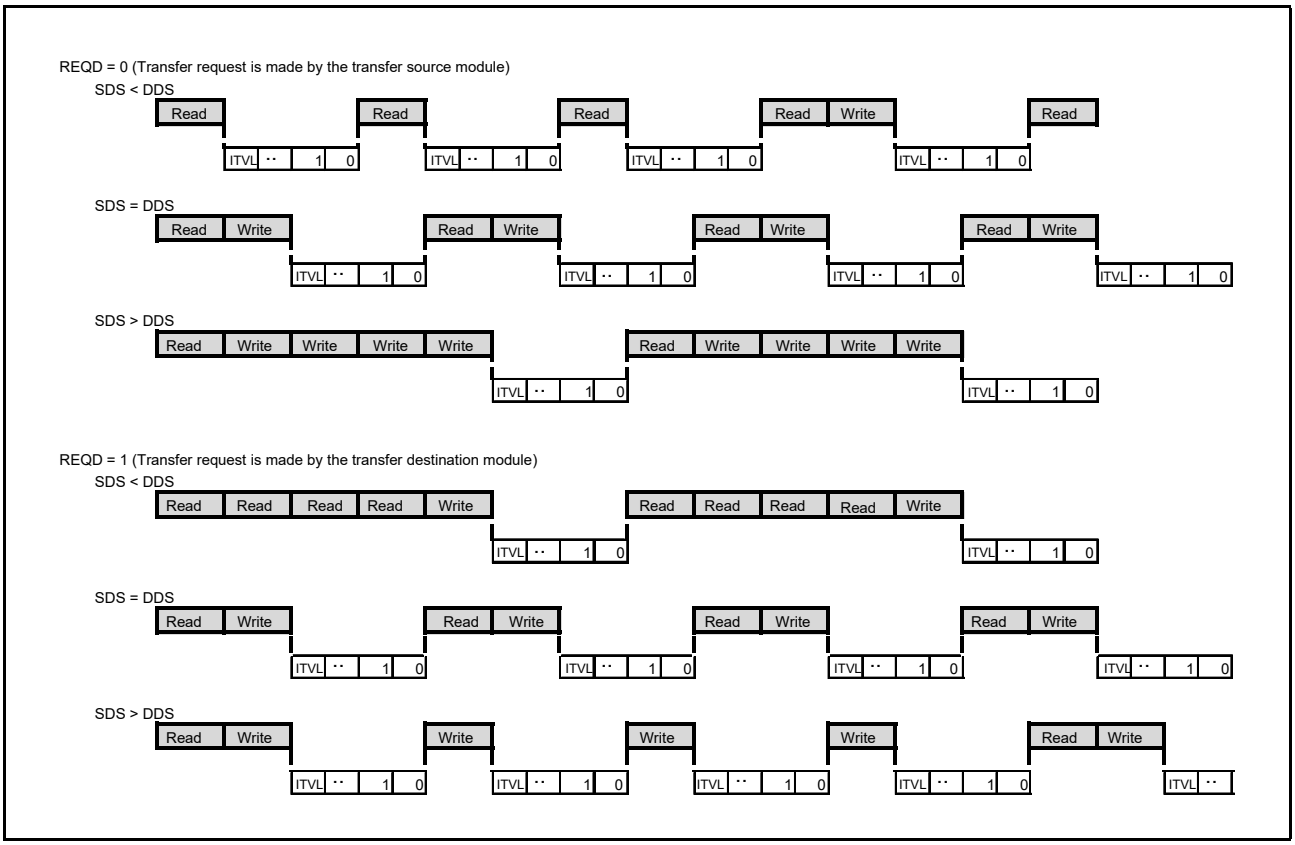

Figure 15.28 DMA Transfer Settings and Interval Counts

15.3.8 Differences in Operation According to the Transfer Data Size

15.3.8.1 When the Transfer Data Size on the Transfer Source is Small

As the transfer data size at the destination is large, reading from the source proceeds several times, and this is followed by writing to the destination.

The following figure shows the timing chart when the transfer source is 8 bits, and the transfer destination is 32 bits (SDS = 0 and DDS = 2 in the CHCFG_n register) for rising edge detection.

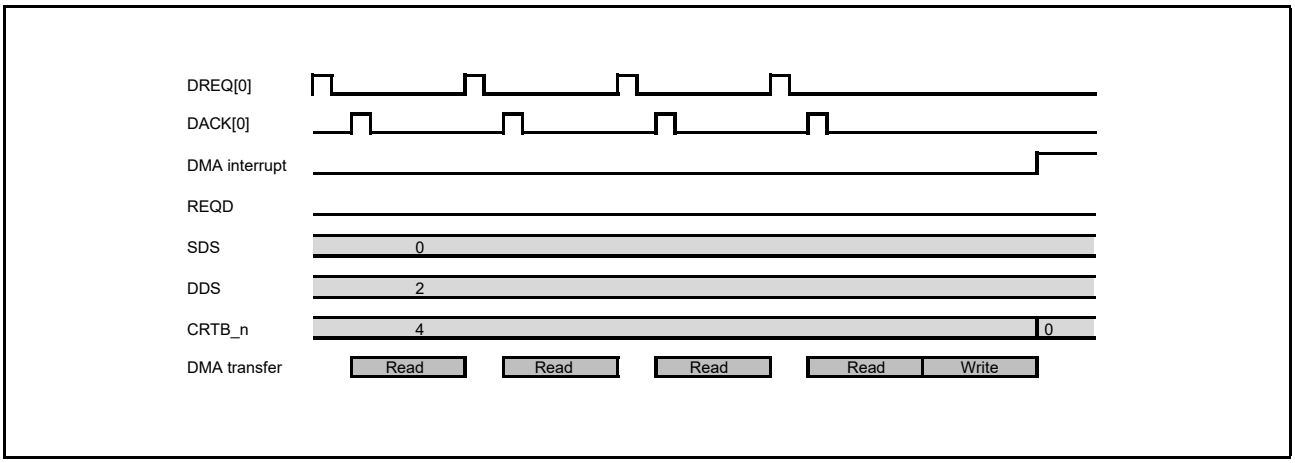

Figure 15.29 When the Size of Data on the Transfer Source is Small (LVL in CHCFGn = 0, HIEN = 1, REQD = 0, SDS < DDS)

15.3.8.2 When the Transfer Data Size on the Transfer Destination is Small

Because the transfer data size on the transfer source is large, after a single read operation, write operation to the transfer destination is performed a few times. The following figure shows the timing chart when the transfer source is 64 bits, and the transfer destination is 16 bits (SDS = 3 and DDS = 1 in the CHCFG_n register) for rising edge detection.

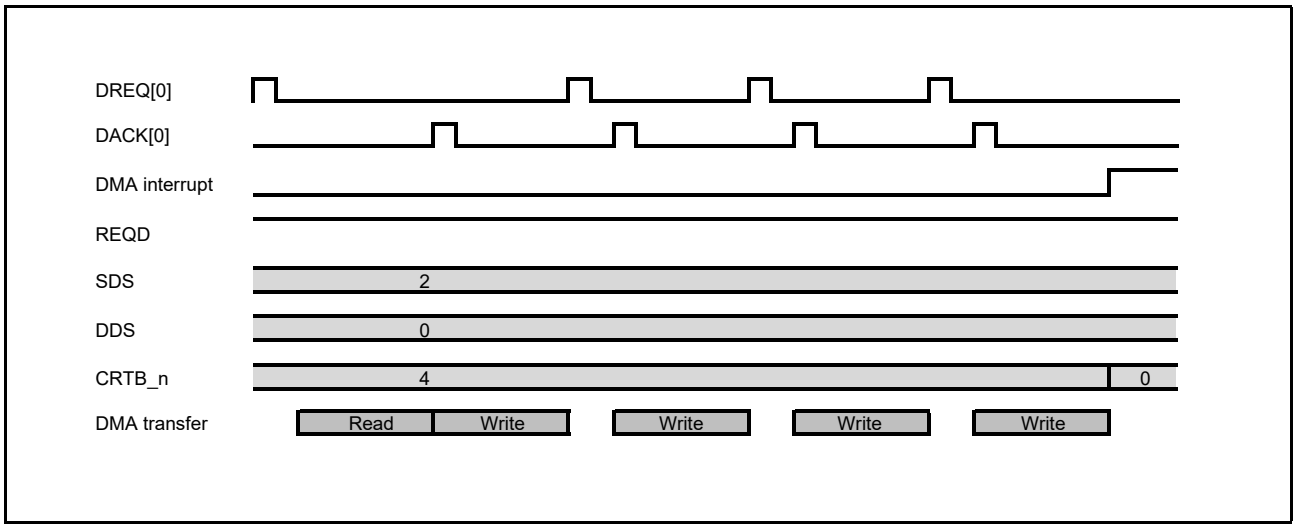

Figure 15.30 When the Size of Data on the Transfer Source is Small (LVL = 0, HIEN = 1, REQD = 1, and SDS > DDS in CHCFG_n)

15.3.8.3 When the Size of Transfer Data on the Transfer Destination and on the Transfer Destination is the Same

Every time a DMA transfer request is detected, read operation is performed on the transfer source, and write operation is performed on the transfer destination.
The following figure shows the timing chart when the transfer source and the transfer destination are 8 bits (SDS = 0 and DDS = 0 in the CHCFG_n register) for rising edge detection.

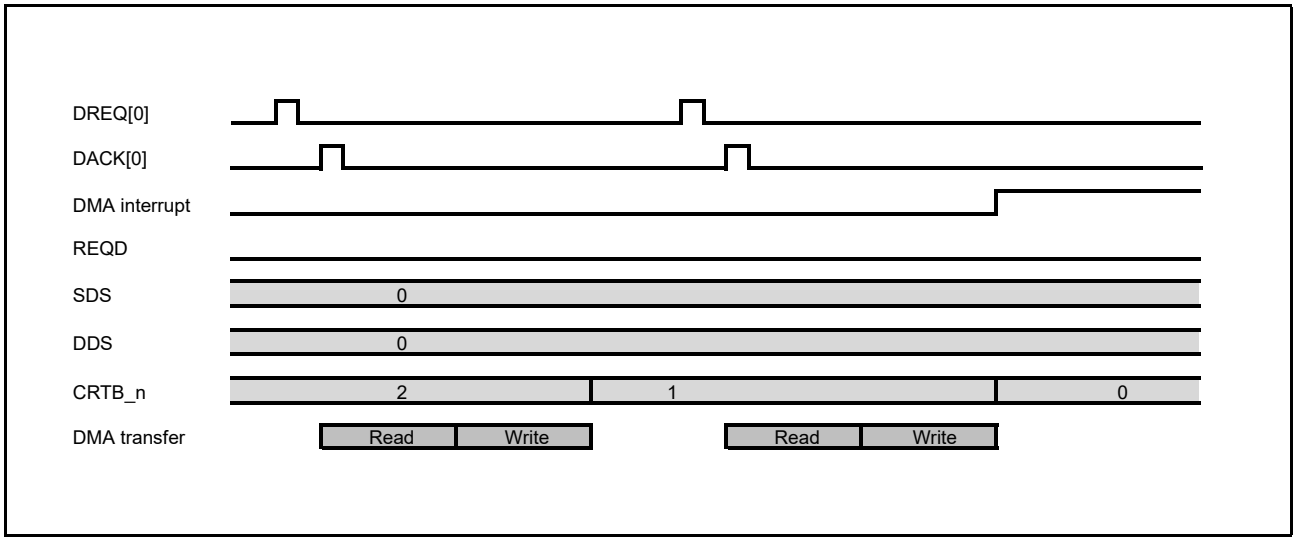

Figure 15.31 When the Sizes of Data on the Transfer Source and the Transfer Destination are the Same (LVL = 0, HIEN = 1, REQD = 0, and SDS = DDS in CHCFG_n)

15.3.9 DMA Transfer Status

The CHSTAT_n register indicates the DMA transfer status of each channel.
The TACT bit in the CHSTAT_n register indicates that DMA operation is being performed on channel n. Writing 1 to the SETEN bit in the CHCTRL_n register sets 1. The TACT bit remains 1 while accessing a descriptor, or waiting for a DMA request.
The TACT bit is cleared when the EN bit in the CHSTAT_n register is cleared (for details on clear conditions, see section 15.2.7, Channel Status Register n (CHSTAT_n)), and DMA transfers for the set number of times are finished.
The TACT bit is not cleared even when a DMA transfer finishes, but the EN bit is not cleared (when the REN bit in the CHCFG_n register = 1 in register mode, or the next descriptor access is performed in link mode).

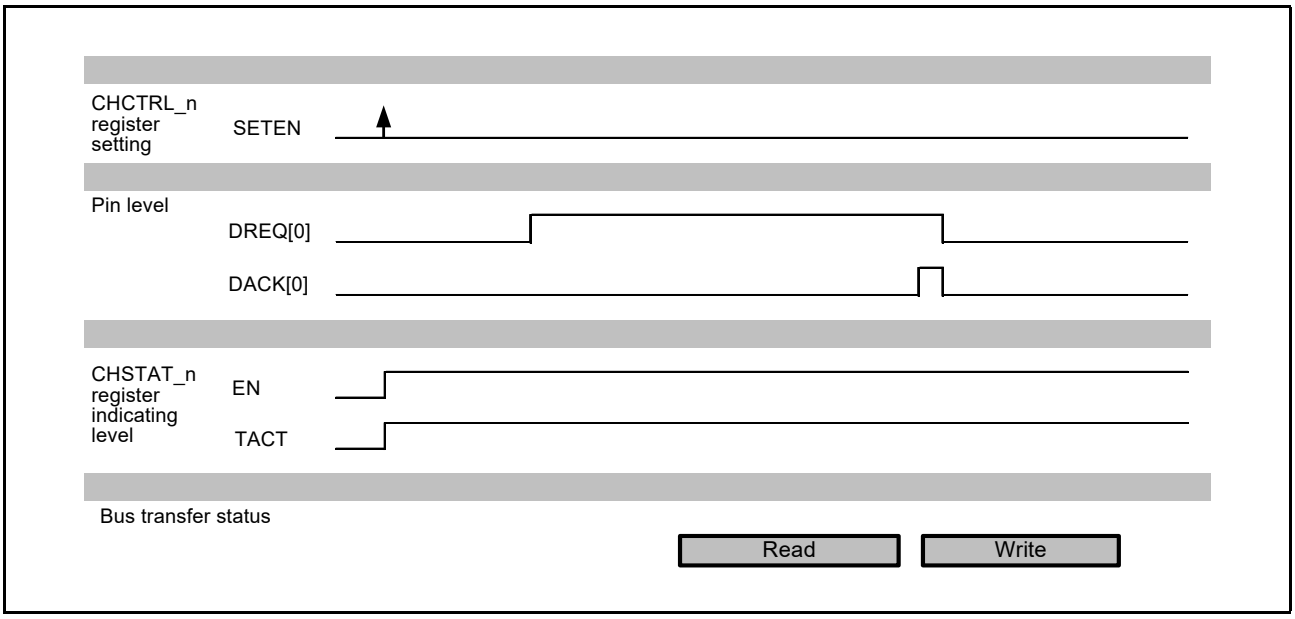

Figure 15.32 DMAC Status Example 1 (Hardware Request)

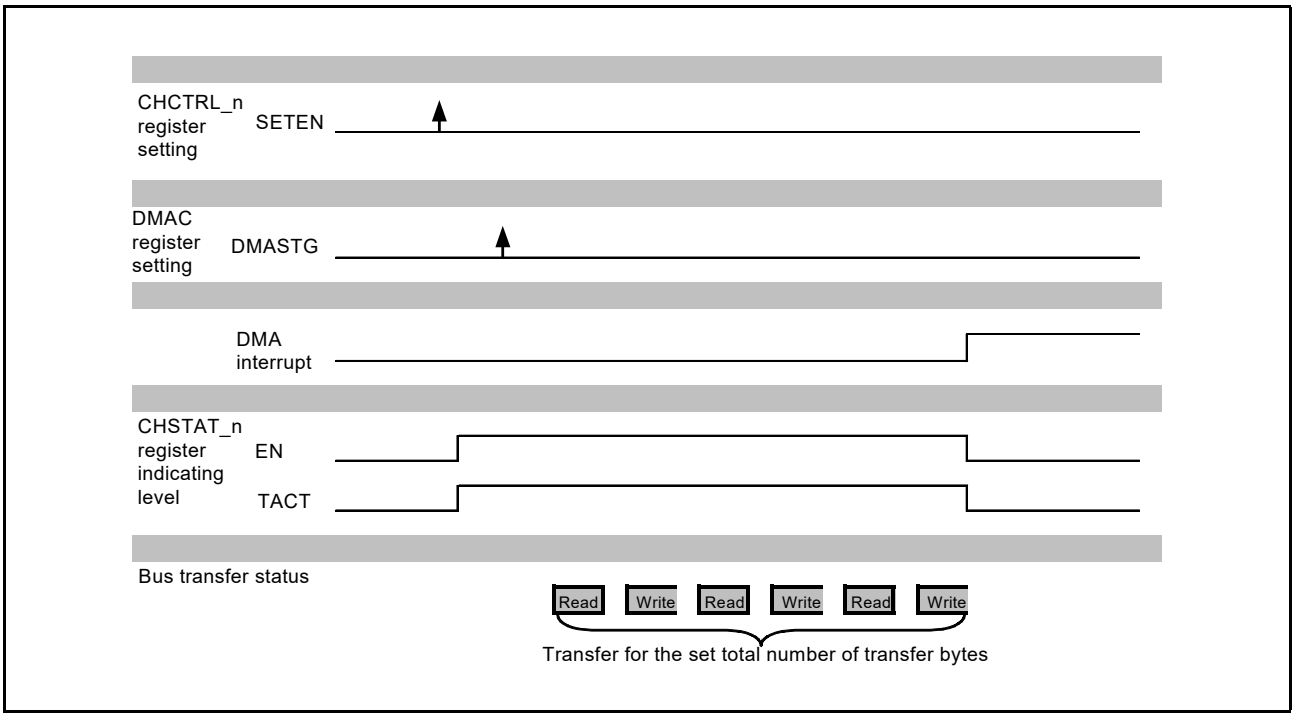

Figure 15.33 DMAC Status Example 2 (Software Request)

15.3.10 Suspending a Transfer

You can suspend a DMA transfer at the SETSUS bit in the CHCTRL_n register. At that time, if there is an already running bus cycle, waits for the cycle to end, and then suspends the transfer. Writing 1 to the CLRSUS bit in the CHCTRL_n register resumes from the suspended state.

To check if the transfer is suspended, set the SETSUS bit in the CHCTRL_n register, and then make sure that the SUS bit in the CHSTAT_n register, or the SUS bit in the DST_SUS register on the applicable channel is set to 1.

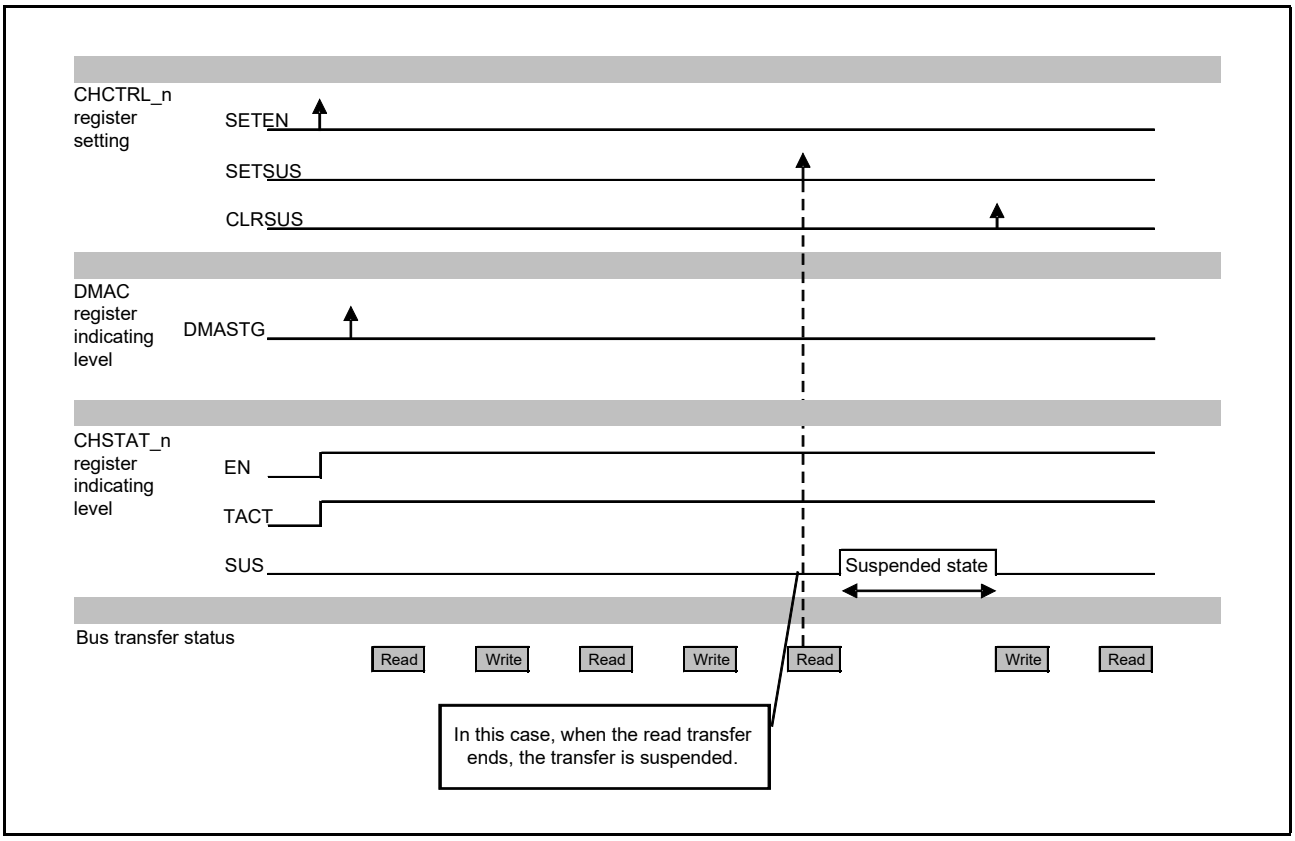

Figure 15.34 DMAC Suspended State (Software Request Block Transfer)

15.3.11 Aborting a Transfer

During a DMA transfer, if you write 1 to the CLREN bit in the CHCTRL_n register, you can abort the DMA transfer of the channel. As processing after aborting the transfer, you can use the SBE bit in the CHCFG_n register to determine whether to flush data remaining in a buffer when a transfer is suspended. By default, SBE = 0 (do not flush data) is selected.
When this mode (flush data) is activated, if a transfer which is being performed when the CLREN bit in the CHCTRL_n register = 1 is aborted, data remaining in the buffer of DMAC is flushed, and the operation stops.

15.3.11.1 Aborting a Transfer (No Buffer Flush: SBE = 0)

During a DMA transfer, if you write 1 to the CLREN bit in the CHCTRL_n register, you can abort and then stop the DMA transfer. The timing to stop the transfer depends on the value set for the REQD bit. After the transfer stops, write 1 to the SWRST bit in the CHCTRL_n register, and clear the contents within the DMAC before setting the next transfer.

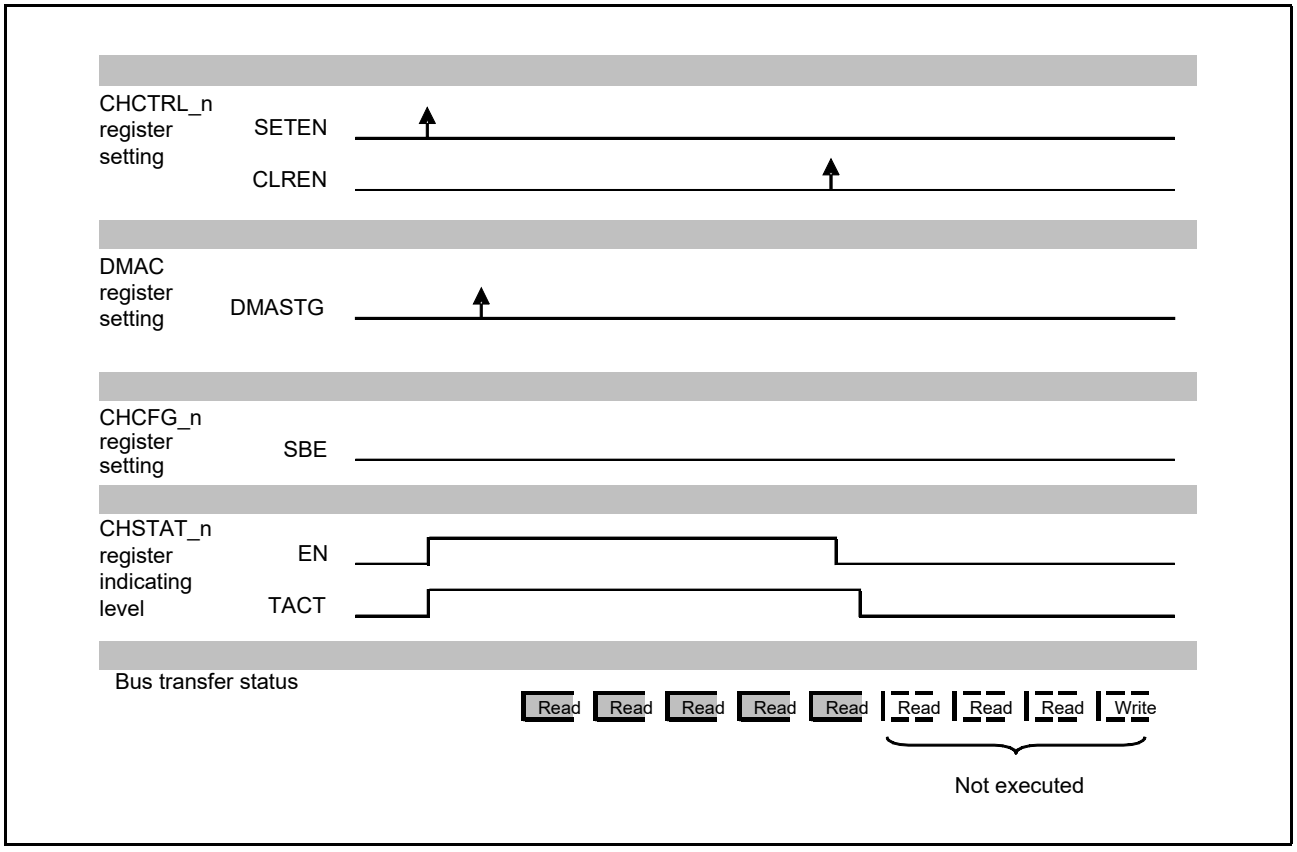

Figure 15.35 Aborting a DMA Transfer

- When the TACT bit in the CHSTAT_n register is cleared, you can confirm that the channel stops completely.
- If a DMA transfer is aborted, no DMA transfer completion interrupt is generated.
- When the REQD bit in the CHCFG_n register = 0, the transfer stops when the next read operation completes (Note that if there is data that can be written in the buffer, the transfer stops after the data is written).
- When the REQD bit in the CHCFG_n register = 1, the transfer stops when the next write operation completes.

15.3.11.2 Aborting a Transfer (Buffer Flush: SBE = 1)

During a DMA transfer, if you write 1 to the CLREN bit in the CHCTRL_n register, you can abort the DMA transfer. When the REQD bit in the CHCFG_n register = 0, already read data is flushed (written), and then the DMA transfer stops. When REQD = 1, flush mode cannot be used.
After the transfer stops, set the SWRST bit in the CHCTRL_n register, and clear the contents within the DMAC before setting the next transfer.

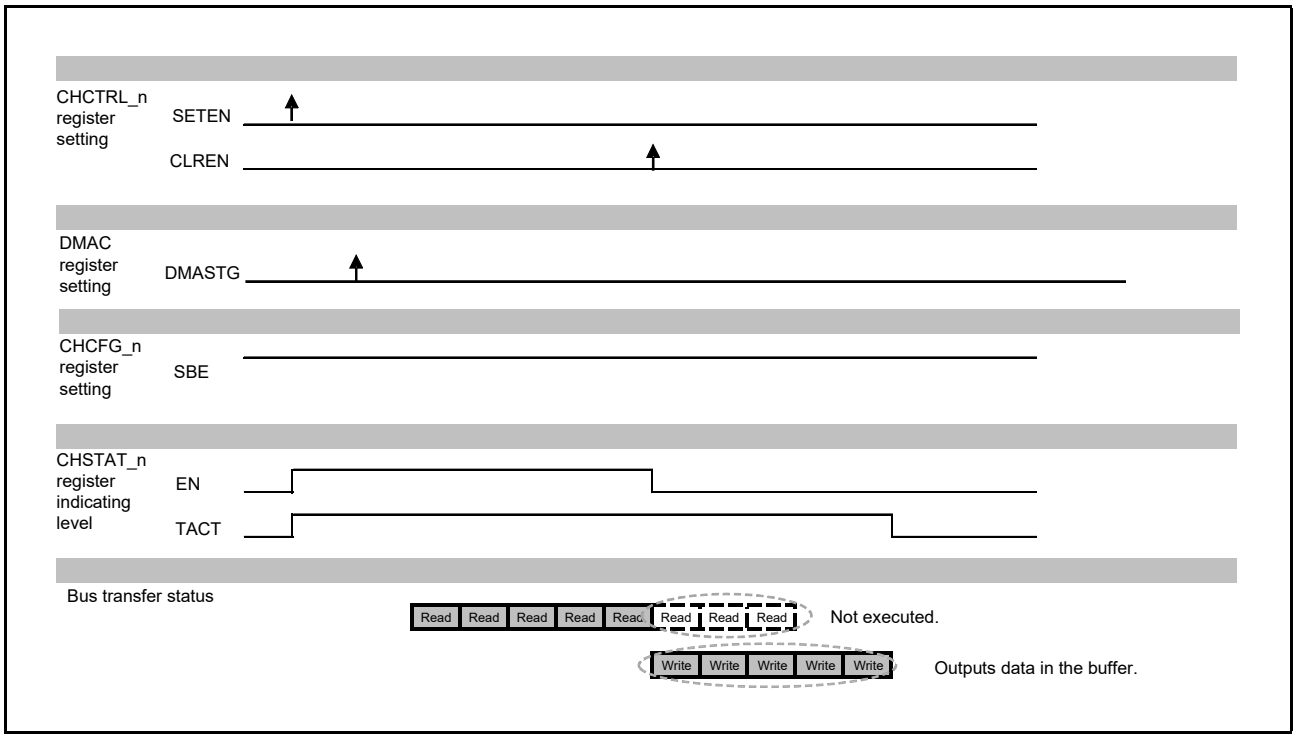

Figure 15.36 Aborting DMA Transfer (Buffer Flush Mode)

- The above figure shows an example when 1 is written to the CLREN bit in the CHCTRL_n register during the fifth read transfer in flush mode (the SBE bit in the CHCFG_n register = 1), and the transfer is aborted. It illustrates how read data is written, and the DMA transfer stops.
- When the TACT bit in the CHSTAT_n register is cleared to 0, you can confirm that the channel stops completely.

15.3.11.3 Checking If the Channel Stops

When 1 is written to the CLREN bit in the CHCTRL_n register, and the EN bit in the CHSTAT_n register is cleared to 0, if a transfer is already performed on a bus, DMAC cannot stop immediately. To check if DMA stops completely, make sure that the EN bit is cleared to 0, and the TACT bit in the CHSTAT_n register is cleared to 0.

15.3.11.4 Procedure for Aborting a Transfer

The following is the procedure for stopping a transfer:

1. Write 1 to the CLREN bit in the CHCTRL_n register.
2. When the SBE bit in the CHCFG_n register = 0, the transfer stops according to value for the REQD bit in the CHCFG_n register. At that time, if SBE = 1, flush mode is used.
3. By reading the CHSTAT_n register, make sure the TACT bit is cleared to 0. When TACT = 0, DMA stops completely. When TACT = 1, perform polling until the TACT bit is cleared to 0.
4. After a transfer is aborted, if you want to perform the next DMA transfer, you must set the SWRST (software reset) bit in the CHCTRL_n register immediately before the next transfer starts.

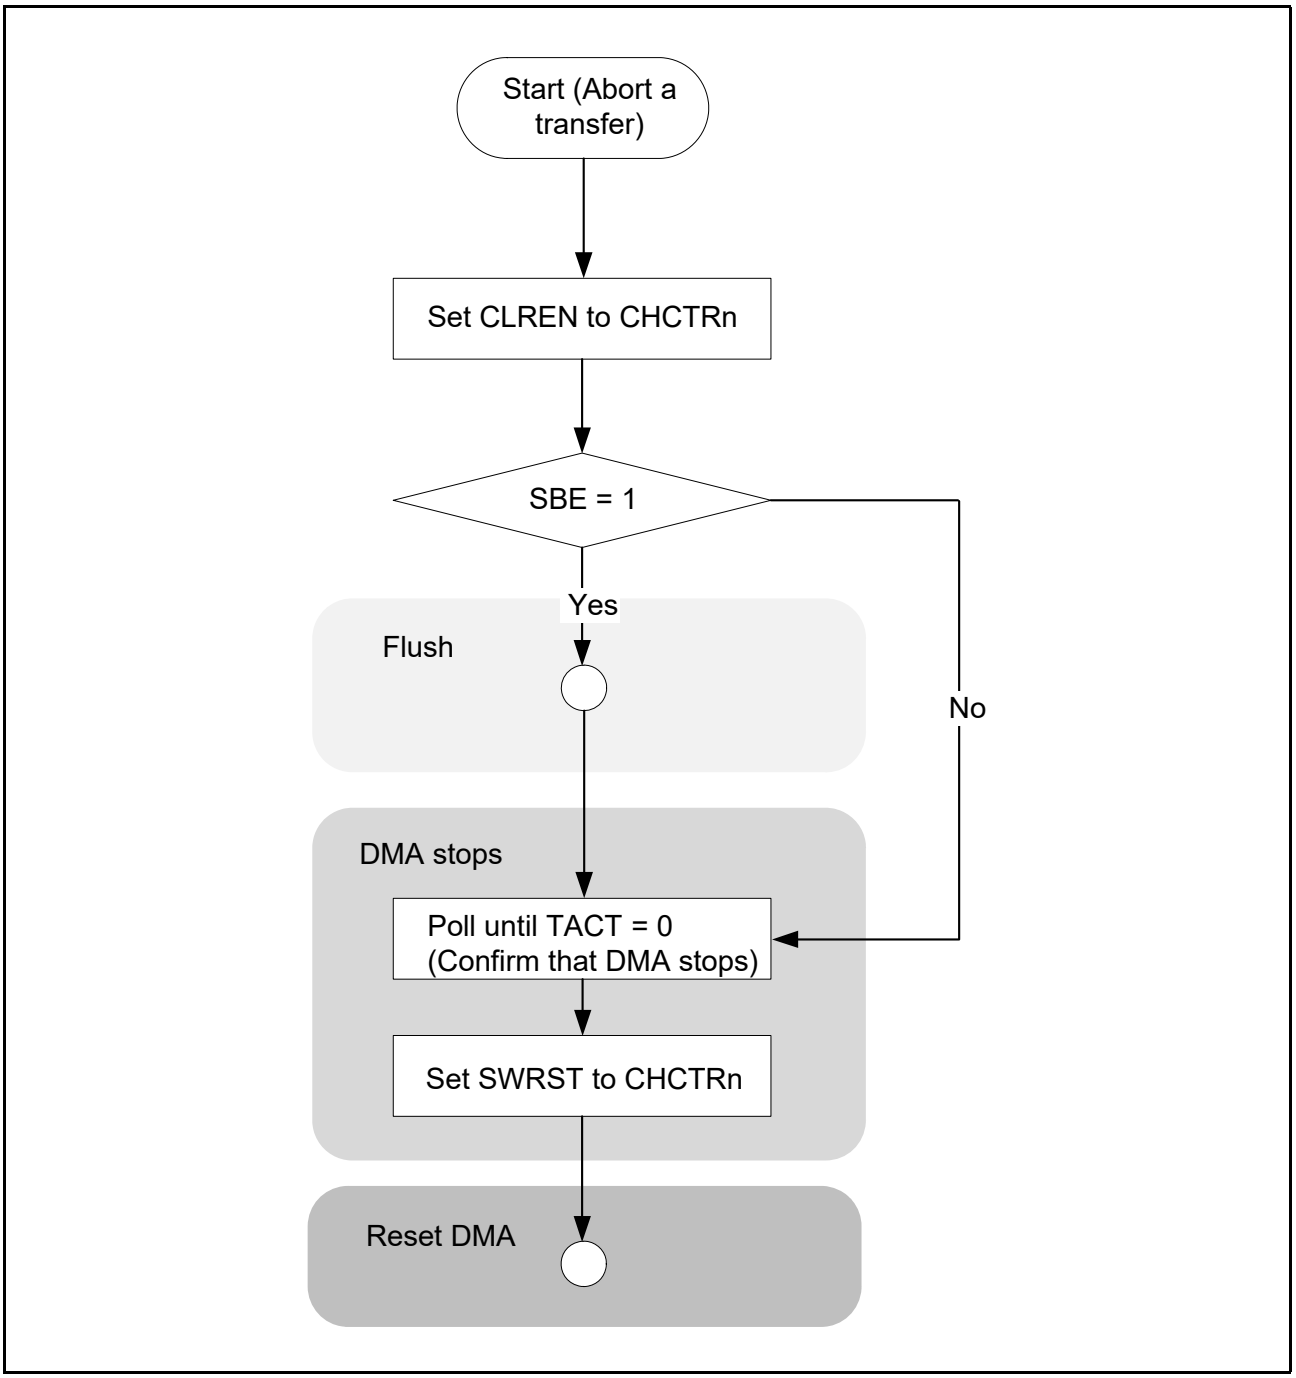

Figure 15.37 Operation Flow of Aborting a Transfer

15.4 Interrupts

15.4.1 Interrupt Sources

DMAC has two types of interrupt sources, such as DMA transfer completion interrupts and DMA error interrupts for each channel.
Table 15.23 shows the relationship among interrupt sources, enable bits, and status flags.

Table 15.23 Interrupt Sources of DMAC

Interrupt Source		Interrupt Enable Bit	Interrupt Status Flag	Output Condition
DMA transfer completion interrupt	DMA transfer completion	CHCFG_n.DEM	CHSTAT_n.END	When a transfer for the total number of transfer bytes loaded to the CRTB_n register completes (after a write back if write back is performed in link mode)
	Descriptor invalid	CHCFG_n.DIM		In link mode, when the DRRP and DIM bits in the CHCFG_n register = 0, and header of the read descriptor's LV = 0
DMA error interrupt		— (Mask disabled)	CHSTAT_n.ER	When a bus error occurs during a DMA transfer and descriptor access

15.4.2 DMA Transfer Completion Interrupts

A DMA transfer completion interrupt is an interrupt request signal indicating that the DMA transfer completes.
Each bit of the DMA transfer completion interrupt corresponds to each channel.

When the transfer of the total number of bytes for transfer loaded to the CRTB_n register is completed, the END bit in the CHSTAT_n register is set to 1. At that time, if the DEM bit in the CHCFG_n register = 0, a DMA transfer completion interrupt is generated (n = 15 to 0). To perform write back in link mode, an interrupt is generated after the write back.

In addition, when the DRRP bit in the CHCFG_n register = 0 in link mode, and header of the read descriptor is LV = 0, the DER bit in the CHSTAT_n register is set to 1. At that time, if the DIM bit in the CHCFG_n register = 0, a DMA transfer completion interrupt is generated.

Note: Instead of an interrupt source from peripheral modules, transfer completion sources of DMAC channels selected by the DMAC source select register are connected to the vector number selected by the DMAC source select registers (DMA0SELi, DMA1SELi). (The vector number selected by the DMA source selection register is handled as the vector number of the DMA transfer completed interrupt.)

Note: Be sure to select edge detection with the PLSn register as the transfer completed interrupt detection type for the DMAC.

For details, see section 12.3.1, Selecting Interrupt Request Destinations.

15.4.3 DMA Error Interrupt

If a bus error occurs during a DMA transfer or descriptor access, this module determines an error occurred, and stops the transfer. When a bus error occurs, the EN bit in the CHSTAT_n register for channel n where a transfer is performed is cleared to 0, and the ER bit is set to 1 (n = 15 to 0). In addition, a DMA error interrupt is generated.
DMA error interrupts cannot be masked.

Data for a series of error transfers cannot be guaranteed. You must perform the transfer from the beginning by using the following procedure.

1. Set the SWRST bit in the CHCTRL_n register to 1.
2. Set each register again.

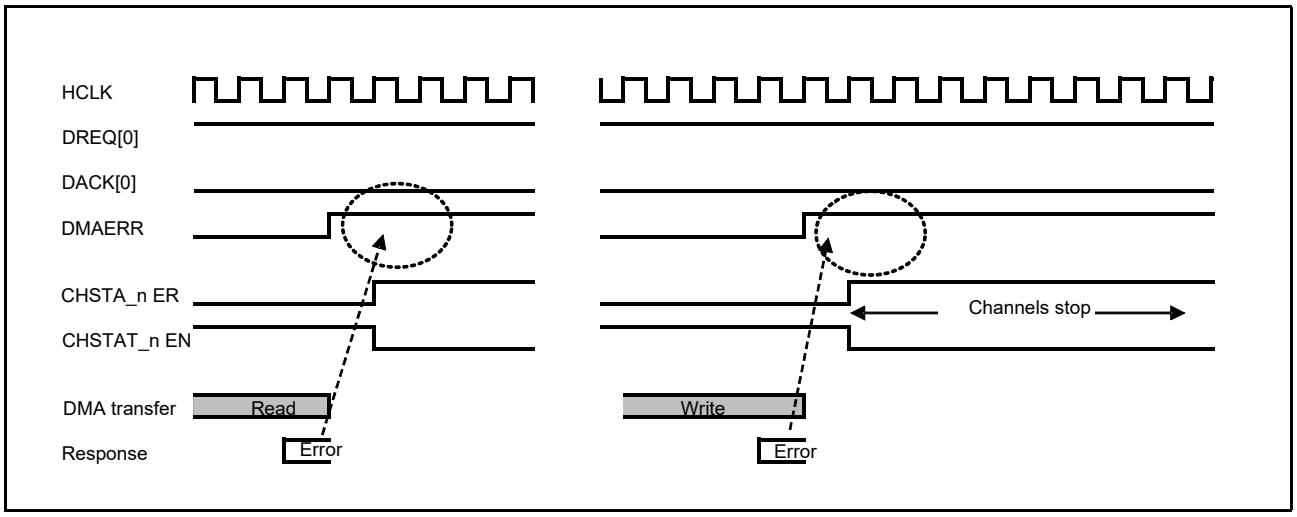

Figure 15.38 Stop Timing for Responding to a Bus Error

Note: When the CPU accesses a register of DMAC, if a bus error occurs, no DMA error interrupt is generated.

15.5 DMA Setting Examples

This section provides examples of DMA transfers. The following table lists the transfer conditions for the setting examples described in this section.

Table 15.24 List of Transfer Conditions for the DMA Transfer Setting Examples

Setting Example	DMA Mode	Transfer Mode	Transfer Request
Setting example 1	Register mode	Single transfer mode	Hardware
Setting example 2	Register mode	Block transfer mode	Software
Setting example 3	Register mode (continuous execution)	Block transfer mode	Software
Setting example 4	Link mode	Block transfer mode	Software

15.5.1 Setting Example 1 (Register Hardware Request)

This subsection provides setting examples of DMA transfers that use hardware requests in register mode.

Table 15.25 DMA Transfer Setting Example 1

Item		Description	
Channel to use		DMAC0 channel 3	
Priority control		Fixed priority	
DMA mode		Register mode	
Transfer mode		Single transfer mode	
Register set to use		Next0 register set	
Transfer source/transfer destination		**Transfer source**	**Transfer destination**
	Start address	6000 0000h	2000 0000h
	Address direction	Increment	Increment
	Data size	32 bits	32 bits
Number of DMA transfer bytes		64 bytes	
DMA transfer request		Detects the rising edge by hardware (DREQ0).	
Selection of the side which makes a DMA transfer request		Requested from the transfer-side module.	
DACK/TEND signal		Outputs by level during read operation.	
DMA transfer completion interrupt output mask		None	

Setting Example 1
N0SA = 6000 0000h (Transfer source address)
N0D = 2000 0000h (Transfer destination address)
N0TB = 0000 0040h (Number of transfer bytes)

CHCFG = 0002 2123h (Configuration)
CHITVL = 0000 0000h (Interval)

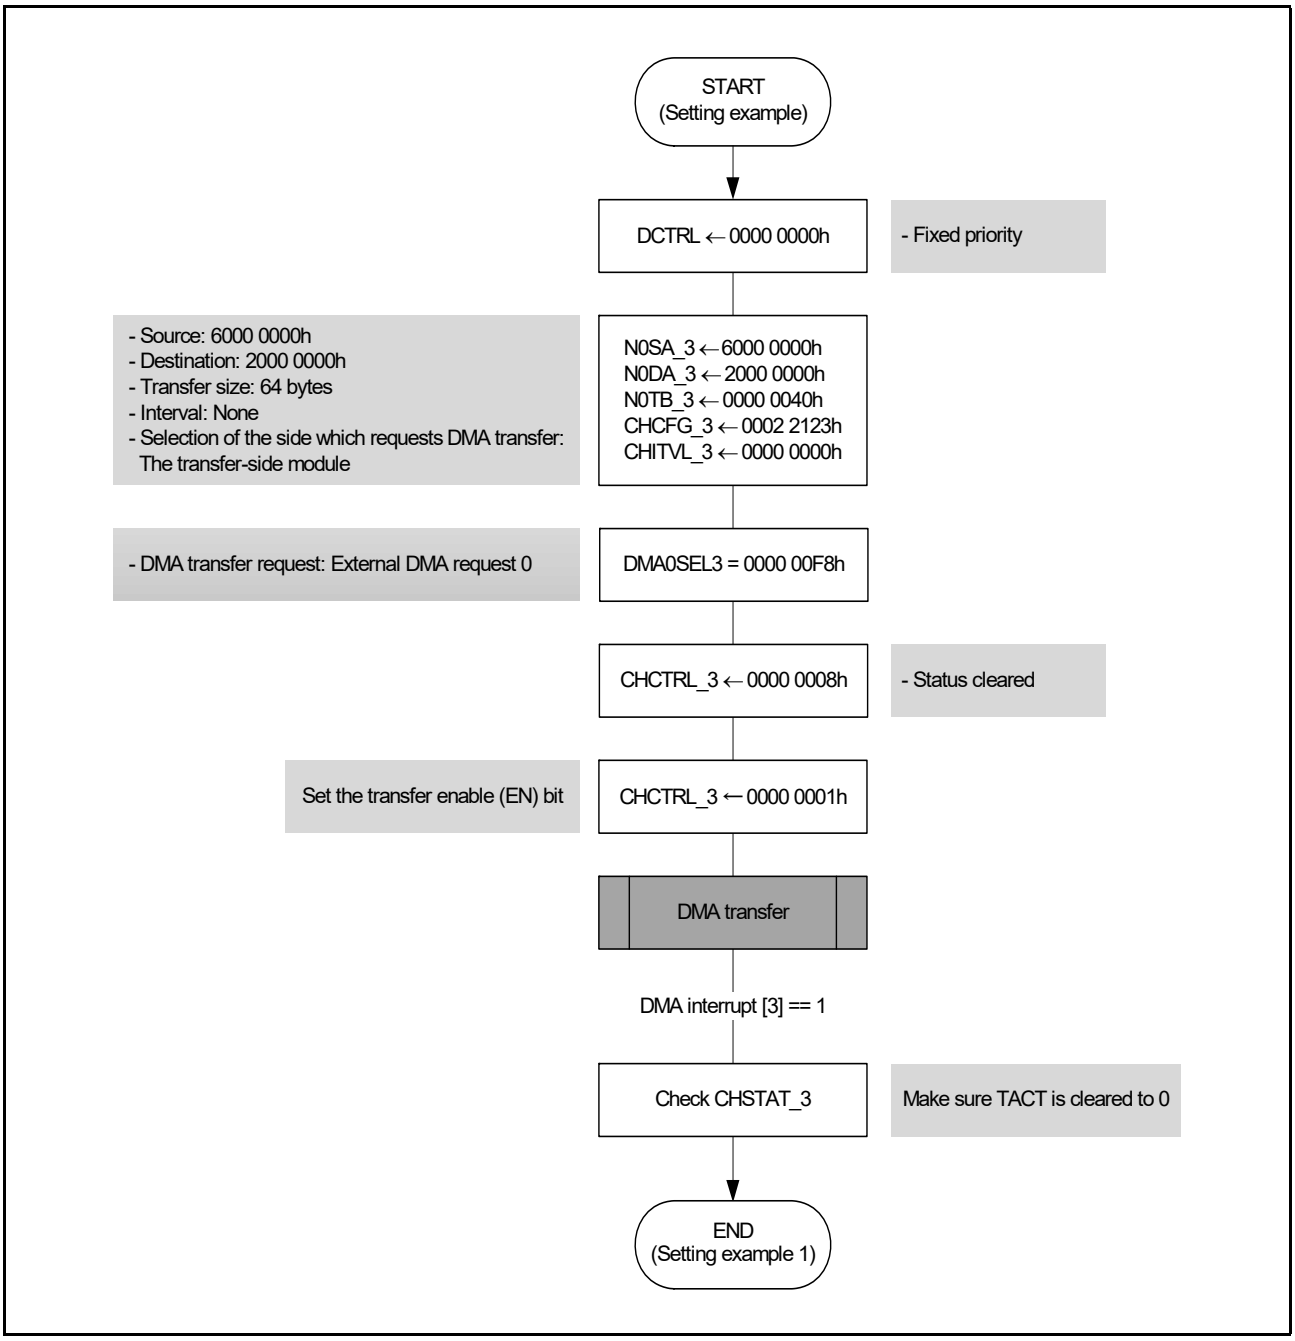

Figure 15.39 Setting Example 1

Note: DMA interrupt [3] indicates the interrupt source assigned to serve as the trigger for DMA transfer on channel 3.

15.5.2 Setting Example 2 (Register Mode Software Request)

This subsection provides a setting example of DMA transfers that use software requests in register mode.

Table 15.26 DMA Transfer Setting Example 2

Item		Description	
Channel to use		DMAC0 channel 2	
Priority control		Round-robin	
DMA mode		Register mode	
Transfer mode		Block transfer mode	
Register set to use		Next1 register set	
Transfer source/transfer destination		Transfer source	Transfer destination
	Start address	0400 0000h	2000 0000h
	Address direction	Increment	Increment
	Data size	8 bits	256 bits
Number of DMA transfer bytes		128 bytes	
DMA transfer request		Software request	
DACK/TEND signal		Mask	
DMA transfer completion interrupt output mask		None	

Setting Example 2
DCTRL = 0000 0001h (DMA setting)

N1SA = 0400 0000h (Transfer source address)
N1DA = 2000 0000h (Transfer destination address)
N1TB = 0000 0080h (Number of transfer bytes)

CHCFG = 1045 0222h (Configuration)
CHITVL = 0000 0000h (Interval)

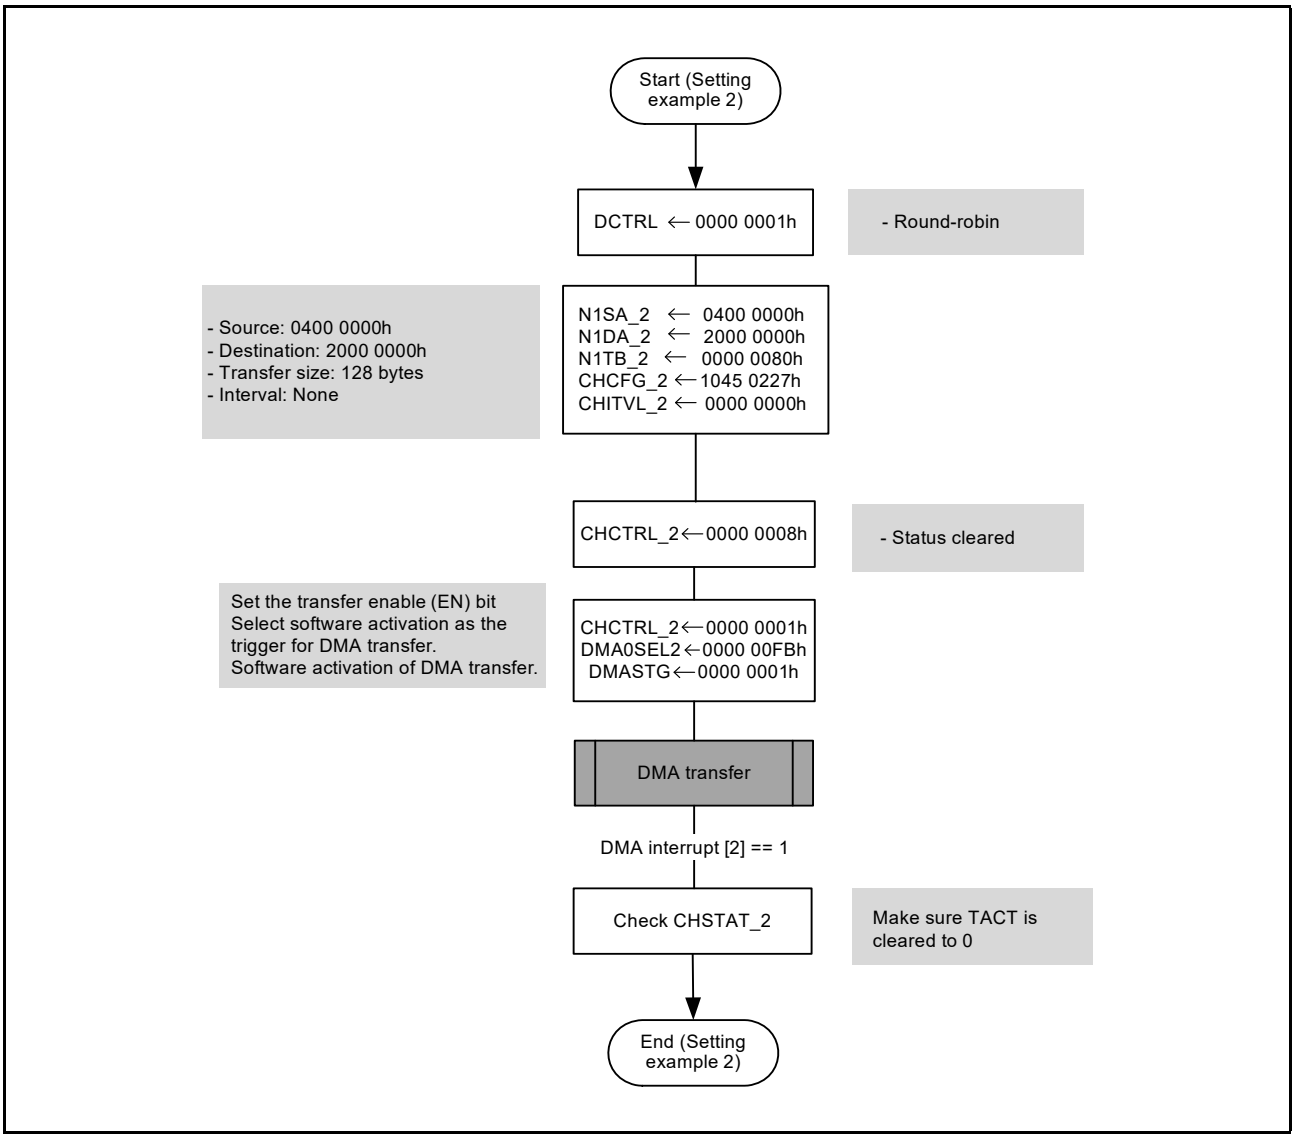

Figure 15.40 Setting Example 2

Note: DMA interrupt [2] indicates the interrupt source assigned to serve as the trigger for DMA transfer on channel 2.

15.5.3 Setting Example 3 (Register Mode Continuous Execution)

This subsection provides a setting example of DMA transfers that use Next0/1 Register Sets in series in register mode.

Table 15.27 DMA Transfer Setting Example 3

Item		Description	
Channel to use		DMAC0 channel 1	
Priority control		Round-robin	
DMA mode		Register mode	
Transfer mode		Block transfer mode	
Register set to use		Next0 register set -> Next1 register set in series	
Transfer source/transfer destination (Next0)		Transfer source	Transfer destination
	Start address	1111 0000h	2000 0000h
	Address direction	Fixed	Fixed
	Data size	32 bits	512 bits
	Number of DMA transfer bytes	512 bytes	
Transfer source/transfer destination (Next1)		Transfer source	Transfer destination
	Start address	0400 0000h	1000 0000h
	Address direction	Fixed	Fixed
	Data size	32 bits	512 bits
	Number of DMA transfer bytes	2,048 bytes	
DMA transfer request		Software request	
DACK/TEND signal		Mask	
DMA transfer completion interrupt output mask		Masks when Next0 completes.	

Setting Example 3
DCTR = 0000 0001h (DMA setting)

N0SA = 1111 0000h (Transfer source address)
N0DA = 2000 0000h (Transfer destination address)
N0TB = 0000 0200h (Number of transfer bytes)

N1SA = 0400 0000h (Transfer source address)
N1DA = 1000 0000h (Transfer destination address)
N1TB = 0000 0800h (Number of transfer bytes)

CHCFG = 6176 2007h (Configuration)
CHITVL = 0000 0000h (Interval)

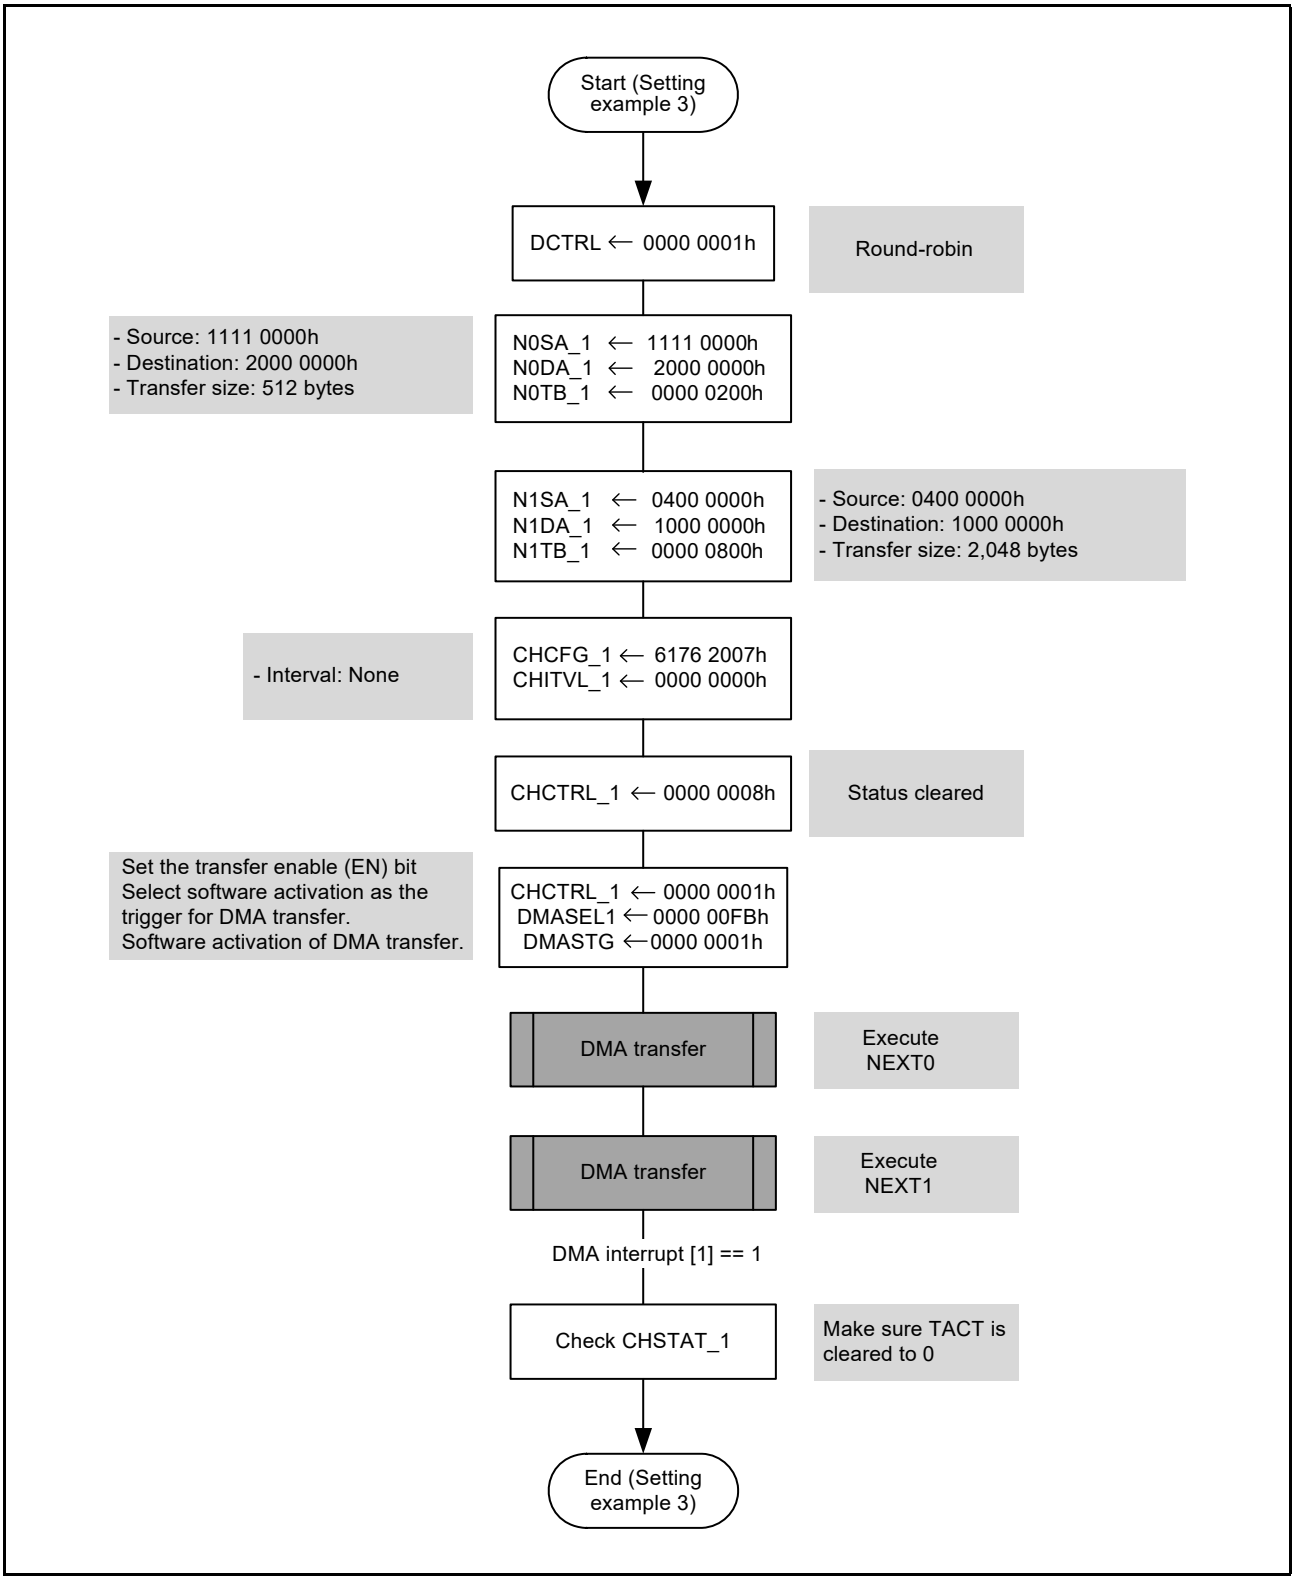

Figure 15.41 Setting Example 3

Note: DMA interrupt [1] indicates the interrupt source assigned to serve as the trigger for DMA transfer on channel 1.

15.5.4 Setting Example 4 (Link Mode)

This subsection provides a setting example when a DMA transfer is performed in link mode.

Table 15.28 DMA Transfer Setting Example 4

Item	Description
Channel to use	DMAC0 channel 0
Priority control	Round-robin
DMA mode	Link mode
Transfer mode	Block transfer mode
Descriptor start address	0080 0000h

Table 15.29 DMA Transfer Setting Example 4 (Descriptor 1)

Item		Description	
Descriptor start address		0080 0000h	
Next descriptor start address		0080 1000h	
Transfer mode		Block transfer mode	
Transfer source/transfer destination		Transfer source	Transfer destination
	Start address	1111 0000h	2000 0000h
	Address direction	Increment	Increment
	Data size	32 bits	32 bits
Number of DMA transfer bytes		2,048 bytes	
DMA transfer request		Software request	
DACK/TEND signal		Mask	
DMA transfer completion interrupt output mask		Masks when a DMA transfer on descriptor 1 completes.	
Descriptor format		1 (8 words)	
Descriptor header			
	Write back of the LV bit	Enable (WBD = 0)	
	Next link destination	Available (LE = 0)	
	Descriptor enabled	Enabled (LV = 1)

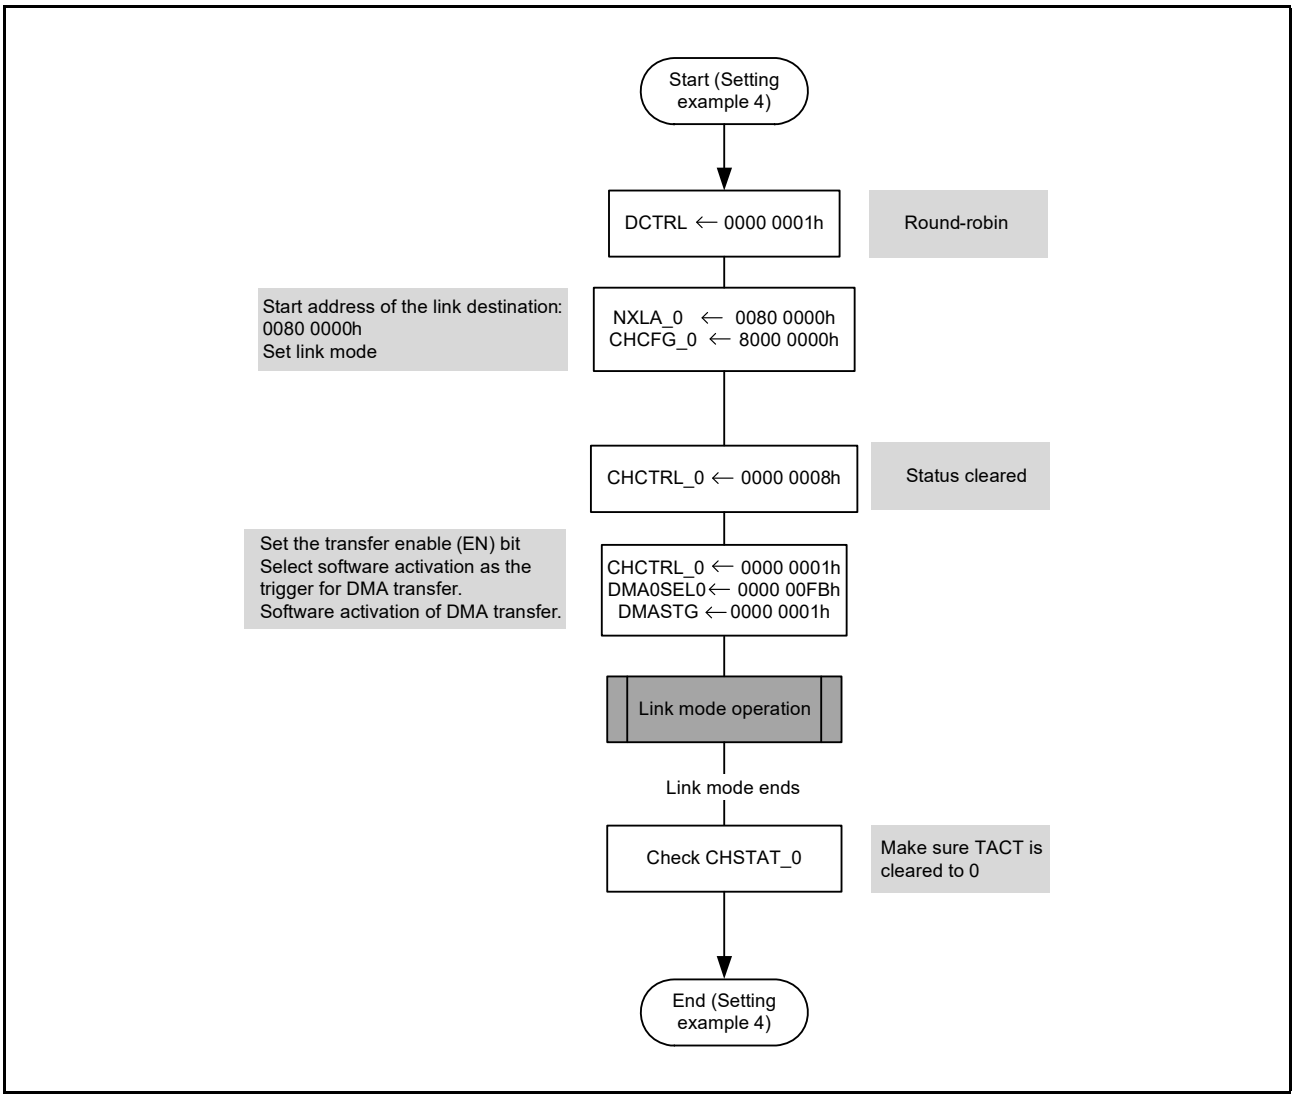

Figure 15.42 Setting Example 4

15.5.5 Next Register Continuous Execution Settings

The following figure shows a flow chart when using two Next register sets to continue DMA transfers in register mode. While performing a DMA transfer of a Next register, set the other Next register, and perform the DMA transfers in series.

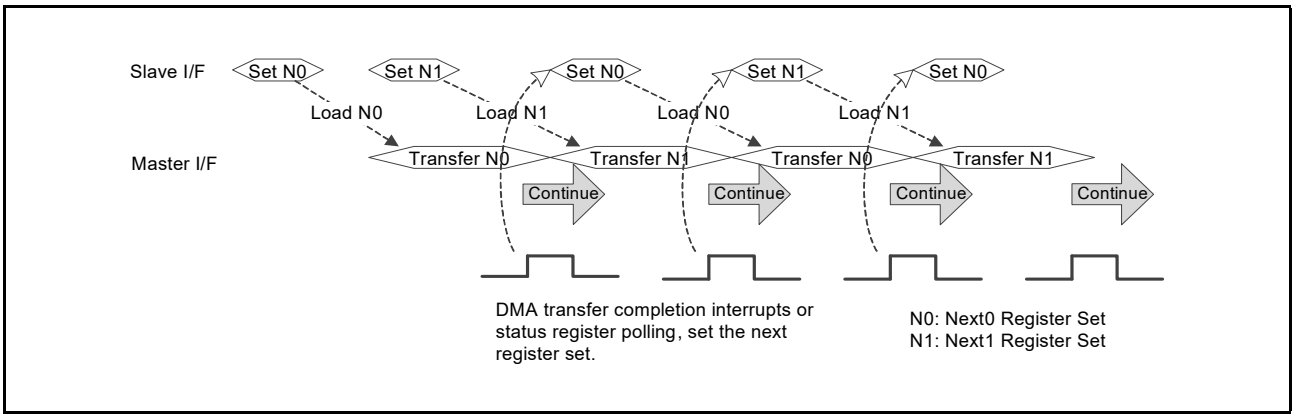

Figure 15.43 Next Register Continuous Execution Setting Image

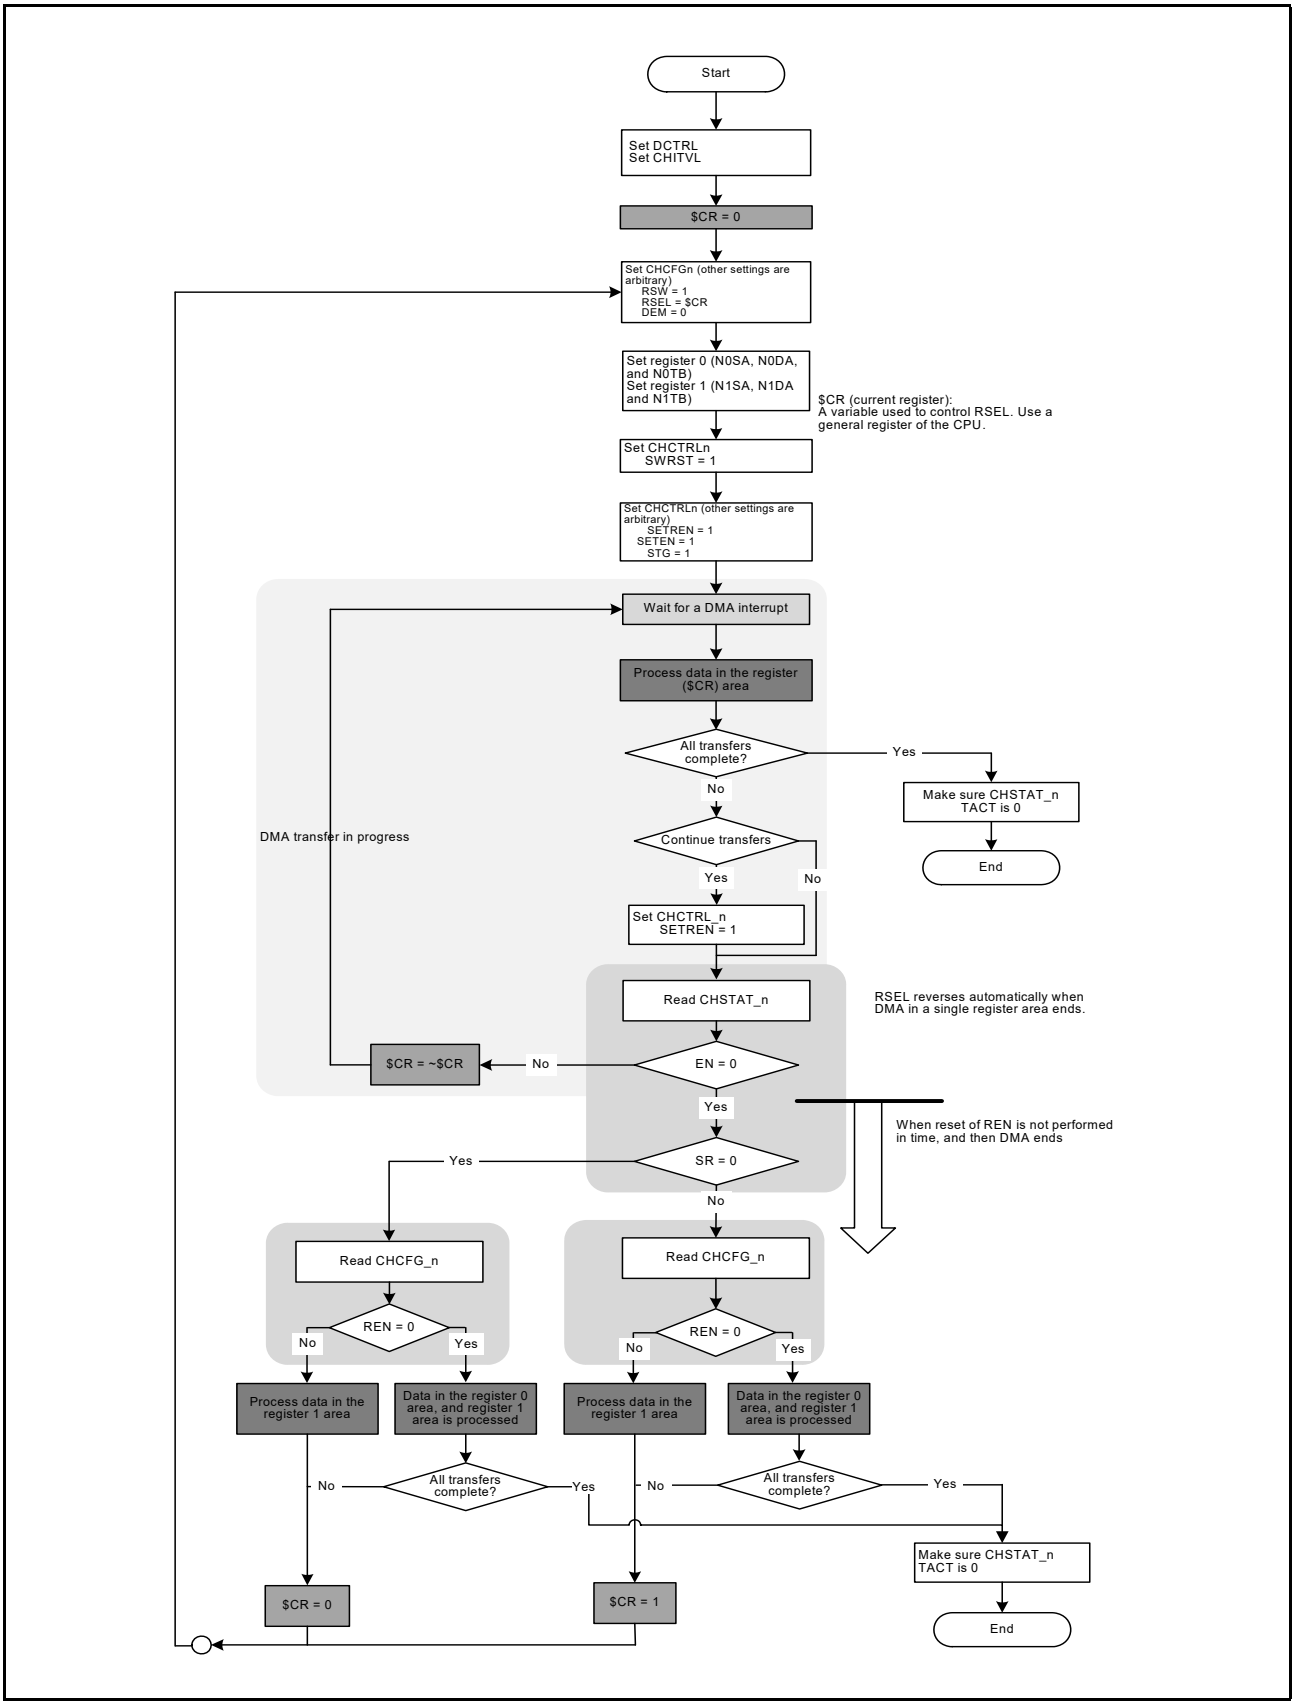

Figure 15.44 Setting Example of Next Register Continuous Execution

- Supplementary information:
  Save the register sets 0 (N0SA_n, N0DA_n, and N0TB_n registers) and 1 (N1SA_n, N1DA_n, and N1TB_n registers) in a general register (call this register value $CR for convenience).
  Every time a DMA transfer of a register set completes (a DMA transfer completion interrupt is generated), the REN bit in the CHCFG_n register is cleared to 0 automatically. To perform transfers in series, write 1 to the SETREN bit in the CHCTR_n register. By doing so, the REN bit in the CHCFG_n register is also set.

  In this mode, two Next registers are executed in series. However, if the SETREN bit is not set before a DMA transfer completes (before the next DMA transfer completion interrupt is generated), the continuous execution stops. In this case, by reading the SR and EN bits in the CHSTAT_n register, and the REN bit in the CHCFG_n register, you can check how far the transfer is performed. To resume the transfer, perform the procedure described in the above flow chart.

15.6 Usage Notes

This subsection provides notes on this module.

- When a transfer of which source and destination are in the same, or partially shared area is performed, consistency of data cannot be guaranteed. Therefore, do not perform a transfer of which source and destination address areas overlap.

- When DAD = 1 (fixed transfer source address), no skip transfer can be performed on the transfer destination. If a transfer is performed with this setting, operation cannot be guaranteed. Do not perform this type of transfers.

- When SAD = 1 (fixed transfer source address), no skip transfer can be performed on the transfer source. If a transfer is performed with this setting, operation cannot be guaranteed. Do not perform this type of transfers.

- For hardware activation, if REQD = 1 (the transfer destination issues a hardware request), SBE = 1 (flush mode) and the forced ejection function cannot be used. The transfer is deactivated by hardware.

- Since access to the region from A00E 0000h to A010 0000h within the peripheral I/O register region is not supported, locations or ranges within this region should never be set as sources or destinations for transfer.

15.6.1 When the DACK and TEND Signals Are Divided and Output

When four-byte or more data is transferred to an 8-bit or 16-bit external device, or two-byte or more data is transferred to an 8-bit external device, a DMA transfer unit is divided into multiple bus cycles. When a DMA transfer is divided into multiple bus cycles, and the CS signal is deactivated between bus cycles, DACK output and TEND output are divided in the same way as the CS signal.

Figure 15.45 provides an example of DACK0/TEND0.

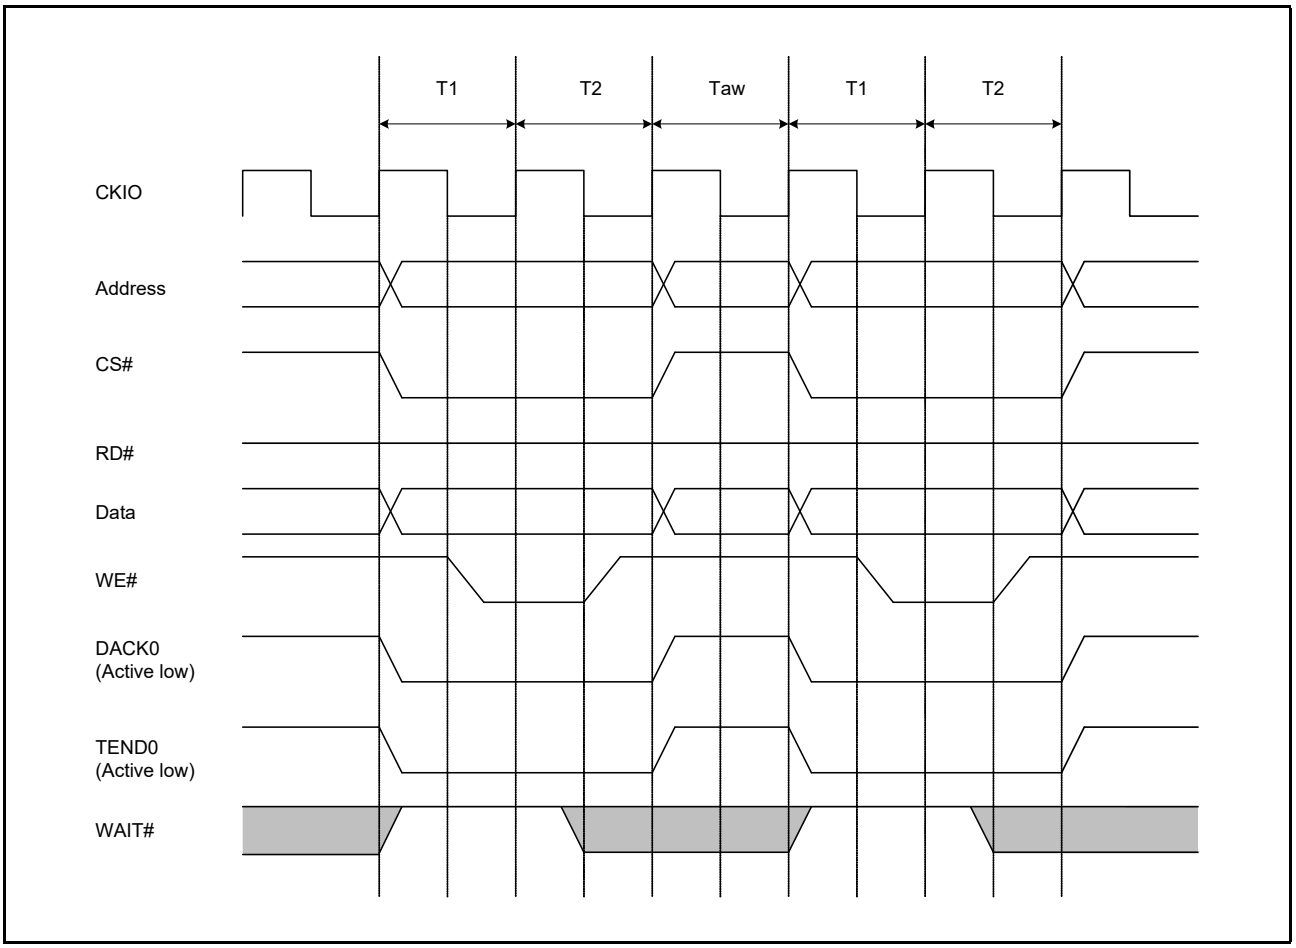

Figure 15.45 DACK/TEND Divided Output Example

15.6.2 When the TEND Signal is Not Output

Note that according to the combination of the DDS[3:0], SDS[3:0], and REQD bits in the CHCFG_n register, the TEND0 signal might not be output.

Table 15.33 shows combinations that are not output, and Figure 15.46 shows operation examples.

Table 15.33 TEND Signal Output Settings

CHCFG_n Register			
REQD	**DDS**	**SDS**	**TEND Output**
1	—	—	Output
0	DDS > SDS		Output
	DDS = SDS		Output
	DDS < SDS		Not output

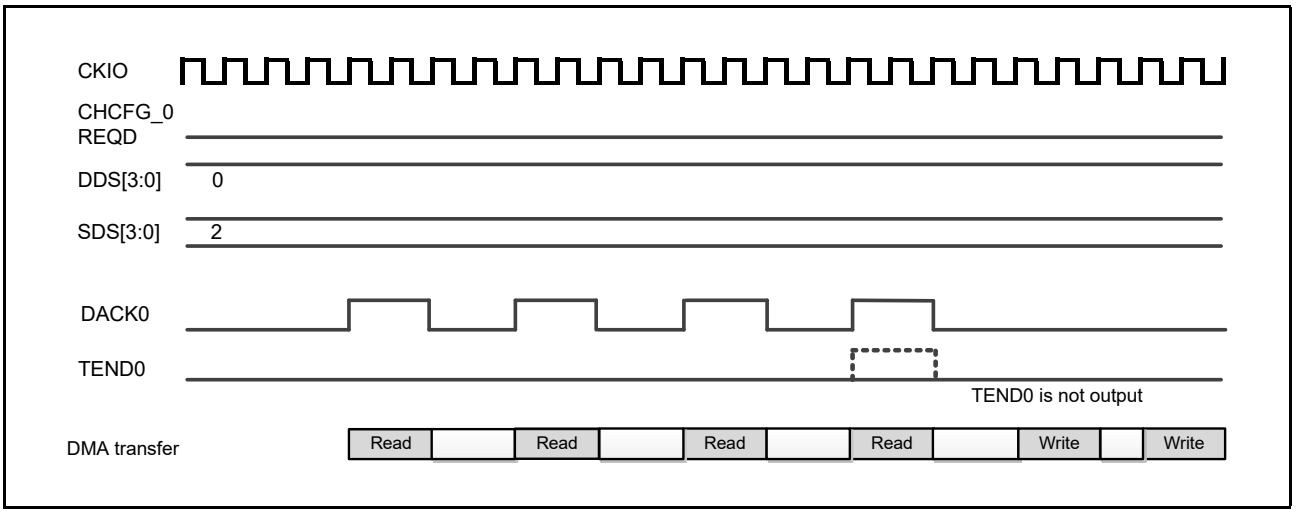

Figure 15.46 Example of TEND that is Not Output Yet

16. Event Link Controller (ELC)

16.1 Overview

The event link controller (ELC) connects (links) events generated by various peripheral modules to other modules. Event link allows direct cooperation among modules without CPU intervention.

Table 16.1 lists the specifications of the ELC, and Figure 16.1 shows a block diagram of the ELC.

Table 16.1 ELC Specifications

Item	Description
Event link function	• 103 types of event signals can be directly connected to modules. • The operation of timer modules can be selected when an event is input to the timer module. • Event link operation is possible for port B and port E. Single port*1: An event link can be set for a single bit specified in a port. Port group*1: An event link can be set for a group of single bits specified within eight I/O ports.
Low-power consumption function	Module-stop state can be set.

Note 1. The single port and port group specified as the input generate an event according to the change in the connected signal value.

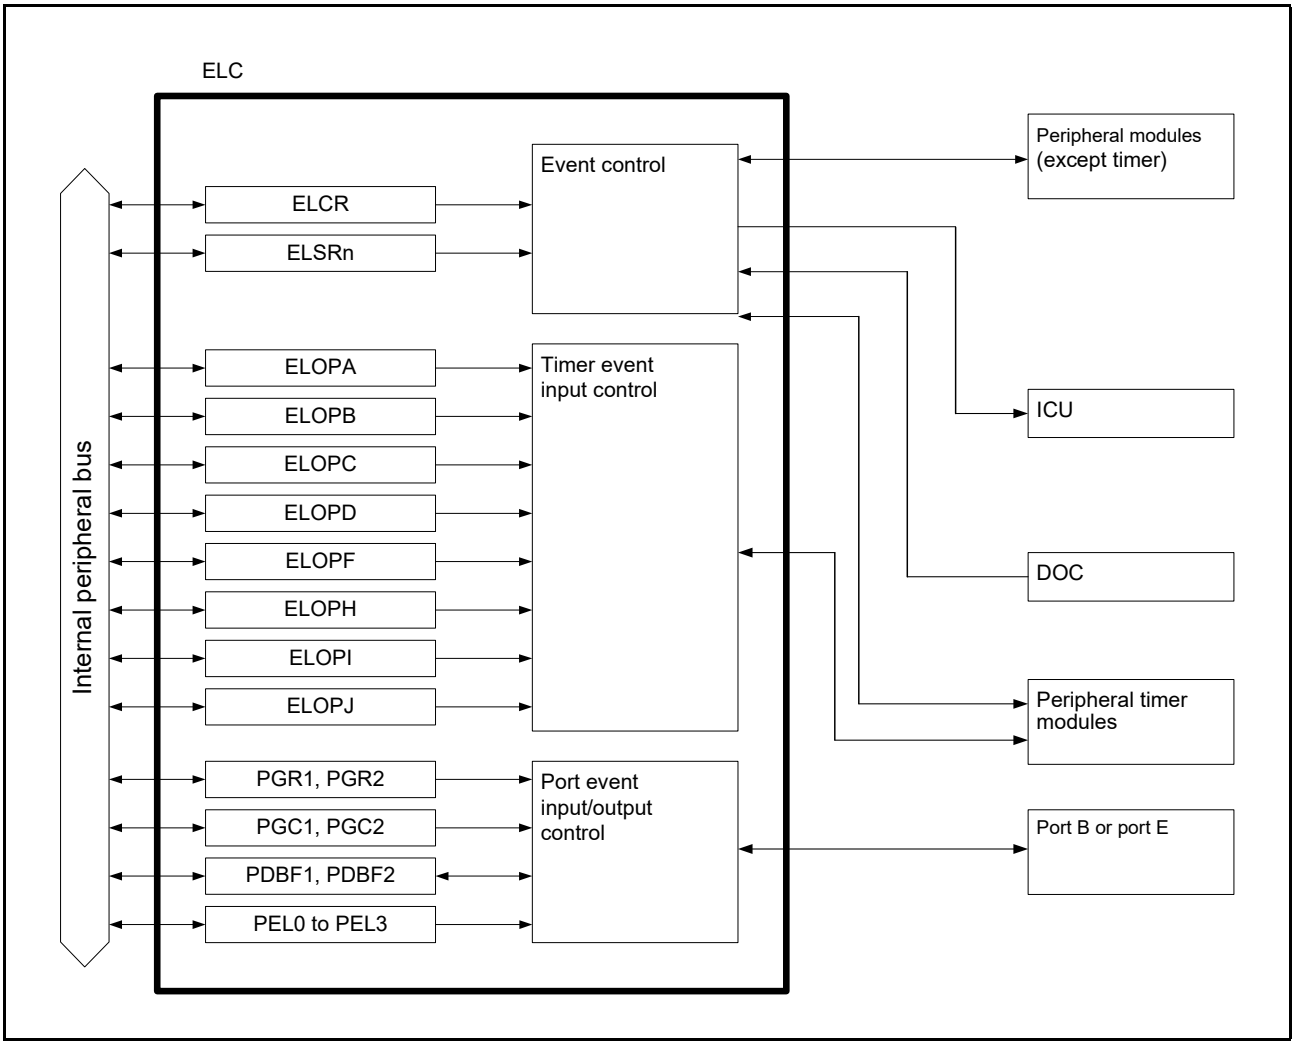

Figure 16.1 ELC Block Diagram (n = 0, 3, 4, 7, 10 to 13, 15, 16, 18 to 28, 33, 35 to 38, 41 to 45)

16.2 Register Descriptions

16.2.1 Event Link Control Register (ELCR)

The ELCR register controls operation of the ELC.

Address(es): A008 0B00h

	b7	b6	b5	b4	b3	b2	b1	b0
	ELCON	—	—	—	—	—	—	—
Value after reset:	0	1	1	1	1	1	1	1

Bit	Symbol	Bit Name	Description	R/W
b6 to b0	—	Reserved	These bits are read as 1. The write value should be 1.	R/W
b7	ELCON	All Event Link Enable	0: ELC function is disabled. 1: ELC function is enabled	R/W

16.2.2 Event Link Setting Register n (ELSRn) (n = 0, 3, 4, 7, 10 to 13, 15, 16, 18 to 28, 33, 35 to 38, 41 to 45)

The ELSRn register specifies an event signal to be linked to for each peripheral module. Table 16.2 shows the correspondence between the ELSRn register and the peripheral modules. Table 16.3 shows the correspondence between the event signal names set in the ELSRn register and the signal numbers.

Address(es): ELSR0 A008 0B01h, ELSR3 A008 0B04h, ELSR4 A008 0B05h, ELSR7 A008 0B08h, ELSR10 A008 0B0Bh, ELSR11 A008 0B0Ch, ELSR12 A008 0B0Dh, ELSR13 A008 0B0Eh, ELSR15 A008 0B10h, ELSR16 A008 0B11h*1, ELSR18 A008 0B13h, ELSR19 A008 0B14h, ELSR20 A008 0B15h, ELSR21 A008 0B16h, ELSR22 A008 0B17h, ELSR23 A008 0B18h, ELSR24 A008 0B19h, ELSR25 A008 0B1Ah, ELSR26 A008 0B1Bh, ELSR27 A008 0B1Ch, ELSR28 A008 0B1Dh*1, ELSR33 A008 0B31h, ELSR35 A008 0B33h, ELSR36 A008 0B34h, ELSR37 A008 0B35h, ELSR38 A008 0B36h, ELSR41 A008 0B39h, ELSR42 A008 0B3Ah, ELSR43 A008 0B3Bh, ELSR44 A008 0B3Ch, ELSR45 A008 0B3Dh

Note 1. Only for products incorporating an Encoder I/F.

16.2.3 Event Link Option Setting Register A (ELOPA)

The ELOPA register determines the operation of MTU0 and MTU3 when an event is input. The event setting should be disabled when the ELC function is not used.

Address(es): A008 0B1Fh

	b7	b6	b5	b4	b3	b2	b1	b0
	MTU3MD [1:0]		—	—	—	—	MTU0MD [1:0]	
Value after reset:	1	1	1	1	1	1	1	1

Bit	Symbol	Bit Name	Description	R/W
b1, b0	MTU0MD [1:0]	MTU0 Operation Select	b1 b0 0 0: Counting is started. 0 1: Counting is cleared. 1 0: Input capture*1 1 1: Event is disabled.	R/W
b5 to b2	—	Reserved	These bits are read as 1. The write value should be 1.	R/W
b7, b6	MTU3MD [1:0]	MTU3 Operation Select	b7 b6 0 0: Counting is started. 0 1: Counting is cleared. 1 0: Input capture*2 1 1: Event is disabled.	R/W

Note 1. The MTU0.TCNT value is captured into MTU0.TGRA.
Note 2. The MTU3.TCNT value is captured into MTU3.TGRA.

16.2.4 Event Link Option Setting Register B (ELOPB)

The ELOPB register determines the operation of MTU4 when an event is input. The event setting should be disabled when the ELC function is not to be used.

Address(es): A008 0B20h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	MTU4MD[1:0]	
Value after reset:	1	1	1	1	1	1	1	1

Bit	Symbol	Bit Name	Description	R/W
b1, b0	MTU4MD[1:0]	MTU4 Operation Select	b1 b0 0 0: Counting is started. 0 1: Counting is cleared. 1 0: Input capture*1 1 1: Event is disabled.	R/W
b7 to b2	—	Reserved	These bits are read as 1. The write value should be 1.	R/W

Note 1. The MTU4.TCNT value is captured into MTU4.TGRA.

16.2.5 Event Link Option Setting Register C (ELOPC)

The ELOPC register determines the operation of CMT1 when an event is input. The event setting should be disabled when the ELC function is not to be used.

Address(es): A008 0B21h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	CMT1MD[1:0]		—	—
Value after reset:	1	1	1	1	1	1	1	1

b3, b2	CMT1MD[1:0]	CMT1 Operation Select	b3 b2 0 0: Counting is started. 0 1: The counter is cleared 1 0: Event counter 1 1: Event is disabled.	R/W
b7 to b4	—	Reserved	These bits are read as 1. The write value should be 1.	R/W

16.2.6 Event Link Option Setting Register D (ELOPD)

The ELOPD register determines the operation of the ΔΣIF unit 0 trigger 0, the ΔΣIF unit 0 trigger 1, the ΔΣIF unit 1 trigger 0, and the ΔΣIF unit 1 trigger 1 when an event is input. The event setting should be disabled when the ELC function is not used.

Address(es): A008 0B22h

16.2.7 Port Group Setting Register n (PGRn) (n = 1, 2)

The PGRn register specifies a group for I/O port bits. This register specifies each port bit in the same eight I/O ports as the member of a group. One to eight port bits can be specified as the members of the same group as required. Table 16.4 shows the PGRn register and corresponding ports.

Address(es): PGR1 A008 0B23h, PGR2 A008 0B24h

	b7	b6	b5	b4	b3	b2	b1	b0
	PGRn7	PGRn6	PGRn5	PGRn4	PGRn3	PGRn2	PGRn1	PGRn0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	PGRn0	Port Group Setting n 0	0: The port bit is not specified as a member of the same group. 1: The port bit is specified as a member of the same group.	R/W
b1	PGRn1	Port Group Setting n 1		R/W

b6	PGRn6	Port Group Setting n 6		R/W
b7	PGRn7	Port Group Setting n 7		R/W

Table 16.4 Registers Related to Port Groups and Corresponding Port Numbers

Port Number	Port Group Setting Register (PGR)	Port Group Control Register (PGC)	Port Buffer Register (PDBF)
Port B	PGR1 register	PGC1 register	PDBF1 register
Port E	PGR2 register	PGC2 register	PDBF2 register

16.2.8 Port Group Control Register n (PGCn) (n = 1, 2)

For the output port group, the PGCn register specifies the form of outputting the signal externally via the port when the event signal is input. For the input port group, this register enables/disables overwriting of the PDBF register and specifies the conditions of event generation (edge of the externally input signal).
Refer to Table 16.4 for the PGRn register and corresponding ports.

Address(es): PGC1 A008 0B25h, PGC2 A008 0B26h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	PGCOn[2:0]			—	PGCOVEn	PGCIn[1:0]	
Value after reset:	1	0	0	0	1	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b1, b0	PGCIn [1:0]	Event Output Edge Select	b1 b0 0 0: Event is generated upon detection of the rising edge of the external input signal. 0 1: Event is generated upon detection of the falling edge of the external input signal. 1 X: Event is generated upon detection of both the rising and falling edges of the external input signal.	R/W
b2	PGCOVEn	PDBF Overwrite	0: Overwriting PDBFn register is disabled. 1: Overwriting PDBFn register is enabled.	R/W
b3	—	Reserved	This bit is read as 1. The write value should be 1.	R/W
b6 to b4	PGCOn [2:0]	Port Group Operation Select	b6 b4 0 0 0: 0 is output when the event is input. 0 0 1: 1 is output when the event is input. 0 1 0: The toggled (inverted) value is output when the event is input. 0 1 1: The buffer value is output when the event is input. 1 X X: The bit value is rotated out in the group (from MSB to LSB) when the event is input.	R/W
b7	—	Reserved	This bit is read as 1. The write value should be 1.	R/W

X: Don't care

16.2.9 Port Buffer Register n (PDBFn) (n = 1, 2)

The PDBFn register is an 8-bit readable/writable register used in combination with the PGRn register. Refer to section 16.3.5, I/O Port Operation upon Event Input and Event Generation for PDBFn register operations. Refer to Table 16.4 for the PDBFn register and corresponding ports.

Address(es): PDBF1 A008 0B27h, PDBF2 A008 0B28h

	b7	b6	b5	b4	b3	b2	b1	b0
	PDBFn 7	PDBFn 6	PDBFn 5	PDBFn 4	PDBFn 3	PDBFn 2	PDBFn 1	PDBFn 0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	PDBFn0	Port Buffer n0	These bits handle the following operations in response to an input to or output from the port. • As an output port The value written to the PDBFn register is transferred to the PODR register. • As an input port The signal values on the external pins are transferred to the PDBFn register. Write access to the bit specified as a member of the input port group is invalid. For details, refer to section 16.3, Operation.	R/W
b1	PDBFn1	Port Buffer n1		R/W
b2	PDBFn2	Port Buffer n2		R/W
b3	PDBFn3	Port Buffer n3		R/W
b4	PDBFn4	Port Buffer n4		R/W
b5	PDBFn5	Port Buffer n5		R/W
b6	PDBFn6	Port Buffer n6		R/W
b7	PDBFn7	Port Buffer n7		R/W

16.2.10 Event Link Port Setting Register n (PELn) (n = 0 to 3)

The PELn register specifies the single port to which an event is to be linked, the port operation upon the event signal input, and the conditions of event generation. In this LSI, a total of 4 bits in port B or port E can be specified as single ports.

Address(es): PEL0 A008 0B29h, PEL1 A008 0B2Ah, PEL2 A008 0B2Bh, PEL3 A008 0B2Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	—	PSMn[1:0]		PSPn[1:0]		PSBn[2:0]		
Value after reset:	1	0	0	0	0	0	0	0

b2 to b0	PSBn[2:0]	Bit Number Specification	A bit number in eight I/O ports is specified.	R/W
b4, b3	PSPn[1:0]	Port Number Specification	b4 b3 0 0: Setting prohibited 0 1: Port B (corresponding to PGR1) 1 0: Port E (corresponding to PGR2) 1 1 1: Setting prohibited	R/W
b6, b5	PSMn[1:0]	Event Link Specification	• For the output port, data to be output from the port is specified. b6 b5 0 0: 0 is output when the event is input. 0 1: 1 is output when the event is input. 1 X: The toggled (inverted) value is output when the event is input. • For the input port, the edge on which the event is to be output is specified. b6 b5 0 0: Event is output upon detection of the rising edge. 0 1: Event is output upon detection of the falling edge. 1 X: Event is output upon detection of both the rising and falling edges.	R/W
b7	—	Reserved	This bit is read as 1. The write value should be 1.	R/W

X: Don’t care

16.2.11 Event Link Software Event Generation Register (ELSEGR)

The ELSEGR register controls event generation by software.

Address(es): A008 0B2Dh

	b7	b6	b5	b4	b3	b2	b1	b0
	WI	WE	—	—	—	—	—	SEG
Value after reset:	1	0	1	1	1	1	1	0

Bit	Symbol	Bit Name	Description	R/W
b0	SEG	Software Event Generation	0: Normal operation 1: Software event is generated.	W
b5 to b1	—	Reserved	These bits are read as 1. The write value should be 1.	R/W
b6	WE	SEG Bit Write Enable	0: Write to SEG bit is disabled. 1: Write to SEG bit is enabled.	R/W
b7	WI	ELSEGR Register Write Disable	0: Write to ELSEGR register is enabled. 1: Write to ELSEGR register is disabled.	W

SEG Bit (Software Event Generation)

When 1 is written to this bit while the WE bit is 1, a software event is generated.
This bit is read as 0. Even if 1 is written to this bit, the data will not be stored.

WE Bit (SEG Bit Write Enable)

The SEG bit can be written to only when the WE bit is 1.
[Setting condition]
If 1 is written to this bit while the WI bit is 0, this bit becomes 1.
[Clearing condition]
If 0 is written to this bit while the WI bit is 0, this bit becomes 0.

WI Bit (ELSEGR Register Write Disable)

The ELSEGR register can be written to only when the value to be written to the WI bit is 0.
This bit is read as 1.

Note 1. The WE bit can only be updated by setting the WI bit and the WE bit at the same time.
Similarly, to update the SEG bit, the WI bit must be set at the same time; set WE = 1 by setting the WI bit and WE bit at the same time, and then set the WI bit and SEG bit. If WE = 1 when SEG is set, the WE bit retains the value 1.
However, setting the three bits at the same time while the current values are WI = 1, WE = 0, and SEG = 0 will not lead to the output of a software trigger. Since WE will only have the value 1 following the first time the three bits are set, a software trigger will only be generated by setting the three bits at the same time again.

16.2.12 Event Link Option Setting Register F (ELOPF)

The ELOPF register determines the operation of TPU0 to TPU3 when an event is input. The event setting should be disabled when the ELC function is not to be used.

Address(es): A008 0B3Fh

	b7	b6	b5	b4	b3	b2	b1	b0
	TPU3MD[1:0]		TPU2MD[1:0]		TPU1MD[1:0]		TPU0MD[1:0]

b6 to b4	GPT1MD[2:0]	GPT1 Operation Select	b6 b5 b4 0 0 0: Counting is started. 0 0 1: Counting is cleared. 0 1 0: Counting is stopped. 0 1 1: Input capture*2 1 1 1: Event is disabled. Settings other than above are prohibited.	R/W
b7	—	Reserved	This bit is read as 1. The write value should be 1.	R/W

Note 1. The GPT0.GTCNT value is captured by GPT0.GTCCRA.
Note 2. The GPT1.GTCNT value is captured by GPT1.GTCCRA.

16.2.15 Event Link Option Setting Register J (ELOPJ)

The ELOPJ register determines the operation of GPT2 and GPT3 when an event is input. The event setting should be disabled when the ELC function is not to be used.

Address(es): A008 0B43h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	GPT3MD[2:0]			—	GPT2MD[2:0]		
Value after reset:	1	1	1	1	1	1	1	1

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	GPT2MD[2:0]	GPT2 Operation Select	b2 b0 0 0 0: Counting is started. 0 0 1: Counting is cleared. 0 1 0: Counting is stopped. 0 1 1: Input capture*1 1 1 1: Event is disabled. Settings other than above are prohibited.	R/W
b3	—	Reserved	This bit is read as 1. The write value should be 1.	R/W
b6 to b4	GPT3MD[2:0]	GPT3 Operation Select	b6 b4 0 0 0: Counting is started. 0 0 1: Counting is cleared. 0 1 0: Counting is stopped. 0 1 1: Input capture*2 1 1 1: Event is disabled. Settings other than above are prohibited.	R/W
b7	—	Reserved	This bit is read as 1. The write value should be 1.	R/W

Note 1. The GPT2.GTCNT value is captured by GPT2.GTCCRA.
Note 2. The GPT3.GTCNT value is captured by GPT3.GTCCRA.

16.3 Operation

16.3.1 Relation between Interrupt Handling and Event Linking

The peripheral modules incorporated in this LSI are provided with the interrupt request status flags and the bits to enable/disable these interrupt requests. When an interrupt request is generated in a module, the corresponding interrupt request status flag is set. If the corresponding interrupt request is enabled then, the interrupt requested is issued to the CPU.
In contrast, the event link controller (ELC) uses the interrupt requests generated by various peripheral modules (excluding the Ethernet MAC and EtherCAT) as event signals to connect (link) them to different modules, allowing direct cooperation between the modules without CPU intervention. Event signals can be output regardless of the setting of the corresponding interrupt request enable bit. Because the Ethernet MAC and EtherCAT use interrupt signals as event signals, interrupt control must be permitted.
Figure 16.2 shows the relation between the interrupt handling and ELC.

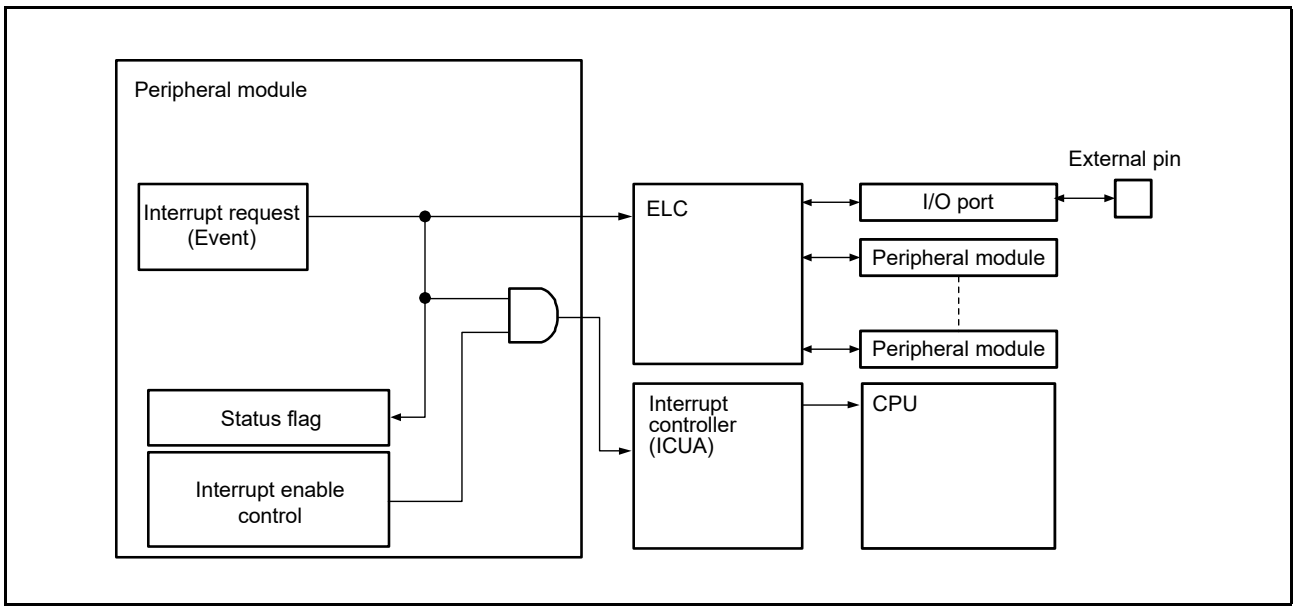

Figure 16.2 Relation between Interrupt Handling and ELC (excluding the Ethernet MAC and EtherCAT)

16.3.2 Event Linkage

Set an event to the ELSRn register of the module to which the event is to be linked. On occurrence of the specified event, the link destination module performs the operation set in the ELOPm register (m = A to D, F, H to J). Only one type of event can be connected with one module. For detailed procedure for setting desired operation, see section 16.3.6, Example of Procedure for Linking Events. Table 16.5 lists the operations of modules when an event is input.

Table 16.5 Operations of Modules When Event is Input

Module	Operations When Event is Input	
MTU CMT CMTW TPU GPT	Each module operates as follows, depending on the setting of the ELOPm register (m = A to C, F, H to J) . • Starts counting when an event signal is input (MTU, CMT, CMTW, TPU, GPT). • Clears counting when an event signal is input (MTU, CMT, CMTW, TPU, GPT). Restarting counting is possible when the start bit of the timer is 1. • Counts the input events (CMT, CMTW). • Performs input-capture operation when an event signal is input (MTU, TPU, GPT). • Stops counting when an event signal is input (GPT).	
A/D converter	Starts A/D conversion when an event signal is input.	
DSMIF	Crest/trough trigger capture function*1	
I/O ports (output)	Port group	• Changes the PODR value to the value specified in the PGCn register. • Transfers the PDBFn value to the PODR register. • Rotates out the bit value.
	Single port	Changes the PODR value to the value specified in the PELn register.
I/O ports (input)	Port group	Transfers the signal value of the external pin to the PDBFn register.
	Single port	Event connection is not possible.
Interrupt controller	Issues an interrupt request to the CPU and starts DMAC data transfer.	
Encoder I/F	Even operation set by the encoder I/F	

Note 1. For details, see section 41.3.3.1, Conversion of Values for Current and Capture of Values in Response to Crest and Trough Triggers.

16.3.3 Operation of Peripheral Timer Modules When Event is Input

The operation when an event signal is input is set by the ELOPm register (m = A to C, F, H to J).

(1) Counting Start Operation

When an event is input, the timer starts counting, which sets the count start bit*1 in each timer control register to 1. An event that is input while the count start bit is 1 is invalid.

(2) Counting Clear Operation

When an event is input, the timer counter is initialized. If the count start bit*1 in each timer control register is set to 1, the counting continues, thus, counting restarts.

(3) Event Counter Operation

Event input is selected as the timer clock source and the timer counts events.

(4) Input Capture Operation

When an event is input, the timer performs input-capture operation.

(5) Stopping Counting

The counter stops counting in response to the input of an event signal

Note 1. Refer to the register descriptions on starting the timer in the relevant peripheral timer module section.

16.3.4 Operation of A/D Converter When Event is Input

The A/D converter starts A/D conversion when the ADCSR.ADST bit*1 is set to 1.

Note 1. Refer to the register descriptions on the A/D converter section.

16.3.5 I/O Port Operation upon Event Input and Event Generation

The I/O port operation to be performed upon event input to the port can be set and the operation causing the port to generate an event can be set.

(1) Single ports and Port Groups

There are two event link modes: event link to single ports and event link to port groups. In the former mode, events can be connected to eight I/O ports. In the latter mode, events can be connected to port groups consisting of any two or more bits in the same eight I/O ports.
A single port can be set by specifying any bit in the I/O port*1 to which an event can be connected using the PELn register. A port group can be set by specifying any one or more bits in the I/O port*1 to which an event can be connected using the PGRn register. One input port group and one output port group can be set in the same I/O port.
If the I/O port bit is specified as both a single port and a member of a port group, both functions are enabled when the relevant port is input, whereas only the port group function is enabled when the relevant port is output.
Set the PDR register to select the direction of the I/O ports.

Note 1. Port B and port E

(2) Single Input Port Operation upon Event Generation

A single input port which is specified by the PDR register generates an event when the signal value of the external pin connected to the relevant port changes. The event generation condition is specified using PELn register. An example of event linking operation by a single input port is shown as [1] in Figure 16.3.

(3) Single Output Port Operation upon Event Input

When an event is input to a single output port which is specified by the PDR register, the signal of the external pin connected to the relevant port changes according to the settings of PELn register. This changes the signal value of the external pin connected to the relevant port. An example of event linking operation by a single output port is shown as [2] in Figure 16.3.

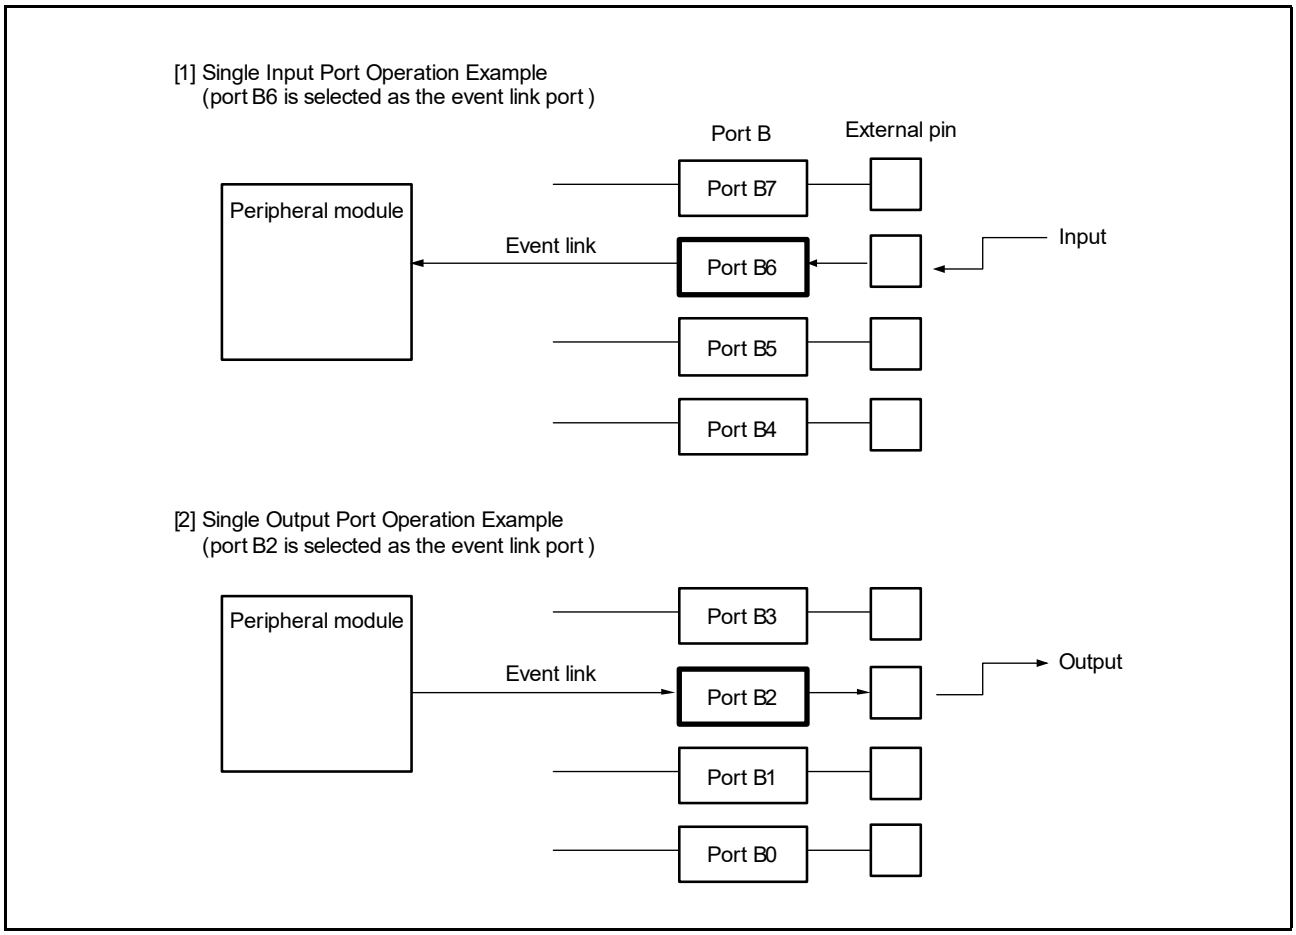

Figure 16.3 Event Linkage Related to Single Ports (Port B)

(4) Input Port Group Operation upon Event Generation

An input port group which is specified by the PDR register generates an event when the signal value of any one of the external pins connected to the relevant port group changes. The event generation condition is specified using the PCIn bit of the PGCn register.

(5) Input Port Group Operation upon Event Input

When an event is input to an input port group, the signal value of the external pin of the bit specified as a member of the input port group is transferred to the PDBFn register. If another event is input to the input port group in this state, operations are performed depending on the PGCn.PGCOVE bit setting as described below. Figure 16.4 shows the input port group operation upon an event input.

- PGCn.PGCOVEn = 0 (overwriting is disabled)
  If the value that was transferred to the PDBFn register upon the previous event input has already been read by the CPU, the signal value of the external pin is transferred to the PDBFn register. If not read, the signal value of the external pin is not transferred to the PDBFn register and the input event is invalid.
- PGCn.PGCOVEn = 1 (overwriting is enabled)
  When another event is input to an input port group, the signal value of the external pin is transferred to the PDBFn register.

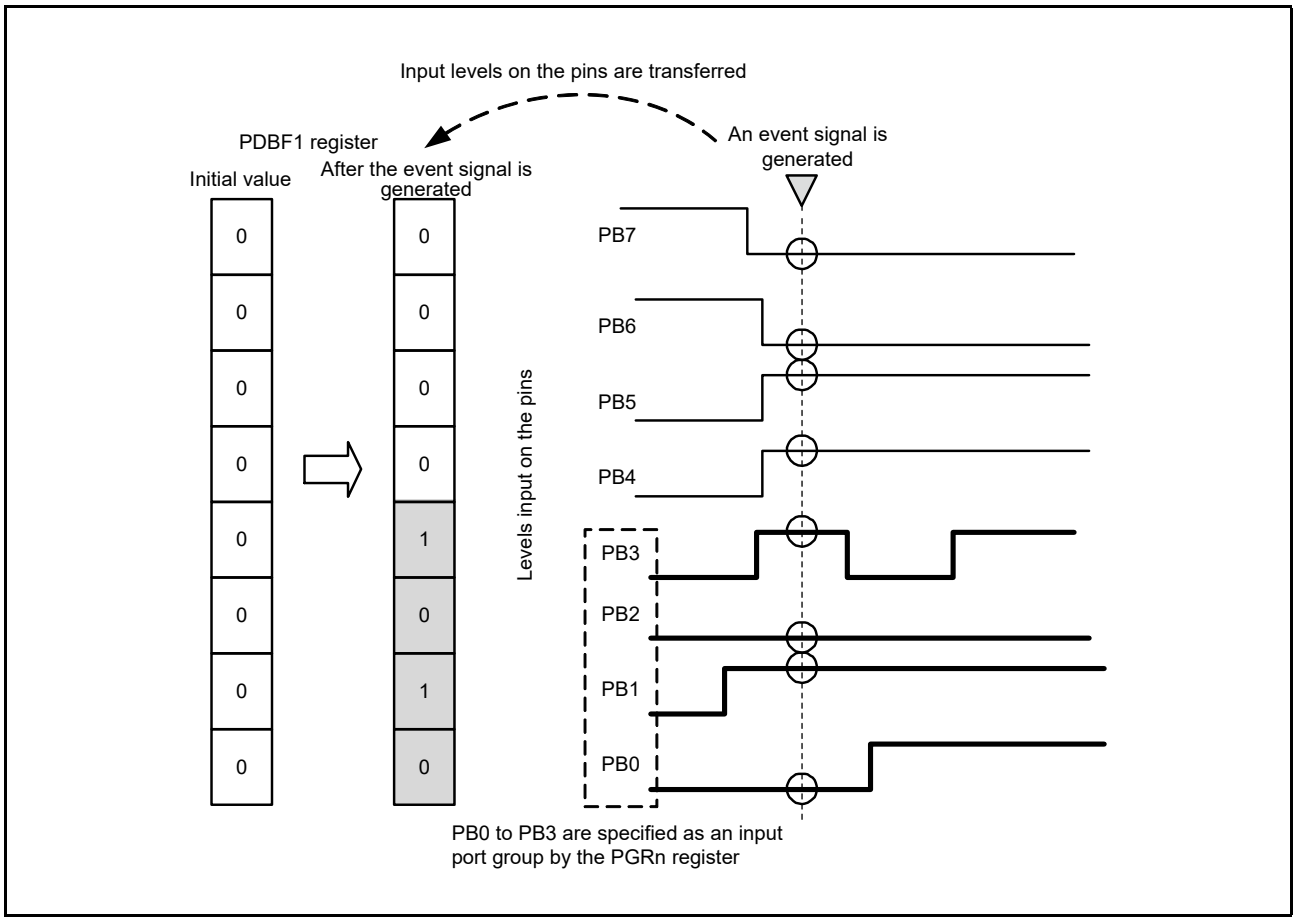

Figure 16.4 Input Port Group Operation upon Event Input (Port B)

(6) Output Port Group Operation upon Event Input

When an event is input to an output port group, the following operations are performed depending on the PGCn.PGCOn bit setting as described below.

- If an event is input to an output port group while the PGCn.PGCOn bit being 000b, 001b, or 010b, the PODR value is changed to the value which was specified in the PGCn register.
- If an event is input to an output port group while the PGCn.PGCOn bit being 011b, the PDBFn value is transferred to the PODR register of the port which was specified in the PGRn register. Example of operation of the output port group upon an event input (when PGCn.PGCOn = 011b) is shown in Figure 16.5.
- If an event is input to the output port group while the PGCn.PGCOn bit being 1XXb, the PDBFn value is transferred to the PODR register of the port which was specified in the PGRn register, and then the PODR value is rotated bit by bit from MSB to LSB. The initial value to be output to the port group should be provided in the PDBFn register in advance. Examples of bit-rotating operation of output port groups upon an event input (when PGCn.PGCOn = 1XXb) is shown in Figure 16.6.

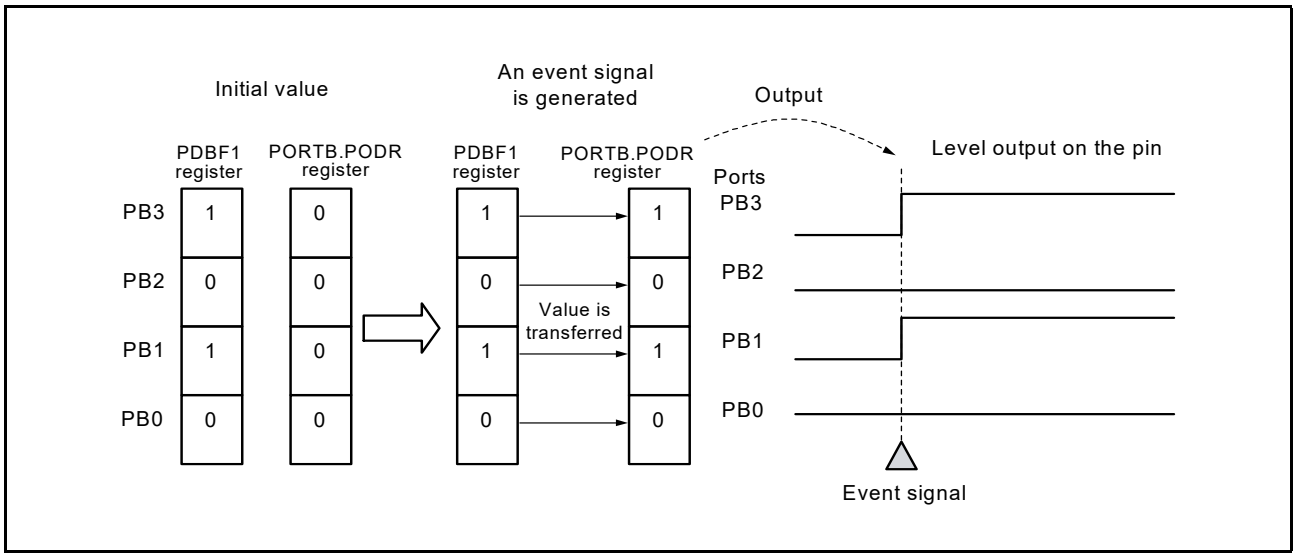

Figure 16.5 Event Linkage Operation of Output Port Group (Port B)

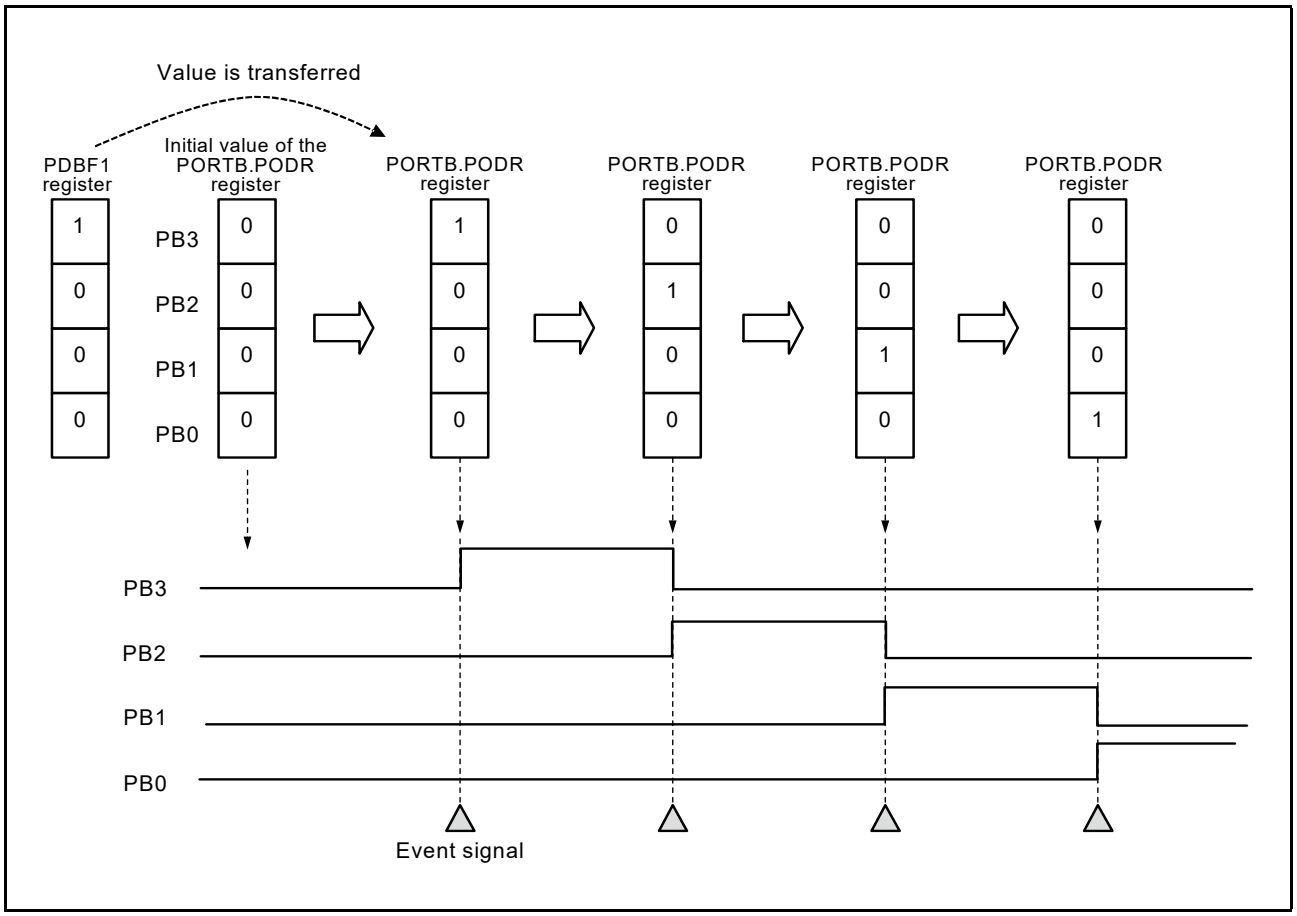

Figure 16.6 Bit-Rotating Operation of Output Port Groups (Port B)

(7) Restrictions on Writing to PODR and PDBFn Registers by a CPU

For event linkage through the I/O ports, following restrictions apply when a CPU writes the PODR and PDBFn registers.

- If port bits are specified as members of the input port group, write access to the relevant bits in the PDBFn register is invalid.
- If port bits are specified as members of the output port group, write access to the relevant bits in the PODR register is invalid.
- If a port bit is specified as a single output port and the event linkage is set (by the ELSRn register) for the port, write access to the relevant bit in the PODR register is invalid.

16.3.6 Example of Procedure for Linking Events

The following describes the procedure for linking events.

1. Set the operation of the module to which an event is to be linked.
2. If events are linked to ports, set the registers corresponding to the ports as below.

- I/O port setting
  PODR: Set the initial values of the output ports.
  PDR: Set the I/O direction of the ports.
- ELC setting
  PGRn: If ports are used as a port group, set the ports (in bit units) to be grouped.
  PGCn: Set the operation of the port group.
  PELn: If ports are used as single ports, set the ports, the operation of the ports when an event is input, and the condition when an event is generated.

Note: Setting the PDBFn register
(1) Output port groups
Set the PGCn register before setting the PDBFn register.
The value of the PGCn register can be changed if this precedes an event trigger which causes the value of the PODR register to change.
(2) Input port groups
Setting the PDBFn is not required. However, since the value after a reset is 00h, if the PDBFn register is used to confirm changes from H to L due to an event input, set the PDBFn bit for the pin for which you wish to confirm this to 1.

3. To the ELSRn register corresponding to the module to which an event signal is to be linked, set the number of the event signal.
4. If events are to be linked to timer modules, set the ELOPm registers (m = A to C, F, H to J) corresponding to the timers as required. If the module to which an event is to be linked is ΔΣIF, set the corresponding ELOPD register as required.
5. Set the ELCR.ELCON bit to 1, which enables linkage of all the events.
6. Set the operation of the module from which an event is output, and activate the module. This allows the event output from the module to start the module to which an event is linked as preset.
7. To stop event linkage of independent modules, set 0000 0000b to the ELSRn.ELS[7:0] bits corresponding to the modules. To stop linkage of all the events, set the ELCR.ELCON bit to 0.

16.4 Usage Notes

16.4.1 Setting ELSR18 and ELSR19 Registers

For event linkage to an interrupt controller, specify the event signals to be set in the ELSR18 and ELSR19 registers from 63h to BDh. Setting any other values is prohibited.

16.4.2 Setting Bit-Rotating Operation of Output Port Groups

When the values of the PDBFn register are changed in the bit-rotating operation mode of the output port group, set the ELSRn register again after changing the PDBFn register value.

16.4.3 Setting Clocks

To link events, it is necessary for the ELC and the related modules to be enabled. The modules cannot operate if the related modules are in the module-stop state or if the low-power consumption mode causes the modules to stop (all-module stop mode).

16.4.4 Module Stop Function Setting

ELC operation can be disabled or enabled using module stop control register C (MSTPCRC). The initial setting allows the ELC to be stopped. Register access is enabled by canceling the module-stop state. For details, see section 9, Low-Power Consumption Function.

17. I/O Ports

17.1 Overview

The pins of an I/O port function as general I/O port pins, I/O pins for peripheral modules, or interrupt input pins.
Each pin is also configurable as an I/O pin of a peripheral module or an input pin for an interrupt. All pins are set to non-use immediately after a reset (Hi-Z input protection), and pin functions can be switched by register settings. The setting of each pin is specified by the registers for the corresponding I/O port and peripheral modules.
Each port has the port direction register (PDR) that selects non-use, input, or output, the port output data register (PODR) that holds data for output, the port input register (PIDR) that indicates the pin states, the pull-up/pull-down control register (PCR) that controls enabling and disabling of the input pull-up/pull-down resistor, and the port mode register (PMR) that specifies the pin function of each port. For details on PMR, refer to section 18, Multi-Function Pin Controller (MPC).
The configuration of the I/O ports differs depending on the package. Table 17.1 shows the specifications of I/O ports, and Table 17.2 lists the port functions.

Table 17.1 Specifications of I/O Ports

17.3 Register Descriptions

17.3.1 Port Direction Register (PDR)

The PDR register is used to select non-use, input, or output (input enable) for individual pins of the corresponding port when the pins are configured as the general I/O pins. When 00 (non-use) is set to this register, this LSI can be protected from input Hi-Z state.

Address(es): PORT0.PDR A000 0000h, PORT1.PDR A000 0002h, PORT2.PDR A000 0004h, PORT3.PDR A000 0006h, PORT4.PDR A000 0008h, PORT5.PDR A000 000Ah, PORT6.PDR A000 000Ch, PORT7.PDR A000 000Eh, PORT8.PDR A000 0010h, PORT9.PDR A000 0012h, PORTA.PDR A000 0014h, PORTB.PDR A000 0016h, PORTC.PDR A000 0018h, PORTD.PDR A000 001Ah, PORTE.PDR A000 001Ch, PORTF.PDR A000 001Eh, PORTG.PDR A000 0020h, PORTH.PDR A000 0022h, PORTJ.PDR A000 0024h, PORTK.PDR A000 0026h, PORTL.PDR A000 0028h, PORTM.PDR A000 002Ah, PORTN.PDR A000 002Ch, PORTP.PDR A000 002Eh, PORTR.PDR A000 0030h, PORTS.PDR A000 0032h, PORTT.PDR A000 0034h, PORTU.PDR A000 0036h

b15, b14	B7[1:0]	Pm7 I/O Select		R/W

m = 0 to 9, A to H, J to N, P, and R to U

Each bit of PORTm.PDR corresponds to each pin of port m; pin function can be specified in 2-bit units. However, set the bits that correspond to ports m (ports 9, J to N, P, and R to U) to 00 (non-use) on the 176-pin product.
Write 00 (non-use) or 10 (input) to the PORT3.PDR.B0 and PORTC.PDR.Bn (n = 0 to 7) bits because the P30 and PC0 to PC7 pins are input only.
The bit corresponding to a pin that does not exist is also reserved. A reserved bit is always read as 0. The write value should always be 0.

17.3.2 Port Output Data Register (PODR)

The PODR register holds the data to be output from the pins used for general I/O.

Address(es): PORT0.PODR A000 0040h, PORT1.PODR A000 0041h, PORT2.PODR A000 0042h, PORT3.PODR A000 0043h, PORT4.PODR A000 0044h, PORT5.PODR A000 0045h, PORT6.PODR A000 0046h, PORT7.PODR A000 0047h, PORT8.PODR A000 0048h, PORT9.PODR A000 0049h, PORTA.PODR A000 004Ah, PORTB.PODR A000 004Bh, PORTC.PODR A000 004Ch, PORTD.PODR A000 004Dh, PORTE.PODR A000 004Eh, PORTF.PODR A000 004Fh, PORTG.PODR A000 0050h, PORTH.PODR A000 0051h, PORTJ.PODR A000 0052h, PORTK.PODR A000 0053h, PORTL.PODR A000 0054h, PORTM.PODR A000 0055h, PORTN.PODR A000 0056h, PORTP.PODR A000 0057h, PORTR.PODR A000 0058h, PORTS.PODR A000 0059h, PORTT.PODR A000 005Ah, PORTU.PODR A000 005Bh

	b7	b6	b5	b4	b3	b2	b1	b0

b1	B1	Pm1 Output Data Store		R/W
b2	B2	Pm2 Output Data Store		R/W
b3	B3	Pm3 Output Data Store		R/W
b4	B4	Pm4 Output Data Store		R/W
b5	B5	Pm5 Output Data Store		R/W
b6	B6	Pm6 Output Data Store		R/W
b7	B7	Pm7 Output Data Store		R/W

m = 0 to 9, A to H, J to N, P, and R to U

Bits that correspond to ports m (ports 9, J to N, P, and R to U) on the 176-pin product are reserved. Be sure to write 0 (low output) to these bits.

The PORT3.PODR.B0 and PORTC.PODR.Bn (n = 0 to 7) bits are reserved because the P30 and PC0 to PC7 pins are input only. The bit corresponding to a pin that does not exist is reserved. A reserved bit is always read as 0. The write value should always be 0.

17.3.3 Port Input Data Register (PIDR)

The PIDR register reflects the states of the individual input port pins.

Address(es): PORT0.PIDR A000 0060h, PORT1.PIDR A000 0061h, PORT2.PIDR A000 0062h, PORT3.PIDR A000 0063h, PORT4.PIDR A000 0064h, PORT5.PIDR A000 0065h, PORT6.PIDR A000 0066h, PORT7.PIDR A000 0067h, PORT8.PIDR A000 0068h, PORT9.PIDR A000 0069h, PORTA.PIDR A000 006Ah, PORTB.PIDR A000 006Bh, PORTC.PIDR A000 006Ch, PORTD.PIDR A000 006Dh, PORTE.PIDR A000 006Eh, PORTF.PIDR A000 006Fh, PORTG.PIDR A000 0070h, PORTH.PIDR A000 0071h, PORTJ.PIDR A000 0072h, PORTK.PIDR A000 0073h, PORTL.PIDR A000 0074h, PORTM.PIDR A000 0075h, PORTN.PIDR A000 0076h, PORTP.PIDR A000 0077h, PORTR.PIDR A000 0078h, PORTS.PIDR A000 0079h, PORTT.PIDR A000 007Ah, PORTU.PIDR A000 007Bh

	b7	b6	b5	b4	b3	b2	b1	b0
	B7	B6	B5	B4	B3	B2	B1	B0

b0	B0	Pm0	0: Low input 1: High input	R
b1	B1	Pm1		R
b2	B2	Pm2		R
b3	B3	Pm3		R
b4	B4	Pm4		R
b5	B5	Pm5		R
b6	B6	Pm6		R
b7	B7	Pm7		R

m = 0 to 9, A to H, J to N, P, and R to U

If PORTm.PDR is set to 10 or 11, the pin states of ports m can be read with PORTm.PIDR, regardless of the values of PORTm.PMR.

The bit corresponding to a pin that does not exist is reserved. A reserved bit is read as undefined, and cannot be modified.

17.3.4 Port Mode Register (PMR)

The PMR register specifies the function of the pins of the port.

Address(es): PORT0.PMR A000 0080h, PORT1.PMR A000 0081h, PORT2.PMR A000 0082h, PORT3.PMR A000 0083h, PORT4.PMR A000 0084h, PORT5.PMR A000 0085h, PORT6.PMR A000 0086h, PORT7.PMR A000 0087h, PORT8.PMR A000 0088h, PORT9.PMR A000 0089h, PORTA.PMR A000 008Ah, PORTB.PMR A000 008Bh, PORTC.PMR A000 008Ch, PORTD.PMR A000 008Dh, PORTE.PMR A000 008Eh, PORTF.PMR A000 008Fh, PORTG.PMR A000 0090h, PORTH.PMR A000 0091h, PORTJ.PMR A000 0092h, PORTK.PMR A000 0093h, PORTL.PMR A000 0094h, PORTM.PMR A000 0095h, PORTN.PMR A000 0096h, PORTP.PMR A000 0097h, PORTR.PMR A000 0098h, PORTS.PMR A000 0099h, PORTT.PMR A000 009Ah, PORTU.PMR A000 009Bh

	b7	b6	b5	b4	b3	b2	b1	b0
	B7	B6	B5	B4	B3	B2	B1	B0
Value after reset: *1	0	0	0	0	0	0	0	0

Note 1. The PMR register value for port 3 after a reset is 18h.

Bit	Symbol	Bit Name	Description	R/W
b0	B0	Pm0 Pin Mode Control	0: Uses the pin as a general I/O pin 1: Uses the pin as an I/O port for peripheral functions	R/W
b1	B1	Pm1 Pin Mode Control		R/W
b2	B2	Pm2 Pin Mode Control		R/W
b3	B3	Pm3 Pin Mode Control		R/W
b4	B4	Pm4 Pin Mode Control		R/W
b5	B5	Pm5 Pin Mode Control		R/W
b6	B6	Pm6 Pin Mode Control		R/W
b7	B7	Pm7 Pin Mode Control		R/W

m = 0 to 9, A to H, J to N, P, and R to U

Each bit of PORTm.PMR corresponds to each pin of port m; pin function can be specified in 1-bit units. Bits that correspond to ports m (ports 9, J to N, P, and R to U) on the 176-pin product are reserved. Be sure to write 0 (general I/O port) to these bits. The bit corresponding to a pin that does not exist is reserved. A reserved bit is always read as 0. The write value should always be 0.

17.3.5 Pull-Up/Pull-Down Control Register (PCR)

The PCR register enables or disables an input pull-up or pull-down resistor for each pin of the port.
When a pin for the general port or peripheral module is in the input state, the input pull-up resistor connected to the pin with the corresponding bit in PORTm.PCR set to 10 is enabled, and the input pull-down resistor connected to the pin with the corresponding bit in PORTm.PCR set to 01 is enabled.
When a pin is set as a general port output pin or a peripheral module output pin, the pull-up resistor for the pin is disabled regardless of the settings of PCR. Note that the P30 and PC0 to PC7 pins do not have his function.
The pull-up and pull-down resistors are also disabled in the reset state.

Address(es): PORT0.PCR A000 0100h, PORT1.PCR A000 0102h, PORT2.PCR A000 0104h, PORT3.PCR A000 0106h, PORT4.PCR A000 0108h, PORT5.PCR A000 010Ah, PORT6.PCR A000 010Ch, PORT7.PCR A000 010Eh, PORT8.PCR A000 0110h, PORT9.PCR A000 0112h, PORTA.PCR A000 0114h, PORTB.PCR A000 0116h, PORTD.PCR A000 011Ah, PORTE.PCR A000 011Ch, PORTF.PCR A000 011Eh, PORTG.PCR A000 0120h, PORTH.PCR A000 0122h, PORTJ.PCR A000 0124h, PORTK.PCR A000 0126h, PORTL.PCR A000 0128h, PORTM.PCR A000 012Ah, PORTN.PCR A000 012Ch, PORTP.PCR A000 012Eh, PORTR.PCR A000 0130h, PORTS.PCR A000 0132h, PORTT.PCR A000 0134h, PORTU.PCR A000 0136h

b13, b12	B6[1:0]	Pm6 Input Pull-Up/Pull-Down Resistor Control		R/W
b15, b14	B7[1:0]	Pm7 Input Pull-Up/Pull-Down Resistor Control		R/W

m = 0 to 9, A to H, J to N, P, and R to U

The bit corresponding to a pin that does not exist is also reserved. A reserved bit is always read as 00b. The write value should always be 00b.

17.3.6 Driving Ability Control Register (DSCR)

The DSCR register controls driving ability of the ports.
Set the CKIO pin to high-drive output by this register if SDRAM (TYPE[2:0] = 100b) is to be selected in the CSn space bus control register (CSnBCR).

Address(es): PORT1.DSCR A000 0142h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	B0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	B0	P10 Driving Ability Control	0: Normal output 1: High-drive output	R/W
b15 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

The bit corresponding to a pin that does not exist is also reserved. A reserved bit is always read as 0. The write value should always be 0.

Note: Select high-drive output when connecting the SDRAM.

17.4 Handling of Unused Pins

Table 17.3 lists the details of handling of unused pins.

Table 17.3 Handling of Unused Pins

Pin Name	Handling
MD0, MD1, MD2	— (Use this as a mode pin.)
BSCANP	— (Use this as a boundary scan enable pin.)
OSCTH	— (Use this as a clock input mode pin.)
EXTAL	— (Use this as a crystal oscillator connection pin or external clock input pin.)
XTAL	Keep this pin open.
ERROROUT#	Keep this pin open.
RSTOUT#	Keep this pin open.
TRST#	Connect these pins to VSS via a resistor (pulling down), or input the same signal as that on the RES# pin.
TCK	Connect these pins to VSS via a resistor (pulling down).
TMS	Connect this pin to VCCQ33 via a resistor (pulling up).
Port 34 (TDI)	Connect this pin to VCCQ33 via a resistor (pulling up).
Port 0 to Port 9, Port A to Port H, Port J to Port N, Port P, and Port R to Port U (except Port 34)*1	Keep these pins open, connect them to VCCQ33 via a resistor (pulling up), or connect them to VSS via a resistor (pulling down).
USB0_DP USB0_DM	Keep these pins open.
USB_RREF	Keep this pin open.
VREFH0	Connect this pin to AVCC0.
VREFL0	Connect this pin to AVSS0.
VREFH1	Connect this pin to AVCC1.
VREFL1	Connect this pin to AVSS1.
AN000 to AN007	Connect these pins to AVSS0 via a resistor (pulling down).

Note 1. When handling them as unused pins, set the corresponding bits of the port direction register (PDR) to “Non-use (Hi-Z input protection)” which is the value after reset release.

18. Multi-Function Pin Controller (MPC)

18.1 Overview

This LSI configures an I/O pin or an interrupt pin of peripheral functions to be multiplexed with multiple ports. The multi-function pin controller (MPC) is a module that selects I/O pins and interrupt pins for the peripheral function to use from multiple ports, and then assigns the function to the selected pins.
Table 18.1 lists the multiplexed pin configurations.Y and N in the table indicate whether the pin is available or unavailable for the package. Selecting a single function for multiple pins is prohibited.

Table 18.1 List of Multiplexed Pin Configurations (1 / 22)

Module/Function	Channel	Pin Function	Allocation Port	Package	
				320-pin	176-pin

Note 1. To use this pin, make the applicable pin unavailable, and configure it as a general input/output port (by setting the PORTm.PDR.Bn bit to 00, and the PORTm.PMR.Bn bit to 0).

18.2 Register Descriptions

The registers and bits of unsupported pins, depending on the package, are reserved. The write value to the reserved bits is the value after a reset.

18.2.1 Write-Protect Register (PWPR)

The PWPR register enables or disables writing to the PFS register and the PFSWE bit of the PWPR register.

Address(es): A000 02FFh

	b7	b6	b5	b4	b3	b2	b1	b0
	B0WI	PFSWE	—	—	—	—	—	—
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b6	PFSWE	PFS Register Write Enable	0: Writing to the PFS register is disabled. 1: Writing to the PFS register is enabled.	R/W
b7	B0WI	PFSWE Bit Write Disable	0: Writing to the PFSWE bit is enabled. 1: Writing to the PFSWE bit is disabled.	R/W

PFSWE Bit (PFS Register Write Enable)

Writing to the PmnPFS register (m = 0 to 9, A to H, J to N, P, R to U, and n = 0 to 7) is enabled only when the PFSWE bit is set to 1.

To set the PFSWE bit to 1, write 0 to the B0WI bit, and then set 1 to the PFSWE bit.

B0WI Bit (PFSWE Bit Write Disable)

Only when the B0WI bit is set to 0, writing to the PFSWE bit is enabled.

18.2.2 P0n Pin Function Control Register (P0nPFS) (n = 0 to 7)

The P0n pin function control register (P0nPFS) selects the function of the pin to use.
The P0nPFS register is protected by the write protect register (PWPR). Modifications to this register can only be made after releasing protection.

Address(es): P00PFS A000 0200h, P01PFS A000 0201h, P02PFS A000 0202h, P03PFS A000 0203h, P04PFS A000 0204h, P05PFS A000 0205h, P06PFS A000 0206h, P07PFS A000 0207h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	PSEL[5:0]					
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	PSEL[5:0]	Pin Function Select	These bits select the peripheral function. For details on each function, see Table 18.2.	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

PSEL[5:0] Bits (Pin Function Select)

These bits select the peripheral function to assign to a pin.

Table 18.2 Register Settings for the Input/Output Function in the 320-pin FBGA and 176-pin HLFQFP Pins

PSEL[5:0] Setting	Pin

Note: —: Do not set.

18.2.3 P1n Pin Function Control Register (P1nPFS) (n = 0 to 7)

The P1n pin function control register (P1nPFS) selects the function of the pin to use.
The P1nPFS register is protected by the write protect register (PWPR). Modifications to this register can only be made after releasing protection. The ISEL bit of the pin without the IRQn function is reserved. A value after a reset must be written.

Address(es): P10PFS A000 0208h, P11PFS A000 0209h, P12PFS A000 020Ah, P13PFS A000 020Bh, P14PFS A000 020Ch, P15PFS A000 020Dh, P16PFS A000 020Eh, P17PFS A000 020Fh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	ISEL	PSEL[5:0]					
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	PSEL[5:0]	Pin Function Select	These bits select the peripheral function. For details on each pin function, see Table 18.3, and Table 18.4.	R/W
b6	ISEL	Interrupt Input Function Select	0: Do not use as the IRQn input pin. 1: Use as the IRQn input pin.	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

PSEL[5:0] Bits (Pin Function Select)

These bits select the peripheral function to assign to a pin.

ISEL Bit (Interrupt Input Function Select)

Set this bit to 1 to use the given pin as the IRQ input pin. This bit can be used with peripheral functions. Note that IRQn (external pin interrupt) with the same number cannot be enabled for two or more pins.

18.2.4 P2n Pin Function Control Register (P2nPFS) (n = 0 to 7)

The P2n pin function control register (P2nPFS) selects the function of the pin to use. The P2nPFS register is protected by the write protect register (PWPR). Modifications to this register can only be made after releasing protection. The ISEL bit of the pin without the IRQn function is reserved. A value after a reset must be written.

Address(es): P20PFS A000 0210h, P21PFS A000 0211h, P22PFS A000 0212h, P23PFS A000 0213h, P24PFS A000 0214h, P25PFS A000 0215h, P26PFS A000 0216h, P27PFS A000 0217h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	ISEL	PSEL[5:0]					
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	PSEL[5:0]	Pin Function Select	These bits select the peripheral function. For details on each function, see Table 18.5.	R/W
b6	ISEL	Interrupt Input Function Select	0: Do not use as the IRQn input pin. 1: Use as the IRQn input pin.	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

PSEL[5:0] Bits (Pin Function Select)

These bits select the peripheral function to assign to a pin.

ISEL Bit (Interrupt Input Function Select)

Set this bit to 1 to use the given pin as the IRQ pin. This bit can be used with peripheral functions. Note that IRQn (external pin interrupt) with the same number cannot be enabled for two or more pins.

Table 18.5 Register Settings for the Input/Output Function in the 320-pin FBGA and 176-pin HLFQFP Pins

PSEL[5:0] Setting	Pin							
	P20	P21	P22	P23	P24	P25	P26	P27

Note: —: Do not set.

18.2.5 P3n Pin Function Control Register (P3nPFS) (n = 0 to 7)

The P3n pin function control register (P3nPFS) selects the function of the pin to use. The P3nPFS register is protected by the write protect register (PWPR). Modifications to this register can only be made after releasing protection. The ISEL bit of the pin without the IRQn function is reserved. A value after a reset must be written. No peripheral functions are assigned to P35. To use P35 as the NMI pin, see section 12.3.4, NMI Pin Interrupts.

Address(es): P30PFS A000 0218h, P31PFS A000 0219h, P32PFS A000 021Ah, P33PFS A000 021Bh, P34PFS A000 021Ch, P35PFS A000 021Dh, P36PFS A000 021Eh, P37PFS A000 021Fh

	b7	b6	b5	b4	b3	b2	b1	b0	
	—	ISEL	PSEL[5:0]						
Value after reset:	0	0	0	0	0	0	0	0	*1
	0	0	1	0	0	1	1	1	*2

Note 1. Other than P33PFS and P34PFS
Note 2. P33PFS, P34PFS

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	PSEL[5:0]	Pin Function Select	These bits select the peripheral function. For details on each pin function, see Table 18.6 and Table 18.7.	R/W
b6	ISEL	Interrupt Input Function Select	0: Do not use as the IRQn input pin or NMI input pin. 1: Use as the IRQn input pin or NMI input pin.	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

PSEL[5:0] Bits (Pin Function Select)

These bits select the peripheral function to assign to a pin.

ISEL Bit (Interrupt Input Function Select)

Set this bit to 1 to use the given pin as the IRQ input pin or the NMI input pin (P35). This bit can be used with peripheral functions. Note that IRQn (external pin interrupt) with the same number cannot be enabled for two or more pins. To use the pin as the NMI pin, see section 12.3.4, NMI Pin Interrupts.

18.2.6 P4n Pin Function Control Register (P4nPFS) (n = 0 to 7)

The P4n pin function control register (P4nPFS) selects the function of the pin to use. The P4nPFS register is protected by the write protect register (PWPR). Modifications to this register can only be made after releasing protection. The ISEL bit of the pin without the IRQn function is reserved. A value after a reset must be written.

Address(es): P40PFS A000 0220h, P41PFS A000 0221h, P42PFS A000 0222h, P43PFS A000 0223h, P44PFS A000 0224h, P45PFS A000 0225h, P46PFS A000 0226h, P47PFS A000 0227h

Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	PSEL[5:0]	Pin Function Select	These bits select the peripheral function. For details on each pin function, see Table 18.10 and Table 18.11.	R/W
b6	ISEL	Interrupt Input Function Select	0: Do not use as the IRQn input pin. 1: Use as the IRQn input pin.	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

PSEL[5:0] Bits (Pin Function Select)

These bits select the peripheral function to assign to a pin.

ISEL Bit (Interrupt Input Function Select)

Set this bit to 1 to use the given pin as the IRQ pin. This bit can be used with peripheral functions. Note that IRQn (external pin interrupt) with the same number cannot be enabled for two or more pins.

Table 18.10 Register Settings for the Input/Output Function in the 320-pin FBGA Pin

18.2.8 P6n Pin Function Control Register (P6nPFS) (n = 0 to 7)

The P6n pin function control register (P6nPFS) selects the function of the pin to use. The P6nPFS register is protected by the write protect register (PWPR). Modifications to this register can only be made after releasing protection. The ISEL bit of the pin without the IRQn function is reserved. A value after a reset must be written.

Address(es): P60PFS A000 0230h, P61PFS A000 0231h, P62PFS A000 0232h, P63PFS A000 0233h, P64PFS A000 0234h, P65PFS A000 0235h, P66PFS A000 0236h, P67PFS A000 0237h

18.2.10 P8n Pin Function Control Register (P8nPFS) (n = 0 to 7)

The P8n pin function control register (P8nPFS) selects the function of the pin to use. The P8nPFS register is protected by the write protect register (PWPR). Modifications to this register can only be made after releasing protection. The ISEL bit of a pin without the IRQn function, and the ASEL bit of a pin without the analog input function are reserved. A value after a reset must be written.

Address(es): P80PFS A000 0240h, P81PFS A000 0241h, P82PFS A000 0242h, P83PFS A000 0243h, P84PFS A000 0244h, P85PFS A000 0245h, P86PFS A000 0246h, P87PFS A000 0247h

	b7	b6	b5	b4	b3	b2	b1	b0
	ASEL	ISEL	PSEL[5:0]					
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	PSEL[5:0]	Pin Function Select	These bits select the peripheral function. For details on each pin function, see Table 18.15 and Table 18.16.	R/W
b6	ISEL	Interrupt Input Function Select	0: Do not use as the IRQn input pin. 1: Use as the IRQn input pin.	R/W
b7	ASEL	Analog Input Function Select	0: Do not use as an analog input. 1: Use as an analog input.	R/W

PSEL[5:0] Bits (Pin Function Select)

These bits select the peripheral function to assign to a pin.

ISEL Bit (Interrupt Input Function Select)

Set this bit to 1 to use the given pin as the IRQ pin. This bit can be used with peripheral functions. Note that IRQn (external pin interrupt) with the same number cannot be enabled for two or more pins. If the setting of the ASEL bit is 1, the given pin does not function as an IRQn input pin even if this bit is set to 1.

ASEL Bit (Analog Input Function Select)

Set this bit to 1 to use the given pin as an analog pin. To set the ASEL bit as an analog pin, select the general input/output port by the port mode register (PORTm.PMR), and disable it by the port direction register (PORTm.PDR). At that time, the pin status cannot be read.

18.2.11 P9n Pin Function Control Register (P9nPFS) (n = 0 to 7)

The P9n pin function control register (P9nPFS) selects the function of the pin to use. The P9nPFS register is protected by the write protect register (PWPR). Modifications to this register can only be made after releasing protection. The ISEL bit of a pin without the IRQn function, and the ASEL bit of a pin without the analog input function are reserved. A value after a reset must be written.

Address(es): P90PFS A000 0248h, P91PFS A000 0249h, P92PFS A000 024Ah, P93PFS A000 024Bh, P94PFS A000 024Ch, P95PFS A000 024Dh, P96PFS A000 024Eh, P97PFS A000 024Fh

	b7	b6	b5	b4	b3	b2	b1	b0
	ASEL	ISEL	PSEL[5:0]					
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	PSEL[5:0]	Pin Function Select	These bits select the peripheral function. For details on each function, see Table 18.17.	R/W
b6	ISEL	Interrupt Input Function Select	0: Do not use as the IRQn input pin. 1: Use as the IRQn input pin.	R/W
b7	ASEL	Analog Input Function Select	0: Do not use as an analog input. 1: Use as an analog input.	R/W

PSEL[5:0] Bits (Pin Function Select)

These bits select the peripheral function to assign to a pin.

ISEL Bit (Interrupt Input Function Select)

Set this bit to 1 to use the given pin as an IRQ input pin. This bit can be used with peripheral functions. Note that IRQn (external pin interrupt) with the same number cannot be enabled for two or more pins.
If the setting of the ASEL bit is 1, the given pin does not function as an IRQn input pin even if this bit is set to 1.

ASEL Bit (Analog Input Function Select)

Set this bit to 1 to use the given pin as an analog pin. To set the ASEL bit as an analog pin, select the general input/output port by the port mode register (PORTm.PMR), and then disable it by the port direction register (PORTm.PDR). At that time, the pin status cannot be read.

Table 18.17 Register Settings for the Input/Output Function in the 320-pin FBGA Pin

Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	PSEL[5:0]	Pin Function Select	These bits select the peripheral function. For details on each pin function, see Table 18.20 and Table 18.21.	R/W
b6	ISEL	Interrupt Input Function Select	0: Do not use as the IRQn input pin. 1: Use as the IRQn input pin.	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

PSEL[5:0] Bits (Pin Function Select)

These bits select the peripheral function to assign to a pin.

ISEL Bit (Interrupt Input Function Select)

Set this bit to 1 to use the given pin as the IRQ pin. This bit can be used with peripheral functions. Note that IRQn (external pin interrupt) with the same number cannot be enabled for two or more pins.

Table 18.20 Register Settings for the Input/Output Function in the 320-pin FBGA Pin

PSEL[5:0] Setting	Pin

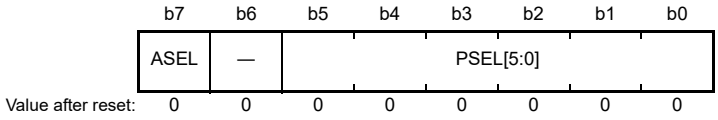
18.2.15 PDn Pin Function Control Register (PDnPFS) (n = 0 to 7)

The PDn pin function control register (PDnPFS) selects the function of the pin to use. The PDnPFS register is protected by the write protect register (PWPR). Modifications to this register can only be made after releasing protection. The ASEL bit of a pin without analog input function is reserved. A value after a reset must be written.

Address(es): PD0PFS A000 0268h, PD1PFS A000 0269h, PD2PFS A000 026Ah, PD3PFS A000 026Bh, PD4PFS A000 026Ch, PD5PFS A000 026Dh, PD6PFS A000 026Eh, PD7PFS A000 026Fh



Bit	Symbol	Bit Name	Description	R/W
b5 to b0	PSEL[5:0]	Pin Function Select	These bits select the peripheral function. For details on each pin function, see Table 18.22 and Table 18.23.	R/W
b6	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b7	ASEL	Analog Input Function Select	0: Do not use as an analog input. 1: Use as an analog input.	R/W

PSEL[5:0] Bits (Pin Function Select)

These bits select the peripheral function to assign to a pin.

ASEL Bit (Analog Input Function Select)

Set this bit to 1 to use the given pin as an analog pin. To set the ASEL bit as an analog pin, select the general input/output port by the port mode register (PORTm.PMR), and then disable it by the port direction register (PORTm.PDR). At that time, the pin status cannot be read.

Table 18.22 Register Settings for the Input/Output Function in the 320-pin FBGA Pin

18.2.16 PEn Pin Function Control Register (PEnPFS) (n = 0 to 7)

The PEn pin function control register (PEnPFS) selects the function of the pin to use. The PEnPFS register is protected by the write protect register (PWPR). Modifications to this register can only be made after releasing protection. The ISEL bit of the pin without the IRQn function is reserved. A value after a reset must be written.

Address(es): PE0PFS A000 0270h, PE1PFS A000 0271h, PE2PFS A000 0272h, PE3PFS A000 0273h, PE4PFS A000 0274h, PE5PFS A000 0275h, PE6PFS A000 0276h, PE7PFS A000 0277h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	ISEL	PSEL[5:0]					
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	PSEL[5:0]	Pin Function Select	These bits select the peripheral function. For details on each function, see Table 18.24.	R/W
b6	ISEL	Interrupt Input Function Select	0: Do not use as the IRQn input pin. 1: Use as the IRQn input pin.	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

PSEL[5:0] Bits (Pin Function Select)

These bits select the peripheral function to assign to a pin.

ISEL Bit (Interrupt Input Function Select)

Set this bit to 1 to use the given pin as an IRQ input pin. This bit can be used with peripheral functions. Note that IRQn (external pin interrupt) with the same number cannot be enabled for two or more pins.

Table 18.24 Register Settings for the Input/Output Function in the 320-pin FBGA and 176-pin HLFQFP Pins

Note: —: Do not set.

18.2.17 PFn Pin Function Control Register (PFnPFS) (n = 5 to 7)

The PFn pin function control register (PFnPFS) selects the function of the pin to use. The PFnPFS register is protected by the write protect register (PWPR). Modifications to this register can only be made after releasing protection. The ISEL bit of the pin without the IRQn function is reserved. A value after a reset must be written.

Address(es): PF5PFS: A000 027Dh, PF6PFS: A000 027Eh, PF7PFS: A000 027Fh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	ISEL	PSEL[5:0]					
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	PSEL[5:0]	Pin Function Select	These bits select the peripheral function. For details on each pin function, see Table 18.25 and Table 18.26.	R/W
b6	ISEL	Interrupt Input Function Select	0: Do not use as the IRQn input pin. 1: Use as the IRQn input pin.	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

PSEL[5:0] Bits (Pin Function Select)

These bits select the peripheral function to assign to a pin.

ISEL Bit (Interrupt Input Function Select)

Set this bit to 1 to use the given pin as the IRQ pin. This bit can be used with peripheral functions. Note that IRQn (external pin interrupt) with the same number cannot be enabled for two or more pins.

b6	ISEL	Interrupt Input Function Select	0: Do not use as the IRQn input pin. 1: Use as the IRQn input pin.	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

PSEL[5:0] Bits (Pin Function Select)

These bits select the peripheral function to assign to a pin.

ISEL Bit (Interrupt Input Function Select)

Set this bit to 1 to use the given pin as the IRQ pin. This bit can be used with peripheral functions. Note that IRQn (external pin interrupt) with the same number cannot be enabled for two or more pins.

Table 18.32 Register Settings for the Input/Output Function in the 320-pin FBGA Pin

PSEL[5:0] Setting	Pin							
	PM0	PM1	PM2	PM3	PM4	PM5	PM6	PM7

010110b	—	CATLEDERR *1	CATLATCH1 *1	CATLATCH0 *1	CATLEDRUN *1	CATLEDSTER *1	CATLINKACT0 *1	CATLINKACT1 *1

Note: —: Do not set.
Note 1. Only for products incorporating an EtherCAT (optional)

18.2.24 PNn Pin Function Control Register (PNnPFS) (n = 0 to 7)

The PNn pin function control register (PNnPFS) selects the function of the pin to use. The PNnPFS register is protected by the write protect register (PWPR). Modifications to this register can only be made after releasing protection. The ISEL bit of the pin without the IRQn function is reserved. A value after a reset must be written.

Address(es): PN0PFS A000 02B0h, PN1PFS A000 02B1h, PN2PFS A000 02B2h, PN3PFS A000 02B3h, PN4PFS A000 02B4h, PN5PFS A000 02B5h, PN6PFS A000 02B6h, PN7PFS A000 02B7h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	ISEL	PSEL[5:0]					
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	PSEL[5:0]	Pin Function Select	These bits select the peripheral function. For details on each function, see Table 18.33.	R/W
b6	ISEL	Interrupt Input Function Select	0: Do not use as the IRQn input pin. 1: Use as the IRQn input pin.	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

PSEL[5:0] Bits (Pin Function Select)

These bits select the peripheral function to assign to a pin.

ISEL Bit (Interrupt Input Function Select)

Set this bit to 1 to use the given pin as the IRQ pin. This bit can be used with peripheral functions. Note that IRQn (external pin interrupt) with the same number cannot be enabled for two or more pins.

Table 18.33 Register Settings for the Input/Output Function in the 320-pin FBGA Pin

PSEL[5:0] Setting	Pin							
	PN0	PN1	PN2	PN3	PN4	PN5	PN6	PN7

Note: —: Do not set.

18.2.29 PUn Pin Function Control Register (PUnPFS) (n = 0 to 7)

The PUn pin function control register (PUnPFS) selects the function of the pin to use. The PUnPFS register is protected by the write protect register (PWPR). Modifications to this register can only be made after releasing protection. The ISEL bit of the pin without the IRQn function is reserved. A value after a reset must be written.

Address(es): PU0PFS A000 02D8h, PU1PFS A000 02D9h, PU2PFS A000 02DAh, PU3PFS A000 02DBh, PU4PFS A000 02DCh, PU5PFS A000 02DDh, PU6PFS A000 02DEh, PU7PFS A000 02DFh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	ISEL	PSEL[5:0]					
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	PSEL[5:0]	Pin Function Select	These bits select the peripheral function. For details on each function, see Table 18.38.	R/W
b6	ISEL	Interrupt Input Function Select	0: Do not use as the IRQn input pin. 1: Use as the IRQn input pin.	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

PSEL[5:0] Bits (Pin Function Select)

These bits select the peripheral function to assign to a pin.

ISEL Bit (Interrupt Input Function Select)

Set this bit to 1 to use the given pin as the IRQ pin. This bit can be used with peripheral functions. Note that IRQn (external pin interrupt) with the same number cannot be enabled for two or more pins.

Table 18.38 Register Settings for the Input/Output Function in the 320-pin FBGA Pin

PSEL[5:0] Setting	Pin							
	PU0	PU1	PU2	PU3	PU4	PU5	PU6	PU7

Note: —: Do not set.
Note 1. Only for products incorporating an EtherCAT (optional)

18.3 Usage Notes

18.3.1 Procedure for Specifying the Pin Input/Output Function

To specify the pin input/output function:

1. Set the port direction register (PDR) of the applicable pin to 00, and clear the port mode register (PMR) to 0 to set them as a general I/O port.
2. For each peripheral module, set the I/O signal to assign to the applicable pin.
3. Clear the PWPR.B0WI bit to 0, and then set the PWPR.PFSWE bit to 1. By doing so, make the Pmn pin function control register (PmnPFS) (m = 0 to 9, A to H, J to N, P, R to U, n = 0 to 7) writable.
4. By using the PmnPFS.PSEL[5:0] bits, set the pin input/output function.
5. Clear the PWPR.PFSWE bit to 0 to disable writing to the PmnPFS register.
6. Set the applicable bit of the PMR register corresponding to the selected pin to 1 as necessary to switch to the pin input/output function of the peripheral function.
7. Set the PDR register to 10 as necessary to enable reading the port status.

18.3.2 Notes on MPC Register Setting

1. Settings of the Pmn pin function control register (PmnPFS) (m = 0 to 9, A to H, J to N, P, R to U, n = 0 to 7) should be made only while the PMR register for the target pin is cleared to 0. If the PmnPFS is set while the applicable bit of the PMR register is 1, unexpected edges might be input for the input function. Besides, unexpected pulses might be output for the output function.
2. When setting the PmnPFS.ISEL bit to use the IRQ or NMI pin interrupt, follow the procedure described in [For IRQ pins] of section 12.3.3, External Pin Interrupts and section 12.3.4, NMI Pin Interrupts. If the PmnPFS.ISEL bit is set using a different procedure, unexpected edges may be input, leading to malfunction.
3. Only the allowed functions should be specified for the PmnPFS register. If a value that is not allowed for the register is specified, correct operation is not guaranteed.
4. Do not assign a single function to multiple pins through the MPC settings.
5. Ports 8 (P86 and P87 only), 9, and D also function as analog input/output pins for the A/D converter. When using these ports as analog input/output pins, disable the pin by clearing the bit of the corresponding pin in the port mode register (PMR) to 0, and setting the port direction register (PDR) to 00, and set the PmnPFS.ASEL bit to 1, and then setting the PmnPFS.ASEL bit to 1 to avoid degradation of accuracy.
6. Points to note regarding the port mode register (PMR), port direction register (PDR), and Pmn pin function control register (PmnPFS) settings for pins that have multiplexed pin functions are listed in Table 18.39. The pin states are readable if the value of the ASEL bit of the Pmn pin is 0. Ensure that the bit corresponding to the applicable pin of the PMR register is 0 when changes to the PSEL[5:0] bits are made.

Table 18.39 Register Settings

Item	PMR.Bn	PDR.Bn[1:0]	PmnPFS			Note
			ASEL	ISEL	PSEL[5:0]	
After a reset is canceled	0 *1	00	0	0	000000b *1	In the disabled (Hi-z input protection) state after a reset is canceled.
Not used	0	00	0	0	N	
General I/O port	0	10/11 *2	0	0/1 *3	N	Set the PmnPFS.ISEL bit to 1 if these are multiplexed with interrupt inputs.
Peripheral functions	1	00/10 *4	0	0/1 *3	Peripheral functions (See Table 18.2 to Table 18.38.)	Set the PmnPFS.ISEL bit to 1 if it is multiplexed with interrupt inputs. Set the PDR.Bn[1:0] bits to 10 if it is multiplexed with the port read function (reading the pin status of the port in the PIDR.Bn bit).
Interrupt input (NMI, IRQ0 to IRQ15)	0	10	0	1	N	
Analog inputs	0	00	1	N *5	N	For use as analog input, set the given pin to “non-use” by setting the associated bits of the port mode register (PMR) and the port direction register (PDR) to 0 and 00, respectively. After that, set the PmnPFS.ASEL bit to 1. This procedure avoids deterioration of the precision of values.

N: Setting is not required.

Note 1. Values after reset for PORT3.PMR, P33PFS.PSEL[5:0], and P34PFS.PSEL[5:0] are different.
For details on the PSEL[5:0] bits, see section 18.2.5, P3n Pin Function Control Register (P3nPFS) (n = 0 to 7).
For details on PORT3.PMR, see section 17.3.4, Port Mode Register (PMR).

Note 2. Setting the PDR.Bn[1:0] bits to 10 makes the register function as a general input port.
Setting the PDR.Bn[1:0] bits to 11 makes the register function as a general output port.

Note 3. If the PmnPFS.ISEL bit is set to 0, the register does not function as an IRQ pin.
Setting the PmnPFS.ISEL bit to 1 makes the register function as an IRQ pin (when the IRQ function is multiplexed).

Note 4. If the PDR.Bn[1:0] bits is set to 00, the port read function (reading the pin status of the port with the PIDR.Bn bit) cannot be used.
Setting the PDR.Bn[1:0] bits to 10 enables reading of the port pin status.

Note 5. Setting the PmnPFS.ISEL bit to 1 does not make the register function as an IRQn input pin.

18.3.3 Usage Notes on Port Read Function

When a peripheral module for a pin which is bidirectional or an output is in use and the value of the PDR bits for the given pin is changed from 00 (initial value) to 10 (input enabled), the state of the pin can be read (port read function) from the PIDR register while the peripheral function is in use.

When a peripheral module for a pin which is an input or any of the input/output pin functions listed in Table 18.40 is in use, input is always enabled and the pin function can be used in parallel with port reading without changing the setting of the PDR register.

A shoot-through current flows when an external pin enters the Hi-Z state. An external pin must be pulled down or up when in the Hi-Z state.

When the pin functions in Table 18.41 are in use with an external bus controller, setting the PDR register to 10 (input enabled) is prohibited because the external bus controller controls enabling and disabling of input to the pins.

Table 18.40 List of Modules and Associated Pin Functions for Which Input is Always Enabled (1 / 4)

18.3.4 Notes on Port Settings for MTU and GPT

(1) MTU

If a set of pins capable of 6-phase PWM output is being used with the MTU in complementary PWM mode or reset-synchronized PWM mode, some restrictions apply to the port settings for the pins in use as MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, and MTIOC4D. For details on the individual port settings, see section 19.6.28, Notes on Port Settings in Complementary PWM Mode or Reset-Synchronized PWM Mode, of section 19, Multi-Function Timer Pulse Unit (MTU3a).

(2) GPT

If a set of pins capable of 6-phase PWM output pins is being used with channels 0, 1, or 2 of the GPT, some restrictions apply to the port settings for the pins in use as GTIOC0A, GTIOC0B, GTIOC1A, GTIOC1B, GTIOC2A, and GTIOC2B. For details on the individual port settings, see section 21.9.5, Notes on Port Settings in PWM Output Operating Mode, of section 21, General PWM Timer (GPTa).

19. Multi-Function Timer Pulse Unit (MTU3a)

19.1 Overview

This LSI has an on-chip multi-function timer pulse unit (MTU3a), consisting of eight 16-bit timer channels and one 32-bit timer channel.

Table 19.1 shows the specifications of the MTU and Table 19.2 lists the functions of the MTU. Figure 19.1 and Figure 19.2 are block diagrams of the MTU.

Table 19.1 Specifications of the MTU

Item	Description
Pulse input/output	28 lines maximum
Pulse input	3 lines
Count clock	11 clocks for each channel (14 clocks for MTU0, 12 clocks for MTU1 and 2, and 10 clocks for channel 5)
Operating frequency	PCLKC (150 MHz)
Available operations	[MTU0 to MTU4, MTU6, MTU7, and MTU8] • Waveform output on compare match • Input capture function (noise filter setting available) • Counter-clearing operation • Simultaneous writing to multiple timer counters (TCNT) (excluding MTU8) • Simultaneous clearing on compare match or input capture (excluding MTU8) • Simultaneous input and output to registers in synchronization with counter operations (excluding MTU8) • Up to 12-phase PWM output in combination with synchronous operation (excluding MTU8)
	[MTU0, MTU3, MTU4, MTU6, MTU7, and MTU8] • Buffer operation specifiable
	[MTU1, MTU2] • Phase counting mode specifiable independently (noise filter setting available for external clock input) • Cascade connection operation available (as a 32-bit counter)
	[MTU3, MTU4, MTU6, and MTU7] • Through interlocked operation of MTU3/MTU4 and MTU6/MTU7, the positive and negative signals in six phases (12 phases in total) can be output in complementary-PWM and reset-PWM operation. • In complementary PWM mode, transfer of values from buffer registers to temporary registers on crests and troughs of the timer-counter values or writing to the buffer registers (MTU4.TGRD and MTU7.TGRD) • Double-buffering selectable in complementary PWM mode
	[MTU3 and MTU4] • Through interlocking with channel 0, a mode for driving AC synchronous motors (brushless DC motors) by using complementary PWM output and reset PWM output is settable and allows the selection of two types of waveform output (chopping or level)
	[MTU5] • Capable of operation as a dead-time compensation counter
	[MTU0/MTU5, MTU1, MTU2, and MTU8] 32-bit phase counting mode specifiable by combining MTU1 and MTU2 and through interlocked operation with MTU0/MTU5 and MTU8
Interrupt-skipping function in complementary PWM mode	In complementary PWM mode, interrupts on crests and troughs of counter values and triggers to start conversion by the A/D converter can be skipped
Interrupt sources	43 sources
Buffer operation	Automatic transfer of register data (transfer from the buffer register to the timer register)
Trigger generation	A/D converter start triggers can be generated
	A/D converter start request delaying function enables A/D converter to be started with any desired timing and to be synchronized with PWM output
Low-power consumption function	Module stop mode can be set

	MTIOC8D	I/O	MTU8.TGRD input capture input/output compare output pin

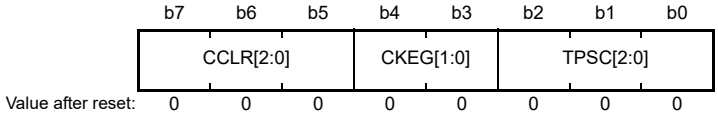
19.2 Register Descriptions

19.2.1 Timer Control Register (TCR)

The TCR register controls the TCNT operation for each channel in combination with the TCR2 register. The MTU has a total of 11 TCR registers, one each for MTU0 to MTU4, MTU 6, MTU7, and MTU8 and three (TCRU, TCRV, and TCRW) for MTU5. TCR values should be specified only while TCNT operation is stopped.

- MTU0, MTU1, MTU2, MTU3, MTU4, MTU6, MTU7, MTU8

Address(es): MTU0.TCR A006 A100h, MTU1.TCR A006 A180h, MTU2.TCR A006 A200h, MTU3.TCR A006 A000h, MTU4.TCR A006 A001h, MTU6.TCR A006 A800h, MTU7.TCR A006 A801h, MTU8.TCR A006 A400h



Bit	Symbol	Bit Name	Description	R/W
b2 to b0	TPSC[2:0]	Time Prescaler Select	See Table 19.6 to Table 19.9.	R/W
b4, b3	CKEG[1:0]	Clock Edge Select	b4 b3 0 0: Count at rising edge 0 1: Count at falling edge 1 x: Count at both edges	R/W
b7 to b5	CCLR[2:0]	Counter Clear Source Select	See Table 19.4 and Table 19.5.	R/W

x: Don't care

TPSC[2:0] Bits (Time Prescaler Select)

These bits select the TCNT counter clock. The clock source can be selected independently for each channel. See Table 19.6 to Table 19.9 for details.

CKEG[1: 0] Bits (Clock Edge Select)

These bits select the input clock edge, including the MTIOC1A pin. When the input clock is counted at both edges, the input clock period is halved (e.g. PCLKC/4 at both edges = PCLKC/2 at rising edge). If phase counting mode is used on MTU1 and MTU2, the setting of these bits is ignored and the phase counting mode setting has priority. Internal clock edge selection is valid when the input clock is PCLKC/2 or slower. When PCLKC/1 or the overflow/underflow in another channel is selected for the input clock, a value can be written to these bits but counter operation compiles with the initial value.

CCLR[2:0] Bits (Counter Clear Source Select)

These bits select the TCNT counter clearing source. See Table 19.4 and Table 19.5 for details.

- MTU5

Address(es): MTU5.TCRU A006 AA84h, MTU5.TCRV A006 AA94h, MTU5.TCRW A006 AAA4h

Bit	Symbol	Bit Name	Description	R/W
b1, b0	TPSC[1:0]	Time Prescaler Select	See Table 19.10.	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

TPSC[1:0] Bits (Time Prescaler Select)

These bits select the TCNT counter clock. See Table 19.10 for details.

19.2.2 Timer Control Register 2 (TCR2)

The TCR2 register controls the TCNT operation for each channel in combination with the TCR register. The MTU has a total of 11 TCR registers, one each for MTU0 to MTU4, MTU 6, MTU7, and MTU8 and three (TCR2U, TCR2V, and TCR2W) for MTU5. TCR values should be specified only while TCNT operation is stopped.

- MTU0, MTU3, MTU4, MTU6, MTU7, MTU8

Address(es): MTU0.TCR2 A006 A128h, MTU3.TCR2 A006 A04Ch, MTU4.TCR2 A006 A04Dh, MTU6.TCR2 A006 A84Ch, MTU7.TCR2 A006 A84Dh, MTU8.TCR2 A006 A406h

	b7	b6	b5	b4	b3	b2	b1	b0

	—	—	—	PCB[1:0]		TPSC2[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	TPSC2[2:0]	Time Prescaler Select	See Table 19.6 to Table 19.9.	R/W
b4, b3	PCB[1:0]	Phase Counting Mode Function Expansion Control	Controls expansion of functionality to modes 2, 3, and 5 of phase-counting mode	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

x: Don't care

TPSC2[2:0] Bits (Time Prescaler Select)

These bits select the TCNT counter clock. The clock source can be selected independently for each channel. See Table 19.6 to Table 19.9 for details.

PCB[1:0] Bits (Functional Expansion Control for Phase Counting Modes 2, 3, and 5)

These bits control extended functions for phase counting mode 2, 3, and 5 in MTU1 and MTU2. For details, see section 19.3.6, Phase Counting Mode.

- MTU5

Address(es): MTU5.TCR2U A006 AA85h, MTU5.TCR2V A006 AA95h, MTU5.TCR2W A006 AAA5h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	CKEG[1:0]		TPSC2[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	TPSC2[2:0]	Time Prescaler Select	See Table 19.10.	R/W
b4, b3	CKEG[1:0]	Clock Edge Select	b4 b3 0 0: Counts at the rising edge. 0 1: Counts at the falling edge. 1 x: Counts at both edges.	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

TPSC2[2:0] Bits (Time Prescaler Select)

These bits select the TCNT counter clock. See Table 19.10 for details.

CKEG[1:0] bits (Clock Edge Select)

These bits select the edge of the counter clock signal output from the MTIOC1A pin.

Table 19.4 CCLR[2:0] (MTU0, MTU3, MTU4, MTU6, MTU7, and MTU8)

	Bit 7	Bit 6	Bit 5	
Channel	CCLR2	CCLR1	CCLR0	Description
MTU0 MTU3 MTU4 MTU6 MTU7 MTU8	0	0	0	TCNT clearing disabled
	0	0	1	TCNT cleared by TGRA compare match/input capture
	0	1	0	TCNT cleared by TGRB compare match/input capture
	0	1	1	TCNT cleared by counter clearing in another channel performing synchronous clearing/ synchronous operation*1
	1	0	0	TCNT clearing disabled
	1	0	1	TCNT cleared by TGRC compare match/input capture*2
	1	1	0	TCNT cleared by TGRD compare match/input capture*2
	1	1	1	TCNT cleared by counter clearing in another channel performing synchronous clearing/ synchronous operation*1

Note 1. Synchronous operation is selected by setting the TSYRA.SYNC or TSYRB.SYNC bit to 1. However, MTU8 is excluded.
Note 2. When TGRC or TGRD is used as a buffer register, TCNT is not cleared because the buffer register setting has priority and compare match/input capture does not occur.

Table 19.5 CCLR[2:0] (MTU1 and MTU2)

	Bit 7	Bit 6	Bit 5	
Channel	Reserved*2	CCLR1	CCLR0	Description
MTU1 MTU2	0	0	0	TCNT clearing disabled
	0	0	1	TCNT cleared by TGRA compare match/input capture
	0	1	0	TCNT cleared by TGRB compare match/input capture
	0	1	1	TCNT cleared by counter clearing in another channel performing synchronous clearing/synchronous operation*1

Note 1. Synchronous operation is selected by setting the TSYRA.SYNC and TSYRB.SYNC bits to 1.
Note 2. Bit 7 is reserved in MTU1 and MTU2. The bit is read as 0. The write value is ignored.

	1	0	1	×	×	Internal clock: counts on PCLKC/1024
	1	1	0	×	×	Setting prohibited
	1	1	1	×	×	Internal clock: counts on MTIOC1A pin input

Note: Bits 7 to 2 in the TCR register are reserved for MTU5. These bits are read as 0. The write value should be 0.

19.2.3 Timer Mode Register 1 (TMDR1)

The TMDR1 register specifies the operating mode of each channel. The MTU has a total of eight TMDR1 registers, one each for MTU0 to MTU4, MTU 6, MTU7, and MTU8. TMDR1 register values should be specified only while TCNT operation is stopped.

- MTU0.TMDR1

Address(es): MTU0.TMDR1 A006 A101h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	BFE	BFB	BFA	MD[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

- MTU1.TMDR1, MTU2.TMDR1

Address(es): MTU1.TMDR1 A006 A181h, MTU2.TMDR1 A006 A201h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	MD[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

- MTU3.TMDR1, MTU4.TMDR1, MTU6.TMDR1, MTU7.TMDR1, MTU8.TMDR1

Address(es): MTU3.TMDR1 A006 A002h, MTU4.TMDR1 A006 A003h, MTU6.TMDR1 A006 A802h, MTU7.TMDR1 A006 A803h, MTU8.TMDR1 A006 A401h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	BFB	BFA	MD[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	MD[3:0]	Mode Select	These bits specify the timer operating mode. See Table 19.11 for details.	R/W
b4	BFA	Buffer Operation A	0: TGRA and TGRC operate normally 1: TGRA and TGRC used together for buffer operation	R/W
b5	BFB	Buffer Operation B	0: TGRB and TGRD operate normally 1: TGRB and TGRD used together for buffer operation	R/W
b6	BFE	Buffer Operation E	0: MTU0.TGRE and MTU0.TGRF operate normally 1: MTU0.TGRE and MTU0.TGRF used together for buffer operation	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

MD[3:0] Bits (Mode Select)

These bits specifies the operating mode of the timer. See Table 19.11.

BFA Bit (Buffer Operation A)

This bit specifies whether to operate TGRA in the normal way or to use TGRA and TGRC together for buffer operation. When TGRC is used as a buffer register, TGRC input capture/output compare does not take place in a mode other than complementary PWM mode, but TGRC compare match takes place in complementary PWM mode. If MTU4 compare match takes place in the Tb interval of complementary PWM mode, clear the TGIEC bit in the timer interrupt enable register (MTU4.TIER) to 0.

In reset synchronized PWM mode or complementary PWM mode, buffer operation in MTU3 and MTU4 (or MTU6 and MTU7) depends on the settings in the BFA bit of MTU3.TMDR1 (MTU6.TMDR1). The BFA bit of MTU4.TMDR1 (MTU7.TMDR1) should be set to 0.

In MTU1 and MTU2, which have no TGRC, this bit is reserved. It is read as 0. The write value should be 0. For details about the Tb interval of complementary PWM mode, see Figure 19.50.

BFB Bit (Buffer Operation B)

This bit specifies whether to operate TGRB in the normal way or to use TGRB and TGRD together for buffer operation. When TGRD is used as a buffer register, TGRD input capture/output compare does not usually take place, but TGRD compare match takes place in complementary PWM mode. If MTU4 compare match takes place in the Tb interval of complementary PWM mode, clear the TGIED bit in the timer interrupt enable register (MTU4.TIER) to 0.

In reset synchronized PWM mode or complementary PWM mode, buffer operation in MTU3 and MTU4 (or MTU6 and MTU7) depends on the settings in the BFB bit of MTU3.TMDR1 (MTU6.TMDR1). The BFB bit of MTU4.TMDR1 (MTU7.TMDR1) should be set to 0.

In MTU1 and MTU2, which have no TGRD, this bit is reserved. It is read as 0. The write value should be 0. For details about the Tb interval of complementary PWM mode, see Figure 19.50.

BFE Bit (Buffer Operation E)

This bit specifies whether to operate MTU0.TGRE and MTU0.TGRF in the normal way or to use them together for buffer operation. TGRF compare match takes place even when TGRF is used as a buffer register.

In MTU1 to MTU4, MTU6, MTU7, and MTU8, this bit is reserved. It is read as 0. The write value should be 0.

Table 19.11 Operating Mode Setting by MD[3:0] Bits (MTU0 to MTU4, MTU6 to MTU8)

Bit 3	Bit 2	Bit 1	Bit 0		MTU0	MTU1	MTU2	MTU3	MTU4	MTU6	MTU7	MTU8
MD3	MD2	MD1	MD0	Description								
0	0	0	0	Normal operation (normal mode)	√	√	√	√	√	√	√	√
0	0	0	1	Setting prohibited								
0	0	1	0	PWM mode 1	√	√	√	√	√	√	√	
0	0	1	1	PWM mode 2	√	√	√					
0	1	0	0	Phase counting mode 1		√	√					
0	1	0	1	Phase counting mode 2		√	√					
0	1	1	0	Phase counting mode 3		√	√					
0	1	1	1	Phase counting mode 4		√	√					
1	0	0	0	Reset-synchronized PWM mode*1				√		√		
1	0	0	1	Phase counting mode 5		√	√					
1	0	1	x	Setting prohibited								
1	1	0	0	Setting prohibited								
1	1	0	1	Complementary PWM mode 1 (transfer at crest)*1				√		√		
1	1	1	0	Complementary PWM mode 2 (transfer at trough)*1				√		√		
1	1	1	1	Complementary PWM mode 3 (transfer at crest and trough)*1				√		√		

x: Don't care

Note 1. Reset-synchronized PWM mode and complementary PWM mode can only be set for MTU3 and MTU6. When MTU3 or MTU6 is set to reset-synchronized PWM mode or complementary PWM mode, the MTU4 or MTU7 settings become ineffective and automatically conform to the MTU3 or MTU6 setting, respectively. MTU4 and MTU7 should be set to the initial values (normal operation).

19.2.4 Timer Mode Registers 2 (TMDR2A, TMDR2B)

TMDR2 specifies the double buffer function in complementary PWM mode 3 (transfer at the crest and trough of the counter value). The MTU has two TMDR2 registers, one each for MTU3 (TMDR2A) and MTU6 (TMDR2B). TMDR2A and TMDR2B values should be specified only while TCNT operation is stopped.

Address(es): MTU.TMDR2A A006 A070h, MTU.TMDR2B A006 A870h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	DRS
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	DRS	Double Buffer Select	0: Double buffer function is disabled 1: Double buffer function is enabled	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

DRS Bit (Double Buffer Select)

This bit enables or disables the double buffer function in complementary PWM mode.

19.2.5 Timer Mode Register 3 (TMDR3)

The TMDR3 register controls access in longword units to the combination of MTU1 and MTU2, and there is only one register, which is in MTU1.
Such access can proceed when the LWA bit is set in the ways listed inTable 19.12.

Address(es): MTU1.TMDR3 A006 A191h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	PHCKSEL	LWA
Value after reset:	0	0	0	0	0	0	1	0

Bit	Symbol	Bit Name	Description	R/W
b0	LWA	MTU1/MTU2 Combination Long-word Access Control	0: 16-bit access is enabled. 1: 32-bit access is enabled.	R/W
b1	PHCKSEL	External Input Phase Clock Select	Selects the external clock pin for phase counting mode. 0: MTCLKA and MTCLKB are selected for the external phase clock. 1: MTCLKC and MTCLKD are selected for the external phase clock.	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

LWA Bit (Longword Access Control)

This bit selects a 32-bit access in combination of MTU1 and MTU2. Set this bit only in 32-bit phase counting mode.
When LWA is cleared to 0, the MTU1.TCNTLW, MTU1.TGRALW, and MTU1.TGRBLW registers cannot be accessed. This bit is read as 0000 0000h.
When LWA is set to 1, the MTU1.TCNT, MTU2.TCNT, MTU1.TGRA, MTU2.TGRA, MTU1.TGRB, and MTU2.TGRB registers cannot be accessed. This bit is read as 0000 0000h.
The settings of the control registers (TCR, TCR2, TIOR, and TMDR1) in MTU1 take priority because MTU1 and MTU2 operates together while LWA = 1.
In this case, the settings of the control registers in MTU2 are ignored. Furthermore, MTU2 input capture and compare match are disabled, which in turn disables any linked operation with the ELC.
Initialize the counters and general registers in MTU1 and MTU2 prior to rewriting to the LWA bit.

PHCKSEL Bit (External Input Phase Clock Select)

When the MTU1 and MTU2 registers are combined for 32-bit phase counting mode or MTU2 phase counting mode, this bit selects the external input clock pin on which A- or B-phase signal is to be input. See Table 19.66, Clock Input Pins in Phase Counting Mode for details.

Table 19.12 Setting and Combination of the TMDR3 Register

	TMDR3.LWA = 0		TMDR3.LWA = 1	
Register	**Symbol**	**Access mode**	**Symbol**	**Access mode**
Counter in MTU1*1	MTU1.TCNT	Word	MTU1.TCNTLW	Longword
Counter in MTU2	MTU2.TCNT	Word		
General register A in MTU1	MTU1.TGRA	Word	MTU1.TGRALW	Longword
General register A in MTU2	MTU2.TGRA	Word		
General register B in MTU1	MTU1.TGRB	Word	MTU1.TGRBLW	Longword
General register B in MTU2	MTU2.TGRB	Word		

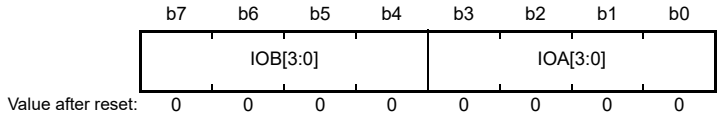
Note 1. When the LWA bit is set to 1, setting the counter clock for MTU1 as MTU2.TCNT overflow/underflow is not required.

19.2.6 Timer I/O Control Register (TIOR)

The TIOR register controls the TGR register. The MTU has a total of 17 TIOR registers, two each for MTU0, MTU3, MTU4, MTU6, MTU7, and MTU8, one each for MTU1 and MTU2, and three (MTU5.TIORU/V/W) for MTU5.
Note that TIOR is affected by the TMDR1 setting.
The initial output specified by TIOR is valid when the counter is stopped (the CST bit in TSTRA and the CST bit in TSTRB are cleared to 0). In PWM mode 2, the output when the counter is cleared to 0 is specified.
When TGRC or TGRD is designated for buffer operation, this setting is invalid and the register operates as a buffer register.

- MTU0.TIORH, MTU1.TIOR, MTU2.TIOR, MTU3.TIORH, MTU4.TIORH, MTU6.TIORH, MTU7.TIORH, MTU8.TIORH

Address(es): MTU0.TIORH A006 A102h, MTU1.TIOR A006 A182h, MTU2.TIOR A006 A202h, MTU3.TIORH A006 A004h, MTU4.TIORH A006 A006h, MTU6.TIORH A006 A804h, MTU7.TIORH A006 A806h, MTU8.TIORH A006 A402h

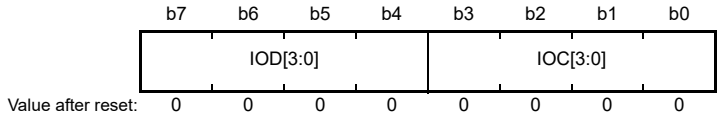


Bit	Symbol	Bit Name	Description	R/W
b3 to b0	IOA[3:0]	I/O Control A*1	See the following tables. MTU0.TIORH: Table 19.27 MTU1.TIOR: Table 19.29 MTU2.TIOR: Table 19.30 MTU3.TIORH: Table 19.31 MTU4.TIORH: Table 19.33 MTU6.TIORH: Table 19.35 MTU7.TIORH: Table 19.37 MTU8.TIORH: Table 19.39	R/W
b7 to b4	IOB[3:0]	I/O Control B*1	See the following tables. MTU0.TIORH: Table 19.13 MTU1.TIOR: Table 19.15 MTU2.TIOR: Table 19.16 MTU3.TIORH: Table 19.17 MTU4.TIORH: Table 19.19 MTU6.TIORH: Table 19.21 MTU7.TIORH: Table 19.23 MTU8.TIORH: Table 19.25	R/W

Note 1. When the value of IOn[3:0] (n = A, B) is changed to the output-prohibited state (0000b or 0100b) during low, high, or toggle output at compare match, this register is in Hi-Z.

- MTU0.TIORL, MTU3.TIORL, MTU4.TIORL, MTU6.TIORL, MTU7.TIORL, MTU8.TIORL

Address(es): MTU0.TIORL A006 A103h, MTU3.TIORL A006 A005h, MTU4.TIORL A006 A007h, MTU6.TIORL A006 A805h, MTU7.TIORL A006 A807h, MTU8.TIORL A006 A403h

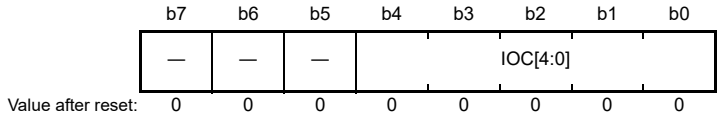


Bit	Symbol	Bit Name	Description	R/W
b3 to b0	IOC[3:0]	I/O Control C*1	See the following tables. MTU0.TIORL: Table 19.28 MTU3.TIORL: Table 19.32 MTU4.TIORL: Table 19.34 MTU6.TIORL: Table 19.36 MTU7.TIORL: Table 19.38 MTU8.TIORL: Table 19.40	R/W
b7 to b4	IOD[3:0]	I/O Control D*1	See the following tables. MTU0.TIORL: Table 19.14 MTU3.TIORL: Table 19.18 MTU4.TIORL: Table 19.20 MTU6.TIORL: Table 19.22 MTU7.TIORL: Table 19.24 MTU8.TIORL: Table 19.26	R/W

Note 1. When the value of IOn[3:0] (n = C, D) is changed to the output-prohibited state (0000b or 0100b) during low, high, or toggle output at compare match, this register is in Hi-Z.

- MTU5.TIORU, MTU5.TIORV, MTU5.TIORW

Address(es): MTU5.TIORU A006 AA86h, MTU5.TIORV A006 AA96h, MTU5.TIORW A006 AAA6h



Bit	Symbol	Bit Name	Description	R/W
b4 to b0	IOC[4:0]	I/O Control C	See the following table. MTU5.TIORU, MTU5.TIORV, MTU5.TIORW: Table 19.41	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Table 19.13 TIORH (MTU0)

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOB3	**IOB2**	**IOB1**	**IOB0**	**MTU0.TGRB Function**	**MTIOC0B Pin Function**
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	0	1	x		Input capture at both edges.
1	1	x	x		Capture input source is the clock source for counting in MTU1. Input capture on counting up or down by MTU1.TCNT (LWA = 0) or MTU1.TCNTLW (LWA = 1)

x: Don't care

Table 19.14 TIORL (MTU0)

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOD3	**IOD2**	**IOD1**	**IOD0**	**MTU0.TGRD Function**	**MTIOC0D Pin Function**
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register*1	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	0	1	x		Input capture at both edges.
1	1	x	x		Capture input source is the clock source for counting in MTU1. Input capture on counting up or down by MTU1.TCNT (LWA = 0) or MTU1.TCNTLW (LWA = 1)

x: Don't care

Note 1. When the MTU0.TMDR1.BFB is set to 1 and MTU0.TGRD is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 19.15 TIOR (MTU1)

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOB3	IOB2	IOB1	IOB0	MTU1.TGRB Function	MTIOC1B Pin Function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	0	1	x		Input capture at both edges.
1	1	0	0		Input capture at occurrence of compare match or input capture in the MTU0.TGRC register
1	1	1	x		Input capture on generation of compare match with MTU8.TGRC

x: Don't care

Table 19.16 TIOR (MTU2)

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOB3	IOB2	IOB1	IOB0	MTU2.TGRB Function	MTIOC2B Pin Function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

x: Don't care

Table 19.17 TIORH (MTU3)

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOB3	**IOB2**	**IOB1**	**IOB0**	**MTU3.TGRB Function**	**MTIOC3B Pin Function**
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

x: Don't care

Table 19.18 TIORL (MTU3)

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOD3	**IOD2**	**IOD1**	**IOD0**	**MTU3.TGRD Function**	**MTIOC3D Pin Function**
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*1	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

x: Don't care

Note 1. When the BFB bit in MTU3.TMDR1 is set to 1 and MTU3.TGRD is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 19.19 TIORH (MTU4)

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOB3	**IOB2**	**IOB1**	**IOB0**	**MTU4.TGRB Function**	**MTIOC4B Pin Function**
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

x: Don't care

Table 19.20 TIORL (MTU4)

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOD3	**IOD2**	**IOD1**	**IOD0**	**MTU4.TGRD Function**	**MTIOC4D Pin Function**
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*1	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

x: Don't care

Note 1. When the BFB bit in MTU4.TMDR1 is set to 1 and MTU4.TGRD is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 19.21 TIORH (MTU6)

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOB3	IOB2	IOB1	IOB0	MTU6.TGRB Function	MTIOC6B Pin Function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

x: Don't care

Table 19.22 TIORL (MTU6)

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOD3	IOD2	IOD1	IOD0	MTU6.TGRD Function	MTIOC6D Pin Function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*1	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

x: Don't care

Note 1. When the BFB bit in MTU6.TMDR1 is set to 1 and MTU6.TGRD is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 19.23 TIORH (MTU7)

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOB3	IOB2	IOB1	IOB0	MTU7.TGRB Function	MTIOC7B Pin Function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

x: Don't care

Table 19.24 TIORL (MTU7)

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOD3	IOD2	IOD1	IOD0	MTU7.TGRD Function	MTIOC7D Pin Function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*1	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

x: Don't care

Note 1. When the BFB bit in MTU7.TMDR1 is set to 1 and MTU7.TGRD is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 19.25 TIORH (MTU8)

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOB3	**IOB2**	**IOB1**	**IOB0**	**MTU8.TGRB Function**	**MTIOC8B Pin Function**
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	0	1	x		Input capture at both edges.
1	1	x	x		Capture input source is the clock source for counting in MTU1. Input capture on counting up or down by MTU1.TCNT (LWA = 0) or MTU1.TCNTLW (LWA = 1)

x: Don't care

Table 19.26 TIORL (MTU8)

Bit 7	Bit 6	Bit 5	Bit 4	Description	
IOD3	**IOD2**	**IOD1**	**IOD0**	**MTU8.TGRD Function**	**MTIOC8D Pin Function**
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*1	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

x: Don't care

Note 1. When the MTU8.TMDR1.BFB bit is set to 1 and the MTU8.TGRD register is used as a buffer register, this setting is not effective and the input capture or output compare operation does not proceed.

Table 19.27 TIORH (MTU0)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOA3	**IOA2**	**IOA1**	**IOA0**	**MTU0.TGRA Function**	**MTIOC0A Pin Function**
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	0	1	x		Input capture at both edges.
1	1	0	0		Capture input source is the clock source for counting in MTU1. Input capture on counting up or down by MTU1.TCNT (LWA = 0) or MTU1.TCNTLW (LWA = 1)
1	1	1	x		Input capture on generation of compare match with MTU8.TGRC

x: Don't care

Table 19.28 TIORL (MTU0)

Bit 3	Bit 2	Bit 1	Bit 0	Description

0	0	1	0		Initial output is low. High output at compare match
0	0	1	1		Initial output is low. Toggle output at compare match
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match
0	1	1	0		Initial output is high. High output at compare match
0	1	1	1		Initial output is high. Toggle output at compare match
1	x	0	0	Input capture register*1	Input capture at rising edge
1	x	0	1		Input capture at falling edge
1	x	1	x		Input capture at both edges

x: Don't care

Note 1. When the BFA bit in MTU4.TMDR1 is set to 1 and MTU4.TGRC is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 19.35 TIORH (MTU6)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOA3	IOA2	IOA1	IOA0	MTU6.TGRA Function	MTIOC6A Pin Function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

x: Don't care

Table 19.36 TIORL (MTU6)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOC3	**IOC2**	**IOC1**	**IOC0**	**MTU6.TGRC Function**	**MTIOC6C Pin Function**
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*1	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

x: Don't care

Note 1. When the BFA bit in MTU6.TMDR1 is set to 1 and MTU6.TGRC is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 19.37 TIORH (MTU7)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOA3	**IOA2**	**IOA1**	**IOA0**	**MTU7.TGRA Function**	**MTIOC7A Pin Function**
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

x: Don't care

Table 19.38 TIORL (MTU7)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOC3	IOC2	IOC1	IOC0	MTU7.TGRC Function	MTIOC7C Pin Function
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*1	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

x: Don't care

Note 1. When the BFA bit in MTU7.TMDR1 is set to 1 and MTU7.TGRC is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

Table 19.39 TIORH (MTU8)

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOA3	IOA2	IOA1	IOA0	MTU8.TGRA Function	MTIOC8A Pin Function
0	0	0	0	Output compare register	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	0	0	0	Input capture register	Input capture at rising edge.
1	0	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

x: Don't care

Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOC3	**IOC2**	**IOC1**	**IOC0**	**MTU8.TGRC Function**	**MTIOC8C Pin Function**
0	0	0	0	Output compare register*1	Output prohibited
0	0	0	1		Initial output is low. Low output at compare match.
0	0	1	0		Initial output is low. High output at compare match.
0	0	1	1		Initial output is low. Toggle output at compare match.
0	1	0	0		Output prohibited
0	1	0	1		Initial output is high. Low output at compare match.
0	1	1	0		Initial output is high. High output at compare match.
0	1	1	1		Initial output is high. Toggle output at compare match.
1	x	0	0	Input capture register*1	Input capture at rising edge.
1	x	0	1		Input capture at falling edge.
1	x	1	x		Input capture at both edges.

x: Don't care

Note 1. When the MTU8.TMDR1.BFA bit is set to 1 and the MTU8.TGRC register is used as a buffer register, this setting is not effective and the input capture or output compare operation does not proceed.

Table 19.41 TIORU, TIORV, and TIORW (MTU5)

Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Description	
IOC4	IOC3	IOC2	IOC1	IOC0	MTU5.TGRU, MTU5.TGRV, MTU5.TGRW Function	MTIC5U, MTIC5V, MTIC5W Pin Function
0	0	0	0	0	Output compare register	No function
0	0	0	0	1		Setting prohibited
0	0	0	1	x		Setting prohibited
0	0	1	x	x		Setting prohibited
0	1	x	x	x		Setting prohibited
1	0	0	0	0	Input capture register	Setting prohibited
1	0	0	0	1		Input capture at rising edge.
1	0	0	1	0		Input capture at falling edge.
1	0	0	1	1		Input capture at both edges.
1	0	1	x	x		Input capture on generation of compare match with MTU8.TGRC
1	1	0	0	0		Setting prohibited
1	1	0	0	1		Measurement of low pulse width of external input signal. Capture at trough in complementary PWM mode.
1	1	0	1	0		Measurement of low pulse width of external input signal. Capture at crest of complementary PWM mode.
1	1	0	1	1		Measurement of low pulse width of external input signal. Capture at crest and trough of complementary PWM mode.
1	1	1	0	0		Setting prohibited
1	1	1	0	1		Measurement of high pulse width of external input signal. Capture at trough in complementary PWM mode.
1	1	1	1	0		Measurement of high pulse width of external input signal. Capture at crest of complementary PWM mode.
1	1	1	1	1		Measurement of high pulse width of external input signal. Capture at crest and trough of complementary PWM mode.

x: Don't care

19.2.7 Timer Compare Match Clear Register (TCNTCMPCLR)

TCNTCMPCLR specifies requests to clear MTU5.TCNTU, MTU5.TCNTV, and MTU5.TCNTW. The MTU has one TCNTCMPCLR (on MTU5).

Address(es): MTU5.TCNTCMPCLR A006 AAB6h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	CMPCLR5U	CMPCLR5V	CMPCLR5W
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	CMPCLR5W	TCNT Compare Clear 5W	0: Disables MTU5.TCNTW to be cleared to 0000h at MTU5.TCNTW and MTU5.TGRW compare match or input capture 1: Enables MTU5.TCNTW to be cleared to 0000h at MTU5.TCNTW and MTU5.TGRW compare match or input capture	R/W
b1	CMPCLR5V	TCNT Compare Clear 5V	0: Disables MTU5.TCNTV to be cleared to 0000h at MTU5.TCNTV and MTU5.TGRV compare match or input capture 1: Enables MTU5.TCNTV to be cleared to 0000h at MTU5.TCNTV and MTU5.TGRV compare match or input capture	R/W
b2	CMPCLR5U	TCNT Compare Clear 5U	0: Disables MTU5.TCNTU to be cleared to 0000h at MTU5.TCNTU and MTU5.TGRU compare match or input capture 1: Enables MTU5.TCNTU to be cleared to 0000h at MTU5.TCNTU and MTU5.TGRU compare match or input capture	R/W
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

CMPCLR5n Bits (TCNT Compare Clear 5n) (n = U, V, W)

These bits are used to enable or disable requests to clear MTU5.TCNTn on compare match or input capture for MTU5.TCNTn and MTU5.TGRn.

19.2.8 Timer Interrupt Enable Register (TIER)

The TIER register enables or disables interrupt requests from each channel. The MTU has a total of ten TIER registers, two for MTU0 and one each for MTU1 to MTU8.

- TIER (MTU1, MTU2)

Address(es): MTU1.TIER A006 A184h, MTU2.TIER A006 A204h

	b7	b6	b5	b4	b3	b2	b1	b0
	TTGE	—	TCIEU	TCIEV	—	—	TGIEB	TGIEA
Value after reset:	0	0	0	0	0	0	0	0

- TIER (MTU0, MTU3, MTU6)

Address(es): MTU0.TIER A006 A104h, MTU3.TIER A006 A008h, MTU6.TIER A006 A808h

	b7	b6	b5	b4	b3	b2	b1	b0
	TTGE	—	—	TCIEV	TGIED	TGIEC	TGIEB	TGIEA
Value after reset:	0	0	0	0	0	0	0	0

- TIER (MTU4, MTU7)

Address(es): MTU4.TIER A006 A009h, MTU7.TIER A006 A809h

	b7	b6	b5	b4	b3	b2	b1	b0
	TTGE	TTGE2	—	TCIEV	TGIED	TGIEC	TGIEB	TGIEA
Value after reset:	0	0	0	0	0	0	0	0

- TIER (MTU8)

Address(es): MTU8.TIER A006 A404hh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	TCIEV	TGIED	TGIEC	TGIEB	TGIEA
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	TGIEA	TGR Interrupt Enable A	0: Interrupt requests (TGIA) disabled 1: Interrupt requests (TGIA) enabled	R/W
b1	TGIEB	TGR Interrupt Enable B	0: Interrupt requests (TGIB) disabled 1: Interrupt requests (TGIB) enabled	R/W
b2	TGIEC	TGR Interrupt Enable C	0: Interrupt requests (TGIC) disabled 1: Interrupt requests (TGIC) enabled	R/W
b3	TGIED	TGR Interrupt Enable D	0: Interrupt requests (TGID) disabled 1: Interrupt requests (TGID) enabled	R/W
b4	TCIEV	Overflow Interrupt Enable	0: Interrupt requests (TCIV) disabled 1: Interrupt requests (TCIV) enabled	R/W
b5	TCIEU	Underflow Interrupt Enable	0: Interrupt requests (TCIU) disabled 1: Interrupt requests (TCIU) enabled	R/W
b6	TTGE2	A/D Converter Start Request Enable 2	0: A/D converter start request generation by MTUn.TCNT underflow (trough) disabled 1: A/D converter start request generation by MTUn.TCNT underflow (trough) enabled	R/W
b7	TTGE	A/D Converter Start Request Enable	0: A/D converter start request generation disabled 1: A/D converter start request generation enabled	R/W

n = 4 or 7

TGIEA and TGIEB Bits (TGR Interrupt Enable A and B)

Each bit enables or disables the interrupt request (TGIn) (n = A or B).

TGIEC and TGIED Bits (TGR Interrupt Enable C and D)

Each bit enables or disables the interrupt request (TGIn) (n = C or D).
In MTU1 and MTU2, these bits are reserved. They are always read as 0. The write value should be 0.

TCIEV Bit (Overflow Interrupt Enable)

This bit enables or disables the interrupt request (TCIV).

TCIEU Bit (Underflow Interrupt Enable)

This bit enables or disables the interrupt request (TCIU).
In MTU0, MTU3, MTU4, MTU5, MTU6, MTU7, and MTU8, this bit is reserved. It is always read as 0. The write value should be 0.

TTGE2 Bit (A/D Converter Start Request Enable 2)

This bit enables or disables generation of A/D converter start requests by MTUn.TCNT underflow (trough) in complementary PWM mode (n = 4 or 7).
In MTU0 to MTU3, MTU6, and MTU8, this bit is reserved. It is always read as 0. The write value should be 0.

TTGE Bit (A/D Converter Start Request Enable)

This bit enables or disables generation of A/D converter start requests by TGRA input capture/compare match.
MTU8 is a reserved bit. It is always read as 0. The write value should be 0.

- TIER2 (MTU0)

Address(es): MTU0.TIER2 A006 A124h

	b7	b6	b5	b4	b3	b2	b1	b0
	TTGE2	—	—	—	—	—	TGIEF	TGIEE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	TGIEE	TGR Interrupt Enable E	0: Interrupt requests (TGIE) disabled 1: Interrupt requests (TGIE) enabled	R/W
b1	TGIEF	TGR Interrupt Enable F	0: Interrupt requests (TGIF) disabled 1: Interrupt requests (TGIF) enabled	R/W
b6 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	TTGE2	A/D Converter Start Request Enable 2	0: A/D converter start request generation by compare match between MTU0.TCNT and MTU0.TGRE disabled 1: A/D converter start request generation by compare match between MTU0.TCNT and MTU0.TGRE enabled	R/W

TGIEE and TGIEF Bits (TGR Interrupt Enable E and F)

Each bit enables or disables interrupt requests by compare match between MTU0.TCNT and MTU0.TGRn (n = E or F).

TTGE2 Bit (A/D Converter Start Request Enable 2)

Each bit enables or disables interrupt requests by compare match between MTU0.TCNT and MTU0.TGRE.

- TIER (MTU5)

Address(es): MTU5.TIER A006 AAB2h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	TGIE5U	TGIE5V	TGIE5W
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Bit Name	Description	R/W
b0	TGIE5W	TGR Interrupt Enable 5W	0: Interrupt requests TGIW5 disabled 1: Interrupt requests TGIW5 enabled	R/W
b1	TGIE5V	TGR Interrupt Enable 5V	0: Interrupt requests TGIV5 disabled 1: Interrupt requests TGIV5 enabled	R/W
b2	TGIE5U	TGR Interrupt Enable 5U	0: Interrupt requests TGIU5 disabled 1: Interrupt requests TGIU5 enabled	R/W
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

TGIE5n Bits (TGR Interrupt Enable 5n)

Each bit enables or disables the interrupt request (TGIn5) (n = U, V, or W).

19.2.9 Timer Status Register (TSR)

The TSR register indicates the state of each channel. The MTU has a total of six TSR registers, one each for MTU1 to MTU7 (excluding MTU5).

- TSR (MTU1, MTU2)

Address(es): MTU1.TSR A006 A185h, MTU2.TSR A006 A205h

	b7	b6	b5	b4	b3	b2	b1	b0
	TCFD	—	TCFU	TCFV	—	—	TGFB	TGFA
Value after reset:	1	1	0	0	0	0	0	0

- TSR (MTU3, MTU4, MTU6, MTU7)

Address(es): MTU3.TSR A006 A02Ch, MTU4.TSR A006 A02Dh, MTU6.TSR A006 A82Ch, MTU7.TSR A006 A82Dh

	b7	b6	b5	b4	b3	b2	b1	b0
	TCFD	—	—	TCFV	TGFD	TGFC	TGFB	TGFA
Value after reset:	1	1	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	TGFA	Input Capture/Output Compare Flag A	0: TGRA input capture or compare match has not occurred. 1: TGRA input capture or compare match has occurred.	R/W*1
b1	TGFB	Input Capture/Output Compare Flag B	0: TGRB input capture or compare match has not occurred. 1: TGRB input capture or compare match has occurred.	R/W*1
b2	TGFC	Input Capture/Output Compare Flag C	0: TGRC input capture or compare match has not occurred. 1: TGRC input capture or compare match has occurred.	R/W*1
b3	TGFD	Input Capture/Output Compare Flag D	0: TGRD input capture or compare match has not occurred. 1: TGRD input capture or compare match has occurred.	R/W*1
b4	TCFV	Overflow Flag	0: TCNT overflow has not occurred. 1: TCNT overflow has occurred.	R/W*1
b5	TCFU	Underflow Flag	0: A TCNT underflow has not occurred in MTU1 and MTU2 when they are in phase-counting mode. 1: A TCNT underflow has occurred in MTU1 and MTU2 when they are in phase-counting mode.	R/W*1
b6	—	Reserved	This bit is read as 1.	R
b7	TCFD	Count Direction Flag	0: TCNT counts down 1: TCNT counts up	R

Note 1. Only writing 0 to this bit after reading 1 from this bit in order to clear the flag is possible. After 1 is read from this bit, if the next flag is set before 0 is written to this bit, writing 0 to this bit does not clear the flag. In this case, read 1 again from this bit, and then write 0 to this bit.

TGFA Flag (Input Capture/Output Compare Flag A)

This status flag indicates generation of TGRA input capture or compare match. Only writing 0 to this bit in order to clear the flag is possible.

[Clearing condition]

- When TGFA = 1, the TGFA flag is read, and then 0 is written to the TGFA flag.

[Setting conditions]

- TCNT = TGRA when the TGRA register functions as an output compare register.
- The value of TCNT is transferred to TGRA due to the input capture signal when the TGRA register functions as an input capture register.

TGFB Flag (Input Capture/Output Compare Flag B)

This status flag indicates generation of TGRB input capture or compare match. Only writing 0 to this bit in order to clear the flag is possible.

[Clearing condition]

- When TGFB = 1, the TGFB flag is read, and then 0 is written to the TGFB flag.

[Setting conditions]

- TCNT = TGRB when the TGRB register functions as an output compare register.
- The value of TCNT is transferred to the TGRB register due to the input capture signal when the TGRB register functions as an input capture register.

TGFC Flag (Input Capture/Output Compare Flag C)

This status flag indicates generation of TGRC input capture or compare match for MTU3, MTU4, MTU6, or MTU7. Only writing 0 to this bit in order to clear the flag is possible.

[Clearing condition]

- When TGFC = 1, the TGFC flag is read, and then 0 is written to the TGFC flag.

[Setting conditions]

- TCNT = TGRC when the TGRC register functions as an output compare register.
- The value of TCNT is transferred to the TGRC register due to the input capture signal when the TGRC register functions as an input capture register.

This bit is reserved for MTU1 and MTU2. This bit is read as 0. The write value should be 0.

TGFD Flag (Input Capture/Output Compare Flag D)

This status flag indicates generation of TGRD input capture or compare match for MTU3, MTU4, MTU6, or MTU7. Only writing 0 to this bit in order to clear the flag is possible.

[Clearing condition]

- When TGFD = 1, the TGFD flag is read, and then 0 is written to the TGFD flag.

[Setting conditions]

- TCNT = TGRD when the TGRD register functions as the output compare register.
- The value of TCNT is transferred to the TGRD register due to the input capture signal when the TGRD register functions as an input capture register.

This bit is reserved for MTU1 and MTU2. This bit is read as 0. The write value should be 0.

TCFV Flag (Overflow Flag)

This status flag indicates generation of TCNT overflow. Only writing 0 to this bit in order to clear the flag is possible.

[Clearing condition]

- When TCFV = 1, the TCFV flag is read, and then 0 is written to the TCFV flag.

[Setting condition]

- The value of TCNT overflows (changed from FFFFh to 0000h).

For MTU4 or MUTU7, the TCFV flag is also set to 1 when the value of TCNT of MTU4 or MTU7 underflows (changed from 0001h to 0000h) in complementary PWM mode.

TCFU Flag (Underflow Flag)

This status flag indicates generation of TCNT underflow when MTU1 and MTU2 are in phase counting mode. Only writing 0 to this bit in order to clear the flag is possible.

[Clearing condition]

- When TCFU = 1, TCFU is read, and then 0 is written to TCFU.

[Setting condition]

- The value of TCNT underflows (changed from 0000h to FFFFh).

This bit is reserved for MTU3, MTU4, MTU6, and MTU7. This bit is read as 0. The write value should be 0.

TCFD Flag (Count Direction Flag)

Status flag that indicates the direction in which TCNT is counting in MTU1 to MTU4, MTU6, and MTU7.

19.2.10 Timer Buffer Operation Transfer Mode Register (TBTM)

TBTM specifies the timing for transferring data from the buffer register to the timer general register in PWM mode. The MTU has a total of five TBTM registers, one each for MTU0, MTU3, MTU4, MTU6, and MTU7.

- MTU0.TBTM

Address(es): MTU0.TBTM A006 A126h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	TTSE	TTSB	TTSA
Value after reset:	0	0	0	0	0	0	0	0

- MTU3.TBTM, MTU4.TBTM, MTU6.TBTM, MTU7.TBTM

Address(es): MTU3.TBTM A006 A038h, MTU4.TBTM A006 A039h, MTU6.TBTM A006 A838h, MTU7.TBTM A006 A839h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	TTSB	TTSA
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	TTSA	Timing Select A	0: When compare match A occurs in each channel, data is transferred from TGRC to TGRA 1: When TCNT is cleared in each channel, data is transferred from TGRC to TGRA	R/W
b1	TTSB	Timing Select B	0: When compare match B occurs in each channel, data is transferred from TGRD to TGRB 1: When TCNT is cleared in each channel, data is transferred from TGRD to TGRB	R/W
b2	TTSE	Timing Select E	0: When compare match E occurs in MTU0, data is transferred from MTU0.TGRF to MTU0.TGRE 1: When MTU0.TCNT is cleared in MTU0, data is transferred from MTU0.TGRF to MTU0.TGRE	R/W
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

TTSA Bit (Timing Select A)

This bit specifies the timing for transferring data from TGRC to TGRA in each channel when they are used together for buffer operation. When a channel is not set to PWM mode, do not set the TTSA bit in the channel to 1.

TTSB Bit (Timing Select B)

This bit specifies the timing for transferring data from TGRD to TGRB in each channel when they are used together for buffer operation. When a channel is not set to PWM mode, do not set the TTSB bit in the channel to 1.

TTSE Bit (Timing Select E)

This bit specifies the timing for transferring data from MTU0.TGRF to MTU0.TGRE when they are used together for buffer operation.
In MTU3, MTU4, MTU6, and MTU7, this bit is reserved. It is read as 0 and the write value should be 0. When a channel is not set to PWM mode, do not set the TTSE bit in the channel to 1.

19.2.11 Timer Input Capture Control Register (TICCR)

TICCR specifies input capture conditions when MTU1.TCNT and MTU2.TCNT are cascaded. The MTU has one TICCR for MTU1.

Address(es): MTU1.TICCR A006 A190h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	I2BE	I2AE	I1BE	I1AE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	I1AE	Input Capture Enable	0: Does not include the MTIOC1A pin in the MTU2.TGRA input capture conditions 1: Includes the MTIOC1A pin in the MTU2.TGRA input capture conditions	R/W
b1	I1BE	Input Capture Enable	0: Does not include the TMTIOC1B pin in the MTU2.TGRB input capture conditions 1: Includes the MTIOC1B pin in the MTU2.TGRB input capture conditions	R/W
b2	I2AE	Input Capture Enable	0: Does not include the MTIOC2A pin in the MTU1.TGRA input capture conditions 1: Includes the MTIOC2A pin in the MTU1.TGRA input capture conditions	R/W
b3	I2BE	Input Capture Enable	0: Does not include the MTIOC2B pin in the MTU1.TGRB input capture conditions 1: Includes the MTIOC2B pin in the MTU1.TGRB input capture conditions	R/W
b7 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

I1AE Bit (Input Capture Enable)

This bit selects or deselects the signal on the MTIOC1A pin as a condition for input capture to MTU2.TGRA.

I1BE Bit (Input Capture Enable)

This bit selects or deselects the signal on the MTIOC1B pin as a condition for input capture to MTU2.TGRB.

I2AE Bit (Input Capture Enable)

This bit selects or deselects the signal on the MTIOC2A pin as a condition for input capture to MTU1.TGRA.

I2BE Bit (Input Capture Enable)

This bit selects or deselects the signal on the MTIOC2B pin as a condition for input capture to MTU1.TGRB.

19.2.12 Timer Synchronous Clear Register (TSYCR)

The TSYCR register specifies synchronous clear conditions for MTU6.TCNT and MTU7.TCNT. The MTU has one TSYCR for MTU6.

Address(es): MTU6.TSYCR A006 A850h

	b7	b6	b5	b4	b3	b2	b1	b0
	CE0A	CE0B	CE0C	CE0D	CE1A	CE1B	CE2A	CE2B
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	CE2B	Clear Enable 2B	0: Disables counter clearing by the MTU2.TGIB2 interrupt generation timing. 1: Enables counter clearing by the MTU2.TGIB2 interrupt generation timing.	R/W
b1	CE2A	Clear Enable 2A	0: Disables counter clearing by the MTU2.TGIA2 interrupt generation timing*1. 1: Enables counter clearing by the MTU2.TGIA2 interrupt generation timing*1.	R/W
b2	CE1B	Clear Enable 1B	0: Disables counter clearing by the MTU1.TGIB1 interrupt generation timing*1. 1: Enables counter clearing by the MTU1.TGIB1 interrupt generation timing*1.	R/W
b3	CE1A	Clear Enable 1A	0: Disables counter clearing by the MTU1.TGIA1 interrupt generation timing*1. 1: Enables counter clearing by the MTU1.TGIA1 interrupt generation timing*1.	R/W
b4	CE0D	Clear Enable 0D	0: Disables counter clearing by the MTU0.TGID0 interrupt generation timing*1. 1: Enables counter clearing by the MTU0.TGID0 interrupt generation timing*1.	R/W
b5	CE0C	Clear Enable 0C	0: Disables counter clearing by the MTU0.TGIC0 interrupt generation timing*1. 1: Enables counter clearing by the MTU0.TGIC0 interrupt generation timing*1.	R/W
b6	CE0B	Clear Enable 0B	0: Disables counter clearing by the MTU0.TGIB0 interrupt generation timing*1. 1: Enables counter clearing by the MTU0.TGIB0 interrupt generation timing*1.	R/W
b7	CE0A	Clear Enable 0A	0: Disables counter clearing by the MTU0.TGIA0 interrupt generation timing*1. 1: Enables counter clearing by the MTU0.TGIA0 interrupt generation timing*1.	R/W

Note 1. This does not depend on the TIERn.TGIEm bit setting. (n = 0, 1, or 2; m = A, B, C, or D)

CEnm Bits (Clear Enable nm) (n = 0, 1, 2; m = A, B, C, D)

These bits enable or disable counter clearing by the MTUn.TGImn interrupt generation timing.

19.2.13 Timer Counter (TCNT)

TCNT of each MTU0 to MTU7 is a 16-bit readable/writable register. TCNT of MTU8 is a 32-bit readable/writable register. The MTU has a total of 11 TCNT counters, one each for MTU0 to MTU4, MTU6, MTU7, and MTU8 and three (MTU5.TCNTU, TCNTUV, and TCNTUW) for MTU5.
The TCNT counters in MTU0 to MTU4, MTU6, and MTU7 are initialized to 0000h by a reset, and, and the MTU8.TCNT counter is initialized to 0000 0000h by a reset.
In MTU0 to MTU4, MTU6, and MTU7, the TCNT counters must not be accessed in 8-bit units; they should always be accessed in 16-bit units. The MTU8.TCNT counter must not be accessed in 8- or 16-bit units; it should always be accessed in 32-bit units.

- MTU0.TCNT to MTU7.TCNT

Address(es): MTU0.TCNT A006 A106h, MTU1.TCNT A006 A186h, MTU2.TCNT A006 A206h, MTU3.TCNT A006 A010h, MTU4.TCNT A006 A012h, MTU6.TCNT A006 A810h, MTU7.TCNT A006 A812h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Note: TCNT must not be accessed in 8-bit units; it should always be accessed in 16-bit units.

- MTU8.TCNT

Address(es): MTU8.TCNT A006 A408h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Note: TCNT must not be accessed in 8- or 16-bit units; they should always be accessed in 32-bit units.

19.2.14 Timer Longword Counter (TCNTLW)

The TCNTLW counter is a 32-bit readable/writable counter. Only one counter of this type is provided, and is formed by combining MTU1.TCNT and MTU2.TCNT. Such operation is only effective when the setting of TMDR3.LWA is 1.
The TCNTLW counter is initialized to 0000 0000h by a reset. See section 19.2.5, Timer Mode Register 3 (TMDR3) for details. This register can only be used in 32-bit phase counting mode.

Address(es): MTU1.TCNTLW A006 A1A0h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

19.2.15 Timer General Register (TGR)

The TGR registers in MTU0 to MTU7 are 16-bit readable/writable registers; the MTU8.TGR register is a 32-bit readable/writable register. The MTU has a total of 39 TGR registers, six for MTU0, two each for MTU1 and MTU2, five each for MTU3 and MTU6, six each for MTU4 and MTU7, three for MTU5 and four for MTU8.
The TGRA, TGRB, TGRC, and TGRD registers function as either output compare or input capture registers. The TGRC and TGRD registers for MTU0, MTU3, MTU4, MTU6, MTU7, and MTU8 can also be designated for operation as buffer registers. TGR buffer register combinations are TGRA and TGRC, and TGRB and TGRD.
MTU0.TGRE and MTU0.TGRF function as compare registers. When the MTU0.TCNT count matches the MTU0.TGRE value, an A/D converter start request can be issued. The TGRF register can also be designated for operation as a buffer register. TGR buffer register combination is TGRE and TGRF. MTU5.TGRU, MTU5.TGRV, and MTU5.TGRW function as compare match, input capture, or external pulse width measurement registers.

Address(es): MTU0.TGRA A006 A108h, MTU0.TGRB A006 A10Ah, MTU0.TGRC A006 A10Ch, MTU0.TGRD A006 A10Eh, MTU0.TGRE A006 A120h, MTU0.TGRF A006 A122h,
MTU1.TGRA A006 A188h, MTU1.TGRB A006 A18Ah,
MTU2.TGRA A006 A208h, MTU2.TGRB A006 A20Ah,
MTU3.TGRA A006 A018h, MTU3.TGRB A006 A01Ah, MTU3.TGRC A006 A024h, MTU3.TGRD A006 A026h, MTU3.TGRE A006 A072h
MTU4.TGRA A006 A01Ch, MTU4.TGRB A006 A01Eh, MTU4.TGRC A006 A028h, MTU4.TGRD A006 A02Ah, MTU4.TGRE A006 A074h, MTU4.TGRF A006 A076h,
MTU5.TGRU A006 AA82h, MTU5.TGRV A006 AA92h, MTU5.TGRW A006 AAA2h,

Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Note: For cycle setting, see section 19.6.3, Note on Cycle Setting.

19.2.16 Timer Longword General Register n (TGRnLW) (n = A, B)

The TGRnLW register is a 32-bit readable/writable register. Two general registers of this type are provided, and are formed by combining MTU1.TGRn and MTU2.TGRn. Such operation is only effective when the setting of TMDR3.LWA is 1.

See section 19.2.5, Timer Mode Register 3 (TMDR3) for details.

The TGRnLW register functions as an output compare or input capture register when TMDR3.LWA is 1.

This register can only be used in 32-bit phase counting mode.

Address(es): MTU1.TGRALW A006 A1A4h, MTU1.TGRBLW A006 A1A8h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

19.2.17 Timer Start Register (TSTR)

TSTRA starts or stops TCNT operation in MTU0 to MTU4 and MTU8.
TSTRB starts or stops TCNT operation in MTU6 and MTU7.
TSTR starts or stops TCNT operation in MTU5.
Before setting the operating mode in TMDR1 or setting the TCNT count clock in TCR, be sure to stop the TCNT counter.

- TSTRA (MTU0 to MTU4 and MTU8)

Address(es): MTU.TSTRA A006 A080h

	b7	b6	b5	b4	b3	b2	b1	b0
	CST4	CST3	—	—	CST8	CST2	CST1	CST0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	CST0	Counter Start 0	0: MTU0.TCNT count operation is stopped 1: MTU0.TCNT performs count operation	R/W
b1	CST1	Counter Start 1	0: MTU1.TCNT count operation is stopped 1: MTU1.TCNT performs count operation	R/W
b2	CST2	Counter Start 2	0: MTU2.TCNT count operation is stopped 1: MTU2.TCNT performs count operation	R/W
b3	CST8	Counter Start 8	0: MTU8.TCNT count operation is stopped. 1: MTU8.TCNT performs count operation.	R/W
b5, b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b6	CST3	Counter Start 3	0: MTU3.TCNT count operation is stopped 1: MTU3.TCNT performs count operation	R/W
b7	CST4	Counter Start 4	0: MTU4.TCNT count operation is stopped 1: MTU4.TCNT performs count operation	R/W

Note: When 1 is written to a bit in TCSYSTR, the corresponding bit in TSTRA is also set to 1 automatically.

CSTn Bits (Counter Start n) (n = 0, 1, 2, 3, 4, 8)

Each bit starts or stops TCNT in the corresponding channel.
If 0 is written to the CSTn bit during operation with the MTIOC pin designated for output, the counter stops but the output compare signal level from the MTIOC pin is retained. If TIOR is written to while the CSTn bit is 0, the pin output level will be changed to the specified initial output value.

- TSTRB (MTU6, MTU7)

Address(es): MTU.TSTRB A006 A880h

	b7	b6	b5	b4	b3	b2	b1	b0
	CST7	CST6	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b6	CST6	Counter Start 6	0: MTU6.TCNT count operation is stopped 1: MTU6.TCNT performs count operation	R/W
b7	CST7	Counter Start 7	0: MTU7.TCNT count operation is stopped 1: MTU7.TCNT performs count operation	R/W

Note: When 1 is written to a bit in TCSYSTR, the corresponding bit in TSTRB is also set to 1 automatically.

CSTn Bits (Counter Start n) (n = 6 or 7)

Each bit starts or stops TCNT in the corresponding channel.
If 0 is written to the CSTn bit during operation with the MTIOC pin designated for output, the counter stops but the output compare signal level from the MTIOC pin is retained. If TIOR is written to while the CSTn bit is 0, the pin output level will be changed to the specified initial output value.

- TSTR (MTU5)

Address(es): MTU5.TSTR A006 AAB4h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	CSTU5	CSTV5	CSTW5
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	CSTW5	Counter Start W5	0: MTU5.TCNTW count operation is stopped 1: MTU5.TCNTW performs count operation	R/W
b1	CSTV5	Counter Start V5	0: MTU5.TCNTV count operation is stopped 1: MTU5.TCNTV performs count operation	R/W
b2	CSTU5	Counter Start U5	0: MTU5.TCNTU count operation is stopped 1: MTU5.TCNTU performs count operation	R/W
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

CSTn5 Bits (Counter Start n5) (n = U, V, W)

These bits cause the respective TCNT registers to stop or run.

19.2.18 Timer Synchronous Register (TSYR)

TSYRA selects independent operation or synchronous operation of TCNT in MTU0 to MTU4.
TSYRB selects independent operation or synchronous operation of TCNT in MTU6 and MTU7.
A channel performs synchronous operation when the corresponding bit in TSYR is set to 1.

- TSYRA (MTU0, MTU1, MTU2, MTU3, MTU4)

Address(es): MTU.TSYRA A006 A081h

	b7	b6	b5	b4	b3	b2	b1	b0
	SYNC4	SYNC3	—	—	—	SYNC2	SYNC1	SYNC0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	SYNC0	Timer Synchronous Operation 0	0: MTU0.TCNT operates independently (TCNT presetting/ clearing is not related to other channels). 1: MTU0.TCNT performs synchronous operation. (TCNT synchronous presetting/synchronous clearing is enabled.)	R/W
b1	SYNC1	Timer Synchronous Operation 1	0: MTU1.TCNT operates independently (TCNT presetting/ clearing is not related to other channels). 1: MTU1.TCNT performs synchronous operation. (TCNT synchronous presetting/synchronous clearing is enabled.)	R/W
b2	SYNC2	Timer Synchronous Operation 2	0: MTU2.TCNT operates independently (TCNT presetting/ clearing is not related to other channels). 1: MTU2.TCNT performs synchronous operation. (TCNT synchronous presetting/synchronous clearing is enabled.)	R/W
b5 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b6	SYNC3	Timer Synchronous Operation 3	0: MTU3.TCNT operates independently (TCNT presetting/ clearing is not related to other channels). 1: MTU3.TCNT performs synchronous operation. (TCNT synchronous presetting/synchronous clearing is enabled.)	R/W
b7	SYNC4	Timer Synchronous Operation 4	0: MTU4.TCNT operates independently (TCNT presetting/ clearing is not related to other channels). 1: MTU4.TCNT performs synchronous operation. (TCNT synchronous presetting/synchronous clearing is enabled.)	R/W

SYNCn Bits (Timer Synchronous Operation n) (n = 0 to 4)

Each bit selects whether operation is independent of or synchronized with other channels.
When synchronous operation is selected, the TCNT synchronous presetting of multiple channels and synchronous clearing by counter clearing on another channel are possible.
To set synchronous operation, the SYNC bits for at least two channels must be set to 1. To set synchronous clearing, in addition to the SYNC bit, the TCNT clearing source must also be set by means of bits TCR.CCLR[2:0].

- TSYRB (MTU6, MTU7)

Address(es): MTU.TSYRB A006 A881h

	b7	b6	b5	b4	b3	b2	b1	b0
	SYNC7	SYNC6	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b6	SYNC6	Timer Synchronous Operation 6	0: MTU6.TCNT operates independently (TCNT presetting/ clearing is not related to other channels). 1: MTU6.TCNT performs synchronous operation. (TCNT synchronous presetting/synchronous clearing is enabled.)	R/W
b7	SYNC7	Timer Synchronous Operation 7	0: MTU7.TCNT operates independently (TCNT presetting/ clearing is not related to other channels). 1: MTU7.TCNT performs synchronous operation. (TCNT synchronous presetting/synchronous clearing is enabled.)	R/W

SYNCn Bits (Timer Synchronous Operation n) (n = 6 or 7)

Each bit selects whether operation is independent of or synchronized with other channels.

When synchronous operation is selected, the TCNT synchronous presetting of multiple channels and synchronous clearing by counter clearing on another channel are possible.

To set synchronous operation, the SYNC bits for at least two channels must be set to 1. To set synchronous clearing, in addition to the SYNC bit, the TCNT clearing source must also be set by means of bits TCR.CCLR[2:0].

19.2.19 Timer Counter Synchronous Start Register (TCSYSTR)

TCSYSTR specifies synchronous start of the counters.

Address(es): MTU.TCSYSTR A006 A082h

	b7	b6	b5	b4	b3	b2	b1	b0
	SCH0	SCH1	SCH2	SCH3	SCH4	—	SCH6	SCH7
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	SCH7	Synchronous Start 7	0: Does not specify synchronous start for MTU7.TCNT 1: Specifies synchronous start for MTU7.TCNT	R/W *1
b1	SCH6	Synchronous Start 6	0: Does not specify synchronous start for MTU6.TCNT 1: Specifies synchronous start for MTU6.TCNT	R/W *1
b2	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b3	SCH4	Synchronous Start 4	0: Does not specify synchronous start for MTU4.TCNT 1: Specifies synchronous start for MTU4.TCNT	R/W *1
b4	SCH3	Synchronous Start 3	0: Does not specify synchronous start for MTU3.TCNT 1: Specifies synchronous start for MTU3.TCNT	R/W *1
b5	SCH2	Synchronous Start 2	0: Does not specify synchronous start for MTU2.TCNT 1: Specifies synchronous start for MTU2.TCNT	R/W *1
b6	SCH1	Synchronous Start 1	0: Does not specify synchronous start for MTU1.TCNT 1: Specifies synchronous start for MTU1.TCNT	R/W *1
b7	SCH0	Synchronous Start 0	0: Does not specify synchronous start for MTU0.TCNT 1: Specifies synchronous start for MTU0.TCNT	R/W *1

Note 1. Only 1 can be written to this bit, and doing so sets the register.
TCSYSTR is automatically cleared to 0 after 1 is written to.

SCH7 Bit (Synchronous Start 7)

This bit controls synchronous start of MTU7.TCNT.

[Clearing condition]

- When 1 is set to the TSTRA.CST7 bit while SCH7 = 1

SCH6 Bit (Synchronous Start 6)

This bit controls synchronous start of MTU6.TCNT.

[Clearing condition]

- When 1 is set to the TSTRA.CST6 bit while SCH6 = 1

SCH4 Bit (Synchronous Start 4)

This bit controls synchronous start of MTU4.TCNT.

[Clearing condition]

- When 1 is set to the TSTRA.CST4 bit while SCH4 = 1

SCH3 Bit (Synchronous Start 3)

This bit controls synchronous start of MTU3.TCNT.

[Clearing condition]

- When 1 is set to the TSTRA.CST3 bit while SCH3 = 1

SCH2 Bit (Synchronous Start 2)

This bit controls synchronous start of MTU2.TCNT.

[Clearing condition]

- When 1 is set to the TSTRA.CST2 bit while SCH2 = 1

SCH1 Bit (Synchronous Start 1)

This bit controls synchronous start of MTU1.TCNT.

[Clearing condition]

- When 1 is set to the TSTRA.CST1 bit while SCH1 = 1

SCH0 Bit (Synchronous Start 0)

This bit controls synchronous start of MTU0.TCNT.

[Clearing condition]

- When 1 is set to the TSTRA.CST0 bit while SCH0 = 1

19.2.20 Timer Read/Write Enable Registers (TRWERA, TRWERB)

TRWERA enables or disables access to the registers and counters that have write-protection capability against accidental modification in MTU3 and MTU4.
TRWERB enables or disables access to the registers and counters that have write-protection capability against accidental modification in MTU6 and MTU7.

Address(es): MTU.TRWERA A006 A084h, MTU.TRWERB A006 A884h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	RWE
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Bit Name	Description	R/W
b0	RWE	Read/Write Enable	0: Read/write access to the registers is disabled 1: Read/write access to the registers is enabled	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

RWE Bit (Read/Write Enable)

This bit enables or disables access to the registers that have write-protection capability against accidental modification.
[Clearing condition]

- When 0 is written to the RWE bit after reading RWE = 1

- Registers and counters having write-protection capability against accidental modification (TRWERA)
  24 registers: MTUn.TCR, MTUn.TCR2, MTUn.TMDR1, MTUn.TIORH, MTUn.TIORL, MTUn.TIER, MTUn.TGRA, MTUn.TGRB, TOERA, TOCR1A, TOCR2A, TGCRA, TCDRA, TDDRA, and MTUn.TCNT (n = 3 or 4)
- Registers and counters having write-protection capability against accidental modification (TRWERB)
  23 registers: MTUn.TCR, MTUn.TCR2, MTUn.TMDR1, MTUn.TIORH, MTUn.TIORL, MTUn.TIER, MTUn.TGRA, MTUn.TGRB, TOERB, TOCR1B, TOCR2B, TCDRB, TDDRB, and MTUn.TCNT (n = 6 or 7)

19.2.21 Timer Output Master Enable Register (TOER)

TOERA enables or disables output settings for output pins MTIOC4D, MTIOC4C, MTIOC3D, MTIOC4B, MTIOC4A, and MTIOC3B.
TOERB enables or disables output settings for output pins MTIOC7D, MTIOC7C, MTIOC6D, MTIOC7B, MTIOC7A, and MTIOC6B.
These pins do not output correctly if the TOER bits have not been set. In MTU3, MTU4, MTU6, and MTU7, set TOER prior to setting TIOR.
Set MTU.TOERA after clearing the CST3 and CST4 bits in MTU.TSTRA to 0.
Set MTU.TOERB after clearing the CST0 and CST1 bits in MTU.TSTRB to 0 (see Figure 19.44 and Figure 19.48).

- TOERA

Address(es): MTU.TOERA A006 A00Ah

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	OE4D	OE4C	OE3D	OE4B	OE4A	OE3B
Value after reset:	1	1	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	OE3B	Master Enable MTIOC3B	0: MTU output is disabled (non-active level)*1 1: MTU output is enabled	R/W
b1	OE4A	Master Enable MTIOC4A	0: MTU output is disabled (non-active level)*1 1: MTU output is enabled	R/W
b2	OE4B	Master Enable MTIOC4B	0: MTU output is disabled (non-active level)*1 1: MTU output is enabled	R/W
b3	OE3D	Master Enable MTIOC3D	0: MTU output is disabled (non-active level)*1 1: MTU output is enabled	R/W
b4	OE4C	Master Enable MTIOC4C	0: MTU output is disabled (non-active level)*1 1: MTU output is enabled	R/W
b5	OE4D	Master Enable MTIOC4D	0: MTU output is disabled (non-active level)*1 1: MTU output is enabled	R/W
b7, b6	—	Reserved	These bits are read as 1. The write value should be 1.	R/W

Note 1. The non-active level depends on the setting of the timer output control register 1 or 2 (TOCR 1/2). See section 19.2.22, Timer Output Control Registers 1 (TOCR1A, TOCR1B) and section 19.2.23, Timer Output Control Registers 2 (TOCR2A, TOCR2B) for details. When MTU output is in a mode other than complementary PWM mode or reset-synchronized PWM mode, set the relevant bit to 1. If the setting is 0, the non-active level will be output due to this setting of the timer output control register.

OEnm Bits (Master Enable MTIOCnm) (n = 3 or 4, m = A to D)

These bits enable or disable the output setting for MTIOCnm output pin of MTU.

- TOERB

Address(es): MTU.TOERB A006 A80Ah

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	OE7D	OE7C	OE6D	OE7B	OE7A	OE6B
Value after reset:	1	1	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	OE6B	Master Enable MTIOC6B	0: MTU output is disabled (non-active level)*1 1: MTU output is enabled	R/W
b1	OE7A	Master Enable MTIOC7A	0: MTU output is disabled (non-active level)*1 1: MTU output is enabled	R/W
b2	OE7B	Master Enable MTIOC7B	0: MTU output is disabled (non-active level)*1 1: MTU output is enabled	R/W
b3	OE6D	Master Enable MTIOC6D	0: MTU output is disabled (non-active level)*1 1: MTU output is enabled	R/W
b4	OE7C	Master Enable MTIOC7C	0: MTU output is disabled (non-active level)*1 1: MTU output is enabled	R/W
b5	OE7D	Master Enable MTIOC7D	0: MTU output is disabled (non-active level)*1 1: MTU output is enabled	R/W
b7, b6	—	Reserved	These bits are read as 1. The write value should be 1.	R/W

Note 1. The non-active level depends on the setting of the timer output control register 1 or 2 (TOCR 1/2). See section 19.2.22, Timer Output Control Registers 1 (TOCR1A, TOCR1B) and section 19.2.23, Timer Output Control Registers 2 (TOCR2A, TOCR2B) for details. When MTU output is in a mode other than complementary PWM mode or reset-synchronized PWM mode, set the relevant bit to 1. If the setting is 0, the non-active level will be output due to this setting of the timer output control register.

OEnm Bits (Master Enable MTIOCnm) (n = 6 or 7, m = A to D)

These bits enable or disable the output setting for MTIOCnm output pin of MTU.

19.2.22 Timer Output Control Registers 1 (TOCR1A, TOCR1B)

TOCR1A is used to configure the MTU3 and MTU4 for use in complementary PWM mode and reset synchronous PWM mode.
TOCR1B is used to configure the MTU6 and MTU7 for use in complementary PWM mode and reset synchronous PWM mode.

Address(es): MTU.TOCR1A A006 A00Eh, MTU.TOCR1B A006 A80Eh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	PSYE	—	—	TOCL	TOCS	OLSN	OLSP
Value after reset:	0	0	0	0	0*4	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	OLSP	Output Level Select P*1, *3	See Table 19.42.	R/W
b1	OLSN	Output Level Select N*1, *3	See Table 19.43.	R/W
b2	TOCS	TOC Select	0: TOCR1j setting is selected (j = A or B) 1: TOCR2j setting is selected	R/W
b3	TOCL	TOC Register Write Protection*2, *4	0: Write access to the TOCS, OLSN, and OLSP bits is enabled 1: Write access to the TOCS, OLSN, and OLSP bits is disabled	R/W
b5, b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b6	PSYE	PWM Synchronous Output Enable	0: Toggle output is disabled 1: Toggle output is enabled	R/W
b7	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

Note 1. Clearing the TOCR1j.TOCS bit to 0 makes this bit setting valid.
Note 2. Setting the TOCR1j.TOCL bit to 1 prevents accidental modification when the CPU goes out of control.
Note 3. If dead-time is not generated, the negative-phase output is always the exact inverse of the positive-phase output. In this case, only the OLSP bit is valid.
Note 4. This bit can be set to 1 only once after a reset. After 1 is written, 0 cannot be written to the bit.

OLSP Bit (Output Level Select P)

This bit selects the positive-phase output level in reset-synchronized PWM mode and complementary PWM mode.

OLSN Bit (Output Level Select N)

This bit selects the negative-phase output level in reset-synchronized PWM mode and complementary PWM mode.

TOCS Bit (TOC Select)

This bit selects either the TOCR1j or TOCR2j (j = A or B) setting to be used for the output level in complementary PWM mode and reset-synchronized PWM mode.

TOCL Bit (TOC Register Write Protection)

This bit enables or disables write access to the TOCS, OLSN, and OLSP bits in TOCR1j (j = A or B).

PSYE Bit (PWM Synchronous Output Enable)

This bit enables or disables toggle output synchronized with the PWM cycle.

Table 19.42 Output Level Select Function

Bit 0			Function	
			Compare Match Output	
OLSP	Initial Output	Active Level	Up-Counting	Down-Counting
0	High level	Low level	Low level	High level
1	Low level	High level	High level	Low level

Table 19.43 Output Level Select Function

Bit 1			Function	
			Compare Match Output	
OLSN	Initial Output	Active Level	Up-Counting	Down-Counting
0	High level	Low level	High level	Low level
1	Low level	High level	Low level	High level

Note: The initial output value of negative-phase waveform changes to an active level after the dead time has passed since counting starts.

Figure 19.3 shows an example of output in complementary PWM mode (one phase) when OLSN = 1 and OLSP = 1.

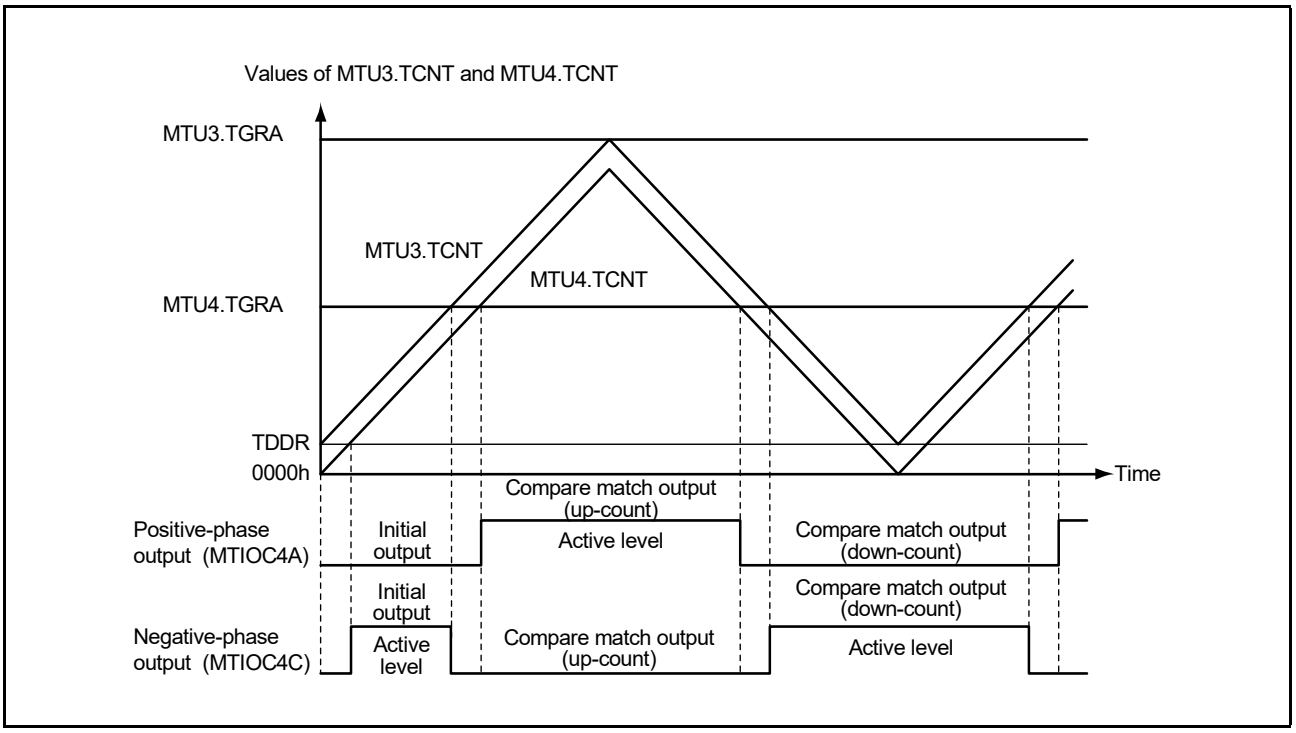

Figure 19.3 Example of Output in Complementary PWM Mode

19.2.23 Timer Output Control Registers 2 (TOCR2A, TOCR2B)

TOCR2A and TOCR2B control inversion of PWM output level in complementary PWM mode and reset-synchronized PWM mode.

Address(es): MTU.TOCR2A A006 A00Fh, MTU.TOCR2B A006 A80Fh

	b7	b6	b5	b4	b3	b2	b1	b0
	BF[1:0]		OLS3N	OLS3P	OLS2N	OLS2P	OLS1N	OLS1P
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	OLS1P	Output Level Select 1P*1, *2	This bit selects the output level on MTIOC3B or MTIOC6B in reset-synchronized PWM mode and complementary PWM mode. See Table 19.44.	R/W
b1	OLS1N	Output Level Select 1N*1, *2	This bit selects the output level on MTIOC3D or MTIOC6D in reset-synchronized PWM mode and complementary PWM mode. See Table 19.45.	R/W
b2	OLS2P	Output Level Select 2P*1, *2	This bit selects the output level on MTIOC4A or MTIOC7Ain reset-synchronized PWM mode and complementary PWM mode. See Table 19.46.	R/W
b3	OLS2N	Output Level Select 2N*1, *2	This bit selects the output level on MTIOC4C or MTIOC7C in reset-synchronized PWM mode and complementary PWM mode. See Table 19.47.	R/W
b4	OLS3P	Output Level Select 3P*1, *2	This bit selects the output level on MTIOC4B or MTIOC7B in reset-synchronized PWM mode and complementary PWM mode. See Table 19.48.	R/W
b5	OLS3N	Output Level Select 3N*1, *2	This bit selects the output level on MTIOC4D or MTIOC7D in reset-synchronized PWM mode and complementary PWM mode. See Table 19.49.	R/W
b7, b6	BF[1:0]	TOLBR Buffer Transfer Timing Select	These bits select the timing for transferring data from TOLBRj to TOCR2j. See Table 19.50 for details.	R/W

j = A or B

Note 1. Setting the TOCR1j.TOCS bit to 1 makes this bit setting valid.

Note 2. If dead-time is not generated, the negative-phase output is always the exact inverse of the positive-phase output. In this case, only the OLSiP bits are valid (i = 1 to 3).

Table 19.44 MTIOCmB Output Level Select Function

Note: The initial output value of negative-phase waveform changes to an active level after the dead time has passed since counting starts.

Table 19.50 Setting of TOCR2j.BF[1:0] Bits

Bit 7	Bit 6	Description	
BF1	**BF0**	**Complementary PWM Mode**	**Reset-Synchronized PWM Mode**
0	0	Does not transfer data from the buffer register (TOLBRj) to TOCR2j.	Does not transfer data from the buffer register (TOLBRj) to TOCR2j.
0	1	Transfers data from the buffer register (TOLBRj) to TOCR2j at the crest of the MTUn.TCNT count.	Transfers data from the buffer register (TOLBRj) to TOCR2j when MTUm.TCNT or MTUn.TCNT is cleared.
1	0	Transfers data from the buffer register (TOLBRj) to TOCR2j at the trough of the MTUn.TCNT count.	Setting prohibited
1	1	Transfers data from the buffer register (TOLBRj) to TOCR2j at the crest and trough of the MTUn.TCNT count.	Setting prohibited

n = 4 or 7, m = 3 or 6, j = A or B

19.2.24 Timer Output Level Buffer Registers (TOLBRA, TOLBRB)

TOLBRA and TOLBRB are buffer registers for TOCR2A and TOCR2B and specify the PWM output level in complementary PWM mode and reset-synchronized PWM mode.

Address(es): MTU.TOLBRA A006 A036h, MTU.TOLBRB A006 A836h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	OLS3N	OLS3P	OLS2N	OLS2P	OLS1N	OLS1P
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	OLS1P	Output Level Select 1P	Specify the buffer value to be transferred to the OLS1P bit in TOCR2j.	R/W
b1	OLS1N	Output Level Select 1N	Specify the buffer value to be transferred to the OLS1N bit in TOCR2j.	R/W
b2	OLS2P	Output Level Select 2P	Specify the buffer value to be transferred to the OLS2P bit in TOCR2j.	R/W
b3	OLS2N	Output Level Select 2N	Specify the buffer value to be transferred to the OLS2N bit in TOCR2j.	R/W
b4	OLS3P	Output Level Select 3P	Specify the buffer value to be transferred to the OLS3P bit in TOCR2j.	R/W
b5	OLS3N	Output Level Select 3N	Specify the buffer value to be transferred to the OLS3N bit in TOCR2j.	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

j = A or B

Figure 19.4 shows an example of the PWM output level setting procedure in buffer operation.

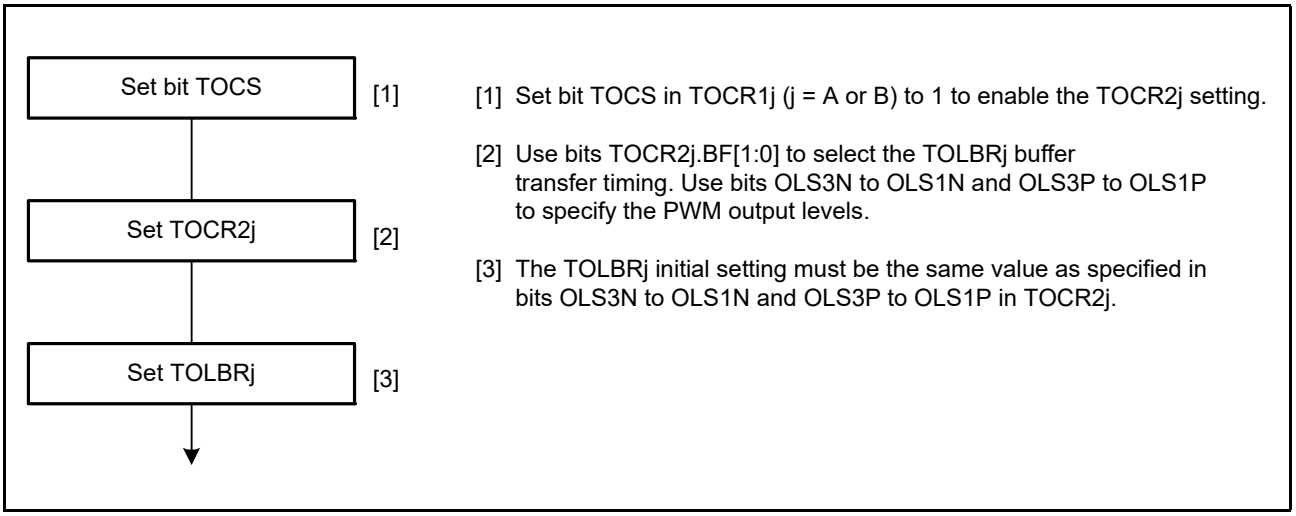

Figure 19.4 Example of PWM Output Level Setting Procedure in Buffer Operation

19.2.25 Timer Gate Control Register A (TGCRA)

TGCRA controls the output waveform necessary for brushless DC motor control in reset-synchronized PWM mode and complementary PWM mode. TGCRA register settings are ineffective for anything other than complementary PWM mode and reset-synchronized PWM mode.

Address(es): MTU.TGCRA A006 A00Dh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	BDC	N	P	FB	WF	VF	UF
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	UF	Output Phase Switch	These bits turn on or off the positive-phase/negative-phase output. The setting of these bits is valid only when the TGCRA.FB bit s set to 1. In this case, the setting of b0 to b2 is used instead of the external input. See Table 19.51.	R/W
b1	VF			R/W
b2	WF			R/W
b3	FB	External Feedback Signal Enable	0: Output is switched by external input (input sources are TGRA, TGRB, and TGRC input capture signals in MTU0) 1: Output is switched by software (TGCRA's UF, VF, and WF settings)	R/W
b4	P	Positive-Phase Output (P) Control	0: Level output 1: Reset-synchronized PWM or complementary PWM output	R/W
b5	N	Negative-Phase Output (N) Control	0: Level output 1: Reset-synchronized PWM or complementary PWM output	R/W
b6	BDC	Brushless DC Motor	0: Ordinary output 1: Functions of this register are made effective	R/W
b7	—	Reserved	This bit is read as 1. The write value should be 1.	R/W

UF, VF, and WF Bits (Output Phase Switch)

These bits are used to switch output of the positive- and negative-phase signals on or off.

FB Bit (External Feedback Signal Enable)

This bit selects whether the positive-/negative-phase output is switched automatically with the TGRA, TGRB, and TGRC input capture signals in MTU0 or by writing 0 or 1 to bits 2 to 0 in TGCRA.

P Bit (Positive-Phase Output (P) Control)

This bit selects the level output or the reset-synchronized PWM/complementary PWM output for the positive-phase output pins (MTIOC3B, MTIOC4A, and MTIOC4B pins).

N Bit (Negative-Phase Output (N) Control)

This bit selects the level output or the reset-synchronized PWM/complementary PWM output for the negative-phase output pins (MTIOC3D, MTIOC4C, and MTIOC4D pins).

BDC Bit (Brushless DC Motor)

This bit selects whether to make the functions of TGCRA effective or ineffective.

Table 19.51 Output Level Select Function

Bit 2	Bit 1	Bit 0	Function					
			MTIOC3B	MTIOC4A	MTIOC4B	MTIOC3D	MTIOC4C	MTIOC4D
WF	VF	UF	U Phase	V Phase	W Phase	U Phase	V Phase	W Phase
0	0	0	OFF	OFF	OFF	OFF	OFF	OFF
0	0	1	ON	OFF	OFF	OFF	OFF	ON
0	1	0	OFF	ON	OFF	ON	OFF	OFF
0	1	1	OFF	ON	OFF	OFF	OFF	ON
1	0	0	OFF	OFF	ON	OFF	ON	OFF
1	0	1	ON	OFF	OFF	OFF	ON	OFF
1	1	0	OFF	OFF	ON	ON	OFF	OFF
1	1	1	OFF	OFF	OFF	OFF	OFF	OFF

19.2.26 Timer Subcounters (TCNTSA, TCNTSB)

TCNTSA and TCNTSB are 16-bit read-only counters that are used only in complementary PWM mode.
The initial value of TCNTSA and TCNTSB after a reset is 0000h.

Address(es): MTU.TCNTSA A006 A020h, MTU.TCNTSB A006 A820h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Note: TCNTSA and TCNTSB must not be accessed in 8-bit units; it should always be accessed in 16-bit units.

19.2.27 Timer Cycle Data Registers (TCDRA, TCDRB)

TCDRA and TCDRB are 16-bit readable/writable registers used only in complementary PWM mode. Set half the PWM carrier cycle as the TCDRA and TCDRB values. The TCDRA and TCDRB registers are always compared with the TCNTSA and TCNTSB counters respectively, in complementary PWM mode. When they match, the TCNTSA or TCNTSB counter switches the count direction (from down-count to up-count).
The initial value of TCDRA and TCDRB after a reset is FFFFh.

Address(es): MTU.TCDRA A006 A014h, MTU.TCDRB A006 A814h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Note: TCDRA and TCDRB must not be accessed in 8-bit units; it should always be accessed in 16-bit units.

19.2.28 Timer Cycle Buffer Registers (TCBRA, TCBRB)

TCBRA and TCBRB are 16-bit readable/writable registers, used only in complementary PWM mode, that function as buffer registers for TCDRA and TCDRB. The TCBRA and TCBRB values are transferred to TCDRA and TCDRB with the transfer timing set in TMDR1.
The initial value of TCBRA and TCBRB after a reset is FFFFh.

Address(es): MTU.TCBRA A006 A022h, MTU.TCBRB A006 A822h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Note: TCBRA and TCBRB must not be accessed in 8-bit units; it should always be accessed in 16-bit units.

19.2.29 Timer Dead Time Data Registers (TDDRA, TDDRB)

TDDRA and TDDRB are 16-bit readable/writable registers, used only in complementary PWM mode, that specify the MTU3.TCNT (MTU6.TCNT) and MTU4.TCNT (MTU7.TCNT) counter offset value. In complementary PWM mode, when the MTU3.TCNT (MTU6.TCNT) and MTU4.TCNT (MTU7.TCNT) counters are cleared and then restarted, the TDDRA (TDDRB) value is loaded into the MTU3.TCNT (MTU6.TCNT) counter and the count operation starts. The initial value of TDDRA and TDDRB after a reset is FFFFh.

Address(es): MTU.TDDRA A006 A016h, MTU.TDDRB A006 A816h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Note: TDDRA and TDDRB must not be accessed in 8-bit units; it should always be accessed in 16-bit units.

19.2.30 Timer Dead Time Enable Registers (TDERA, TDERB)

TDERA and TDERB control dead time generation in complementary PWM mode. The MTU has one TDER each for MTU3 and MTU6. TDERA and TDERB should be modified only while TCNT stops.

Address(es): MTU.TDERA A006 A034h, MTU.TDERB A006 A834h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	TDER
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Bit Name	Description	R/W
b0	TDER	Dead Time Enable	0: No dead time is generated. 1: Dead time is generated.*1	R/(W)
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. TDDRA and TDDRB must be set to 1 or a larger value.

TDER Bit (Dead Time Enable)

This bit specifies whether to generate dead time.

[Clearing condition]

- When 0 is written to TDER after reading TDER = 1

19.2.31 Timer Buffer Transfer Set Registers (TBTERA, TBTERB)

TBTERA and TBTERB enable or disable transfer from the buffer registers used in complementary PWM mode to the temporary registers, and specify whether to link the transfer with interrupt skipping 1 operation.

Address(es): MTU.TBTERA A006 A032h, MTU.TBTERB A006 A832h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	BTE[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b1, b0	BTE[1:0]	Buffer Transfer Disable and Interrupt Skipping Link Setting	These bits enable or disable transfer from the buffer registers*1 used in complementary PWM mode to the temporary registers, and specify whether to link the transfer with interrupt skipping function 1. For details, see Table 19.52.	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Applicable buffer registers (TBTERA):
MTU3.TGRC, MTU3.TGRD, MTU4.TGRC, MTU4.TGRD, and TCBRA
Applicable buffer registers (TBTER_B):
MTU6.TGRC, MTU6.TGRD, MTU7.TGRC, MTU7.TGRD, and TCBRB

Table 19.52 Setting of TBTER.BTE[1:0] Bits

Bit 1	Bit 0	
BTE1	BTE0	Description
0	0	Enables transfer from the buffer registers to the temporary registers*1 and does not link the transfer with interrupt skipping function 1.
0	1	Disables transfer from the buffer registers to the temporary registers.
1	0	Links transfer from the buffer registers to the temporary registers with interrupt skipping function 1.*2
1	1	Setting prohibited

Note 1. Data is transferred according to the MD3 to MD0 bit setting in TMDR1. For details, see section 19.3.8, Complementary PWM Mode.

Note 2. When interrupt skipping is disabled (the T3AEN and T4VEN (T6AEN and T7VEN) bits are cleared to 0 in the timer interrupt skipping set register (TITCR1A (TITCR1B)) or the skipping count set bits (T3ACOR and T4VCOR (T6ACOR and T7VCOR)) in TITCR1A (TITCR1B) are cleared to 0), be sure to disable link of buffer transfer with interrupt skipping (clear the BTE1 bit in the timer buffer transfer set register (TBTERA (TBTERB)) to 0). If link with interrupt skipping is enabled while interrupt skipping is disabled, buffer transfer will not be performed.

19.2.32 Timer Waveform Control Registers (TWCRA, TWCRB)

TWCRA and TWCRB control the output waveform when synchronous counter clearing occurs in MTU3.TNCT and MTU4.TNCT (MTU6.TNCT and MTU7.TNCT) in complementary PWM mode and specifies whether to clear the counters at MTU3.TGRA (MTU6.TGRA) compare match.
The CCE bit and WRE bit in TWCRA and TWCRB should be modified only while TCNT stops.

Address(es): MTU.TWCRA A006 A060h, MTU.TWCRB A006 A860h

	b7	b6	b5	b4	b3	b2	b1	b0
	CCE	—	—	—	—	—	SCC	WRE
Value after reset:	0*2	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	WRE	Waveform Retain Enable	0: Initial values specified in TOCR1A and TOCR2A (TOCR1B and TOCR2B) are output 1: Initial output is inhibited	R/(W)*3
b1	SCC*1, *3	Synchronous Clearing Control	(Only valid in register TWCRB) 0: Clearing of MTU6.TCNT and MTU7.TCNT in response to synchronous clearing for MTU0, MTU1, MTU2–MTU6, MTU7 is enabled. 1: Clearing of MTU6.TCNT and MTU7.TCNT in response to synchronous clearing for MTU0, MTU1, MTU2–MTU6, MTU7 is disabled.	R/(W)
b6 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b7	CCE*2	Compare Match Clear Enable	0: Counters are not cleared at MTU3.TGRA (MTU6.TGRA) compare match 1: Counters are cleared at MTU3.TGRA (MTU6.TGRA) compare match	R/(W)

Note 1. This bit is only valid in register TWCRB and is a reserved bit in register TWCRA.
Note 2. Do not set to 1 when complementary PWM mode 1 is not selected.
Note 3. Do not set to 1 when complementary PWM mode is not selected.

WRE Bit (Waveform Retain Enable)

This bit selects the waveform output when synchronous counter clearing occurs in complementary PWM mode.
The initial output is inhibited with this function only when synchronous clearing occurs within the Tb interval at the trough in complementary PWM mode. When synchronous clearing occurs outside this interval, the initial values specified in TOCR1A and TOCR2A (TOCR1B and TOCR2B) are output regardless of the WRE bit setting. The initial values specified in TOCR1A and TOCR2A (TOCR1B and TOCR2B) are also output when synchronous clearing occurs in the Tb interval at the trough immediately after MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) start operation.
For the Tb interval at the trough in complementary PWM mode, see Figure 19.50.
[Setting condition]

- When 1 is written to WRE after reading WRE = 0

SCC Bit (Synchronous Clearing Control) (Only valid in register TWCRB)

The setting of this bit selects whether MTU6.TCNT and MTU7.TCNT are or are not cleared when counter-synchronous clearing is generated for MTU0, MTU1, MTU2 to MTU6, and MTU7 in complementary PWM mode.
Make the complementary PWM mode settings for MTU6 and MTU7 when this function is in use. When writing a new value to the SCC bit while the counter is operating, do so in such a way that the values of the CCE and WRE bits are not changed.
Synchronous clearing from the MTU module only becomes disabled due to the setting of the SCC bit when synchronous clearing is generated outside the Tb interval in the trough. If synchronous clearing is generated within the Tb interval in the trough including immediately after the value at which MTU6.TCNT and MTU7.TCNT start, MTU6.TCNT and MTU7.TCNT are cleared.
Regarding the Tb interval in the trough in complementary PWM mode, see Figure 19.50.
[Setting condition]

- Writing of 1 to the SCC bit after reading it as 0

The corresponding bit in register TWCRA is reserved and is always read as 0. When writing to TWCRA, always write 0 to this bit.

CCE Bit (Compare Match Clear Enable)

This bit specifies whether to clear counters at MTU3.TGRA (MTU6.TGRA) compare match in complementary PWM mode.
[Setting condition]

- When 1 is written to CCE after reading CCE = 0

19.2.33 Noise Filter Control Register n (NFCRn) (n = 0 to 4, 6, 7, 8, C)

NFCRn controls noise filtering for the input pins of MTUn (n = 0 to 4, 6, 7, or 8). NFCRC controls noise filtering for the external clock input pins of the MTU.

- NFCRn (n = 0 to 4, 6, 7, 8)

Address(es): MTU0.NFCR0 A006 A090h, MTU1.NFCR1 A006 A091h, MTU2.NFCR2 A006 A092h, MTU3.NFCR3 A006 A093h, MTU4.NFCR4 A006 A094h, MTU6.NFCR6 A006 A893h, MTU7.NFCR7 A006 A894h, MTU8.NFCR8 A006 A098h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	NFCS[1:0]		NFDEN	NFCEN	NFBEN	NFAEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	NFAEN	Noise Filter A Enable Bit	0: The noise filter for the MTIOCnA pin is disabled. 1: The noise filter for the MTIOCnA pin is enabled.	R/W
b1	NFBEN	Noise Filter B Enable Bit	0: The noise filter for the MTIOCnB pin is disabled. 1: The noise filter for the MTIOCnB pin is enabled.	R/W
b2	NFCEN	Noise Filter C Enable Bit	0: The noise filter for the MTIOCnC pin is disabled. 1: The noise filter for the MTIOCnC pin is enabled.	R/W*1
b3	NFDEN	Noise Filter D Enable Bit	0: The noise filter for the MTIOCnD pin is disabled. 1: The noise filter for the MTIOCnD pin is enabled.	R/W*1
b5, b4	NFCS[1:0]	Noise Filter Clock Select	b5 b4 0 0: PCLKC/1 0 1: PCLKC/8 1 0: PCLKC/32 1 1: Clock source for counting	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. These bits are reserved in the NFCR1 and NFCR2 registers. These bits are read as 0 and writing to them is not effective.

NFAEN Bit (Noise Filter A Enable)

This bit enables or disables the noise filter for input from the MTIOCnA pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register or set the TMDR.MD[3:0] bits to a value other than that for normal mode (0000b) before doing so.

NFBEN Bit (Noise Filter B Enable)

This bit enables or disables the noise filter for input from the MTIOCnB pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register or set the TMDR.MD[3:0] bits to a value other than that for normal mode (0000b) before doing so.

NFCEN Bit (Noise Filter C Enable)

This bit enables or disables the noise filter for input from the MTIOCnC pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register or set the TMDR.MD[3:0] bits to a value other than that for normal mode (0000b) before doing so.

NFDEN Bit (Noise Filter D Enable)

This bit enables or disables the noise filter for input from the MTIOCnD pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register or set the TMDR.MD[3:0] bits to a value other than that for normal mode (0000b) before doing so.

NFCS[1:0] Bits (Noise Filter Clock Select)

These bits set the sampling interval for the noise filters. When setting the NFCS[1:0] bits, wait for two cycles of the selected sampling interval before setting the input-capture function. When the NFCS[1:0] bits are set to 11b, i.e. selecting the external clock as the source to drive counting, wait for two cycles of the external clock before setting the input capture function.

- NFCRC

Address(es): MTU0.NFCRC A006 A099h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	NFCSC[1:0]		NFDEN	NFCEN	NFBEN	NFAEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W

b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

NFAEN Bit (Noise Filter A Enable)

This bit enables or disables the noise filter for input from the MTCLKA pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, do so after stopping the internal counter.

NFBEN Bit (Noise Filter B Enable)

This bit enables or disables the noise filter for input from the MTCLKB pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, do so after stopping the internal counter.

NFCEN Bit (Noise Filter C Enable)

This bit enables or disables the noise filter for input from the MTCLKC pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, do so after stopping the internal counter.

NFDEN Bit (Noise Filter D Enable)

This bit enables or disables the noise filter for input from the MTCLKD pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, do so after stopping the internal counter.

NFCSC[1:0] Bits (Noise Filter Clock Select)

These bits set the sampling interval for the noise filters. After setting the NFCS[1:0] bits, wait for two cycles of the selected sampling interval to set the input capture function.

19.2.34 Noise Filter Control Register 5 (NFCR5)

NFCR5 controls noise filtering for the input pins of MTU5.

Address(es): MTU5.NFCR5 A006 A895h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	NFCS[1:0]		—	NFWEN	NFVEN	NFUEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W

b3	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b5, b4	NFCS[1:0]	Noise Filter Clock Select	b5 b4 0 0: PCLKC/1 0 1: PCLKC/8 1 0: PCLKC/32 1 1: Clock source for counting	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

NFUEN Bit (Noise Filter U Enable)

This bit enables or disables the noise filter for input from the MTIOC5U pin. Since unexpected edges may be internally generated when the value of this bit is changed, select the output compare function for the relevant pin in the timer I/O control register.

NFVEN Bit (Noise Filter V Enable)

This bit enables or disables the noise filter for input from the MTIOC5V pin. Since unexpected edges may be internally generated when the value of this bit is changed, select the output compare function for the relevant pin in the timer I/O control register.

NFWEN Bit (Noise Filter W Enable)

This bit enables or disables the noise filter for input from the MTIOC5W pin. Since unexpected edges may be internally generated when the value of this bit is changed, select the output compare function for the relevant pin in the timer I/O control register.

NFCS[1:0] Bits (Noise Filter Clock Select)

These bits set the sampling interval for the noise filters. When setting the NFCS[1:0] bits, wait for two cycles of the selected sampling interval before setting the input-capture function.

19.2.35 Timer A/D Converter Start Request Control Register (TADCR)

TADCR enables or disables A/D converter start requests and specifies whether to link A/D converter start requests with interrupt skipping function. The MTU has one TADCR each for MTU4 and MTU7.

- TADCR (MTU4)

Address(es): MTU.TADCR A006 A040h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

b7	UT4AE	Up-Count TRG4AN Enable	0: A/D converter start requests (TRG4AN) disabled during MTU4.TCNT up-count operation 1: A/D converter up requests (TRG4AN) enabled during MTU4.TCNT down-count operation	R/W
b13 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b15, b14	BF[1:0]	MTU4.TADCOBRA/B Transfer Timing Select	See Table 19.53 for details. These bits specify the transfer timing from MTU4.TADCOBRA and MTU4.TADCOBRB to MTU4.TADCORA and MTU4.TADCORB.	R/W

Note 1. MTU4.TADCR must not be accessed in 8-bit units; it should always be accessed in 16-bit units.
Note 2. When interrupt skipping is disabled (the T3AEN and T4VEN bits in TITCR1A are cleared to 0 or the T3ACOR and T4VCOR bits in TITCR1A are cleared to 0), do not link A/D converter start requests with interrupt skipping function 1 (clear the ITA3AE, ITA4VE, ITB3AE, and ITB4VE bits in MUT3_4.TADCR to 0).
Note 3. If link with interrupt skipping is enabled while interrupt skipping is disabled, A/D converter start requests will not be issued.
Note 4. Do not set to 1 when complementary PWM mode is not selected.

Table 19.53 Setting of Transfer Timing by TADCR.BF[1:0] Bits (MTU4)

Bit 15	Bit 14	
BF1	**BF0**	**Description**
0	0	Does not transfer data from the cycle set buffer register (MTU4.TADCOBRA, MTU4.TADCOBRB) to the cycle set register (MTU4.TADCORA, MTU4.TADCORB).
0	1	Transfers data from the cycle set buffer register to the cycle set register at the crest of the MTU4.TCNT count.*1
1	0	Transfers data from the cycle set buffer register to the cycle set register at the trough of the MTU4.TCNT count.*2
1	1	Transfers data from the cycle set buffer register to the cycle set register at the crest and trough of the MTU4.TCNT count.*2

Note 1. Data is transferred from the cycle set buffer register (MTU4.TADCOBRA, MTU4.TADCOBRB) to the cycle set register (MTU4.TADCORA, MTU4.TADCORB) when the crest of the MTU4.TCNT count is reached or the MTU4.TGRD is written to in complementary PWM mode, when a compare match occurs between MTU3.TCNT and MTU3.TGRA in reset-synchronized PWM mode, or when a compare match occurs between MTU4.TCNT and MTU4.TGRA in PWM mode 1 or normal operation mode.

Note 2. These settings are prohibited when complementary PWM mode is not selected.

b0	ITB7VE*4	TCIV7 Interrupt Skipping Link Enable	0: A/D converter start request signal TRG7BN and TCI7V interrupt skipping 1 are not linked 1: A/D converter start request signal TRG7BN and TCI7V interrupt skipping 1 are linked	R/W
b1	ITB6AE*4	TGIA6 Interrupt Skipping Link Enable	0: A/D converter start request signal TRG7BN and TGI6A interrupt skipping 1 are not linked 1: A/D converter start request signal TRG7BN and TGI6A interrupt skipping 1 are linked	R/W
b2	ITA7VE*4	TCIV7 Interrupt Skipping Link Enable	0: A/D converter start request signal TRG7AN and TCI7V interrupt skipping 1 are not linked 1: A/D converter start request signal TRG7AN and TCI7V interrupt skipping 1 are linked	R/W
b3	ITA6AE*4	TGIA6 Interrupt Skipping Link Enable	0: A/D converter start request signal TRG7AN and TGI6A interrupt skipping 1 are not linked 1: A/D converter start request signal TRG7AN and TGI6A interrupt skipping 1 are linked	R/W
b4	DT7BE*4	Down-Count TRG7BN Enable	0: A/D converter start requests (TRG7BN) disabled during MTU7.TCNT down-count operation 1: A/D converter start requests (TRG7BN) enabled during MTU7.TCNT down-count operation	R/W
b5	UT7BE	Up-Count TRG7BN Enable	0: A/D converter start requests (TRG7BN) disabled during MTU7.TCNT up-count operation 1: A/D converter start requests (TRG7BN) enabled during MTU7.TCNT up-count operation	R/W
b6	DT7AE*4	Down-Count TRG7AN Enable	0: A/D converter start requests (TRG7AN) disabled during MTU7.TCNT down-count operation 1: A/D converter start requests (TRG7AN) enabled during MTU7.TCNT down-count operation	R/W
b7	UT7AE	Up-Count TRG7AN Enable	0: A/D converter start requests (TRG7AN) disabled during MTU7.TCNT up-count operation 1: A/D converter up requests (TRG7AN) enabled during MTU7.TCNT down-count operation	R/W
b13 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b15, b14	BF[1:0]	MTU7.TADCOBRA/B Transfer Timing Select	See Table 19.54 for details. These bits specify the transfer timing from MTU7.TADCOBRA and MTU7.TADCOBRB to MTU7.TADCORA and MTU7.TADCORB.	R/W

Note 1. MTU7.TADCR must not be accessed in 8-bit units; it should always be accessed in 16-bit units.
Note 2. When interrupt skipping is disabled (the T6AEN and T7VEN bits in TITCR1B are cleared to 0 or the T6ACOR and T7VCOR bits in TITCR1B are cleared to 0), do not link A/D converter start requests with interrupt skipping function 1 (clear the ITA6AE, ITA7VE, ITB6AE, and ITB7VE bits in MUT3_7.TADCR to 0).
Note 3. If link with interrupt skipping is enabled while interrupt skipping is disabled, A/D converter start requests will not be issued.
Note 4. Do not set to 1 when complementary PWM mode is not selected.

Table 19.54 Setting of Transfer Timing by TADCR.BF[1:0] Bits (MTU7)

Bit 15	Bit 14	
BF1	**BF0**	**Description**
0	0	Does not transfer data from the cycle set buffer register (MTU7.TADCOBRA, MTU7.TADCOBRB) to the cycle set register (MTU7.TADCORA, MTU7.TADCORB).
0	1	Transfers data from the cycle set buffer register to the cycle set register at the crest of the MTU7.TCNT count.*1
1	0	Transfers data from the cycle set buffer register to the cycle set register at the trough of the MTU7.TCNT count.*2
1	1	Transfers data from the cycle set buffer register to the cycle set register at the crest and trough of the MTU7.TCNT count.*2

Note 1. Data is transferred from the cycle set buffer register (MTU7.TADCOBRA, MTU7.TADCOBRB) to the cycle set register (MTU7.TADCORA, MTU7.TADCORB) when the crest of the MTU7.TCNT count is reached or the MTU7.TGRD is written to in complementary PWM mode, when a compare match occurs between MTU6.TCNT and MTU6.TGRA in reset-synchronized PWM mode, or when a compare match occurs between MTU7.TCNT and MTU7.TGRA in PWM mode 1 or normal operation mode.

Note 2. These settings are prohibited when complementary PWM mode is not selected.

19.2.36 Timer A/D Converter Start Request Cycle Set Registers (TADCORA, TADCORB)

TADCORA and TADCORB are 16-bit readable/writable registers that issue a corresponding A/D converter start request when the MTUn.TCNT (n = 4 or 7) count reaches the value in TADCORA or TADCORB.
MTUn.TADCORA and TADCORB are initialized to FFFFh by a reset.

Address(es): MTU4.TADCORA A006 A044h, MTU4.TADCORB A006 A046h, MTU7.TADCORA A006 A844h, MTU7.TADCORB A006 A846h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Note: MTUn.TADCORA and MTUn.TADCORB (n = 4 or 7) must not be accessed in 8-bit units; they should always be accessed in 16-bit units.

Note 1. When the A/D converter start request delaying function linked with skipping function 1 (for details, see section 19.3.9 (4), A/D Converter Start Request Delaying Function Linked with Interrupt Skipping Function 1) is used, the value of this register should be 0002h to TCDRA setting - 2 in MTU4 and 0002h to TCDRB setting - 2 in MTU7.

Note 2. When interrupt skipping function 2 is used and the difference between the MTUn.TADCORA value and the MTUn.TADCORB value is small, the skipping count may not be counted correctly and the A/D converter start request may not be generated with the expected timing in some cases. The TADCORA and TADCORB values should satisfy the following conditions.

(1) When skipping function 2 is specified with the skipping count set to 0

- The difference between the MTUn.TADCORA and MTUn.TADCORB values should be equal to or greater than 4.
- The MTUn.TADCORA compare interval should be equal to or greater than 4 PCLKC cycles (the MTUn.TADCORA update value should be the previous value + 4 or greater, or previous value - 4 or smaller).
- The MTUn.TADCORB compare interval should be equal to or greater than 4 PCLKC cycles (the MTUn.TADCORB update value should be the previous value + 4 or greater, or previous value - 4 or smaller).

(2) When skipping function 2 is specified with the skipping count set to 1 or greater

- The difference between the MTUn.TADCORA and MTUn.TADCORB values should be equal to or greater than 2.
- The MTUn.TADCORB compare interval should be equal to or greater than 2 PCLKC cycles (the MTUn.TADCOR update value should be the previous value + 2 or greater, or previous value - 2 or smaller)

19.2.37 Timer A/D Converter Start Request Cycle Set Buffer Registers (TADCOBRA, TADCOBRB)

TADCOBRA and TADCOBRB are 16-bit readable/writable registers whose values are transferred to TADCORA and TADCORB, respectively, when the crest or trough of the MTUn.TCNT count is reached.
TADCOBRA and TADCOBRB are initialized to FFFFh by a reset.

Address(es): MTU4.TADCORA A006 A048h, MTU4.TADCORB A006 A04Ah, MTU7.TADCORA A006 A848h, MTU7.TADCORB A006 A84Ah

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Note: TADCOBRA and TADCOBRB must not be accessed in 8-bit units; it should always be accessed in 16-bit units.

19.2.38 Timer Interrupt Skipping Mode Registers (TITMRA, TITMRB)

TITMRA and TITMRB are used to select either of two skipping functions for the TITMRA and TITMRB registers.

Address(es): MTU.TITMRA A006 A03Ah, MTU.TITMRB A006 A83Ah

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	TITM
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	TITM	Interrupt Skipping Function Select	Selects one of the two types of interrupt skipping functions shown in Table 19.55.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Table 19.55 Interrupt Skipping Function Selected through TITM Bit

Bit 0	
TITM	**Description**
0	Selects interrupt skipping function 1*1
1	Selects interrupt skipping function 2*2

Note 1. TITCR1A or TITCR1B enables interrupt skipping function 1.
Note 2. TITCR2A or TITCR2B enables interrupt skipping function 2.

19.2.39 Timer Interrupt Skipping Set Registers 1 (TITCR1A, TITCR1B)

TITCR1A and TITCR1B enable or disable interrupt skipping and specify the interrupt skipping count. This setting is valid only while TITMRA or TITMRB is set to 0; when TITMRA or TITMRB is set to 1, the setting in the corresponding TITCR1 register is cleared.

- TITCR1A

Address(es): MTU.TITMRA A006 A030h

	b7	b6	b5	b4	b3	b2	b1	b0
	T3AEN		T3ACOR[2:0]			T4VEN	T4VCOR[2:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	T4VCOR[2:0]	TCIV4 Interrupt Skipping Count Setting	These bits specify the TCIV4 interrupt skipping count within the range from 0 to 7.*1 For details, see Table 19.56.	R/W
b3	T4VEN	T4VEN	0: TCIV4 interrupt skipping disabled 1: TCIV4 interrupt skipping enabled	R/W
b6 to b4	T3ACOR[2:0]	TGIA3 Interrupt Skipping Count Setting	These bits specify the TGIA3 interrupt skipping count within the range from 0 to 7.*1 For details, see Table 19.57.	R/W
b7	T3AEN	T3AEN	0: TGIA3 interrupt skipping disabled 1: TGIA3 interrupt skipping enabled	R/W

Note 1. When 0 is specified for the interrupt skipping count, no interrupt skipping will be performed.
Before changing the interrupt skipping count, be sure to clear the TITCR1A.T3AEN and TITCR1A.T4VEN bits to 0 to clear the skipping counter (TITCNT1A).

- TITCR1B

Address(es): MTU.TITCR1B A006 A830h

	b7	b6	b5	b4	b3	b2	b1	b0
	T6AEN		T6ACOR[2:0]		T7VEN		T7VCOR[2:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	T7VCOR[2:0]	TCIV7 Interrupt Skipping Count Setting	These bits specify the TCIV7 interrupt skipping count within the range from 0 to 7.*1 For details, see Table 19.58.	R/W
b3	T7VEN	T7VEN	0: TCIV7 interrupt skipping disabled 1: TCIV7 interrupt skipping enabled	R/W
b6 to b4	T6ACOR[2:0]	TGIA6 Interrupt Skipping Count Setting	These bits specify the TGIA6 interrupt skipping count within the range from 0 to 7.*1 For details, see Table 19.59.	R/W
b7	T6AEN	T6AEN	0: TGIA6 interrupt skipping disabled 1: TGIA6 interrupt skipping enabled	R/W

Note 1. When 0 is specified for the interrupt skipping count, no interrupt skipping will be performed.
Before changing the interrupt skipping count, be sure to clear the TITCR1B.T6AEN and TITCR1B.T7VEN bits to 0 to clear the skipping counter (TITCNT1B).

Table 19.56 Setting of Interrupt Skipping Count by T4VCOR[2:0] Bits

Bit 2	Bit 1	Bit 0	
T4VCOR2	T4VCOR1	T4VCOR0	Description
0	0	0	Does not skip TCIV4 interrupts.
0	0	1	Sets the TCIV4 interrupt skipping count to 1.
0	1	0	Sets the TCIV4 interrupt skipping count to 2.
0	1	1	Sets the TCIV4 interrupt skipping count to 3.
1	0	0	Sets the TCIV4 interrupt skipping count to 4.
1	0	1	Sets the TCIV4 interrupt skipping count to 5.
1	1	0	Sets the TCIV4 interrupt skipping count to 6.
1	1	1	Sets the TCIV4 interrupt skipping count to 7.

Table 19.57 Setting of Interrupt Skipping Count by T3ACOR[2:0] Bits

Bit 6	Bit 5	Bit 4	
T3ACOR2	T3ACOR1	T3ACOR0	Description
0	0	0	Does not skip TGIA3 interrupts.
0	0	1	Sets the TGIA3 interrupt skipping count to 1.
0	1	0	Sets the TGIA3 interrupt skipping count to 2.
0	1	1	Sets the TGIA3 interrupt skipping count to 3.
1	0	0	Sets the TGIA3 interrupt skipping count to 4.
1	0	1	Sets the TGIA3 interrupt skipping count to 5.
1	1	0	Sets the TGIA3 interrupt skipping count to 6.
1	1	1	Sets the TGIA3 interrupt skipping count to 7.

Table 19.58 Setting of Interrupt Skipping Count by T7VCOR[2:0] Bits

Bit 2	Bit 1	Bit 0	
T7VCOR2	T7VCOR1	T7VCOR0	Description
0	0	0	Does not skip TCIV7 interrupts.
0	0	1	Sets the TCIV7 interrupt skipping count to 1.
0	1	0	Sets the TCIV7 interrupt skipping count to 2.
0	1	1	Sets the TCIV7 interrupt skipping count to 3.
1	0	0	Sets the TCIV7 interrupt skipping count to 4.
1	0	1	Sets the TCIV7 interrupt skipping count to 5.
1	1	0	Sets the TCIV7 interrupt skipping count to 6.
1	1	1	Sets the TCIV7 interrupt skipping count to 7.

Table 19.59 Setting of Interrupt Skipping Count by T6ACOR[2:0] Bits

Bit 6	Bit 5	Bit 4	
T6ACOR2	**T6ACOR1**	**T6ACOR0**	**Description**
0	0	0	Does not skip TGIA6 interrupts.
0	0	1	Sets the TGIA6 interrupt skipping count to 1.
0	1	0	Sets the TGIA6 interrupt skipping count to 2.
0	1	1	Sets the TGIA6 interrupt skipping count to 3.
1	0	0	Sets the TGIA6 interrupt skipping count to 4.
1	0	1	Sets the TGIA6 interrupt skipping count to 5.
1	1	0	Sets the TGIA6 interrupt skipping count to 6.
1	1	1	Sets the TGIA6 interrupt skipping count to 7.

19.2.40 Timer Interrupt Skipping Counters 1 (TITCNT1A, TITCNT1B)

TITCNT1A and TITCNT1B are 8-bit readable/writable counters. TITCNTA and TITCNTB retain their values even after stopping the count operation of MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT).

- TITCNT1A

Address(es): MTU.TITCNT1A A006 A031h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	T3ACNT[2:0]			—	T4VCNT[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	T4VCNT[2:0]	TCIV4 Interrupt Counter	While the T4VEN bit in TITCR1A is set to 1, the count in these bits is incremented every time a TCIV4 interrupt occurs.	R
b3	—	Reserved	This bit is read as 0. Writing to this bit has no effect.	R
b6 to b4	T3ACNT[2:0]	TGIA3 Interrupt Counter	While the T3AEN bit in TITCR1A is set to 1, the count in these bits is incremented every time a TGIA3 interrupt occurs.	R
b7	—	Reserved	This bit is read as 0. Writing to this bit has no effect.	R

Note 1. To clear the TITCNT1A, clear the TITCR1A.T3AEN and TITCR1A.T4VEN bits to 0.

T4VCNT[2:0] Bits (TCIV4 Interrupt Counter)

While the T4VEN bit in TITCR1A is set to 1, the count in these bits is incremented every time a TCIV4 interrupt occurs.
[Clearing conditions]

- When the TITM bit in TITMRA is 1
- When the T4VEN bit in TITCR1A is cleared to 0
- When the T4VCOR[2:0] bits in TITCR1A are cleared to 000b
- When the T4VCNT[2:0] bits in TITCNT1A match the T4VCOR[2:0] bits in TITCR1A

T3ACNT[2:0] Bits (TGIA3 Interrupt Counter)

While the T3AEN bit in TITCR1A is set to 1, the count in these bits is incremented every time a TGIA3 interrupt occurs.
[Clearing conditions]

- When the TITM bit in TITMRA is 1
- When the T3AEN bit in TITCR1A is cleared to 0
- When the T3ACOR[2:0] bits in TITCR1A are cleared to 000b
- When the T3ACNT[2:0] bits in TITCNT1A match the T3ACOR[2:0] bits in TITCR1A

- TITCNT1B

Address(es): MTU.TITCNT1B A006 A831h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	T6ACNT[2:0]			—	T7VCNT[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	T7VCNT[2:0]	TCIV7 Interrupt Counter	While the T7VEN bit in TITCR1B is set to 1, the count in these bits is incremented every time a TCIV7 interrupt occurs.	R
b3	—	Reserved	This bit is read as 0. Writing to this bit has no effect.	R
b6 to b4	T6ACNT[2:0]	TGIA6 Interrupt Counter	While the T6AEN bit in TITCR1B is set to 1, the count in these bits is incremented every time a TGIA6 interrupt occurs.	R
b7	—	Reserved	This bit is read as 0. Writing to this bit has no effect.	R

Note 1. To clear the TITCNT1B, clear the TITCR1B.T6AEN and TITCR1B.T7VEN bits to 0.

T7VCNT[2:0] Bits (TCIV7 Interrupt Counter)

While the T7VEN bit in TITCR1B is set to 1, the count in these bits is incremented every time a TCIV7 interrupt occurs.
[Clearing conditions]

- When the TITM bit in TITMRB is 1
- When the T7VEN bit in TITCR1B is cleared to 0
- When the T7VCOR[2:0] bits in TITCR1B are cleared to 000b
- When the T7VCNT[2:0] bits in TITCNT1B match the T7VCOR[2:0] bits in TITCR1B

T6ACNT[2:0] Bits (TGIA6 Interrupt Counter)

While the T6AEN bit in TITCR1B is set to 1, the count in these bits is incremented every time a TGIA6 interrupt occurs.
[Clearing conditions]

- When the TITM bit in TITMRB is 1
- When the T6AEN bit in TITCR1B is cleared to 0
- When the T6ACOR[2:0] bits in TITCR1B are cleared to 000b
- When the T6ACNT[2:0] bits in TITCNT1B match the T6ACOR[2:0] bits in TITCR1B

19.2.41 Timer Interrupt Skipping Set Registers 2 (TITCR2A, TITCR2B)

TITCR2A and TITCR2B specify the interrupt skipping count for TRG4AN and TRG4BN (TRG7AN and TRG7BN). This setting is valid only while TITMRA or TITMRB is set to 1.

- TITCR2A

Address(es): MTU.TITCR2A A006 A03Bh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	TRG4COR[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	TRG4COR [2:0]	TRG4AN/TRG4BN Interrupt Skipping Count Setting	These bits specify the TRG4AN/TRG4BN interrupt skipping count within the range from 0 to 7. For details, see Table 19.60.	R/W
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Table 19.60 Setting of Interrupt Skipping Count by TRG4COR[2:0] Bits

Bit 2	Bit 1	Bit 0	
TRG4COR2	TRG4COR1	TRG4COR0	Description
0	0	0	Does not skip TRG4AN and TRG4BN interrupts.
0	0	1	Sets the TRG4AN and TRG4BN interrupt skipping count to 1.
0	1	0	Sets the TRG4AN and TRG4BN interrupt skipping count to 2.
0	1	1	Sets the TRG4AN and TRG4BN interrupt skipping count to 3.
1	0	0	Sets the TRG4AN and TRG4BN interrupt skipping count to 4.
1	0	1	Sets the TRG4AN and TRG4BN interrupt skipping count to 5.
1	1	0	Sets the TRG4AN and TRG4BN interrupt skipping count to 6.
1	1	1	Sets the TRG4AN and TRG4BN interrupt skipping count to 7.

- TITCR2B

Address(es): MTU.TITCR2B A006 A83Bh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	TRG7COR[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	TRG7COR [2:0]	TRG7AN/TRG7BN Interrupt Skipping Count Setting	These bits specify the TRG7AN/TRG7BN interrupt skipping count within the range from 0 to 7. For details, see Table 19.61.	R/W
b7 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Table 19.61 Setting of Interrupt Skipping Count by TRG7COR[2:0] Bits

Bit 2	Bit 1	Bit 0	
TRG7COR2	TRG7COR1	TRG7COR0	Description
0	0	0	Does not skip TRG7AN and TRG7BN interrupts.
0	0	1	Sets the TRG7AN and TRG7BN interrupt skipping count to 1.
0	1	0	Sets the TRG7AN and TRG7BN interrupt skipping count to 2.
0	1	1	Sets the TRG7AN and TRG7BN interrupt skipping count to 3.
1	0	0	Sets the TRG7AN and TRG7BN interrupt skipping count to 4.
1	0	1	Sets the TRG7AN and TRG7BN interrupt skipping count to 5.
1	1	0	Sets the TRG7AN and TRG7BN interrupt skipping count to 6.
1	1	1	Sets the TRG7AN and TRG7BN interrupt skipping count to 7.

19.2.42 Timer Interrupt Skipping Counters 2 (TITCNT2A, TITCNT2B)

TITCNT2A and TITCNT2B start counting from the values set in the TRG4COR[2:0] and TRG7COR[2:0] bits and the count decrements every time TRG4AN or TRG4BN (TITCNT2A) is generated or TRG7AN or TRG7BN (TITCNT2B) is generated. When the count reaches 0 and is reloaded, the TRG4AN and TRG4BN interrupts or the TRG7AN and TRG7BN interrupts become valid.

- TITCNT2A

Address(es): MTU.TITCNT2A A006 A03Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	TRG4CNT[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	TRG4CNT [2:0]	TRG4AN/TRG4BN Interrupt Counter	These bits start counting from the value set in TRG4COR[2:0] and the count decrements every time TRG4AN or TRG4BN is generated. When the count reaches 0 and is reloaded, the TRG4AN and TRG4BN interrupts become valid.	R
b7 to b3	—	Reserved	These bits are read as 0. Writing to this bit has no effect.	R

TRG4CNT[2:0] Bits (TRG4AN/TRG4BN Interrupt Counter)

These bits start counting from the value set in the TRG4COR[2:0] bits and the count decrements every time a TRG4AN or TRG4BN interrupt is generated. When the count reaches 0 and is reloaded, the TRG4AN and TRG4BN interrupts become valid.

[Clearing conditions]

- When the TITM bit in TITMRA is 0
- When the TRG4COR[2:0] bits in TITCR2A are cleared to 000b
- When the count of TRG4AN and TRG4BN occurrence matches the TRG4COR[2:0] value in TITCR2A

- TITCNT2B

Address(es): MTU.TITCNT2B A006 A83Ch

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	TRG7CNT[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	TRG7CNT [2:0]	TRG7AN/TRG7BN Interrupt Counter	These bits start counting from the value set in TRG7COR[2:0] and the count decrements every time TRG7AN or TRG7BN is generated. When the count reaches 0 and is reloaded, the TRG7AN and TRG7BN interrupts become valid.	R
b7 to b3	—	Reserved	These bits are read as 0. Writing to this bit has no effect.	R

TRG7CNT[2:0] Bits (TRG7AN/TRG7BN Interrupt Counter)

These bits start counting from the value set in the TRG7COR[2:0] bits and the count decrements every time a TRG7AN or TRG7BN interrupt is generated. When the count reaches 0 and is reloaded, the TRG7AN and TRG7BN interrupts become valid.

[Clearing conditions]

- When the TITM bit in TITMRB is 0
- When the TRG7COR[2:0] bits in TITCR2B are cleared to 000b
- When the count of TRG7AN and TRG7BN occurrence matches the TRG7COR[2:0] value in TITCR2B

19.2.43 Bus Master Interface

The timer counter (MTU8.TCNT), general registers (MTU8.TGRn) for MTU8, and MTU1.TCNTLW, MTU1.TGRALW, and MTU1.TGRBLW registers when TMDR3.LWA = 1 are 32-bit registers. A 32-bit data bus to the bus master enables 32-bit read/write access. 8- and 16-bit read/write are not allowed. Always access these registers in 32-bit units.

The timer counters (MTU0.TCNT to MTU7.TCNT) excluding MTU8, general registers (MTU0.TGRn to MTU7.TGRn), timer subcounters (TCNTSA and TCNTSB), timer cycle buffer registers (TCBRA and TCBRB), timer dead time data registers (TDDRA and TDDRB), timer cycle data registers (TCDRA and TCDRB), timer A/D converter start request control registers (MTU4.TADCR and MTU7.TADCR), timer A/D converter start request cycle set registers (MTU4.TADCORA, MTU4.TADCORB, MTU7.TADCORA, and MTU7.TADCORB), and timer A/D converter start request cycle set buffer registers (MTU4.TADCOBRA, MTU4.TADCOBRB, MTU7.TADCOBRA, and MTU7.TADCOBRB) are 16-bit registers. A 16-bit data bus to the bus master enables 16-bit read/write access. 8-bit read/write is not allowed. Always access the registers in 16-bit units.

All registers other than the above registers are 8-bit registers. A 16-bit data bus to the CPU enables 16-bit read/write access. These registers can also be accessed in 8-bit units.

19.3 Operation

19.3.1 Basic Functions

Each channel has TCNT and TGR. TCNT performs up-counting, and is also capable of free-running operation, periodic counting, and external event counting.
Each TGR can be used as an input capture register or an output compare register.

(1) Counter Operation

When one of bits CST0 to CST4 and CST8 in TSTRA, bits CST6 and CST7 in TSTRB, and bits CSTU5, CSTV5, and CSTW5 in MTU5.TSTR is set to 1, TCNT for the corresponding channel begins counting. TCNT can operate as a free-running counter, periodic counter, for example.

(a) Example of Count Operation Setting Procedure

Figure 19.5 shows an example of the count operation setting procedure.

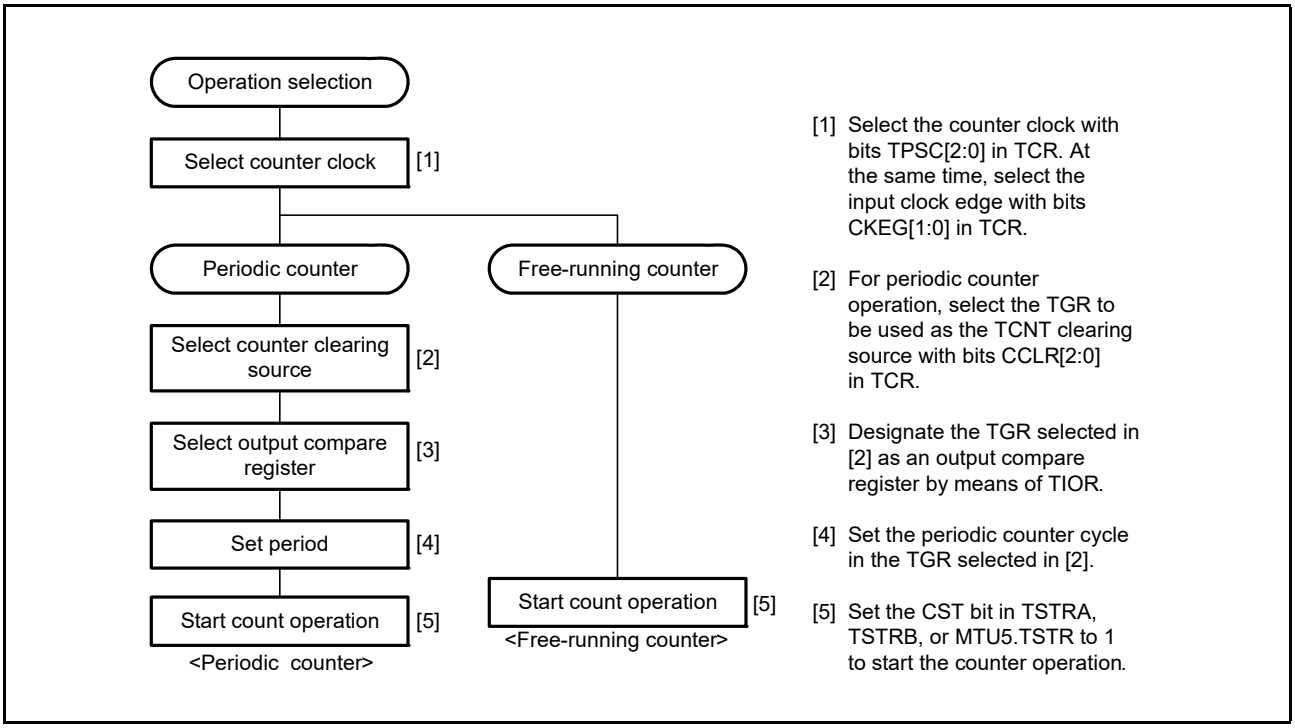

Figure 19.5 Example of Counter Operation Setting Procedure

(b) Free-Running Count Operation and Periodic Count Operation

Immediately after a reset, the MTU's TCNT counters are all designated as free-running counters. When the relevant bit in TSTRA, TSTRB, or MTU5.TSTR is set to 1, the corresponding TCNT counter starts up-count operation as a free-running counter. When TCNT overflows (from FFFFh to 0000h), if the corresponding TIER.TCIEV bit is 1, the MTU requests an interrupt. After an overflow, TCNT starts counting up again from 0000h.
Figure 19.6 illustrates free-running counter operation.

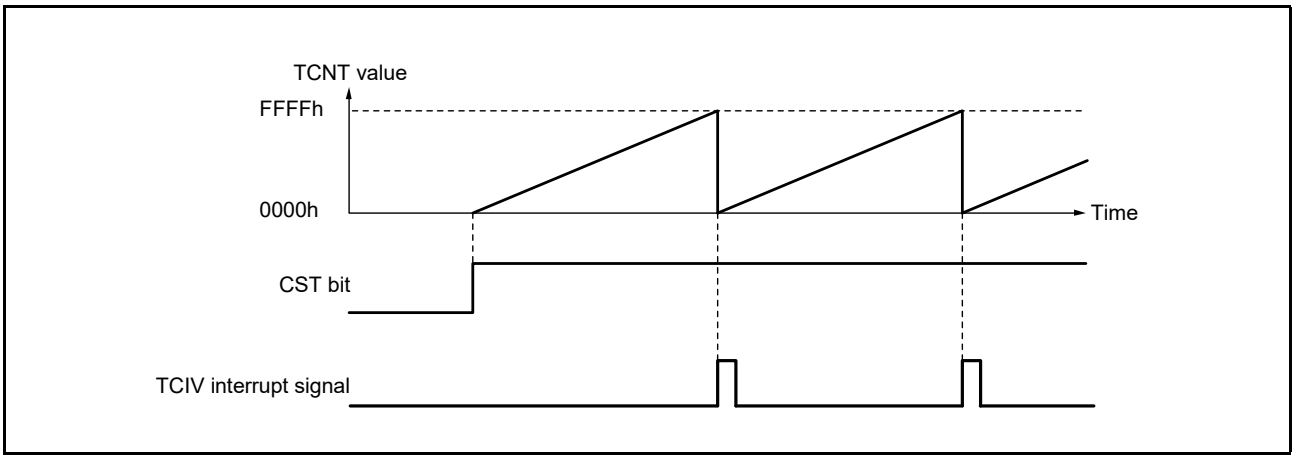

Figure 19.6 Free-Running Counter Operation

When compare match is selected as the TCNT clearing source, TCNT for the relevant channel performs periodic count operation. TGR for setting the cycle is designated as an output compare register, and counter clearing by compare match is selected by means of bits CCLR[2:0] in TCR. After the settings have been made, TCNT starts up-count operation as a periodic counter when the corresponding bit in TSTRA, TSTRB or MTU5.TSTR is set to 1. When the count matches the value in TGR, TCNT is cleared to 0000h.
If the value of the corresponding TIER.TGIE bit is 1 at this point, the MTU requests an interrupt. After a compare match, TCNT starts counting up again from 0000h.
Figure 19.7 illustrates periodic counter operation.

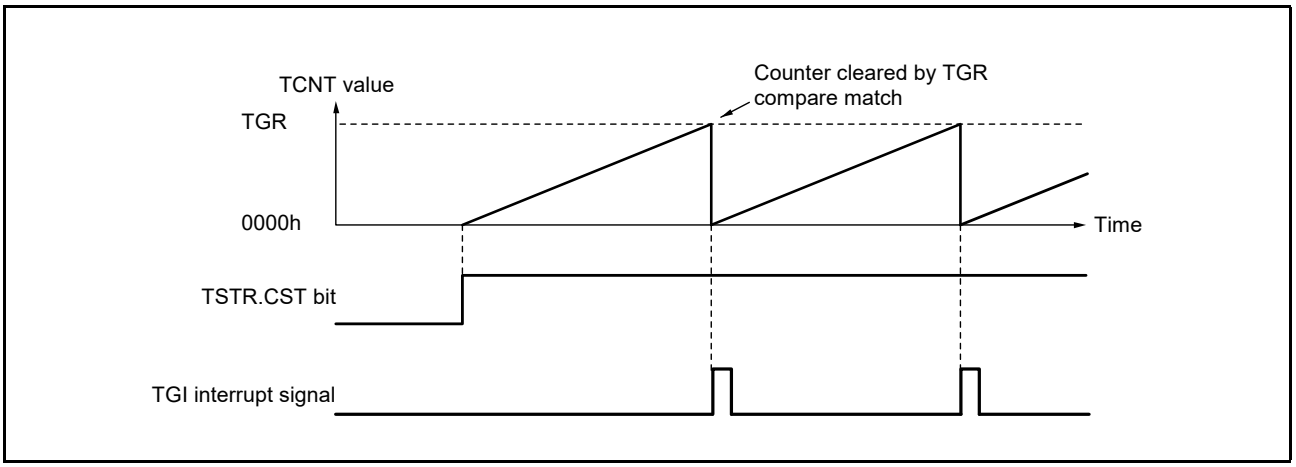

Figure 19.7 Periodic Counter Operation

(2) Waveform Output by Compare Match

The MTU can output low or high or toggles output from the corresponding output pin using compare match. Note that MTU5 cannot output compare-match signals.

(a) Example of Procedure for Setting Waveform Output by Compare Match

Figure 19.8 shows an example of the procedure for setting waveform output by compare match

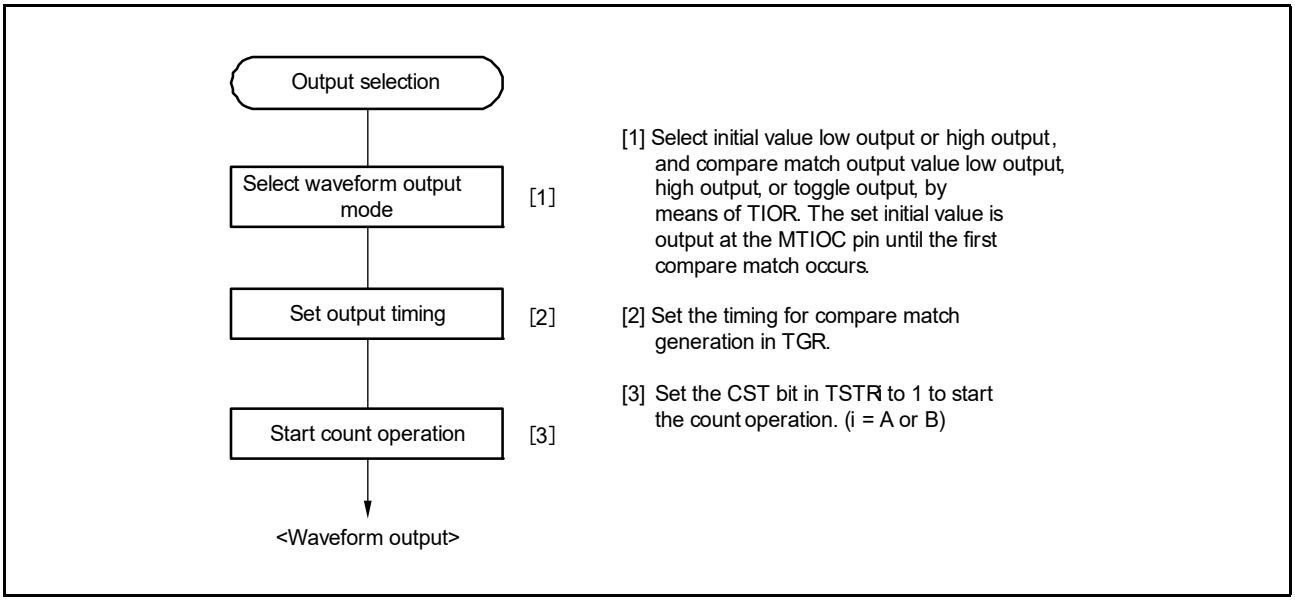

Figure 19.8 Example of Procedure for Setting Waveform Output by Compare Match

(b) Examples of Waveform Output Operation

Figure 19.9 shows an example of low output and high output.
In this example, TCNT has been designated as a free-running counter, and settings have been made so that high is output by compare match A and low is output by compare match B. When the pin level is the same as the specified level, the pin level does not change.

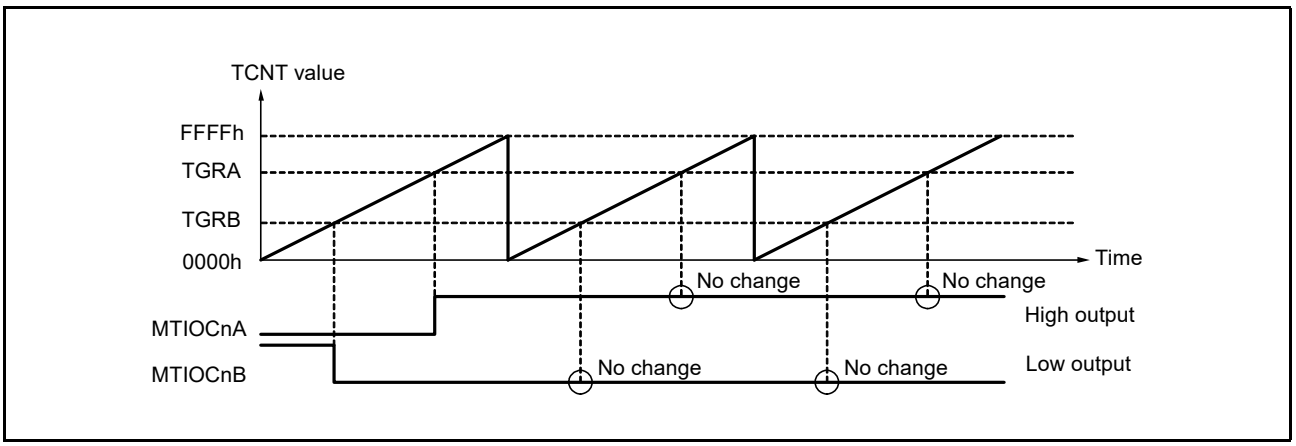

Figure 19.9 Example of low output and high output Operation

Figure 19.10 shows an example of toggle output.
In this example, TCNT has been designated as a periodic counter (with counter clearing on compare match B), and settings have been made so that the output is toggled by both compare match A and compare match B.

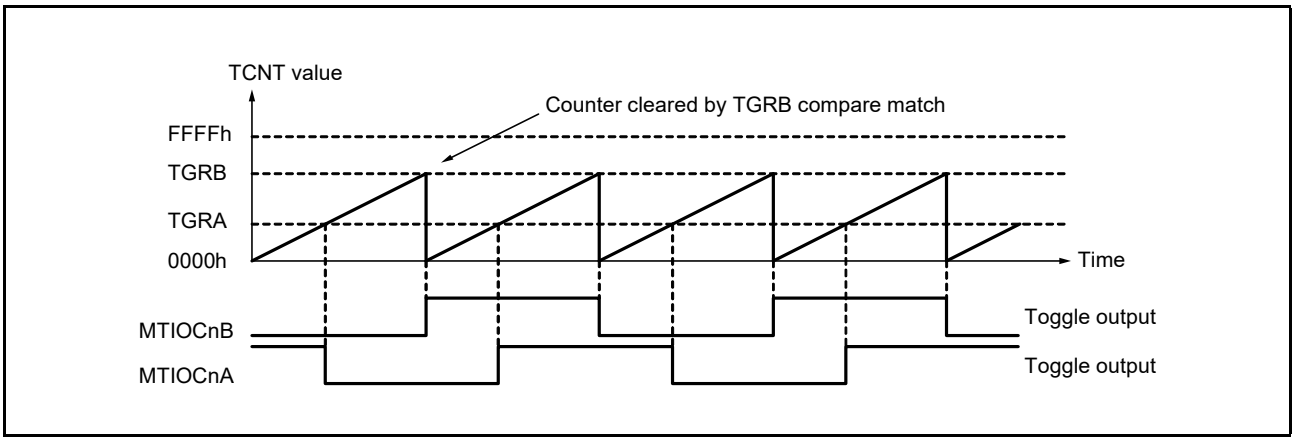

Figure 19.10 Example of Toggle Output Operation

(3) Input Capture Function

The TCNT value can be transferred to TGR on detection of an edge input on the MTIOCnm (n = 0 to 4, 6, 7, or 8, m = A to D), MTIC5U, MTIC5V, or MTIC5W pin.

The rising edge, falling edge, or both edges can be selected as the detection edge. For MTU0 and MTU1, another channel's counter input clock or compare match signal can also be specified as the input capture source.

Note: When another channel's counter input clock is used as the input capture input for MTU0 and MTU1, PCLKC/1 should not be selected as the counter input clock used for input capture input. Input capture will not be generated if PCLKC/1 is selected.

(a) Example of Input Capture Operation Setting Procedure

Figure 19.11 shows an example of the input capture operation setting procedure.

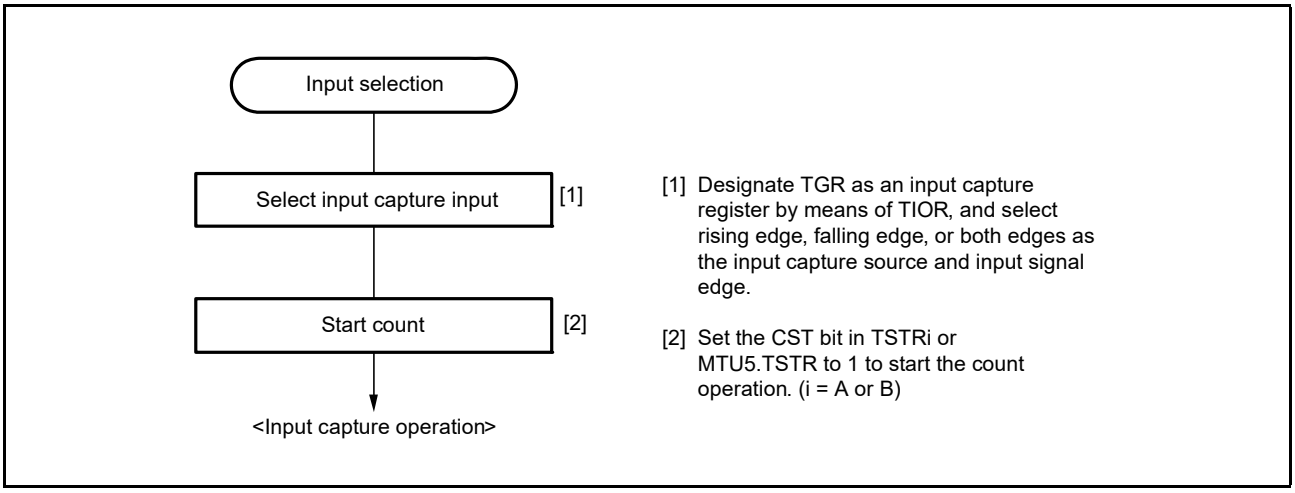

Figure 19.11 Example of Input Capture Operation Setting Procedure

(b) Example of Input Capture Operation

Figure 19.12 shows an example of input capture operation.
In this example, both rising and falling edges have been selected as the MTIOCnA pin input capture input edge, the falling edge has been selected as the MTIOCnB pin input capture input edge, and counter clearing by TGRB input capture has been designated for TCNT (n = 0 to 4, 6, 7, or 8).

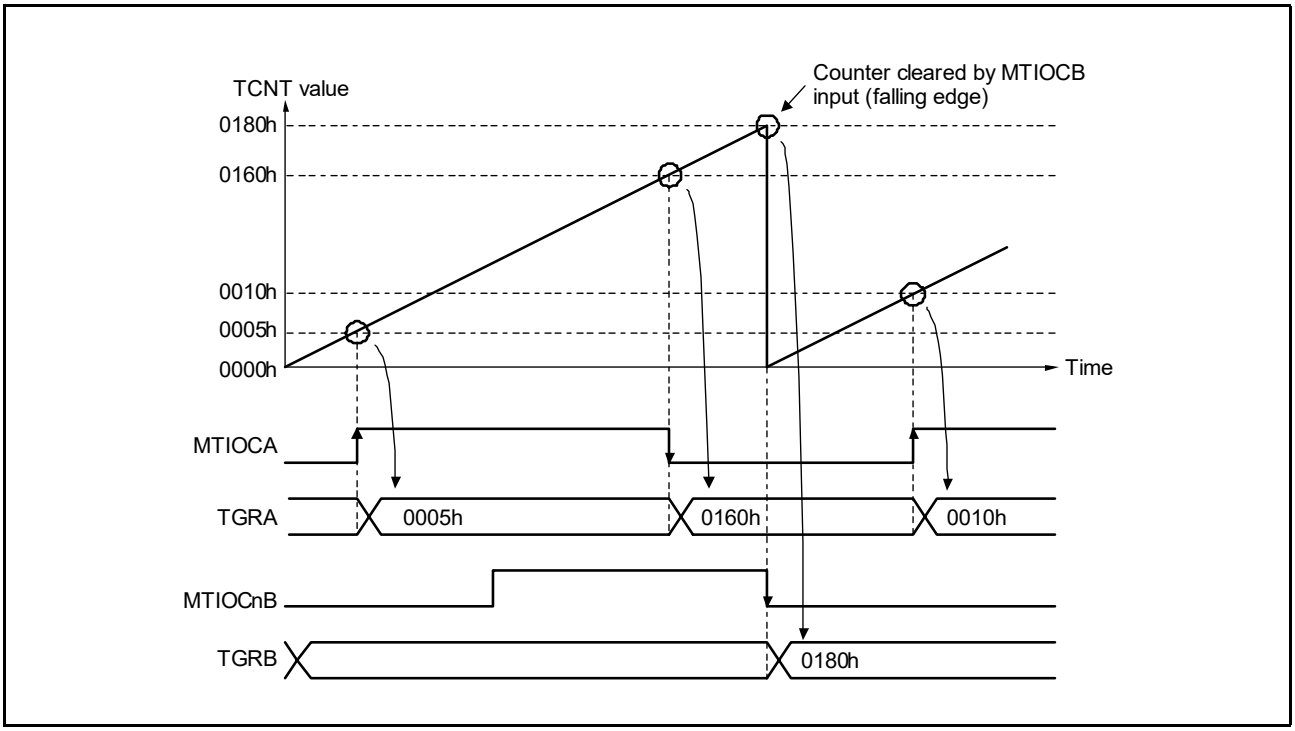

Figure 19.12 Example of Input Capture Operation (n = 0 to 4, 6, 7, or 8)

19.3.2 Synchronous Operation

In synchronous operation, the values in multiple TCNT counters can be modified simultaneously (synchronous presetting). In addition, multiple TCNT counters can be cleared simultaneously (synchronous clearing) by making the appropriate setting in TCR.
Synchronous operation increases the number of TGR registers assigned to a single time base.
MTU0 to MTU4, MTU6, and MTU7 can all be designated for synchronous operation.
MTU5 and MTU8 cannot be used for synchronous operation.

(1) Example of Synchronous Operation Setting Procedure

Figure 19.13 shows an example of the synchronous operation setting procedure.

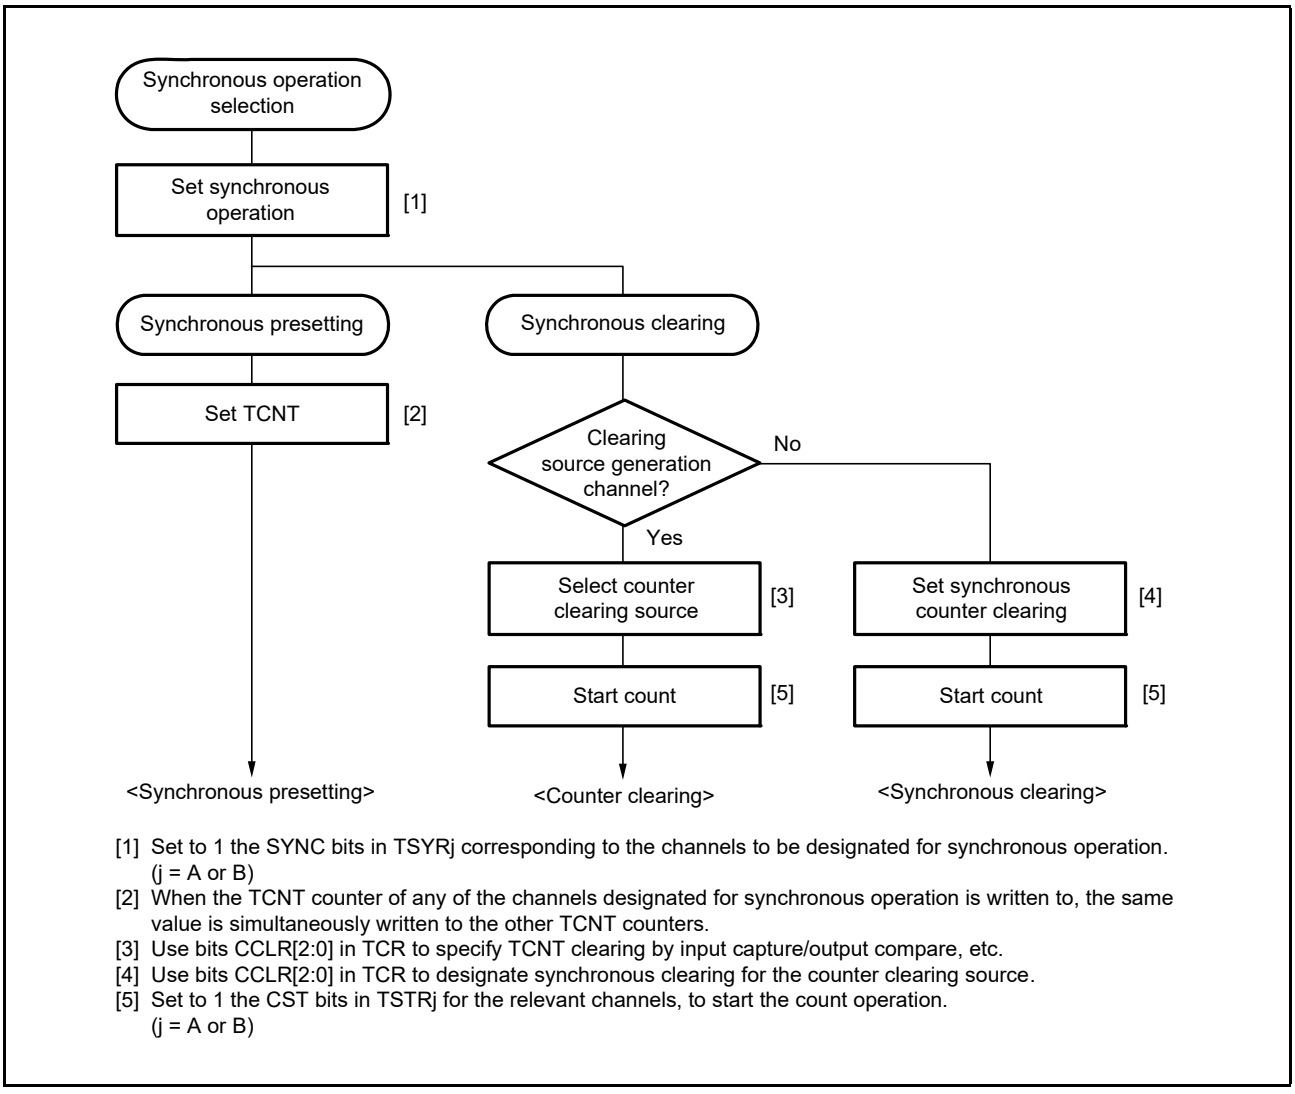

Figure 19.13 Example of Synchronous Operation Setting Procedure

(2) Example of Synchronous Operation

Figure 19.14 shows an example of synchronous operation.
In this example, synchronous operation and PWM mode 1 have been designated for MTU0 to MTU2, MTU0.TGRB compare match has been set as the counter clearing source in MTU0, and synchronous clearing has been set for the counter clearing source in MTU1 and MTU2.
Three-phase PWM waveforms are output from pins MTIOC0A, MTIOC1A, and MTIOC2A. At this time, synchronous presetting and synchronous clearing by MTU0.TGRB compare match are performed for the TCNT counters in MTU0 to MTU2, and the data set in MTU0.TGRB is used as the PWM cycle.
For details of PWM modes, see section 19.3.5, PWM Modes.

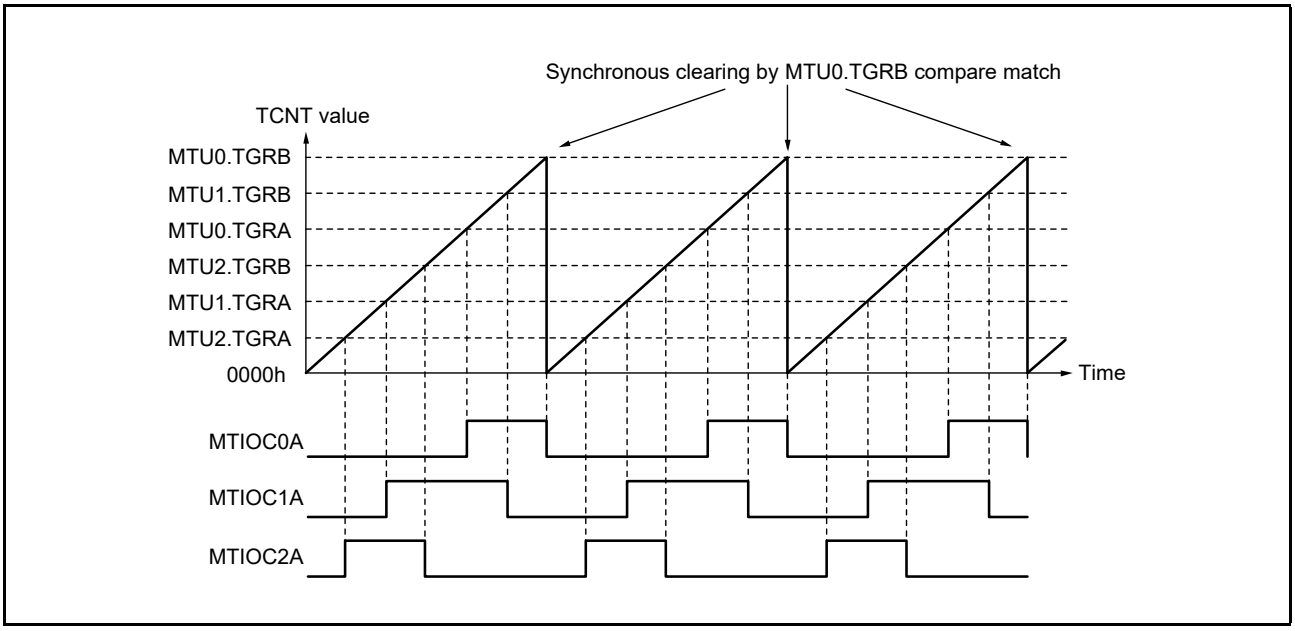

Figure 19.14 Example of Synchronous Operation

19.3.3 Buffer Operation

Buffer operation, provided for MTU0, MTU3, MTU4, MTU6, MTU7, and MTU8, enables TGRC and TGRD to be used as buffer registers. In MTU0, TGRF can also be used as a buffer register.
Buffer operation differs depending on whether TGR has been designated as an input capture register or as a compare match register.

Note: MTU0.TGRE cannot be designated as an input capture register and can only operate as a compare match register.

Table 19.62 shows the register combinations used in buffer operation.

Table 19.62 Register Combinations in Buffer Operation

Channel	Timer General Register	Buffer Register
MTU0	TGRA	TGRC
	TGRB	TGRD
	TGRE	TGRF
MTU3	TGRA	TGRC
	TGRB	TGRD
MTU4	TGRA	TGRC
	TGRB	TGRD
MTU6	TGRA	TGRC
	TGRB	TGRD
MTU7	TGRA	TGRC
	TGRB	TGRD
MTU8	TGRA	TGRC
	TGRB	TGRD

- When TGR is an output compare register

When a compare match occurs, the value in the buffer register for the corresponding channel is transferred to the timer general register.
This operation is illustrated in Figure 19.15.

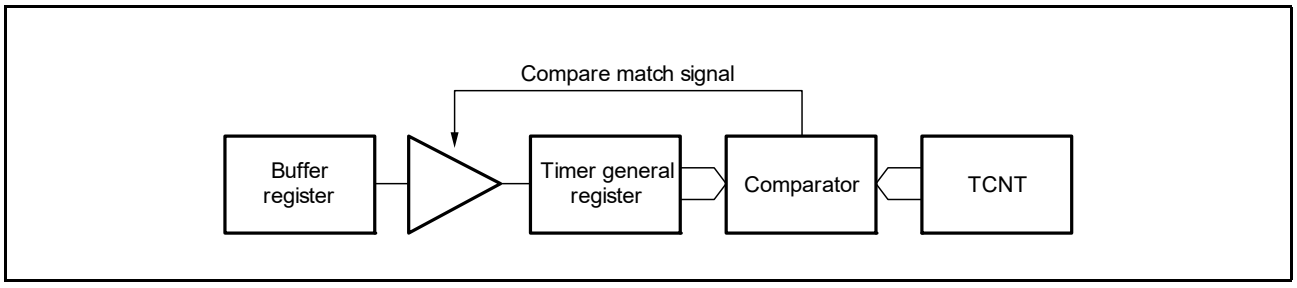

Figure 19.15 Compare Match Buffer Operation

- When TGR is an input capture register

When an input capture occurs, the value in TCNT is transferred to TGR and the value previously held in TGR is transferred to the buffer register.
This operation is illustrated in Figure 19.16.

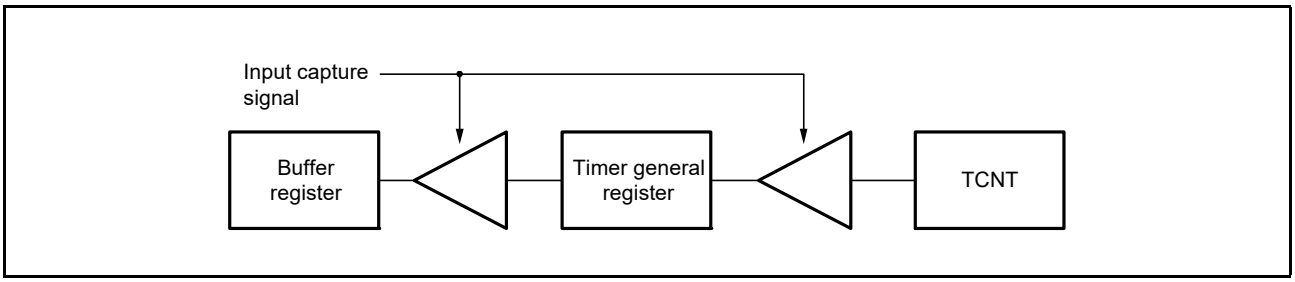

Figure 19.16 Input Capture Buffer Operation

(1) Example of Buffer Operation Setting Procedure

Figure 19.17 shows an example of the buffer operation setting procedure.

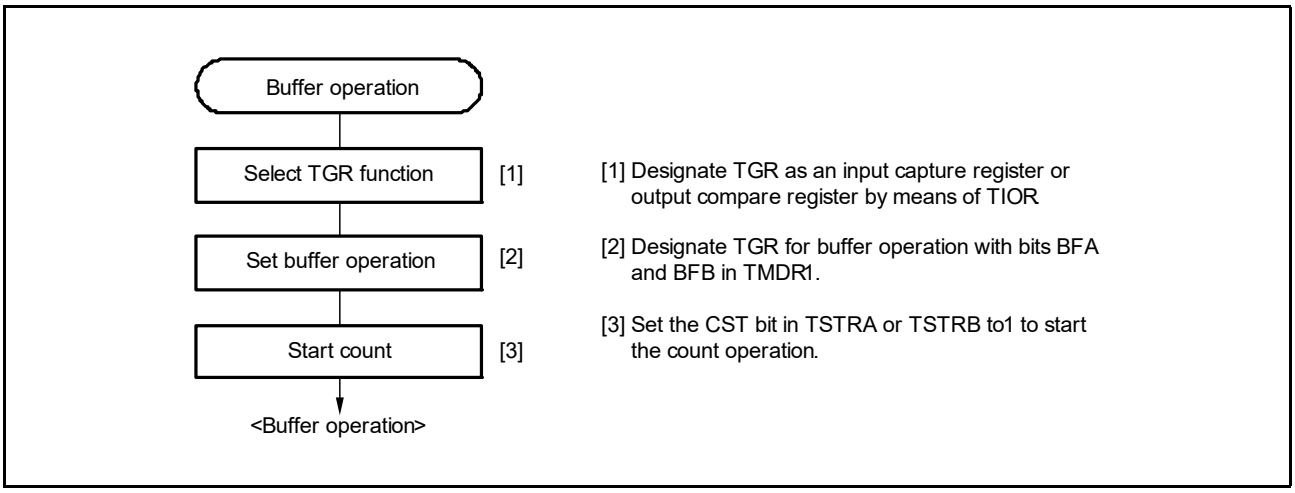

Figure 19.17 Example of Buffer Operation Setting Procedure

(2) Examples of Buffer Operation

(a) When TGR is an Output Compare Register

Figure 19.18 shows an operation example in which PWM mode 1 has been designated for MTU0, and TGRC has been designated as a buffer register for TGRA. The settings used in this example are TCNT clearing by compare match B, high output at compare match A, and low output at compare match B. In this example, the TTSA bit in TBTM is cleared to 0.

As buffer operation has been set, when compare match A occurs, the output changes and the value in buffer register TGRC is simultaneously transferred to timer general register TGRA. This operation is repeated each time compare match A occurs.

For details of PWM modes, see section 19.3.5, PWM Modes.

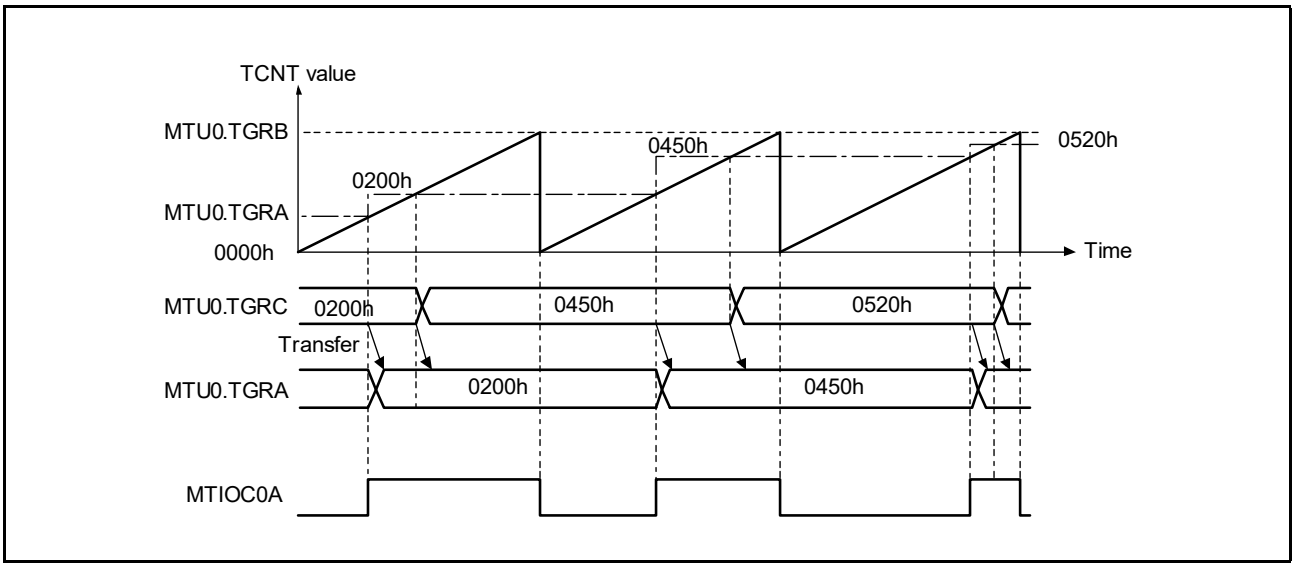

Figure 19.18 Example of Buffer Operation (1)

(b) When TGR is an Input Capture Register

Figure 19.19 shows an operation example in which TGRA has been designated as an input capture register, and TGRC has been designated as a buffer register for TGRA.
Counter clearing by TGRA input capture has been set for TCNT, and both rising and falling edges have been selected as the MTIOCnA pin input capture input edge (n = 0 to 4, 6, 7, or 8).
As buffer operation has been set, when the TCNT value is stored in TGRA upon occurrence of input capture A, the value previously stored in TGRA is simultaneously transferred to TGRC.

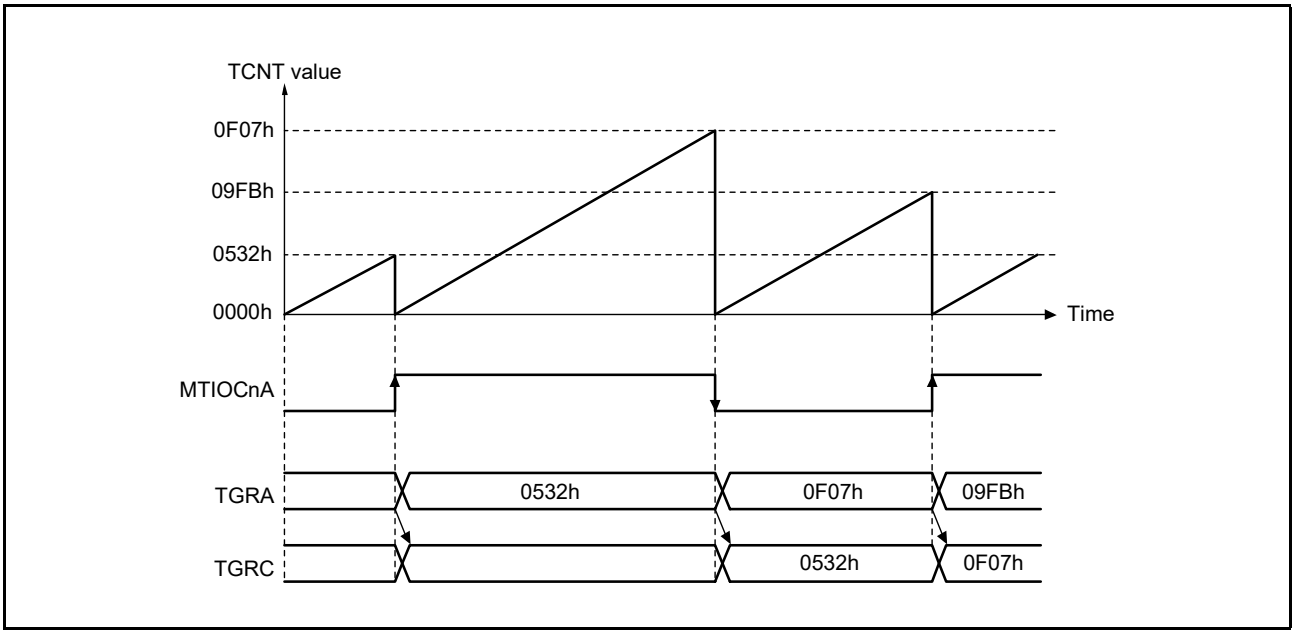

Figure 19.19 Example of Buffer Operation (2) (n = 0 to 4, 6, 7, or 8)

(3) Selecting Timing for Transfer from Buffer Registers to Timer General Registers in PWM Mode

The timing for transfer from buffer registers to timer general registers can be selected in PWM mode only by setting the buffer operation transfer mode registers (MTUn.TBTM (n = 0, 3, 4, 6, or 7)). The timing for transfer can be selected in PWM mode 1 or 2 for MTU0, or in PWM mode 1 for MTU3, MTU4, MTU6, and MTU7. Either compare match (value after reset) or TCNT clearing can be selected for the transfer timing. TCNT clearing as transfer timing is one of the following cases.

- When TCNT overflows (FFFFh to 0000h)
- When 0000h is written to TCNT during counting
- When TCNT is cleared to 0000h under the condition specified in the CCLR[2:0] bits in TCR

Note: TBTM must be modified only while TCNT stops.

Figure 19.20 shows an operation example in which PWM mode 1 is designated for MTU0 and buffer operation is designated for MTU0.TGRA and MTU0.TGRC. The settings used in this example are MTU0.TCNT clearing by compare match B, high output at compare match A, and low output at compare match B. The TTSA bit in MTU0.TBTM is set to 1.

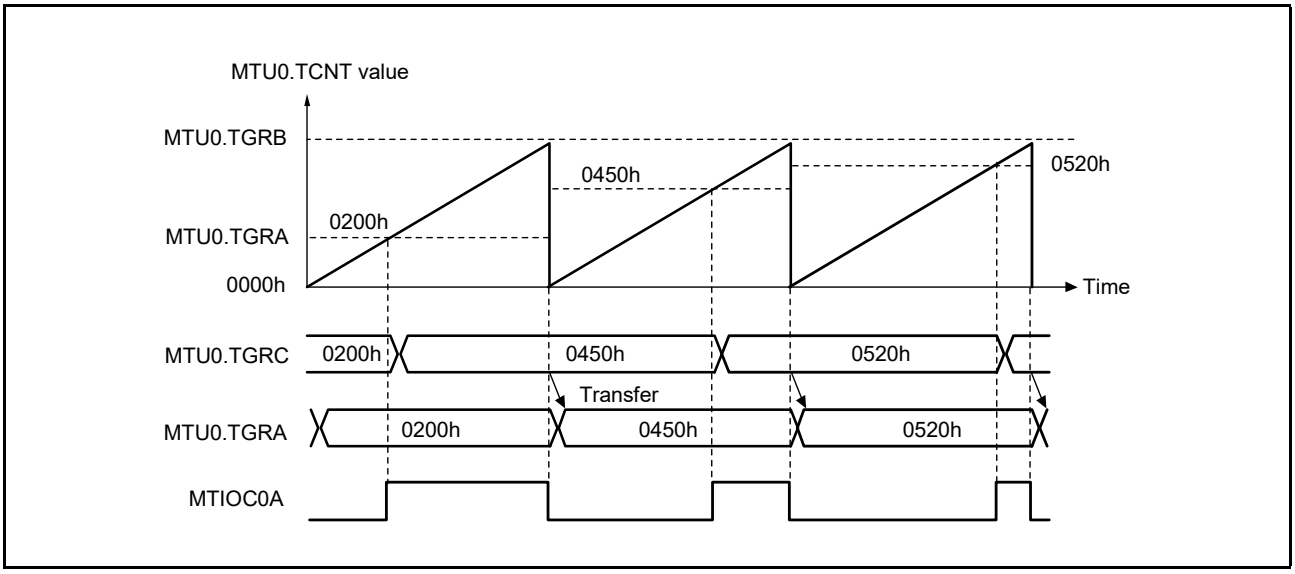

Figure 19.20 Example of Buffer Operation When MTU0.TCNT Clearing is Selected for MTU0.TGRC-to-MTU0.TGRA Transfer Timing

19.3.4 Cascaded Operation

In cascaded operation, two 16-bit counters in different channels are used together as a 32-bit counter. The following describes operation when the MTU1.TMDR3.LWA bit is set to 0.

This function works when overflow/underflow of MTU2.TCNT is selected as the counter clock for MTU1 through the TCR.TPSC[2:0] bits.

Underflow occurs only when the lower 16 bits of TCNT is in phase counting mode.

Table 19.63 shows the register combinations used in cascaded operation.

Note: When phase counting mode is set for MTU1, the counter clock setting is invalid and the counters operate independently in phase counting mode.

Table 19.63 Cascaded Combinations

Combination	Upper 16 Bits	Lower 16 Bits
MTU1 and MTU2	MTU1.TCNT	MTU2.TCNT

For simultaneous input capture of MTU1.TCNT and MTU2.TCNT during cascaded operation, additional input capture input pins can be specified by the input capture control register (TICCR). The input-capture condition is of edges in the signal produced by taking the logical OR of the input level on the main input pin and the input level on the added input pin. Accordingly, if either is at the high level, a change in the level of the other will not produce an edge for detection. For details, see (4), Cascaded Operation Example (c). For input capture in cascade connection, see section 19.6.21, Simultaneous Input Capture in MTU1.TCNT and MTU2.TCNT in Cascade Connection.

Table 19.64 shows the TICCR setting and input capture input pins.

Table 19.64 TICCR Setting and Input Capture Input Pins

Target Input Capture	TICCR Setting	Input Capture Input Pin
Input capture from MTU1.TCNT to MTU1.TGRA	I2AE bit = 0 (initial value)	MTIOC1A
	I2AE bit = 1	MTIOC1A, MTIOC2A
Input capture from MTU1.TCNT to MTU1.TGRB	I2BE bit = 0 (initial value)	MTIOC1B
	I2BE bit = 1	MTIOC1B, MTIOC2B
Input capture from MTU2.TCNT to MTU2.TGRA	I1AE bit = 0 (initial value)	MTIOC2A
	I1AE bit = 1	MTIOC2A, MTIOC1A
Input capture from MTU2.TCNT to MTU2.TGRB	I1BE bit = 0 (initial value)	MTIOC2B
	I1BE bit = 1	MTIOC2B, MTIOC1B

(1) Example of Cascaded Operation Setting Procedure

Figure 19.21 shows an example of the cascaded operation setting procedure.

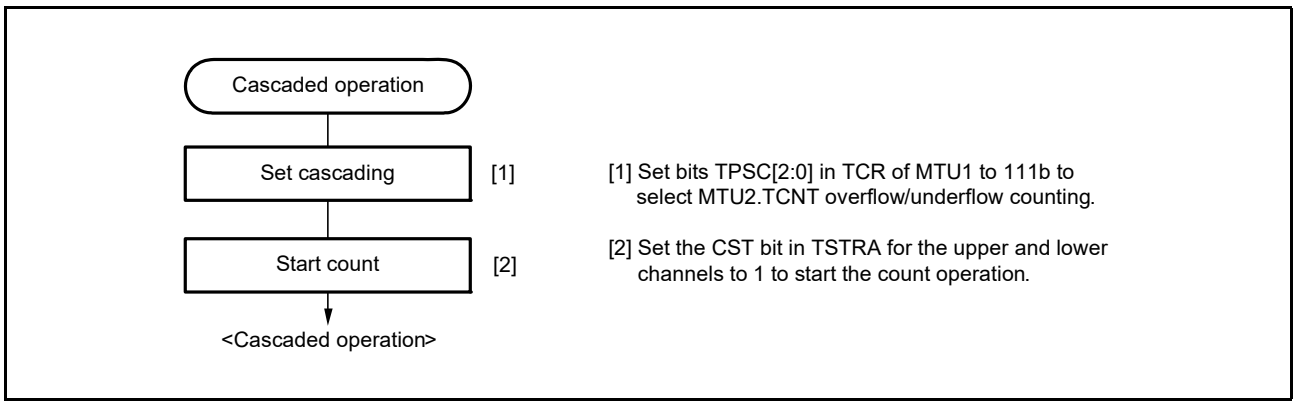

Figure 19.21 Cascaded Operation Setting Procedure

(2) Cascaded Operation Example (a)

Figure 19.22 illustrates the operation when MTU2.TCNT overflow/underflow counting has been set for MTU1.TCNT and phase counting mode has been designated for MTU2.
MTU1.TCNT is incremented by MTU2.TCNT overflow and decremented by MTU2.TCNT underflow.

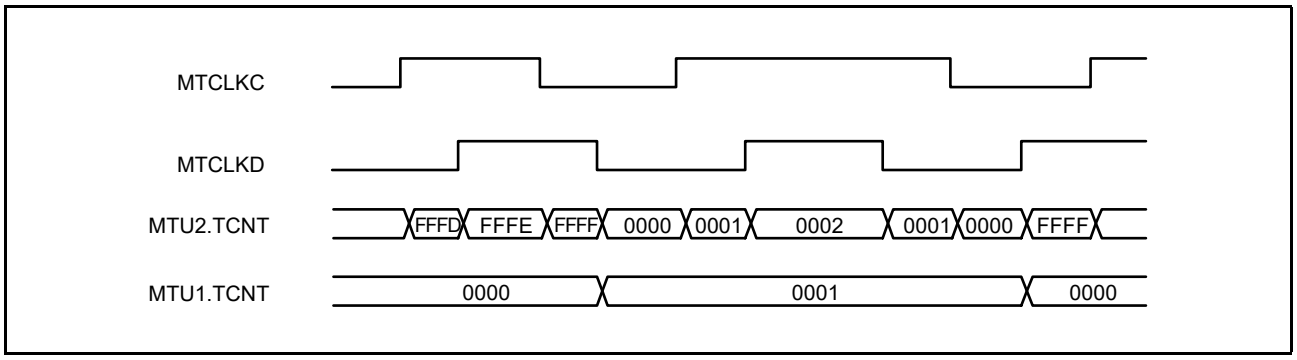

Figure 19.22 Cascaded Operation Example (a)

(3) Cascaded Operation Example (b)

Figure 19.23 illustrates the operation when MTU1.TCNT and MTU2.TCNT have been cascaded and the I2AE bit in TICCR has been set to 1 to include the MTIOC2A pin in the MTU1.TGRA input capture conditions. In this example, the MTU1.TIOR.IOA[3:0] bits have selected the MTIOC1A rising edge for the input capture timing while the MTU2.TIOR.IOA[3:0] bits have selected the MTIOC2A rising edge for the input capture timing.
Under these conditions, the rising edge of both MTIOC1A and MTIOC2A is used for the MTU1.TGRA input capture condition. For the MTU2.TGRA input capture condition, the MTIOC2A rising edge is used.

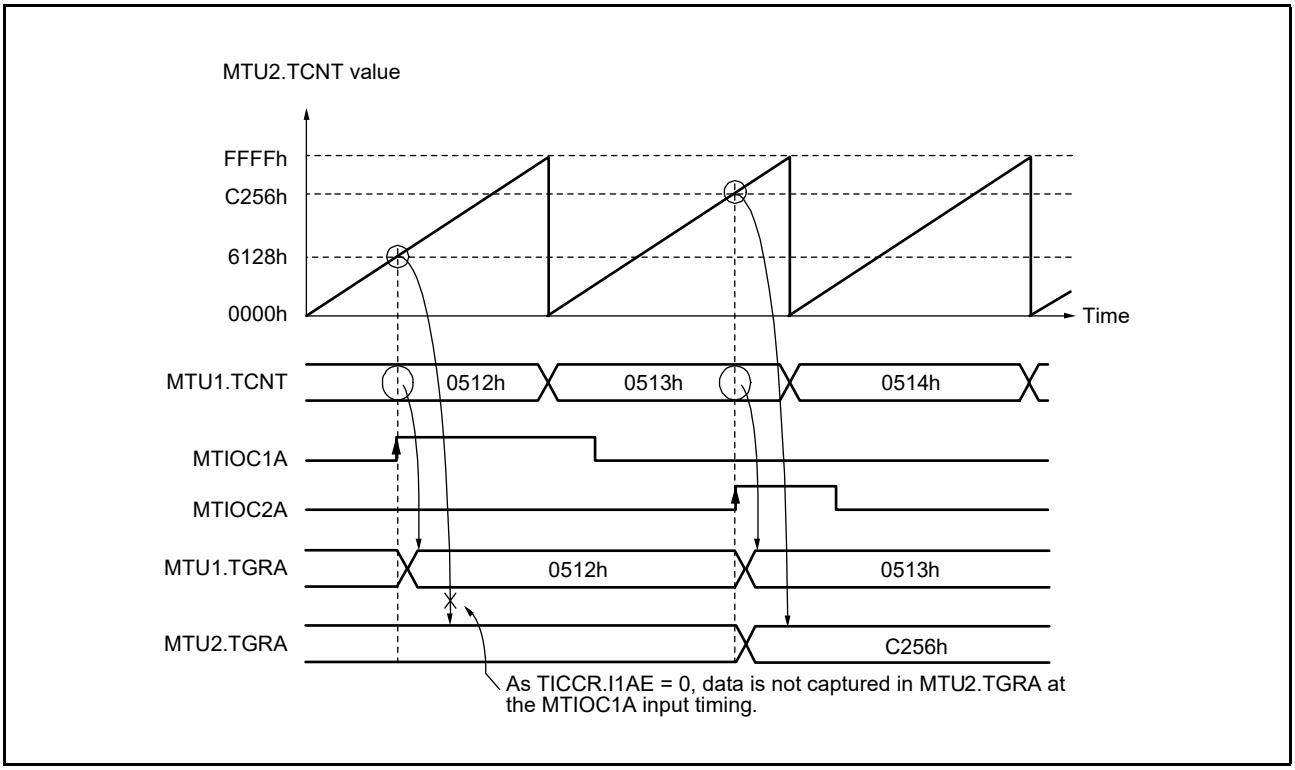

Figure 19.23 Cascaded Operation Example (b)

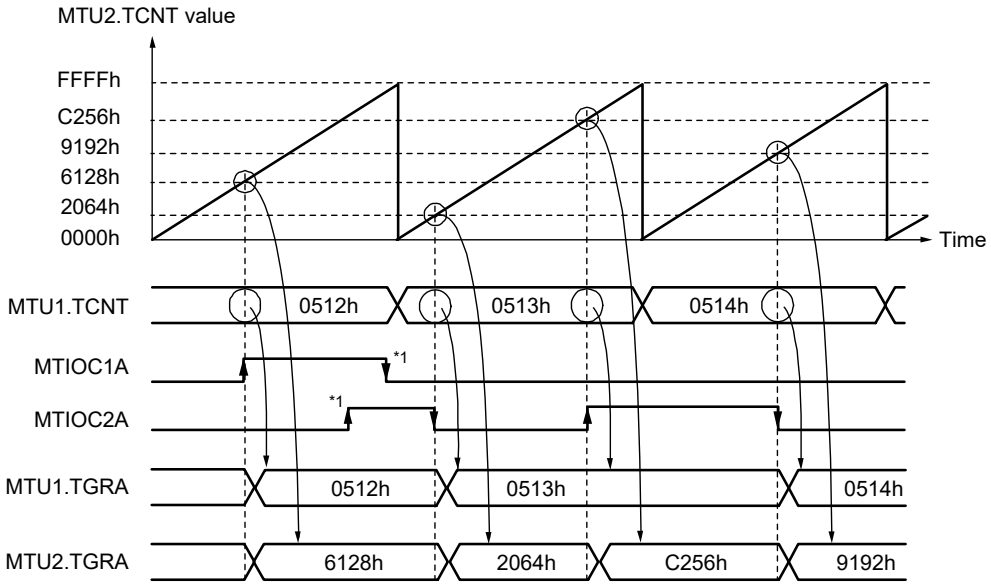
(4) Cascaded Operation Example (c)

Figure 19.24 illustrates the operation when MTU1.TCNT and MTU2.TCNT have been cascaded and the TICCR.I2AE and I1AE bits have been set to 1 to include the MTIOC2A and MTIOC1A pins in the MTU1.TGRA and MTU2.TGRA input capture conditions, respectively. In this example, the IOA[3:0] bits in both MTU1.TIOR and MTU2.TIOR have selected both the rising and falling edges for the input capture timing. Under these conditions, the ORed result of MTIOC1A and MTIOC2A input is used for the MTU1.TGRA and MTU2.TGRA input capture conditions.



Note 1. When either of the input signals is driven high, the selected edge of the other cannot act as the input capture condition.

Figure 19.24 Cascaded Operation Example (c)

(5) Cascaded Operation Example (d)

Figure 19.25 illustrates the operation when MTU1.TCNT and MTU2.TCNT have been cascaded and the TICCR.I2AE bit has been set to 1 to include the MTIOC2A pin in the MTU1.TGRA input capture conditions. In this example, the IOA[3:0] bits in MTU1.TIOR have selected occurrence of MTU0.TGRA compare match or input capture for the input capture timing while the IOA[3:0] bits in MTU2.TIOR have selected the MTIOC2A rising edge for the input capture timing.

Under these conditions, as MTU1.TIOR has selected occurrence of MTU0.TGRA compare match or input capture for the input capture timing, the MTIOC2A edge is not used for MTU1.TGRA input capture condition although the I2AE bit in TICCR has been set to 1.

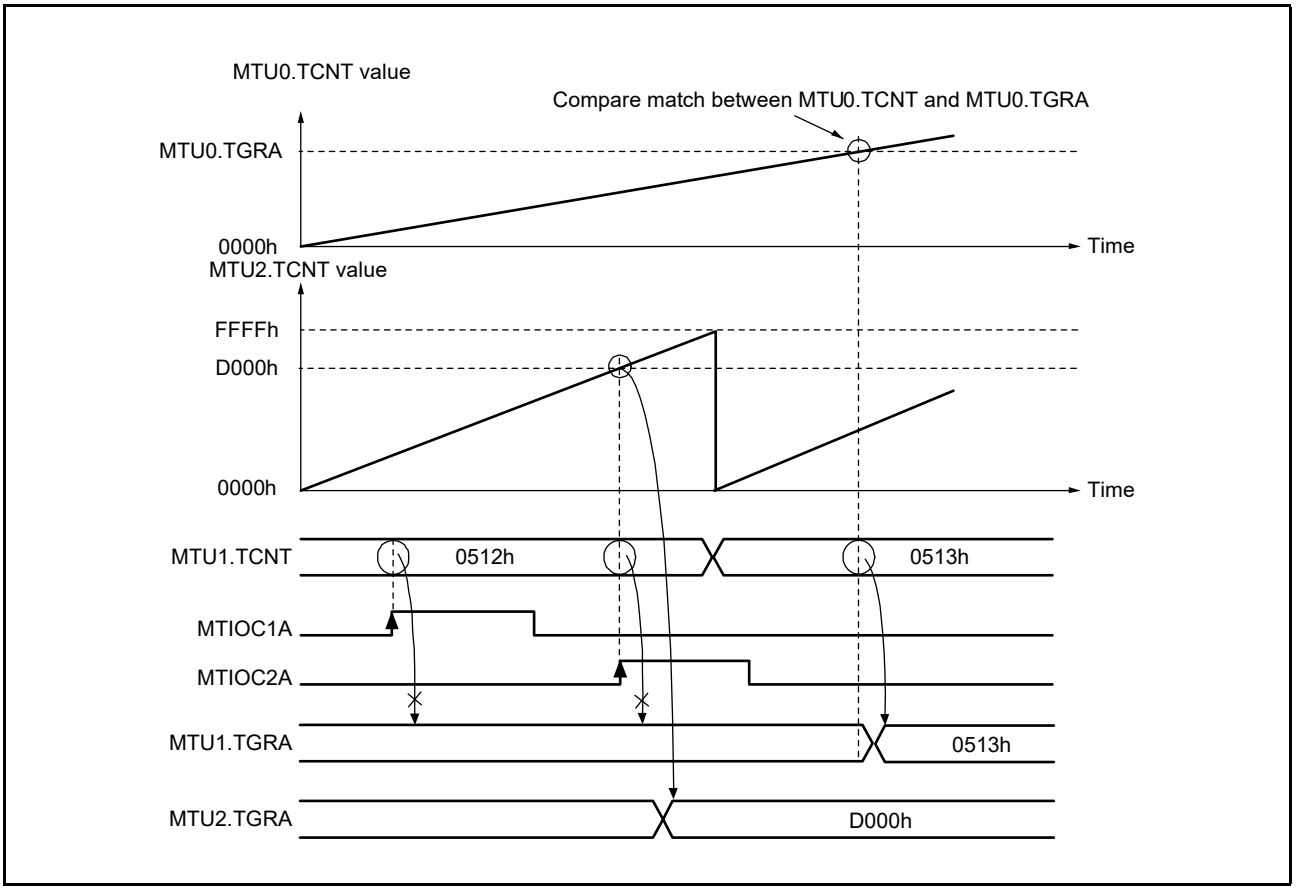


Figure 19.25 Cascaded Operation Example (d)

19.3.5 PWM Modes

PWM modes are provided to output PWM waveforms from the external pins. The output level can be selected as low, high, or toggle output in response to a compare match of each TGR.
PWM waveforms in the range of 0% to 100% duty cycle can be output according to the TGR settings.
By designating TGR compare match as the counter clearing source, the PWM cycle can be specified in that register.
Every channel can be set to PWM mode independently. Synchronous operation is also possible.
There are two PWM modes as described below.

(a) PWM Mode 1

PWM waveforms are output from the MTIOCnA and MTIOCnC pins by pairing TGRA with TGRB and TGRC with TGRD. The levels specified by the TIOR.IOA[3:0] and TIOR.IOC[3:0] bits are output from the MTIOCnA and MTIOCnC pins at compare matches A and C, and the level specified by the TIOR.IOB[3:0] and TIOR.IOD[3:0] bits are output at compare matches B and D (n = 0 to 4, 6, or 7). The initial output value is set in TGRA or TGRC. If the values set in paired TGRs are identical, the output value does not change even when a compare match occurs.
In PWM mode 1, PWM waveforms in up to 12 phases can be output.

(b) PWM Mode 2

PWM waveform output is generated using one TGR as the cycle register and the others as duty registers. The level specified in TIOR is output at compare matches. Upon counter clearing by a cycle register compare match, the initial value set in TIOR is output from each pin. If the values set in the cycle and duty registers are identical, the output value does not change even when a compare match occurs.

In PWM mode 2, up to eight phases of PWM waveforms can be output when using synchronous operation in combination.

The correspondence between PWM output pins and registers is shown in Table 19.65.

Table 19.65 PWM Output Registers and Output Pins

		Output Pins	
Channel	**Register**	**PWM Mode 1**	**PWM Mode 2**
MTU0	TGRA	MTIOC0A	MTIOC0A
	TGRB		MTIOC0B
	TGRC	MTIOC0C	MTIOC0C
	TGRD		MTIOC0D
MTU1	TGRA	MTIOC1A	MTIOC1A
	TGRB		MTIOC1B
MTU2	TGRA	MTIOC2A	MTIOC2A
	TGRB		MTIOC2B
MTU3	TGRA	MTIOC3A	Setting prohibited
	TGRB		
	TGRC	MTIOC3C	
	TGRD		
MTU4	TGRA	MTIOC4A	
	TGRB		
	TGRC	MTIOC4C	
	TGRD		
MTU6	TGRA	MTIOC6A	
	TGRB		
	TGRC	MTIOC6C	
	TGRD		
MTU7	TGRA	MTIOC7A	
	TGRB		
	TGRC	MTIOC7C	
	TGRD		

Note: In PWM mode 2, PWM waveform output is not possible for the TGR register in which the PWM cycle is set.

(1) Example of PWM Mode Setting Procedure

Figure 19.26 shows an example of the PWM mode setting procedure.

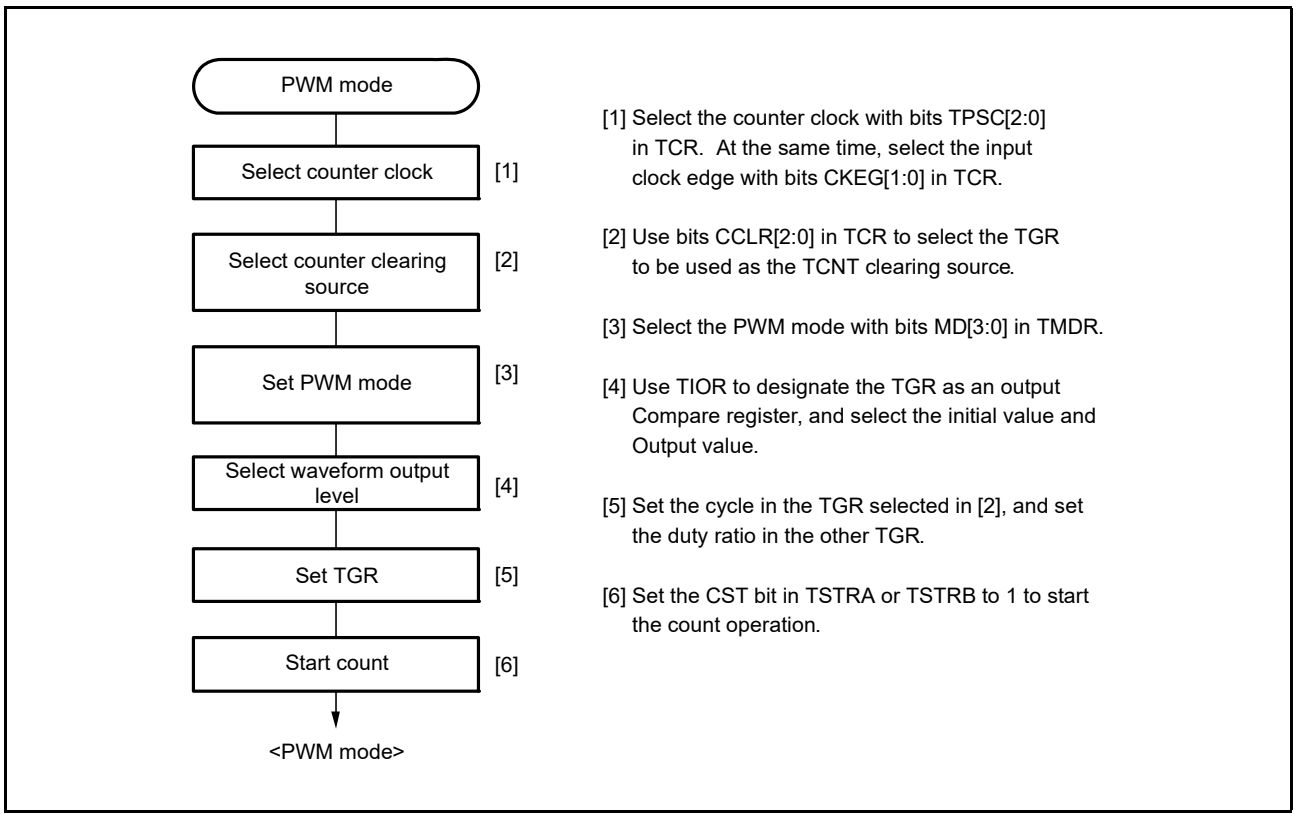

Figure 19.26 Example of PWM Mode Setting Procedure

(2) Examples of PWM Mode Operation

Figure 19.27 shows an example of operation in PWM mode 1.
In this example, TGRA compare match is set as the TCNT clearing source, 0 is set as the initial output value and output value for TGRA, and 1 is set as the output value for TGRB.
In this case, the value set in TGRA is used as the cycle, and the value set in TGRB is used as the duty ratio.

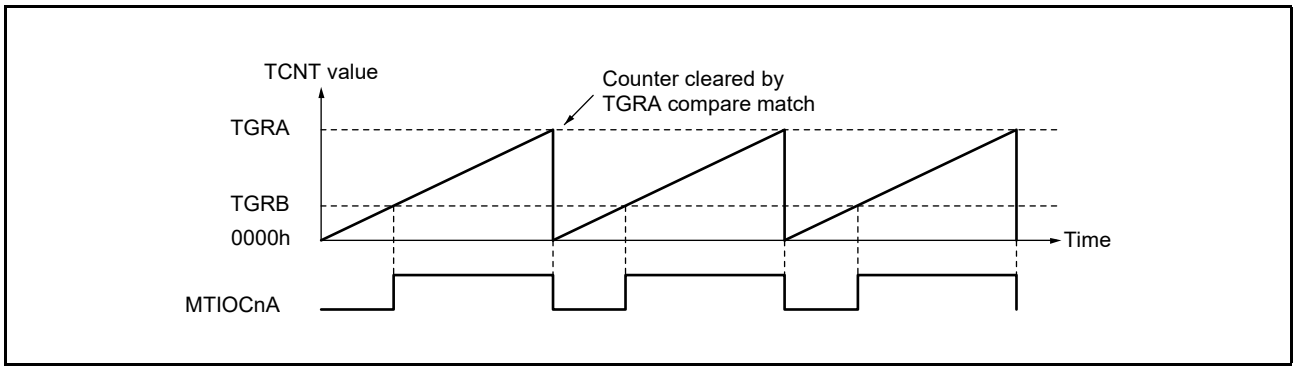

Figure 19.27 Example of PWM Mode 1 Operation (n = 0 to 4, 6, or 7)

Figure 19.28 shows an example of operation in PWM mode 2.
In this example, synchronous operation is designated for MTU0 and MTU1, MTU1.TGRB compare match is set as the TCNT clearing source, and Low is set as the initial output value and High as the output value for the other TGR registers (MTU0.TGRA to MTU0.TGRD and MTU1.TGRA), outputting 5-phase PWM waveforms.
In this case, the value set in MTU1.TGRB is used as the cycle, and the values set in the other TGRs are used as the duty ratio.

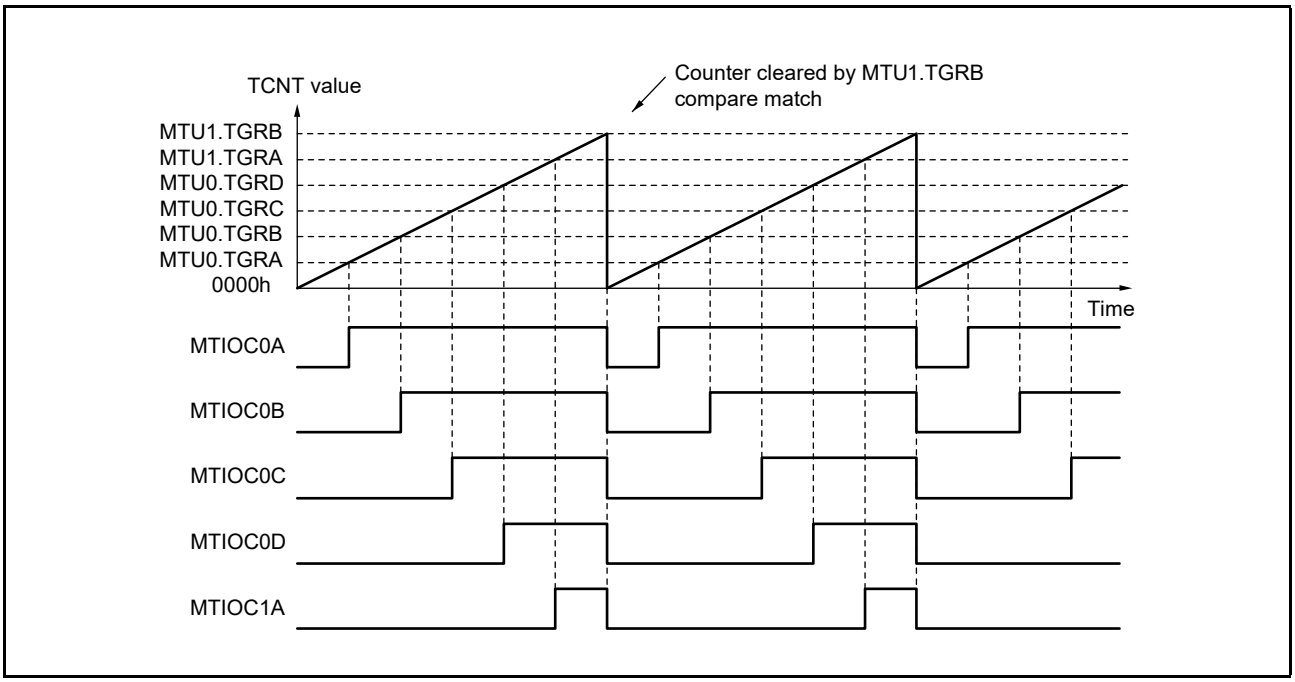

Figure 19.28 Example of PWM Mode 2 Operation

Figure 19.29 shows examples of PWM waveform output with 0% duty and 100% duty in PWM mode.

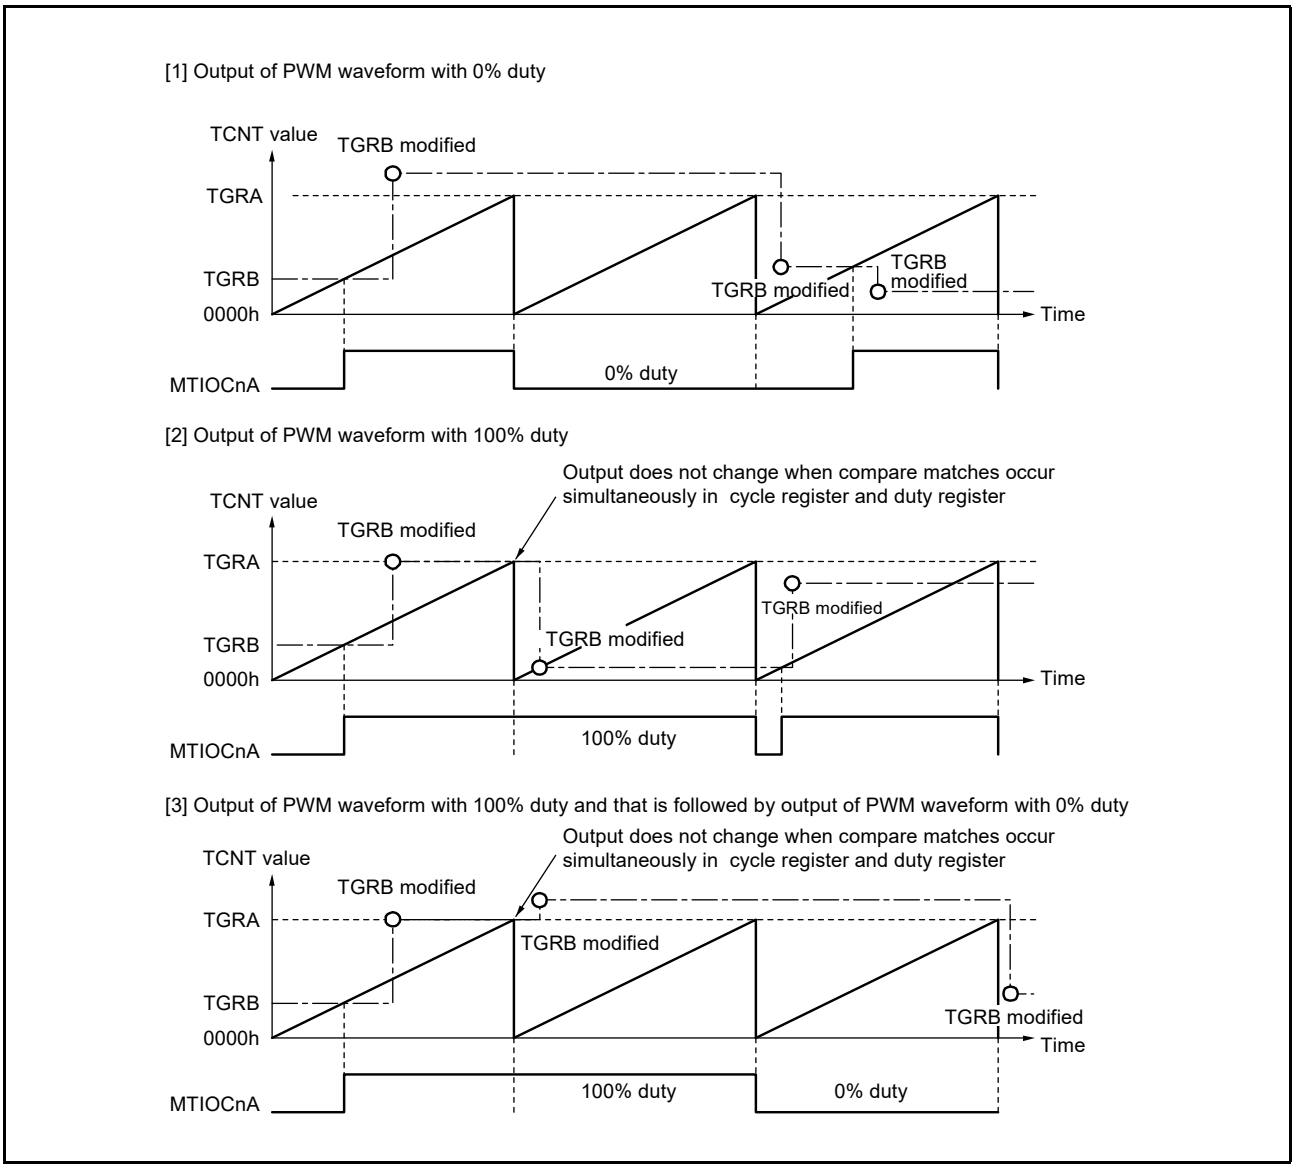

Figure 19.29 Examples of PWM Mode Operation (PWM Waveform Output with 0% Duty and 100% Duty) (n = 0 to 4, 6, or 7)

19.3.6 Phase Counting Mode

In phase counting mode, the phase difference between two external input clocks is detected and TCNT is incremented or decremented accordingly. This mode can be set for MTU1 and MTU2.

When phase counting mode is specified, an external clock is selected as the counter input clock and TCNT operates as an up-counter/down-counter regardless of the setting of the TCR.TPSC[2:0], TCR2.TPSC2[2:0], and TCR2.CKEG[1:0] bits. However, the functions of bits CCLR[1:0] in TCR and of TIOR, TIER, and TGR are valid, and input capture/compare match and interrupt functions can be used.

This can be used for two-phase encoder pulse input.

If an overflow occurs while TCNT is counting up, a TCIV interrupt is generated if the TCIEV bit in the TIER register is 1. If an underflow occurs while TCNT is counting down, a TCIU interrupt is generated if the TCIEU bit in the TIER register is 1.

The TCFD flag in TSR is the count direction flag. Read the TCFD flag to check whether TCNT is counting up or down.

This module operates in two phase counting mode: 16- and 32-bit modes. In 16-bit phase counting mode, MTU1 and MTU2 independently operate. In 32-bit phase counting mode, meanwhile, MTU1 and MTU2 jointly operate when the MTU1.TMDR3.LWA bit is set to 1. In 32-bit phase counting mode, the TCR, TCR2, TIOR, TIER, TMDR1, and TSR registers control MTU1. See Figure 19.43 for the procedure of selecting 32-bit phase counting mode.

Table 19.66 shows the correspondence between external clock pins and channels. In 32-bit phase counting mode, the TCR, TCR2, TIOR, TIER, TMDR1, and TSR registers are controlled by MTU1.

Table 19.66 Clock Input Pins in Phase Counting Mode

			External Clock Input Pins	
16-/32-bit mode	**Channel**	**TMDR3.PHCKSEL bit**	**A-Phase**	**B-Phase**
16-bit	MTU1	× (Don't care)	MTCLKA	MTCLKB
	MTU2	0	MTCLKA	MTCLKB
		1 (initial value)	MTCLKC	MTCLKD
32-bit	MTU1 and MTU2	0	MTCLKA	MTCLKB
		1 (initial value)	MTCLKC	MTCLKD

(1) Example of Phase Counting Mode Setting Procedure

Figure 19.30 shows an example of the phase counting mode setting procedure.

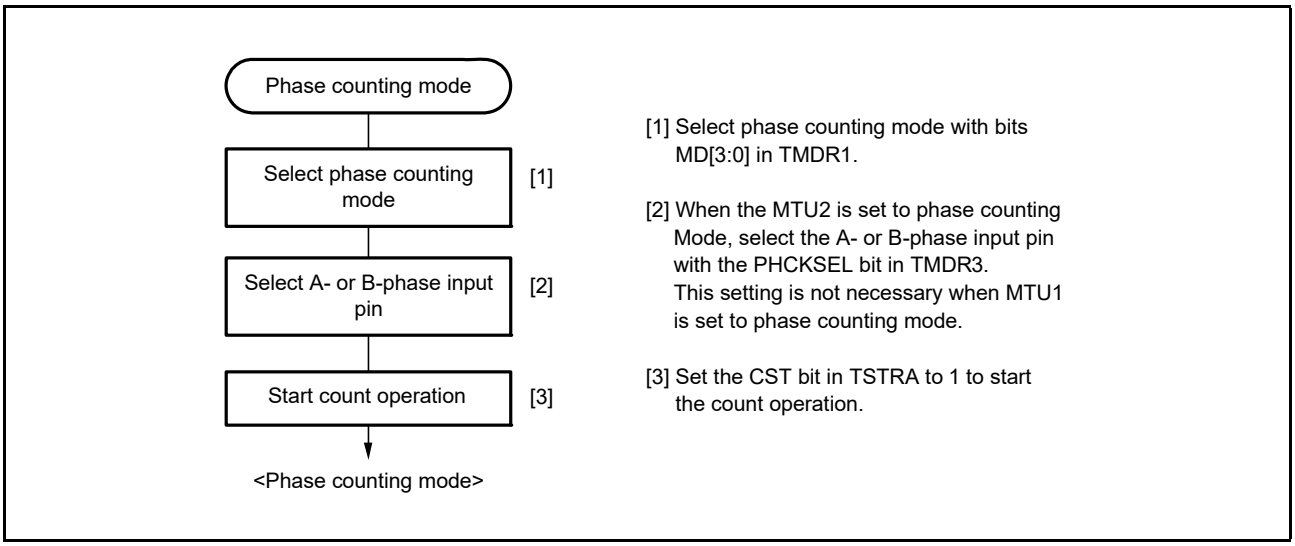

Figure 19.30 Example of Phase Counting Mode Setting Procedure

(2) Examples of Phase Counting Mode Operation

In phase counting mode, TCNT is incremented or decremented according to the phase difference between two external clocks. There are five modes according to the count conditions.
Operation in each mode is described by giving an example of 16-bit phase counting mode where the PHCKSEL bit in TMDR3 is 1 (the phase clock for MTU1 is MTCLKA or MTCLKB and that for MTU2 is MTCLKC or MTCLKD).

(a) Phase Counting Mode 1

Figure 19.31 shows an example of operation in phase counting mode 1, and Table 19.67 summarizes the TCNT up-/down-count conditions.

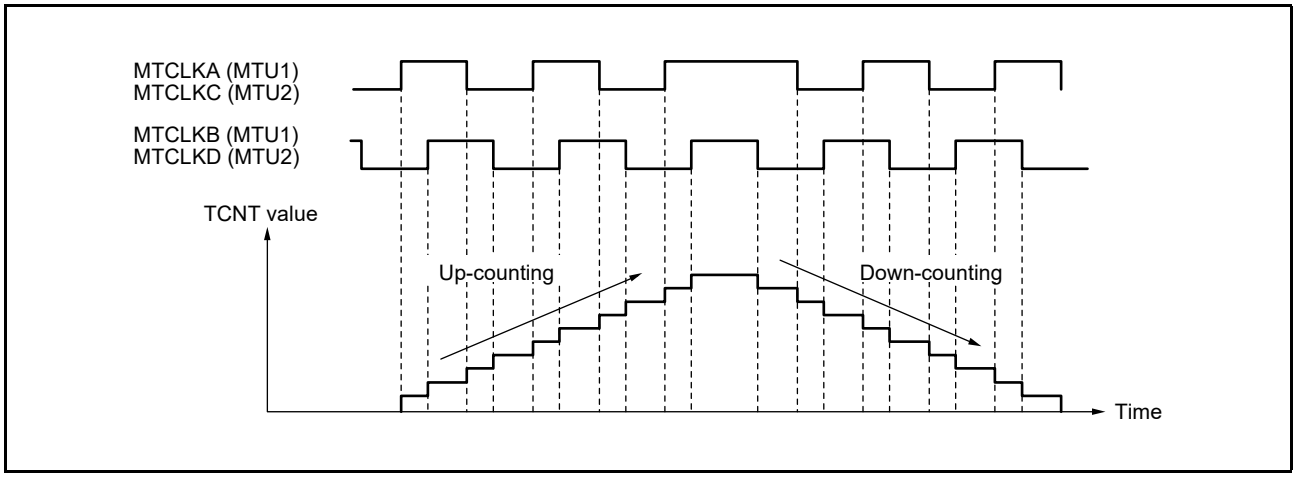

Figure 19.31 Example of Operation in Phase Counting Mode 1

(3) 16-bit Phase Counting Mode Application Example

Figure 19.41 shows an example in which MTU1 is in phase counting mode, and MTU1 is coupled with MTU0 to input 2-phase encoder pulses of a servo motor in order to detect position or speed.
MTU1 is set to phase counting mode 1, and the encoder pulse A-phase and B-phase are input to MTCLKA and MTCLKB.
In MTU0, MTU0.TGRC compare match is specified as the TCNT clearing source and MTU0.TGRA and MTU0.TGRC are used for the compare match function and are set with the speed control cycle and position control cycle.
MTU0.TGRB is used for input capture, with MTU0.TGRB and MTU0.TGRD operating in buffer mode.
The MTU1 counter input clock is designated as the MTU0.TGRB input capture source, and the widths of 2-phase encoder 4-multiplication pulses are detected.
MTU1.TGRA and MTU1.TGRB for MTU1 are designated for the input capture function and MTU0.TGRA and MTU0.TGRC compare matches in MTU0 are selected as the input capture sources to store the up/down-counter values for the control cycles.
This procedure enables the accurate detection of position and speed.

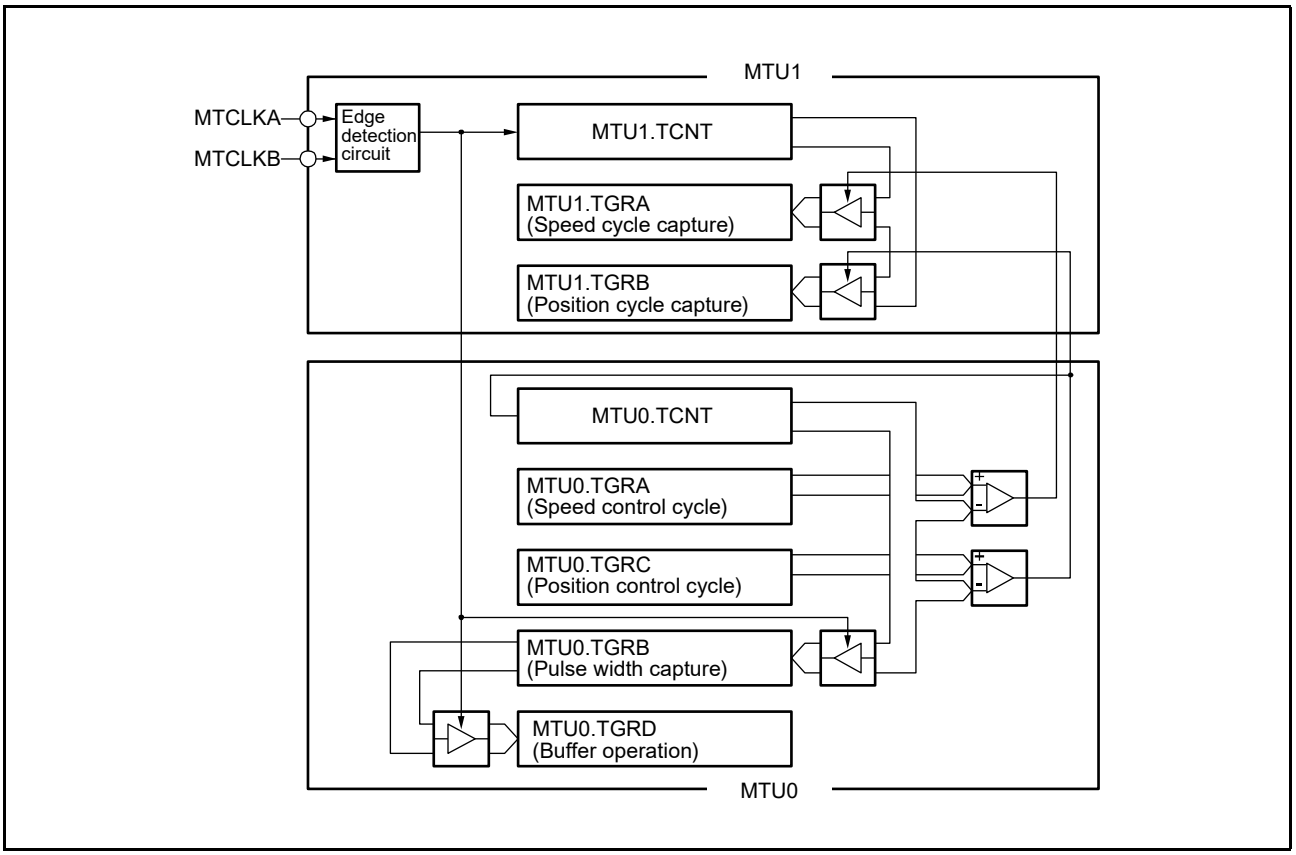

Figure 19.41 Phase Counting Mode Application Example

(4) 32-bit Phase Counting Mode Application Example

When MTU1 is set to phase counting mode by setting MTU1.TMDR3.LWA = 1, MTU1 and MTU2 are connected to operate in cascade connection 32-bit phase counting mode as shown in Figure 19.42. When this mode is used, the TCR, TCR2, TIOR, TIER, TMDR1, and TSR registers are controlled by MTU1 and the settings of MTU2 are disabled. Refer to Figure 19.43 for the procedure for setting cascade connection 32-bit phase counting mode.

In this mode, three-phase (A, B, and Z) signals can be input. As an encoder pulse signal, the external input phase clocks MTCLKA and MTCLKB or MTCLKC and MTCLKD can be selected for A-phase and B-phase, and MTIOC1A can be selected for Z-phase, respectively. Refer to Table 19.70 for selecting external clock input of A-phase and B-phase. A counter event is generated using an A-phase or B-phase pulse and counted by the 32-bit counter MTU1.TCNTLW.

An input capture can also be generated using a Z-phase signal; thus the angular velocity can be measured using the captured value in the general register (MTU1.TGRALW, MTU1.TGRBLW).

Furthermore, MTU8 can be used as a channel for measuring a control period interval, and a compare match signal can be output at a control period interval to the MTU1 and MTU2, which operate in cascade connection 32-bit phase counting mode. That is, a compare match signal of MTU8 is used as a capture signal of MTU1 and MTU2, and the number of A-phase and B-phase pulses for a control period can be measured.

When MTU0 or MTU5 is specified as the channel for measuring a Z-phase signal pulse, this compare match signal of MTU8.TGRC can be output as a capture signal or clear signal to MTU0 or MTU5, thus the Z-phase count at a control period interval can be measured.

In addition, a counter event signal of combined MTU1 and MTU2 can be used as a capture signal of MTU8.TGRD, and measurement can be performed including the intervals of A, B, or both phase pulses. In this case, the general register for measurement (MTU8.TGRD) should be set to a register for buffer operation.

Refer to section 19.3.4, Cascaded Operation, for details on the cascade connection function for connecting MTU1 and MTU2 in a mode other than cascade connection 32-bit phase counting mode.

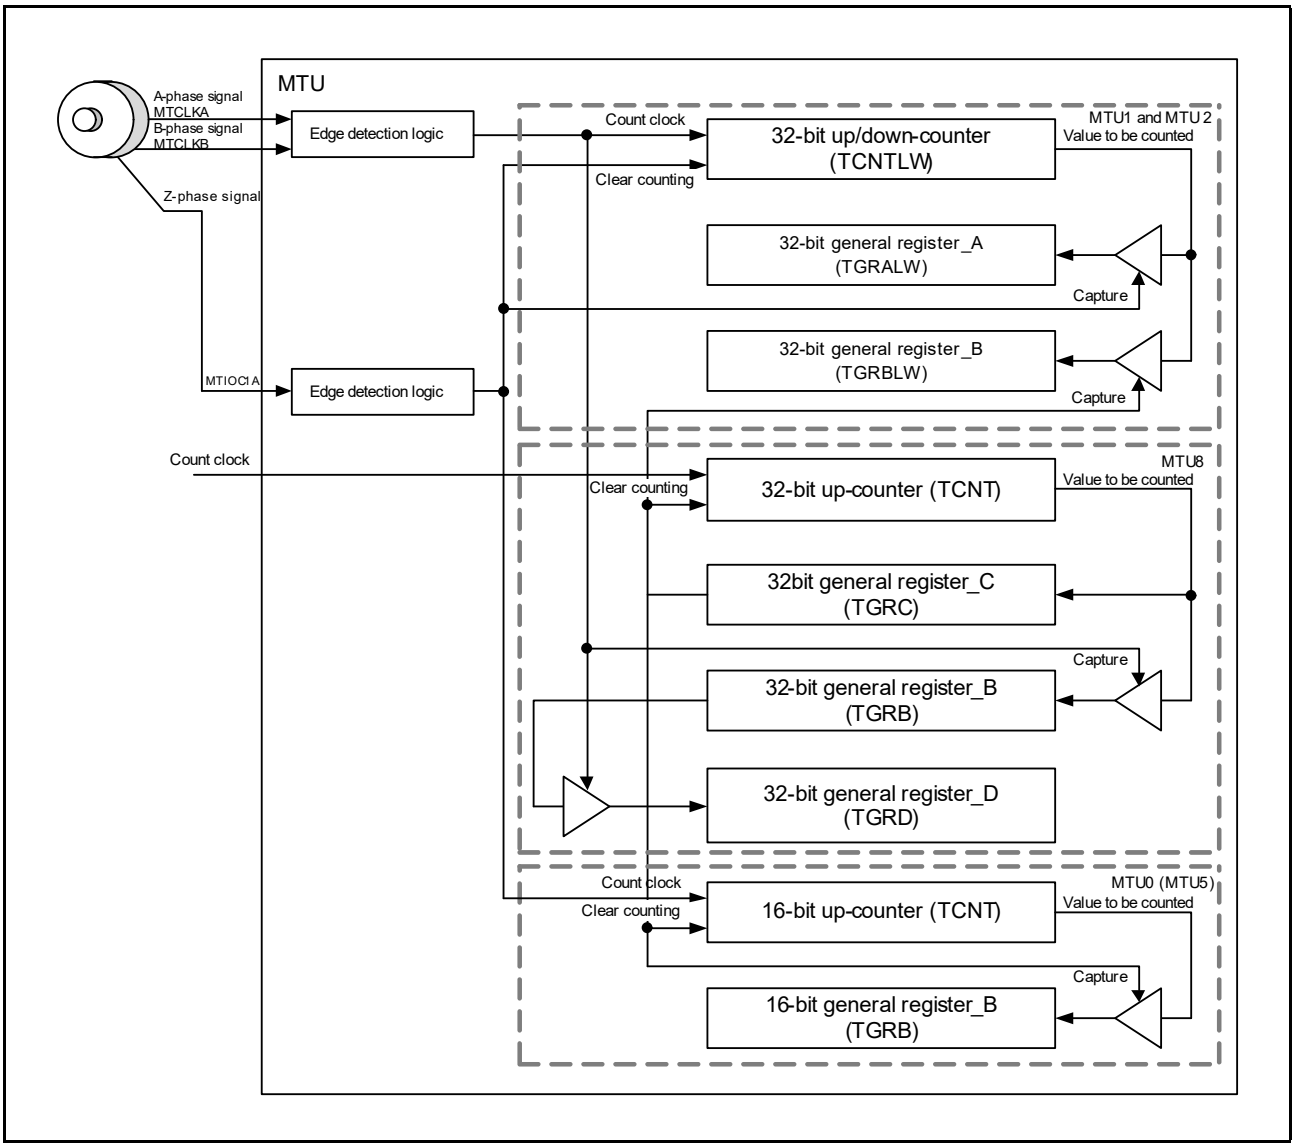

Figure 19.42 32-bit Phase Counting Mode Application Example

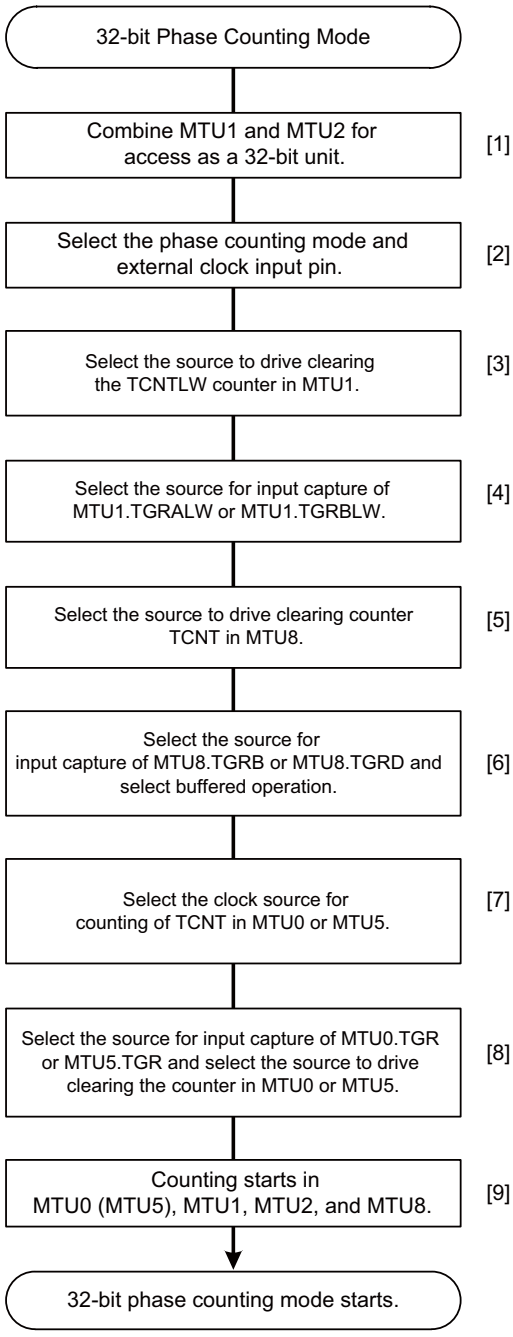


[1] Set the LWA bit in MTU1.TMDR3 to 1 and combine MTU1 and MTU2 for access as a 32-bit unit.

[2] Select phase counting mode with the MD[3:0] bits in MTU1.TMDR1 and select the external clock input pin with the PHCKSEL bits in MTU1.TMDR3.

[3] Set the CCLR[2:0] bits in MTU1.TCR to 001b to select input capture of MTU1.TGRALW as the source of the signal to drive clearing counter TCNTLW in MTU1.

[4] Set the IOA[3:0] bits in MTU1.TIOR to select the effective edge (rising, falling or both) of the signal produced by input capture of TGRALW in MTU1. After that, set the IOB[3:0] bits in MTU1.TIOR to 1110b to select the compare match signal of MTU8.TGRC as the source to drive input capture of MTU1.TGRBLW.

[5] Set the CCLR[2:0] bits in MTU8.TCR to 101b to select the compare match signal of MTU8.TGRC as the source to drive clearing counter TCNT in MTU8.

[6] Select the source for input capture of MTU8.TGRB as the clock source for counting of TCNTLW in MTU1 by setting the IOB[3:0] bits in MTU8.TIORH to 1110b. At the same time, select buffered operation for TGRB and TGRD by setting the BFB bit in MTU8.TMDR1 to 1.

[7] Set the TPSC2[2:0] bits in MTU0.TCR2 to 111b to select the MTIOC1A pin as the clock source for counting of TCNT in MTU0.
(When using TCNT in MTU5, set the TPSC2[2:0] bits in MTU5.TCR2 to 111b).

[8] Select the compare match signal of MTU8.TGRC as the source to drive input capture of MTU0.TGRA by setting the IOA[3:0] bits in MTU0.TIORH to 1110b.
(When using TCNT in MTU5, set the TIORU, TIORV, or TIORW bit in MTU5 is set to 10100b).
After that, select input capture of MTU0.TGRA as the source to drive clearing counter TCNT in MTU0 by setting the CCLR[2:0] bits in MTU0.TCR to 001b.

[9] Start counting in MTU0, MTU1, MTU2, and MTU8 by setting the TSTRA bit to 00001111b.
(When using TCNT in MTU5, set the counter corresponding to TSTR in MTU5 to 1).

Note: When the LWA bit in MTU1.TMDR3 is set to 1, the TCR, TCR2, TMDR1, and TIOR registers in MTU1 are effective in controlling cascaded operation. In this case, the settings of these registers in MTU2 are ignored.

Figure 19.43 Procedure of Selecting 32-bit Phase Counting Mode

19.3.7 Reset-Synchronized PWM Mode

In reset-synchronized PWM mode, three phases of positive and negative PWM waveforms (six phases in total) that share a common wave transition point can be output by combining MTU3 and MTU4 and MTU6 and MTU7.
When set for reset-synchronized PWM mode, the MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D, MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, and MTIOC7D pins function as PWM output pins and timer counters 3 and 6 (MTU3.TCNT and MTU6.TCNT) functions as an up-counter.
Table 19.72 shows the PWM output pins used. Table 19.73 shows the settings of the registers.

Table 19.72 Output Pins for Reset-Synchronized PWM Mode

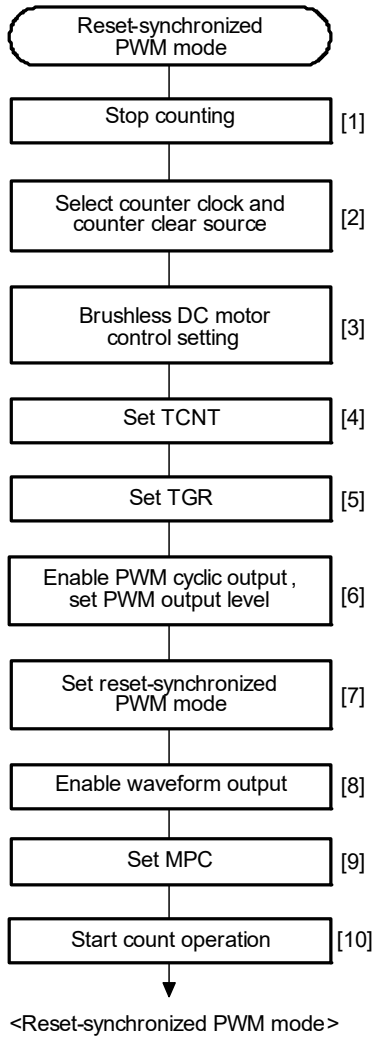
Channel	Output Pin	Description
MTU3	MTIOC3B	PWM output pin 1
	MTIOC3D	PWM output pin 1' (negative-phase waveform of PWM output 1)
MTU4	MTIOC4A	PWM output pin 2
	MTIOC4C	PWM output pin 2' (negative-phase waveform of PWM output 2)
	MTIOC4B	PWM output pin 3
	MTIOC4D	PWM output pin 3' (negative-phase waveform of PWM output 3)
MTU6	MTIOC6B	PWM output pin 4
	MTIOC6D	PWM output pin 4' (negative-phase waveform of PWM output 4)
MTU7	MTIOC7A	PWM output pin 5
	MTIOC7C	PWM output pin 5' (negative-phase waveform of PWM output 5)
	MTIOC7B	PWM output pin 6
	MTIOC7D	PWM output pin 6' (negative-phase waveform of PWM output 6)

Table 19.73 Register Settings for Reset-Synchronized PWM Mode

Register	Setting
MTU3.TCNT	Initial setting (0000h)
MTU4.TCNT	Initial setting (0000h)
MTU3.TGRA	Set the count cycle for MTU3.TCNT
MTU3.TGRB	Set the transition point of the PWM waveform to be output from the MTIOC3B and MTIOC3D pins
MTU4.TGRA	Set the transition point of the PWM waveform to be output from the MTIOC4A and MTIOC4C pins
MTU4.TGRB	Set the transition point of the PWM waveform to be output from the MTIOC4B and MTIOC4D pins
MTU6.TCNT	Initial setting (0000h)
MTU7.TCNT	Initial setting (0000h)
MTU6.TGRA	Set the count cycle for MTU6.TCNT
MTU6.TGRB	Set the transition point of the PWM waveform to be output from the MTIOC6B and MTIOC6D pins
MTU7.TGRA	Set the transition point of the PWM waveform to be output from the MTIOC7A and MTIOC7C pins
MTU7.TGRB	Set the transition point of the PWM waveform to be output from the MTIOC7B and MTIOC7D pins

(1) Example of Procedure for Setting Reset-Synchronized PWM Mode

Figure 19.44 shows an example of procedure for setting the reset-synchronized PWM mode.



[1] Clear the CST3 and CST4 bits in TSTRA to 0 to stop the TCNT operation. Specify the reset-synchronized PWM mode while MTU3.TCNT and MTU4.TCNT are stopped.

[2] Set bits TPSC[2:0] and CKEG[1:0] in MTU3.TCR to select the counter clock and clock edge for MTU3. Set bits CCLR[2:0] to select TGRA compare match as a counter clear source.

[3] When performing brushless DC motor control, set bit BDC in the timer gate control register (TGCRA) and set the feedback signal input source and output chopping or gate signal direct output.

[4] Set MTU3.TCNT and MTU4.TCNT to 0000h.

[5] MTU3.TGRA is the cycle register. Set the waveform cycle value in MTU3.TGRA. Set the transition timing of the PWM output waveforms in MTU3.TGRB, MTU4.TGRA, and MTU4.TGRB. The set value should be within the range of compare match between MTU3.TCNT and MTU3.TGRA.

$X \leq$ MTU3.TGRA (X: Set value)

[6] Enable or disable toggle output synchronized with the PMW cycle using bit PSYE in TOCR1A, and set the PWM output level with bits OLSP and OLSN. When specifying the PWM output level by using TOLBRA as a buffer for TOCR2A, see Figure 19.3.

[7] Set bits MD[3:0] in MTU3.TMDR1 to 1000b to select the reset-synchronized PWM mode. In addition, specify the buffer operation of the MTU3.TGRA (BFA = 1) and MTU3.TGRC (BFB = 1) when necessary. Set the MTU4.TMDR1 to the initial value (normal operation; BFA = 0 and BFB = 0).

[8] Set the enabling/disabling of the PWM waveform output pin in TOERA.

[9] Set the port control register and the port I/O register.

[10] Set the CST3 bit in the TSTRA to 1 to start the count operation.

Note: The output waveform starts to toggle at the point of MTU3.TCNT = MTU3.TGRA = X by setting X = MTU3.TGRA, i.e., cycle = duty ratio.

Figure 19.44 Procedure for Selecting Reset-Synchronized PWM Mode

(2) Example of Reset-Synchronized PWM Mode Operation

Figure 19.45 shows an example of operation in the reset-synchronized PWM mode.
MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) operate as up-counters. The counters are cleared when a compare match occurs between MTU3.TCNT (MTU6.TCNT) and MTU3.TGRA (MTU6.TGRA), and then begin incrementing from 0000h. The output from the PWM pins toggles every time a compare match occurs in MTU3.TGRB (MTU6.TGRB), MTU4.TGRA (MTU7.TGRA), and MTU4.TGRB (MTU7.TGRB) and the counters are cleared.

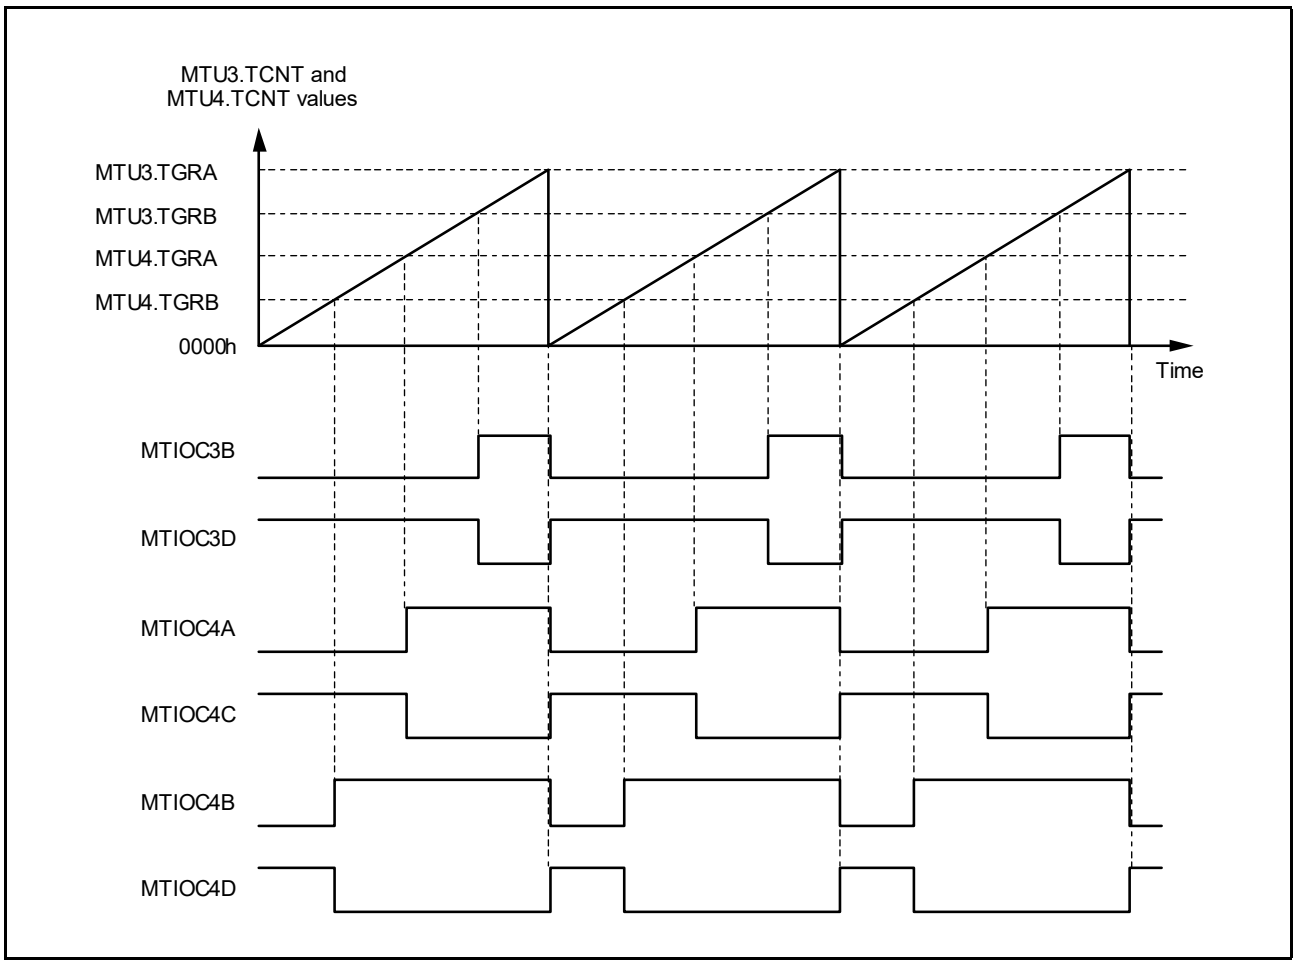


Figure 19.45 Example of Reset-Synchronized PWM Mode Operation (When TOCR1A's OLSN = 1 and OLSP = 1 in MTU3 and MTU4)

19.3.8 Complementary PWM Mode

In complementary PWM mode, the dead time can be set for the output PWM waveforms. The dead time is a period during which both the upper and lower arm transistors are set to the non-active level to prevent a short circuit of the arm. PWM waveforms can be output in six positive and inverse phases (12 phases in total) with dead time by combining MTU3 and MTU4 and MTU6 and MTU7. PWM waveforms without dead time can also be output.
In complementary PWM mode, MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4B, MTIOC4C, MTIOC4D, MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7B, MTIOC7C, and MTIOC7D pins function as PWM output pins, and the MTIOC3A and MTIOC6A pins can be set for toggle output synchronized with the PWM cycle.
MTU3.TCNT, MTU4.TCNT, MTU6.TCNT, and MTU7.TCNT function as up/down-counters.
Table 19.74 shows the PWM output pins used. Table 19.75 shows the settings of the registers used.
A function to directly cut off the PWM output by using an external signal is supported as a port function.

Table 19.74 Output Pins for Complementary PWM Mode

Channel	Output Pin	Description
MTU3	MTIOC3A	Toggle output synchronized with PWM cycle (or I/O port)
	MTIOC3B	PWM output pin 1
	MTIOC3C	I/O port*1
	MTIOC3D	PWM output pin 1' (Negative-phase waveform of PWM output 1 is output.)
MTU4	MTIOC4A	PWM output pin 2
	MTIOC4C	PWM output pin 2' (Negative-phase waveform of PWM output 2 is output.)
	MTIOC4B	PWM output pin 3
	MTIOC4D	PWM output pin 3' (Negative-phase waveform of PWM output 3 is output.)
MTU6	MTIOC6A	Toggle output synchronized with PWM cycle (or I/O port)
	MTIOC6B	PWM output pin 4
	MTIOC6C	I/O port*1
	MTIOC6D	PWM output pin 4' (non-overlapping negative-phase waveform of PWM output 4; PWM output without non-overlapping interval is also available)
MTU7	MTIOC7A	PWM output pin 5
	MTIOC7C	PWM output pin 5' (non-overlapping negative-phase waveform of PWM output 5; PWM output without non-overlapping interval is also available)
	MTIOC7B	PWM output pin 6
	MTIOC7D	PWM output pin 6' (non-overlapping negative-phase waveform of PWM output 6; PWM output without non-overlapping interval is also available)

Note 1. Avoid setting the MTIOC3C and MTIOC6C pins as timer I/O pins in complementary PWM mode.

Table 19.75 Register Settings for Complementary PWM Mode (1/2)

Channel	Counter/ Register	Description	Read/Write from CPU
MTU3	TCNT	Starts up-counting from the value set in the dead time register	Maskable by TRWERA setting*1
	TGRA	Set MTU3.TCNT upper limit value (1/2 carrier cycle + dead time)	Maskable by TRWERA setting*1
	TGRB	PWM output 1 compare register	Maskable by TRWERA setting*1
	TGRC	MTU3.TGRA buffer register	Readable/writable
	TGRD	PWM output 1/MTU3.TGRB buffer register	Readable/writable
	TGRE	MTU3.TGRB buffer register B (when double buffer function is used)	Readable/writable
MTU4	TCNT	Starts up-counting after being initialized to 0000h	Maskable by TRWERA setting*1
	TGRA	PWM output 2 compare register	Maskable by TRWERA setting*1
	TGRB	PWM output 3 compare register	Maskable by TRWERA setting*1
	TGRC	PWM output 2/MTU4.TGRA buffer register	Readable/writable
	TGRD	PWM output 3/MTU4.TGRB buffer register	Readable/writable
	TGRE	MTU4.TGRA buffer register B (when double buffer function is used)	Readable/writable
	TGRF	MTU4.TGRB buffer register B (when double buffer function is used)	Readable/writable
MTU6	TCNT	Starts up-counting from the value set in the dead time register	Maskable by TRWERB setting*2
	TGRA	Set MTU6.TCNT upper limit value (1/2 carrier cycle + dead time)	Maskable by TRWERB setting*2
	TGRB	PWM output 4 compare register	Maskable by TRWERB setting*2
	TGRC	MTU6.TGRA buffer register	Readable/writable
	TGRD	PWM output 4/MTU6.TGRB buffer register	Readable/writable
	TGRE	MTU6.TGRB buffer register B (when double buffer function is used)	Readable/writable
MTU7	TCNT	Starts up-counting after being initialized to 0000h	Maskable by TRWERB setting*2
	TGRA	PWM output 5 compare register	Maskable by TRWERB setting*2
	TGRB	PWM output 6 compare register	Maskable by TRWERB setting*2
	TGRC	PWM output 5/MTU7.TGRA buffer register	Readable/writable
	TGRD	PWM output 6/MTU7.TGRB buffer register	Readable/writable
	TGRE	MTU7.TGRA buffer register B (when double buffer function is used)	Readable/writable
	TGRF	MTU7.TGRB buffer register B (when double buffer function is used)	Readable/writable

Note 1. Access can be enabled or disabled according to the setting in TRWERA (timer read/write enable register A).
Note 2. Access can be enabled or disabled according to the setting in TRWERB (timer read/write enable register B).

Table 19.75 Register Settings for Complementary PWM Mode (2/2)

Channel	Counter/ Register	Description	Read/Write from CPU
Timer dead time data register A (TDDRA)		Set MTU4.TCNT and MTU3.TCNT offset value (dead time value)	Maskable by TRWERA setting*1
Timer dead time data register B (TDDRB)		Set MTU7.TCNT and MTU6.TCNT offset value (dead time value)	Maskable by TRWERB setting*2
Timer cycle data register A (TCDRA)		Set MTU4.TCNT upper limit value (1/2 carrier cycle)	Maskable by TRWERA setting*1
Timer cycle data register B (TCDRB)		Set MTU7.TCNT upper limit value (1/2 carrier cycle)	Maskable by TRWERB setting*2
Timer cycle buffer register A (TCBRA)		TCDRA buffer register	Readable/writable
Timer cycle buffer register B (TCBRB)		TCDRB buffer register	Readable/writable
Subcounter A (TCNTSA)		Subcounter A for dead time generation	Read-only
Subcounter B (TCNTSB)		Subcounter B for dead time generation	Read-only
Temporary register 1A (TEMP1A)		PWM output 1/MTU3.TGRB temporary register A	Not readable/writable
Temporary register 1B (TEMP1B)		PWM output 1/MTU3.TGRB temporary register B (when double buffer function is used)	Not readable/writable
Temporary register 2A (TEMP2A)		PWM output 2/MTU4.TGRA temporary register A	Not readable/writable
Temporary register 2B (TEMP2B)		PWM output 2/MTU4.TGRA temporary register B (when double buffer function is used)	Not readable/writable
Temporary register 3A (TEMP3A)		PWM output 3/MTU4.TGRB temporary register A	Not readable/writable
Temporary register 3B (TEMP3B)		PWM output 3/MTU4.TGRB temporary register B (when double buffer function is used)	Not readable/writable
Temporary register 4A (TEMP4A)		PWM output 4/MTU6.TGRB temporary register A	Not readable/writable
Temporary register 4B (TEMP4B)		PWM output 4/MTU6.TGRB temporary register B (when double buffer function is used)	Not readable/writable
Temporary register 5A (TEMP5A)		PWM output 5/MTU7.TGRA temporary register A	Not readable/writable
Temporary register 5B (TEMP5B)		PWM output 5/MTU7.TGRA temporary register B (when double buffer function is used)	Not readable/writable
Temporary register 6A (TEMP6A)		PWM output 6/MTU7.TGRB temporary register A	Not readable/writable
Temporary register 6B (TEMP6B)		PWM output 6/MTU7.TGRB temporary register B (when double buffer function is used)	Not readable/writable

Note 1. Access can be enabled or disabled according to the setting in TRWERA (timer read/write enable register A).
Note 2. Access can be enabled or disabled according to the setting in TRWERB (timer read/write enable register B).

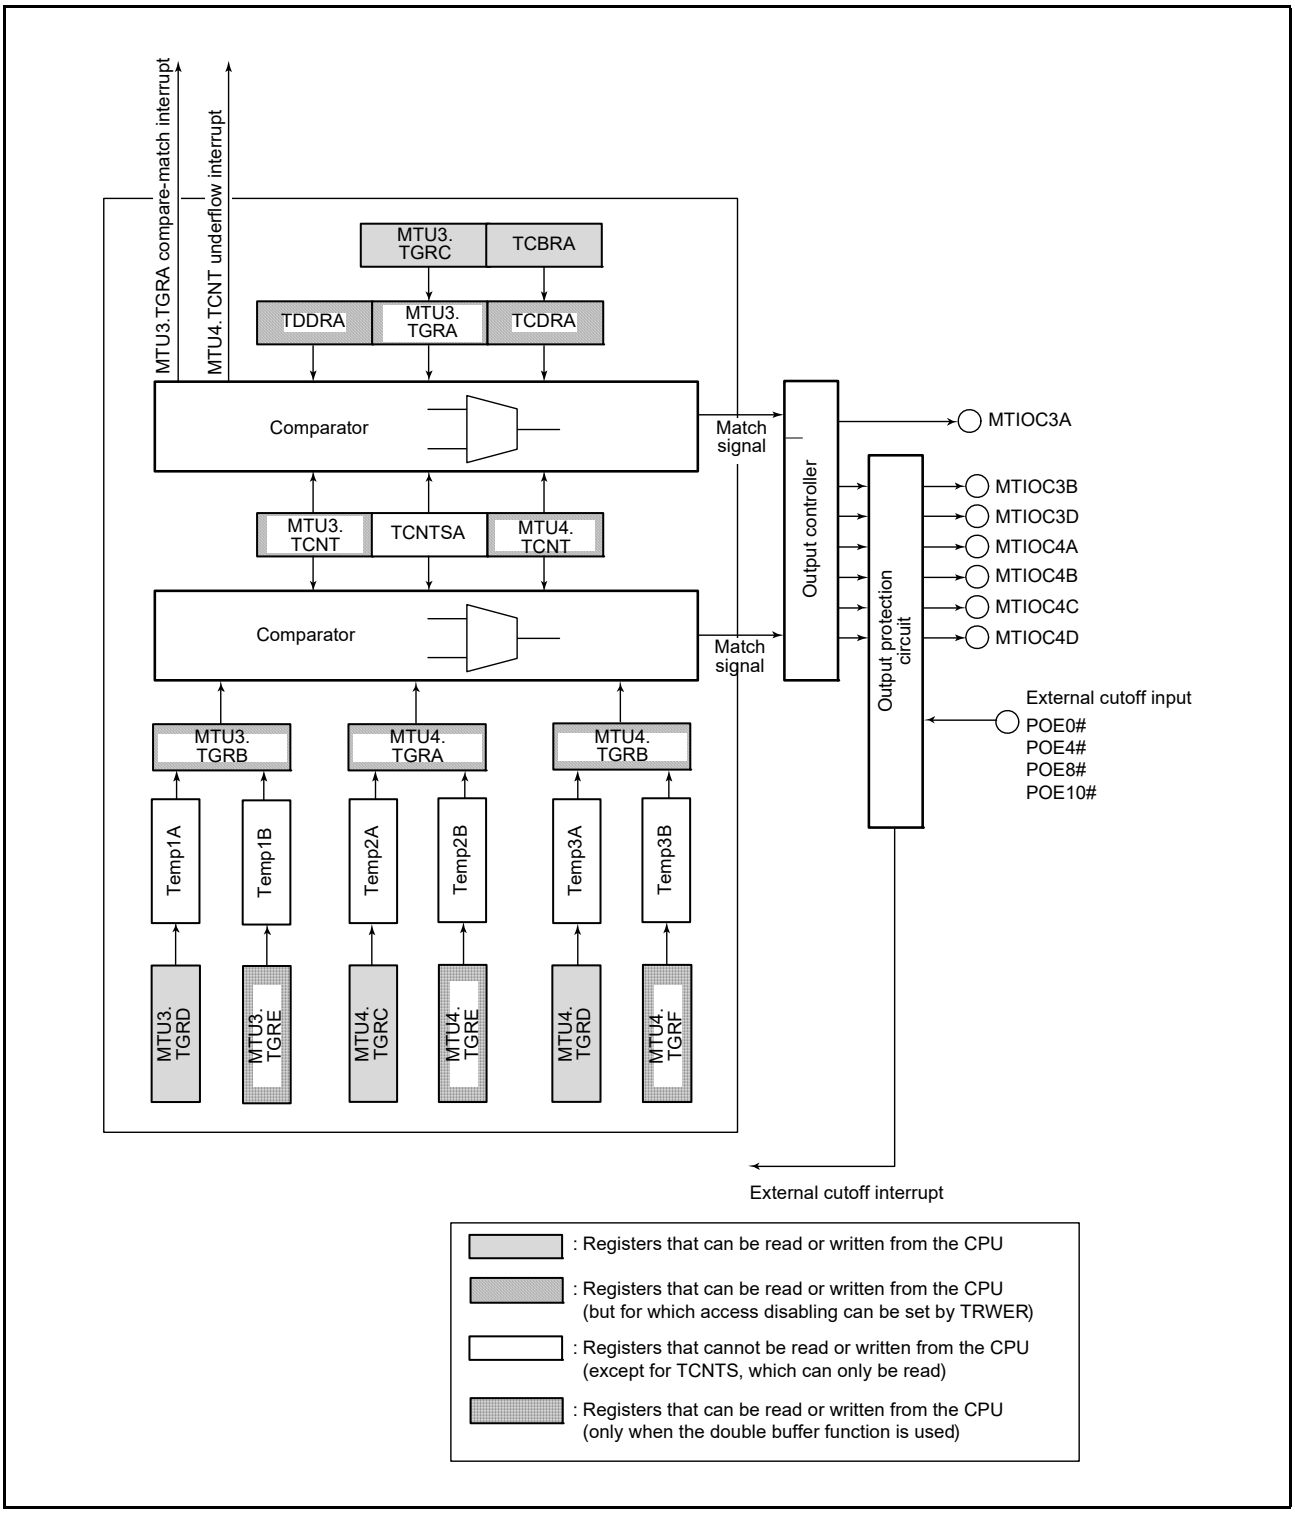

Figure 19.46 Block Diagram of MTU3 and MTU4 in Complementary PWM Mode

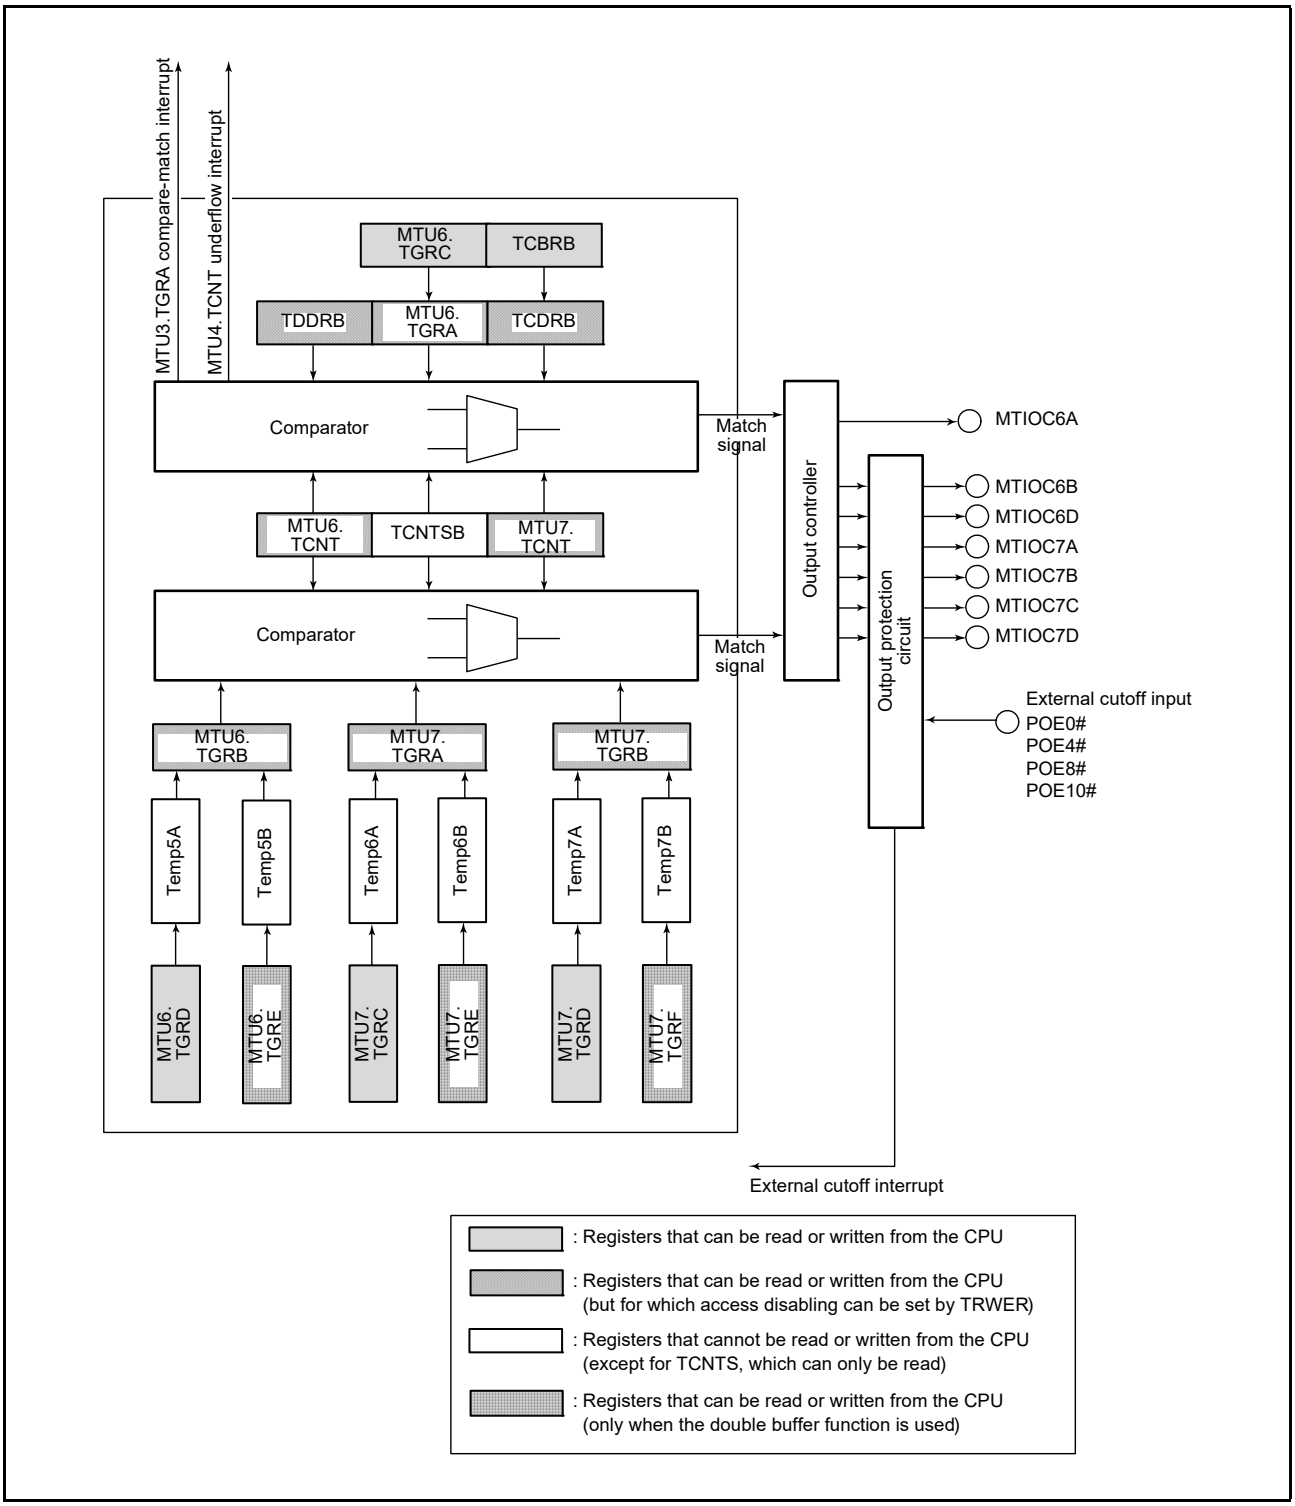

Figure 19.47 Block Diagram of MTU6 and MTU7 in Complementary PWM Mode

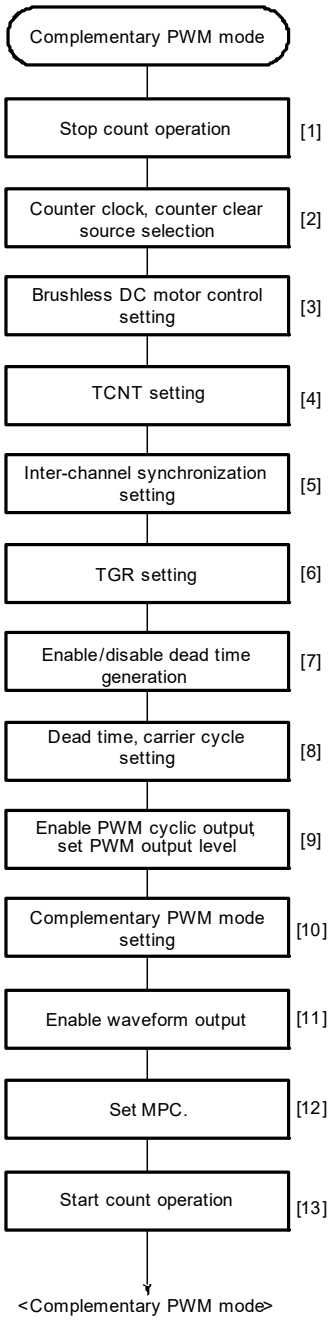
(1) Example of Complementary PWM Mode Setting Procedure

Figure 19.48 shows an example of the complementary PWM mode setting procedure.



[1] Clear bits CST3 and CST4 in the timer start register (TSTRA) to 0 to stop timer counter (TCNT) operation. Specify complementary PWM mode while MTU3.TCNT and MTU4.TCNT are stopped.

[2] Set the same counter clock and clock edge for MTU3 and MTU4 with bits TPSC[2:0] and bits CKEG[1:0] in the timer control register (TCR). Use bits CCLR[2:0] to set synchronous clearing only when restarting by synchronous clearing with another channel during complementary PWM mode operation.

[3] When performing brushless DC motor control, set bit BDC in the timer gate control register (TGCRA) and set the feedback signal input source and output chopping or gate signal direct output.

[4] Set the dead time in MTU3.TCNT. Set MTU4.TCNT to 0000h.

[5] Set only when restarting by synchronous clearing with another channel during complementary PWM mode operation. In this case, synchronize the channel generating the synchronous clear with MTU3 and MTU4 using the timer synchronous register (TSYRA).

[6] Set the output PWM duty cycles in the duty registers (MTU3.TGRB, MTU4.TGRA, and MTU4.TGRB) and buffer registers (MTU3.TGRD, MTU4.TGRC, and MTU4.TGRD). Be sure to set the same value in each pair of duty register and buffer register. Only when using the double buffer function, set the output PWM duty value - 1 in the buffer registers (MTU3.TGRDE, MTU4.TGRCE, MTU4.TGRDF).

[7] This setting is necessary only when no dead time should be generated. Make appropriate settings in the timer dead time enable register (TDERA) so that no dead time is generated.

[8] Set the dead time in the dead time register (TDDRA), 1/2 the carrier cycle in the timer cycle data register (TCDRA) and timer cycle buffer register (TCBRA), and 1/2 the carrier cycle plus the dead time in MTU3. TGRA and MTU3.TGRC. When no dead time generation is selected, set 1 in TDDRA and 1/2 the carrier cycle + 1 in MTU3.TGRA and MTU3.TGRC.

[9] Enable or disable toggle output synchronized with the PWM cycle using bit PSYE in the timer output control register 1 (TOCR1A), and set the PWM output level with bits OLSP and OLSN. When specifying the PWM output level by using TOLBRA as a buffer for TOCR2A, see Figure 19.3.

[10] Select complementary PWM mode in the timer mode register1 (MTU3.TMDR1). In addition, specify the buffer operation of the MTU3.TGRA (BFA = 1) and MTU3.TGRC (BFB = 1) when necessary. Enable the double buffer operation with the TMDR2 register only when the double buffer function is used.

[11] Set enabling/disabling of PWM waveform output pin output in the timer output master enable register (TOERA).

[12] Set the MPC and port mode registers (PMR) of the I/O ports.

[13] Set bits CST3 and CST4 in TSTRA to 1 simultaneously to start the count operation.

Figure 19.48 Example of Complementary PWM Mode Setting Procedure

(2) Outline of Complementary PWM Mode Operation

In complementary PWM mode, six waveforms of three-phase PWM can be output. Figure 19.49 illustrates counter operation in complementary PWM mode (MTU3 and MTU4), and Figure 19.50 shows an example of operation in complementary PWM mode.

(a) Counter Operation

In complementary PWM mode, three counters—MTU3.TCNT, MTU4.TCNT, and TCNTSA (MTU6.TCNT, MTU7.TCNT, and TCNTSB) —in each unit perform up-/down-count operations.
MTU3.TCNT (MTU6.TCNT) is automatically initialized to the value set in TDDRA (TDDRB) when complementary PWM mode is selected and the CST bit in TSTRA (TSTRB) is 0. When the CST bit is set to 1, MTU3.TCNT (MTU6.TCNT) counts up to the value set in MTU3.TGRA (MTU6.TGRA), then switches to down-counting when it matches MTU3.TGRA (MTU6.TGRA). When the MTU4.TCNT (MTU7.TCNT) value matches 0000h, MTU3.TCNT (MTU6.TCNT) switches to up-counting, and the operation is repeated in this way.
MTU4.TCNT (MTU7.TCNT) should be initialized to 0000h after a reset. When the CST bit is set to 1, MTU4.TCNT (MTU7.TCNT) counts up in synchronization with MTU3.TCNT (MTU6.TCNT), and switches to down-counting when MTU3.TCNT (MTU6.TCNT) matches MTU3.TGRA (MTU6.TGRA). On reaching 0000h, MTU4.TCNT (MTU7.TCNT) switches to up-counting, and the operation is repeated in this way.
TCNTSA (TCNTSB) is a read-only counter. It does not need to be initialized after a reset. In counting up by MTU3.TCNT and MTU4.TCNT (or MTU6.TCNT and MTU7.TCNT), MTU3.TCNT (or MTU6.TCNT) starts counting up when it matches TCDRA (or TCDRB) and switches to counting down when it matches MTU3.TGRA (or MTU6.TGRA).
Furthermore, when MTU4.TCNT (or MTU7.TCNT) matches TDDRA (or TDDRB), TCNTSA (or TCNTSB) is set to the value in MTU3.TGRA (or MTU6.TGRA) and counting is stopped.When MTU4.TCNT (MTU7.TCNT) matches TDDRA (TDDRB) during down-counting of MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT), TCNTSA (TCNTSB) starts up-counting, and when MTU4.TCNT (MTU7.TCNT) matches 0000h, the operation switches to down-counting.
When MTU3.TCNT (MTU6.TCNT) matches TCDRA (TCDRB), TCNTSA (TCNTSB) is cleared to 0000h and stops counting.
TCNTSA (TCNTSB) is compared with the compare register and temporary register, in which the PWM duty is specified, only during the count operation.

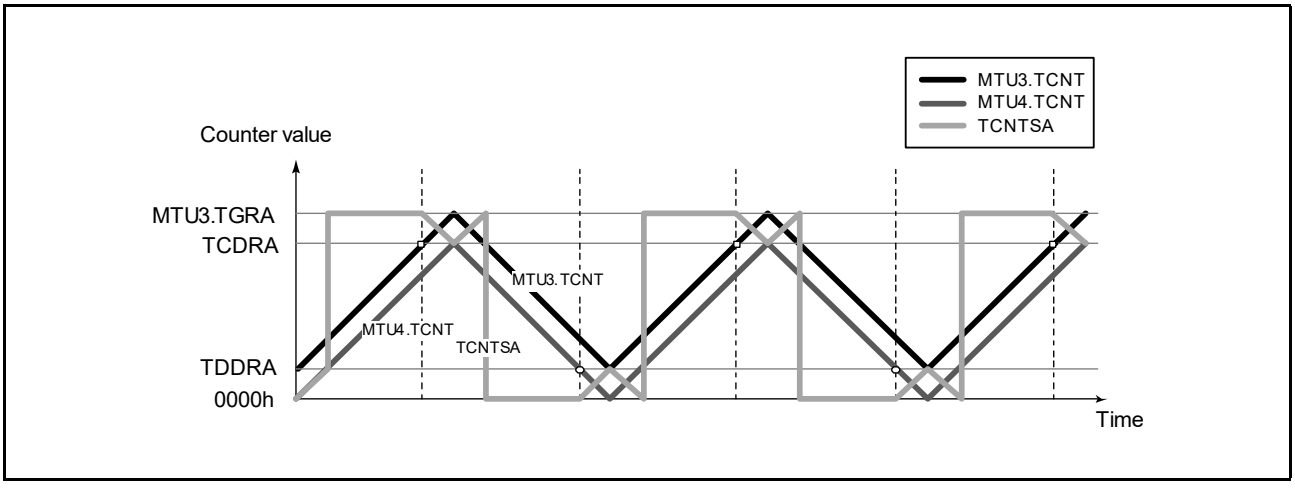


Figure 19.49 Counter Operation in Complementary PWM Mode (MTU3, MTU4)

(b) Register Operation

In complementary PWM mode, nine registers (compare registers, buffer registers, and temporary registers) are used for each unit. Figure 19.50 shows an example of operation in complementary PWM mode (MTU3 and MTU4).
MTU3.TGRB, MTU4.TGRA, and MTU4.TGRB (MTU6.TGRB, MTU7.TGRA, and MTU7.TGRB) are compared with the counters to generate PWM waveforms. When these registers match the counter, the value set in bits OLSN and OLSP in the timer output control register (TOCR1) is output.
MTU3.TGRD, MTU4.TGRC, and MTU4.TGRD (MTU6.TGRD, MTU7.TGRC, and MTU7.TGRD) are buffer registers for these compare registers.
When the double buffer function is used, MTU3.TGRE, MTU4.TGRE, and MTU4.TGRF (MTU6.TGRE, MTU7.TGRE, and MTU7.TGRF) are also used as buffer registers B. For details of double buffer operation, see section 19.3.8 (2) (s) Double Buffer Function in Complementary PWM Mode.
To update data in a compare register, write the data to be updated to the corresponding buffer register. Buffer registers are always readable and writable.
Data in a compare register can be changed by writing new data to the corresponding buffer register. The buffer registers can be read or written at any time.
The data written to a buffer register is constantly transferred to the temporary register in the Ta interval. Data is not transferred to the temporary register in the Tb interval. Data written to a buffer register in this interval is transferred to the temporary register at the end of the Tb interval.
The value transferred to a temporary register is transferred to the compare register when TCNTSA (TCNTSB) for which the Tb interval ends matches MTU3.TGRA (MTU6.TGRA) while TCNTSA (TCNTSB) is counting up, or 0000h while counting down. The timing for transfer from the temporary register to the compare register can be selected with bits MD[3:0] in the timer mode register 1 (TMDR1). Figure 19.50 shows an example in which the trough is selected for the transfer timing.
In the Tb interval in which data is not transferred to the temporary register (Tb1 in Figure 19.50), the temporary register has the same function as the compare register and is compared with the counter. In this interval, therefore, there are two compare match registers for one output phase; the compare register contains the pre-change data and the temporary register contains new data. In this interval, three counters MTU3.TCNT, MTU4.TCNT, and TCNTSA (MTU6.TCNT, MTU7.TCNT, and TCNTSB) and two registers (compare register and temporary register) are compared, and PWM output is controlled accordingly.

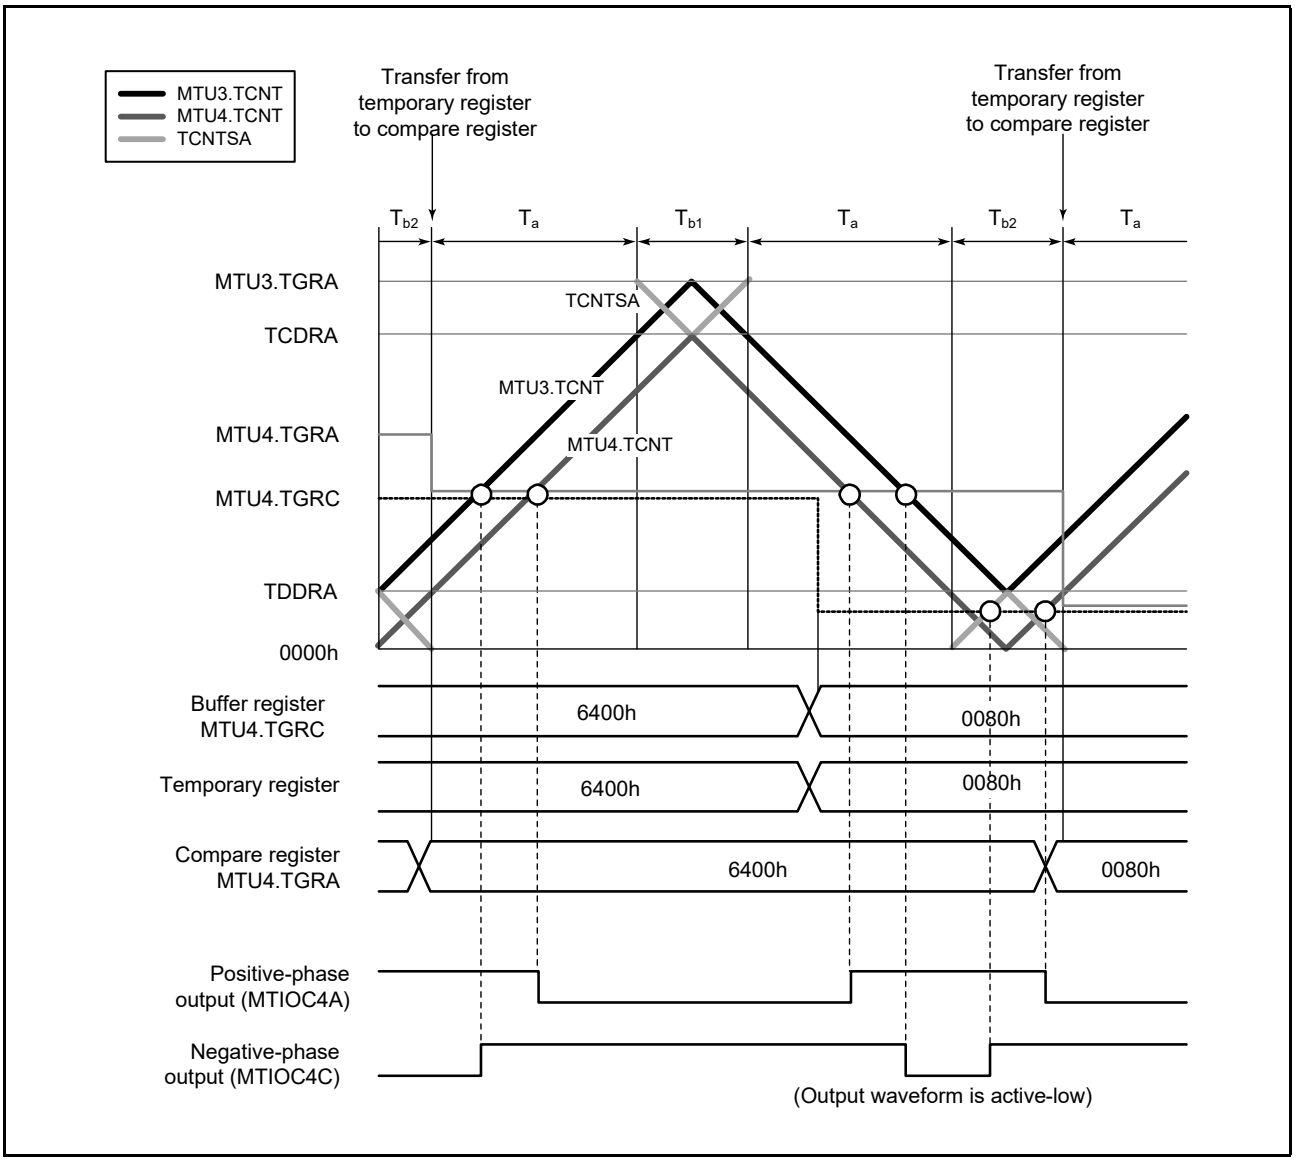

Figure 19.50 Example of Operation in Complementary PWM Mode (MTU3 and MTU4)

(c) Initial Setting

In complementary PWM mode, there are six registers that require initial setting. In addition, there is a register that specifies whether to generate dead time (it should be used only when dead time generation should be disabled).
Before setting complementary PWM mode with bits MD[3:0] in the timer mode register 1 (TMDR1), initial values should be set in the following registers.
MTU3.TGRC (MTU6.TGRC) operates as the buffer register for MTU3.TGRA (MTU6.TGRA), and should be set with 1/2 the PWM carrier cycle + dead time Td. The timer cycle buffer register (TCBRA or TCBRB) operates as the buffer register for the timer cycle data register (TCDRA or TCDRB), and should be set with 1/2 the PWM carrier cycle. Set dead time Td in the timer dead time data register (TDDRA or TDDRB).
When dead time is not needed, the TDER bit in the timer dead time enable register (TDERA or TDERB) should be cleared to 0, MTU3.TGRC and MTU3.TGRA (MTU6.TGRC and MTU6.TGRA) should be set to 1/2 the PWM carrier cycle + 1, and TDDRA (TDDRB) should be set to 1.
Set the respective initial PWM duty values in three buffer registers A (MTU3.TGRD, MTU4.TGRC, and MTU4.TGRD (MTU6.TGRD, MTU7.TGRC, and MTU7.TGRD)).
Set the respective (initial PWM duty – 1) values in three buffer registers B (MTU3.TGRE, MTU4.TGRE, and MTU4.TGRF (MTU6.TGRE, MTU7.TGRE, and MTU7.TGRF)) only when the double buffer function is used.
The values set in the five buffer registers excluding TDDRA (TDDRB) are transferred to the corresponding compare registers as soon as complementary PWM mode is set.
Set MTU4.TCNT (MTU7.TCNT) to 0000h before setting complementary PWM mode.

Table 19.76 Registers and Counters Requiring Initial Setting

Register and Counter	Setting
MTU3.TGRC MTU6.TGRC	1/2 PWM carrier cycle + dead time Td (1/2 PWM carrier cycle + 1 when dead time generation is disabled by TDERA or TDERB)
TDDRA, TDDRB	Dead time Td (1 when dead time generation is disabled by TDERA or TDERB)
TCBRA, TCBRB	1/2 PWM carrier cycle
MTU3.TGRD, MTU4.TGRC, MTU4.TGRD MTU6.TGRD, MTU7.TGRC, MTU7.TGRD	Initial PWM duty ratio value for each phase
MTU3.TGRE, MTU4.TGRE, MTU4.TGRF MTU6.TGRE, MTU7.TGRE, MTU7.TGRF	Initial PWM duty ratio – 1 value for each phase (only when double buffer function is used)
MTU4.TCNT MTU7.TCNT	0000h

Note: The value set in MTU3.TGRC (MTU6.TGRC) should be the sum of 1/2 the PWM carrier cycle set in TCBRA (TCBRB) and dead time Td set in TDDRA (TDDRB). When dead time generation is disabled by TDERA (TDERB), TGRC should be set to 1/2 the PWM carrier cycle + 1.

(d) PWM Output Level Setting

In complementary PWM mode, the PWM pulse output level is set with bits OLSN and OLSP in timer output control register 1 (TOCR1A or TOCR1B) or bits OLS1P to OLS3P and OLS1N to OLS3N in timer output control register 2 (TOCR2A or TOCR2B).
The output level can be set for each of the three positive phases and three negative phases of 6-phase output.
Complementary PWM mode should be cleared before setting or changing output levels.

(e) Dead Time Setting

In complementary PWM mode, the dead time can be set for the output PWM waveforms.
The dead time is set in the timer dead time data register (TDDRA or TDDRB). The value set in TDDRA (TDDRB) is used as the MTU3.TCNT (MTU6.TCNT) counter start value and creates a non-overlapping interval between MTU3.TCNT (MTU6.TCNT) and MTU4.TCNT (MTU7.TCNT). Complementary PWM mode should be cleared before changing the contents of TDDRA (TDDRB).

(f) Dead Time Suppressing

Dead time generation is suppressed by clearing the TDER bit in the timer dead time enable register (TDERA or TDERB) to 0. TDERA (TDERB) can be cleared to 0 only when 0 is written to it after reading TDER = 1.
MTU3.TGRA and MTU4.TGRC (MTU6.TGRA and MTU7.TGRC) should be set to 1/2 PWM carrier cycle + 1 and the timer dead time data register (TDDRA or TDDRB) should be set to 1.
By the above settings, PWM waveforms without dead time can be obtained. Figure 19.51 shows an example of operation without dead time (MTU3 and MTU4).

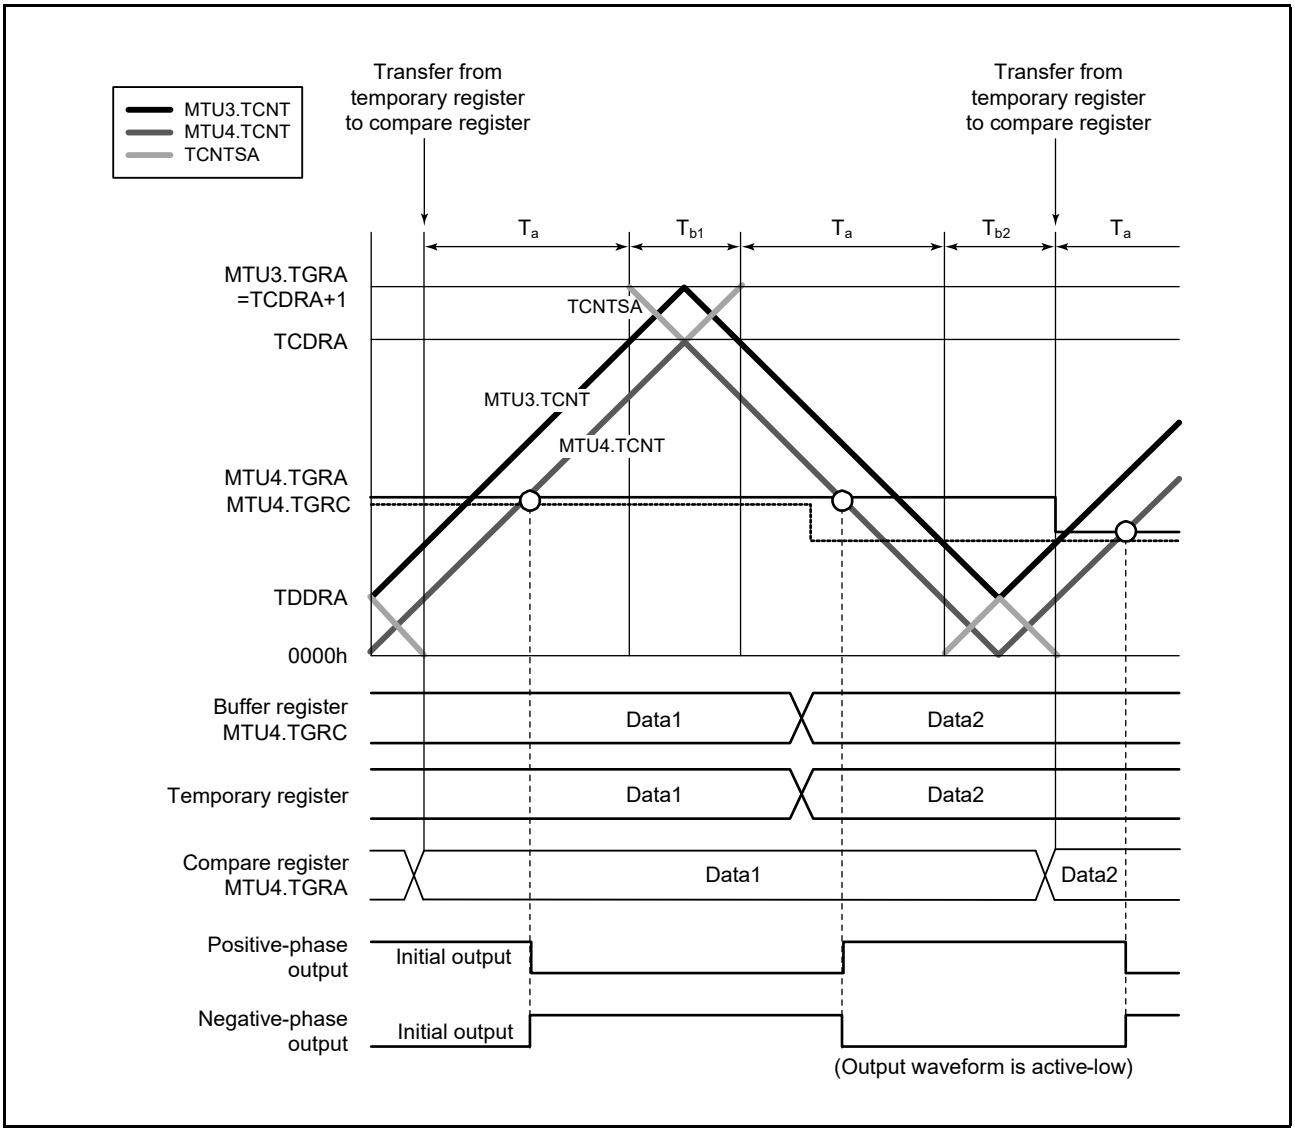

Figure 19.51 Example of Operation without Dead Time (MTU3 and MTU4)

(g) PWM Cycle Setting

In complementary PWM mode, the PWM pulse cycle is set in two registers—MTU3.TGRA (MTU6.TGRA), in which the MTU3.TCNT (MTU6.TCNT) upper limit value is set, and TCDRA (TCDRB), in which the MTU4.TCNT (MTU7.TCNT) upper limit value is set. The settings should be made so as to achieve the following relationship between these two registers:

With dead time: MTU3.TGRA (MTU6.TGRA) setting = TCDRA (TCDRB) setting + TDDRA (TDDRB) setting
Without dead time: MTU3.TGRA (MTU6.TGRA) setting = TCDRA (TCDRB) setting + 1

In addition, the settings should be made so as to achieve the following relationship between the TCDRA (TCDRB) register and the TDDRA (TDDRB) register:
TCDRA (TCDRB) setting value > TDDRA (TDDRB) setting value × 2 + 2

The MTU3.TGRA and TCDRA (MTU6.TGRA and TCDRB) settings are made by setting values in buffer registers MTU3.TGRC and TCBRA (MTU6.TGRC and TCBRB). The values set in MTU3.TGRC and TCBRA (MTU6.TGRC and TCBRB) are transferred simultaneously to MTU3.TGRA and TCDRA (MTU6.TGRA and TCDRB) with the transfer timing selected with bits MD[3:0] in the timer mode register 1 (TMDR1).
The new PWM cycle is reflected from the next cycle when data is updated at the crest, or from the current cycle when updated in the trough. Figure 19.52 illustrates the operation when the PWM cycle is updated at the crest.
See the following section, (h) Register Data Updating, for the method of updating the data in each buffer register.

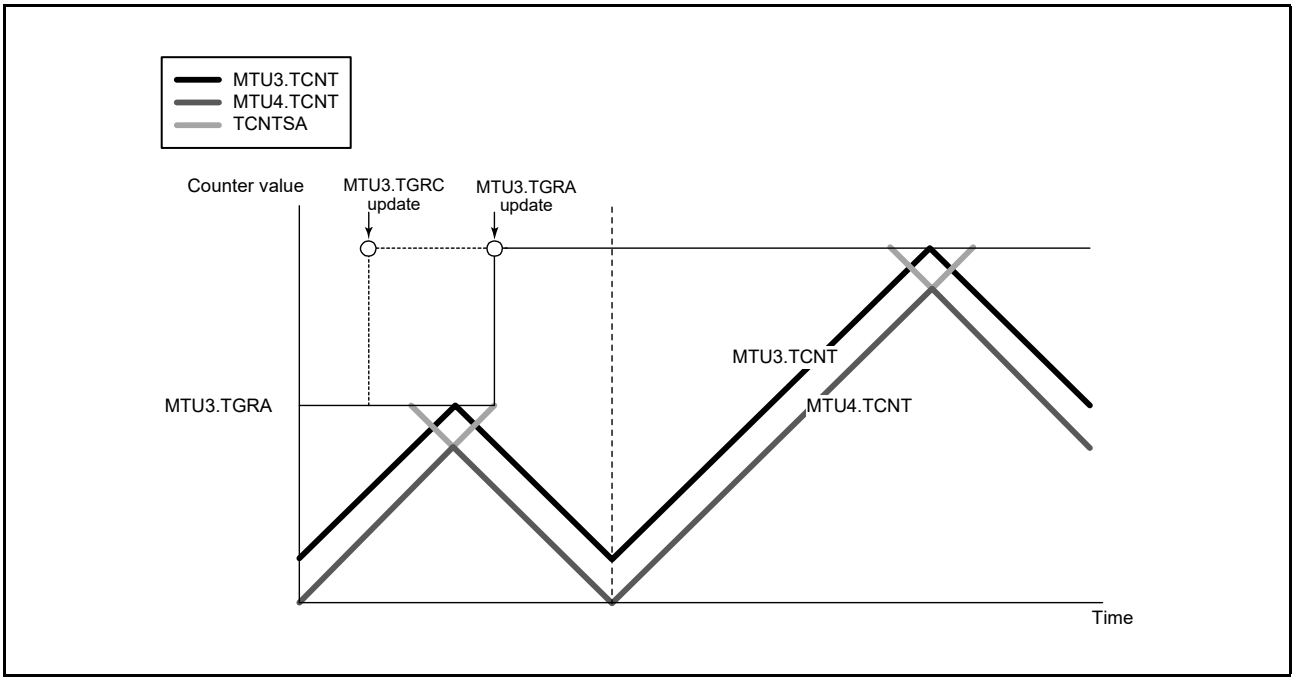

Figure 19.52 Example of PWM Cycle Updating (MTU3 and MTU4)

(h) Register Data Updating

In complementary PWM mode, the buffer register is used to update the data in a compare register. The update data can be written to the buffer register at any time. There are five registers (PWM duty and carrier cycle registers) that have buffer registers and can be updated during operation.

There is a temporary register between each of these registers and its buffer register. While subcounter TCNTSA (TCNTSB) is not counting, if buffer register data is updated, the temporary register value also changes. Data is not transferred from buffer registers to temporary registers while TCNTSA (TCNTSB) is counting; in this case, the value written to a buffer register is transferred after TCNTSA (TCNTSB) halts.

The temporary register value is transferred to the compare register at the data update timing set with bits MD[3:0] in the timer mode register 1 (TMDR1). Figure 19.53 shows an example of data updating in complementary PWM mode (MTU3 and MTU4). This example shows the mode in which data is updated at both the counter crest and trough.

When updating buffer register data, be sure to write to MTU4.TGRD (MTU7.TGRD) at the end of the update. Data is transferred from buffer registers to the temporary registers simultaneously for all five registers after the write to MTU4.TGRD (MTU7.TGRD).

Even when not updating all five registers or when not updating the MTU4.TGRD (MTU7.TGRD) data, be sure to write to MTU4.TGRD (MTU7.TGRD) after writing data to the registers to be updated. In this case, the data written to MTU4.TGRD (MTU7.TGRD) should be the same as the data prior to the write operation.

See section 19.3.8 (2) (s) Double Buffer Function in Complementary PWM Mode, for data updating when the double buffer function is used.

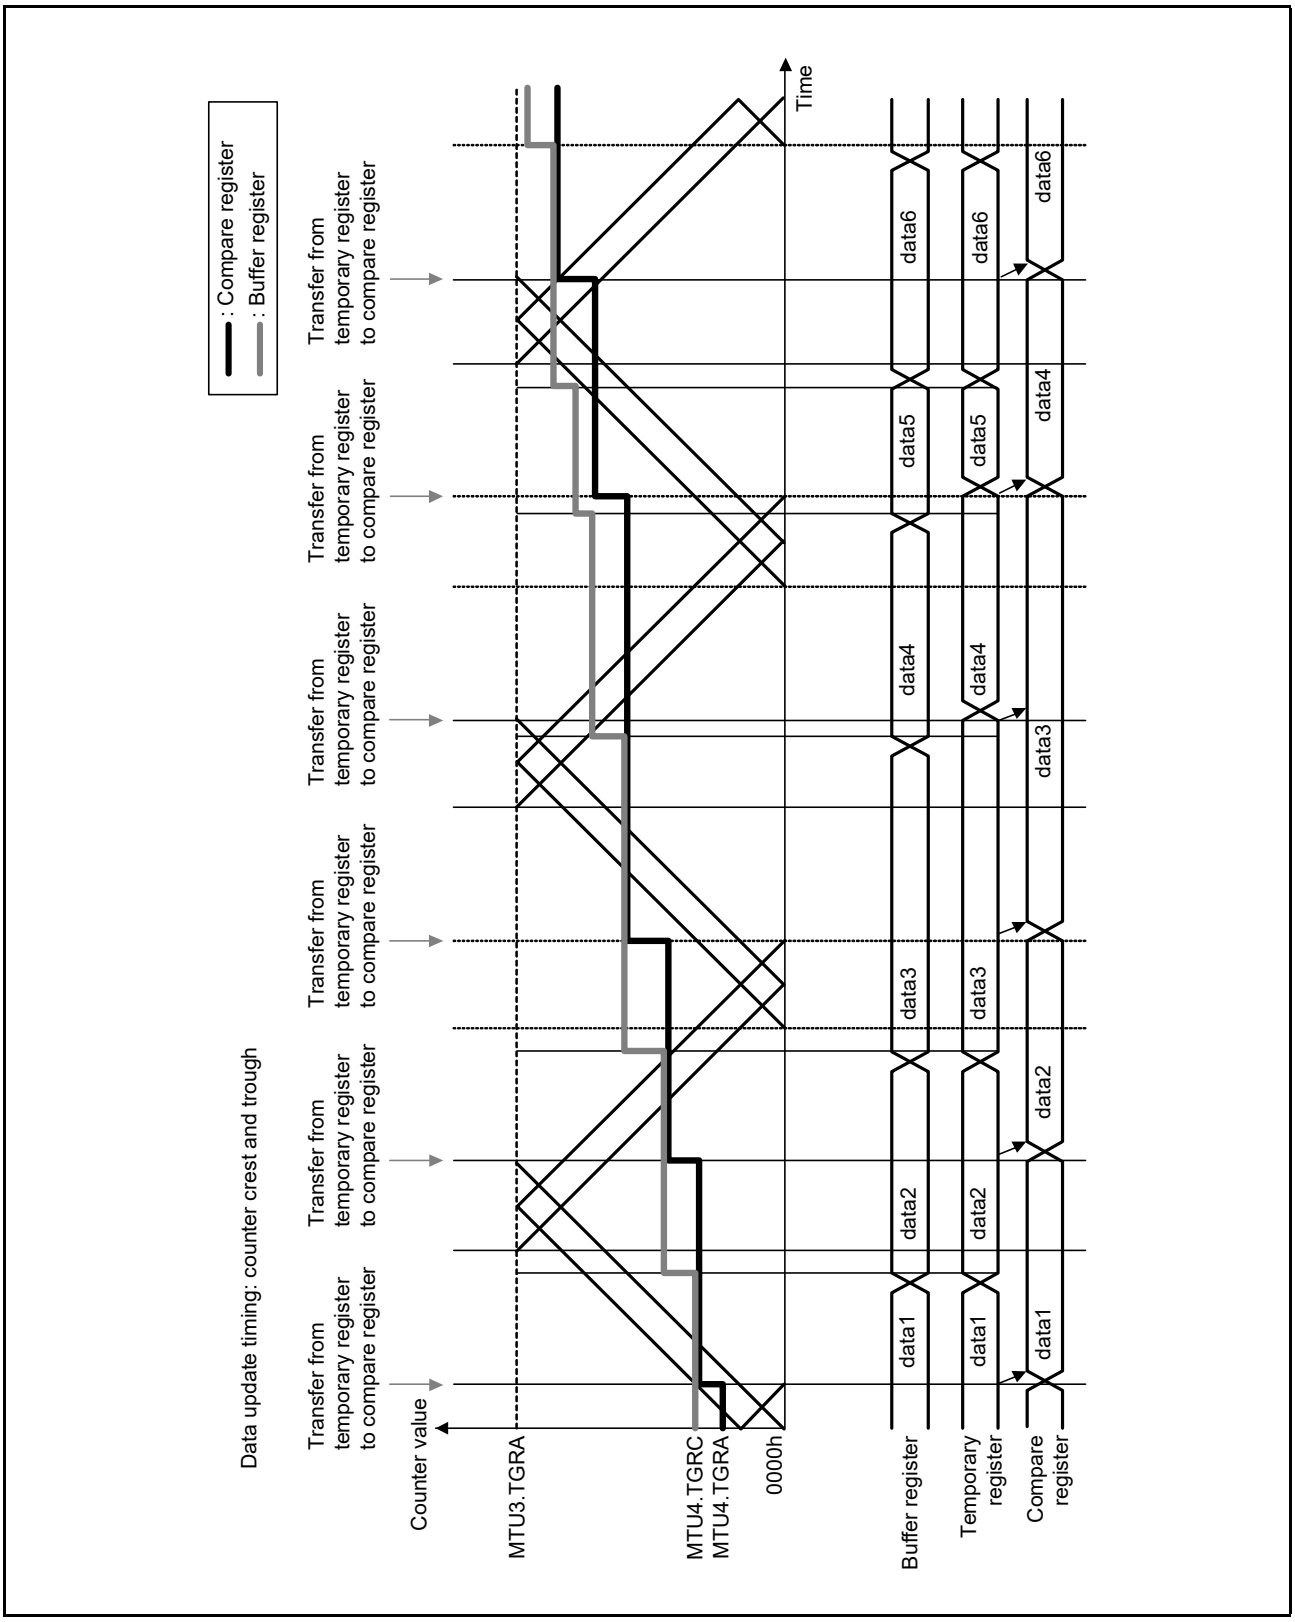

Figure 19.53 Example of Data Updating in Complementary PWM Mode (MTU3 and MTU4)

(i) Initial Output in Complementary PWM Mode

In complementary PWM mode, the initial output is determined by the setting of bits OLSN and OLSP in timer output control register 1 (TOCR1A or TOCR1B) or bits OLS1N to OLS3N and OLS1P to OLS3P in timer output control register 2 (TOCR2A or TOCR2B).

This initial output is the non-active level of the PWM pulse and continues from when complementary PWM mode is set with the timer mode register 1 (TMDR1) until MTU4.TCNT (MTU7.TCNT) exceeds the value set in the dead time register (TDDRA or TDDRB). Figure 19.54 shows an example of the initial output in complementary PWM mode. An example of the waveform when the initial PWM duty ratio value is smaller than the TDDRA (TDDRB) value is shown in Figure 19.55.

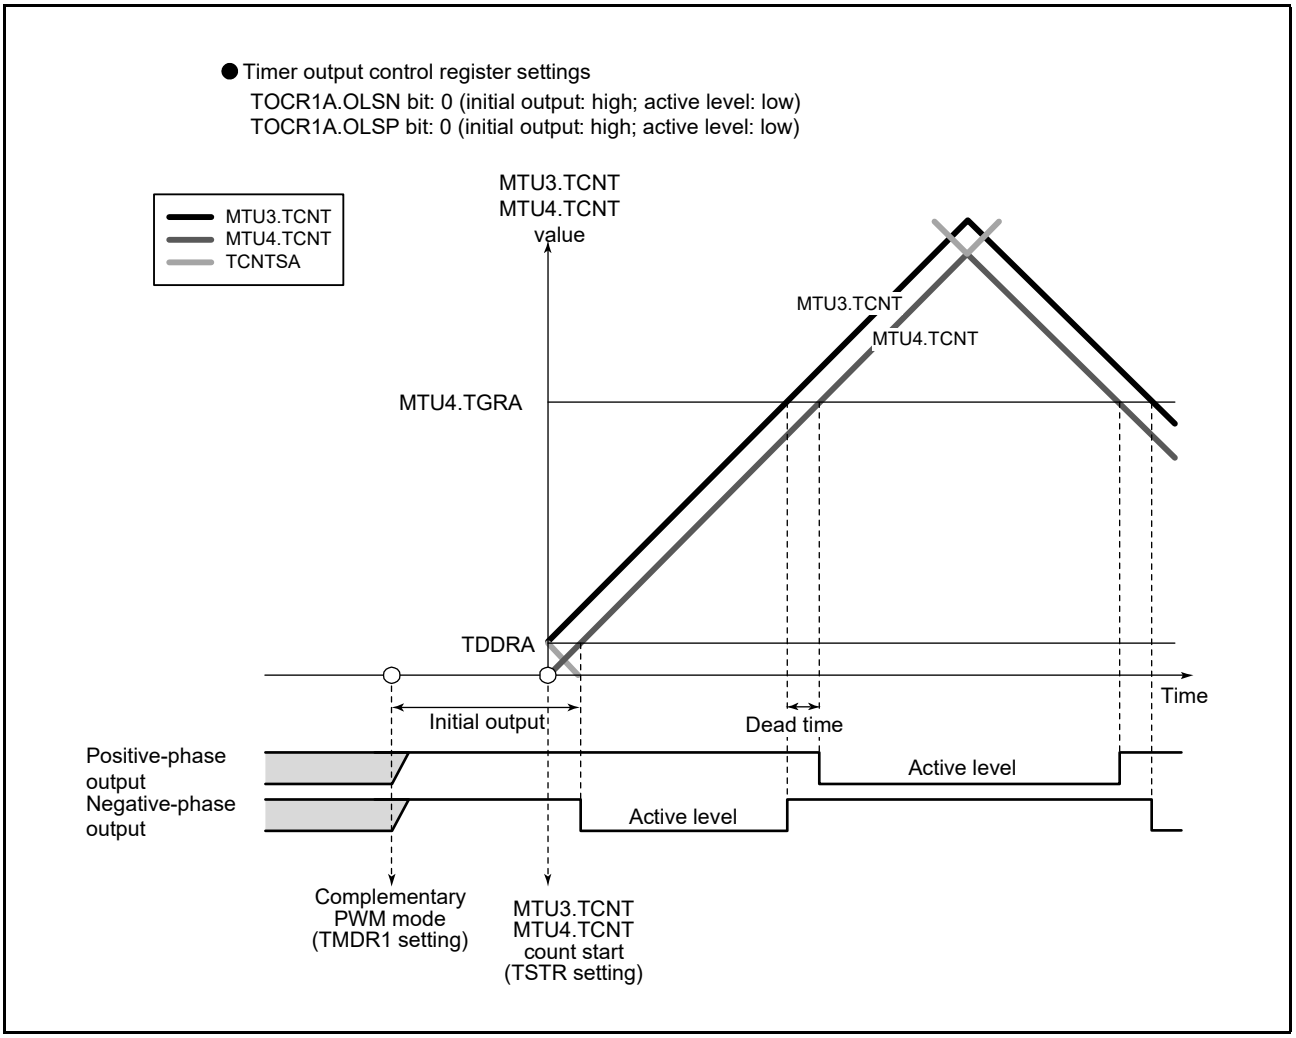

Figure 19.54 Example of Initial Output in Complementary PWM Mode (MTU3 and MTU4) (1)

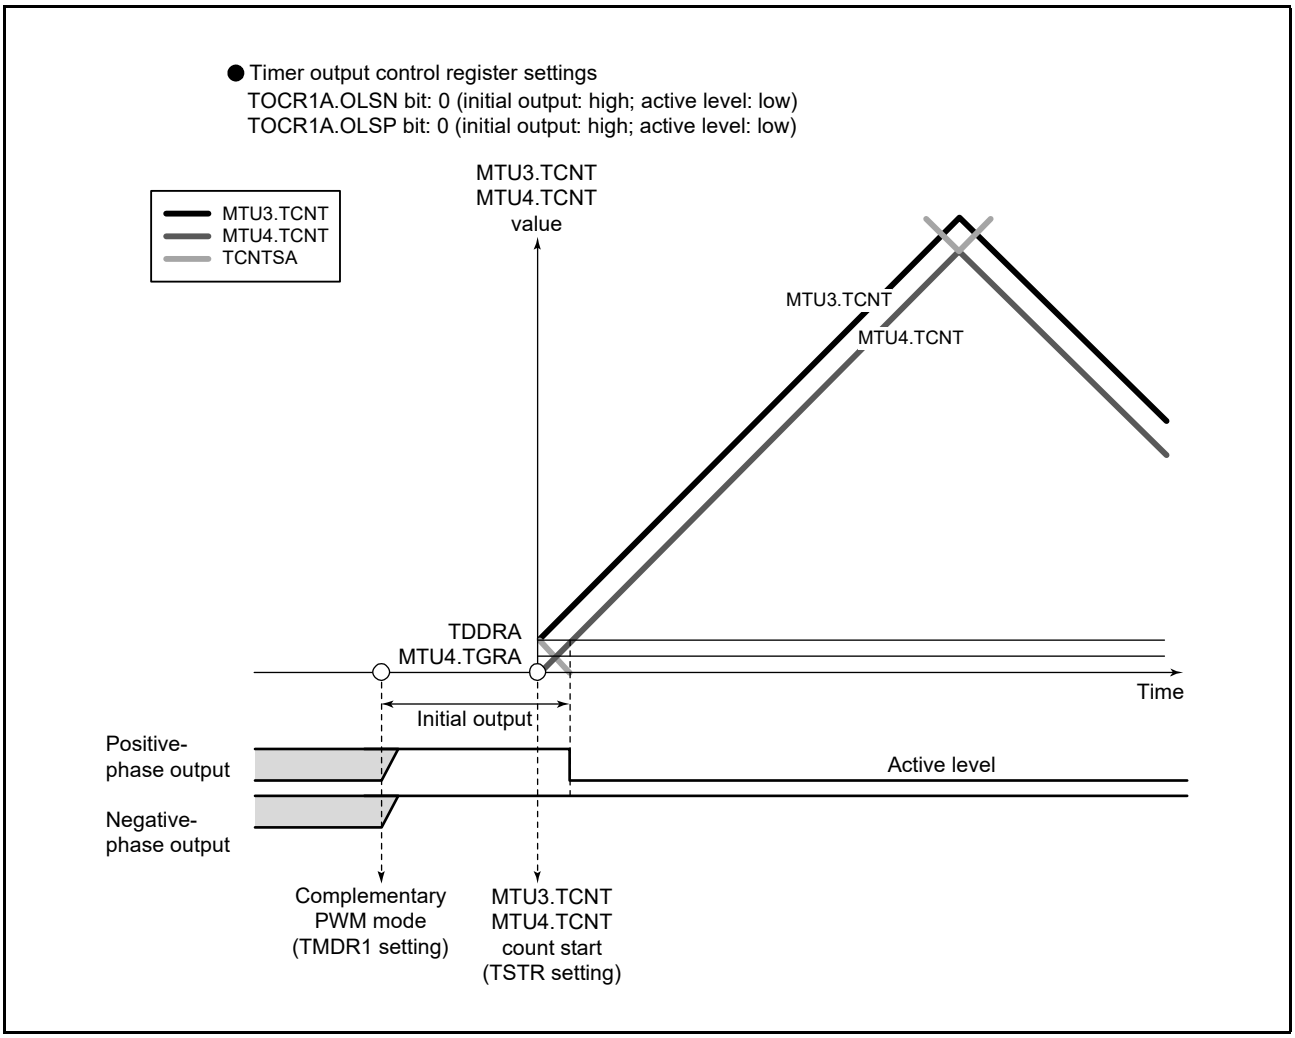

Figure 19.55 Example of Initial Output in Complementary PWM Mode (MTU3 and MTU4) (2)

(j) Method for Generating PWM Output in Complementary PWM Mode

In complementary PWM mode, six waveforms of three-phase PWM are output. The dead time can be set for the output PWM waveforms.

A PWM waveform is generated by output of the level selected in the timer output control register in the event of a compare match between a counter and a compare register. While TCNTSA (TCNTSB) is counting, the compare register and temporary register values are simultaneously compared to create consecutive PWM pulses from 0 to 100%. The relative timing of turn-on and turn-off compare match occurrence may vary, but the compare match that turns off each phase takes precedence to secure the dead time and ensure that the positive-phase and negative-phase turn-on times do not overlap. Figure 19.56 to Figure 19.58 show examples of waveform generation in complementary PWM mode.

The positive-phase and negative-phase turn-off timing is generated by a compare match with the counter value indicated in MTU3.TCNT in the figure, and the turn-on timing by a compare match with the counter indicated in MTU4.TCNT, which operates with a delay of the dead time behind the MTU3.TCNT counter. In the T1 period, compare match a that turns off the negative phase has the highest priority, and compare matches before a are ignored. In the T2 period, compare match c that turns off the positive phase has the highest priority, and compare matches before c are ignored.

In most cases, compare matches occur in the order a → b → c → d (or c → d → a' → b') as shown in Figure 19.56.

If compare matches deviate from the a → b → c → d order, since the time for which the negative phase is off is shorter than twice the dead time, the positive phase is not turned on. If compare matches deviate from the c → d → a' → b' order, since the time for which the positive phase is off is shorter than twice the dead time, the negative phase is not turned on.

As shown in Figure 19.57, if compare match c follows compare match a before compare match b, compare match b is ignored and the negative phase is turned on by compare match d. This is because turning off the positive phase has priority due to the occurrence of compare match c (positive-phase off timing) before compare match b (positive-phase on timing) (consequently, the waveform does not change because the positive phase goes from off to off).

Similarly, in the example in Figure 19.58, compare match a' with new data in the temporary register occurs before compare match c, but until compare match c, which turns off the positive phase, other compare matches are ignored. As a result, the negative phase is not turned on.

Thus, in complementary PWM mode, compare matches at turn-off timings take precedence, and turn-on timing compare matches that occur before a turn-off timing compare match are ignored.

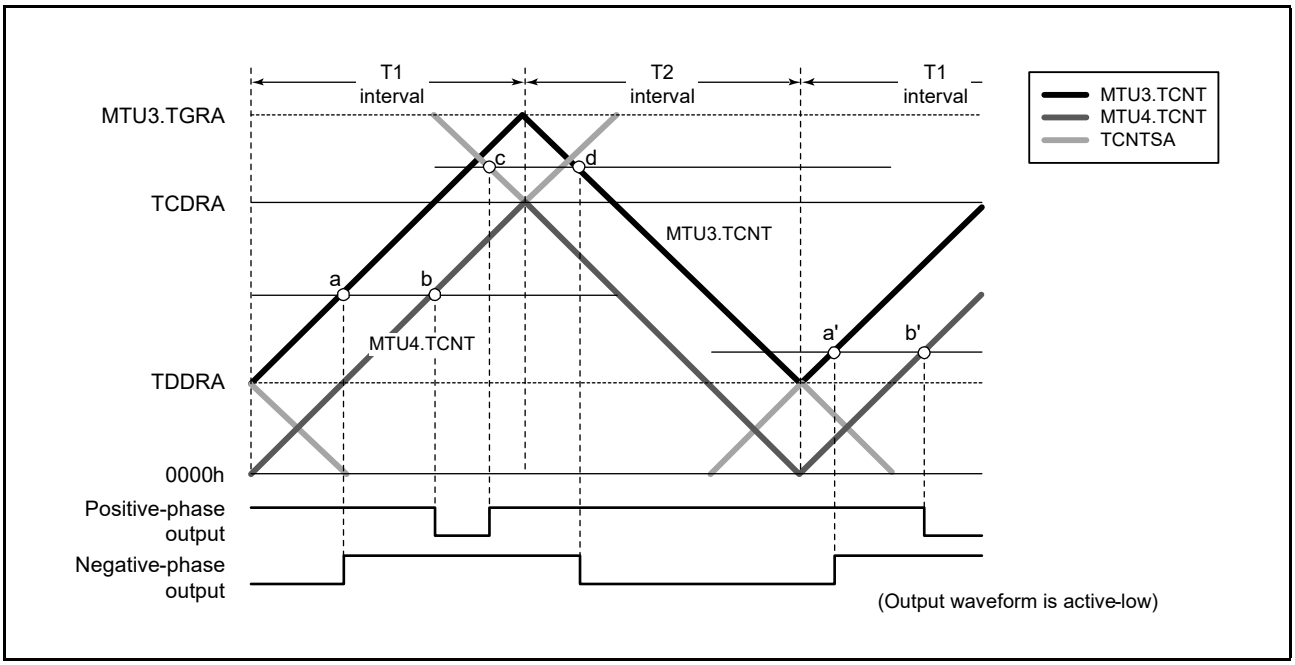

Figure 19.56 Example of Waveform Output in Complementary PWM Mode (MTU3 and MTU4) (1)

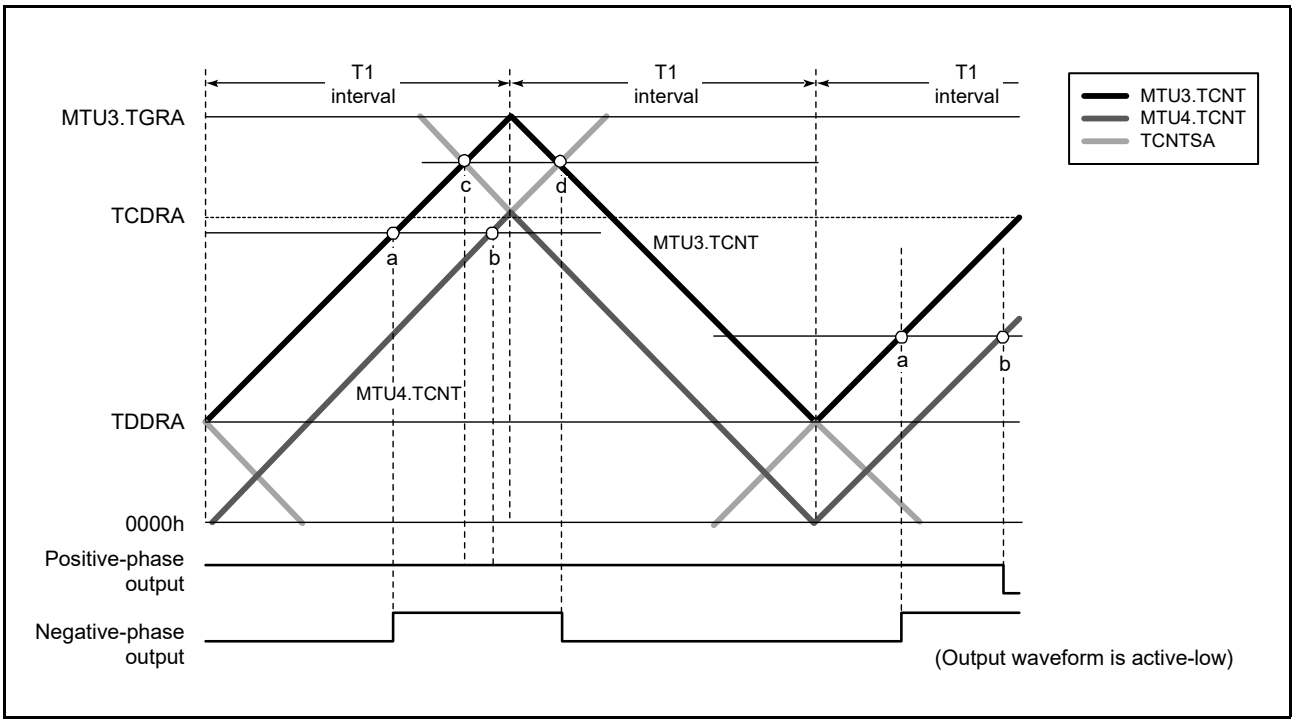

Figure 19.57 Example of Waveform Output in Complementary PWM Mode (MTU3 and MTU4) (2)

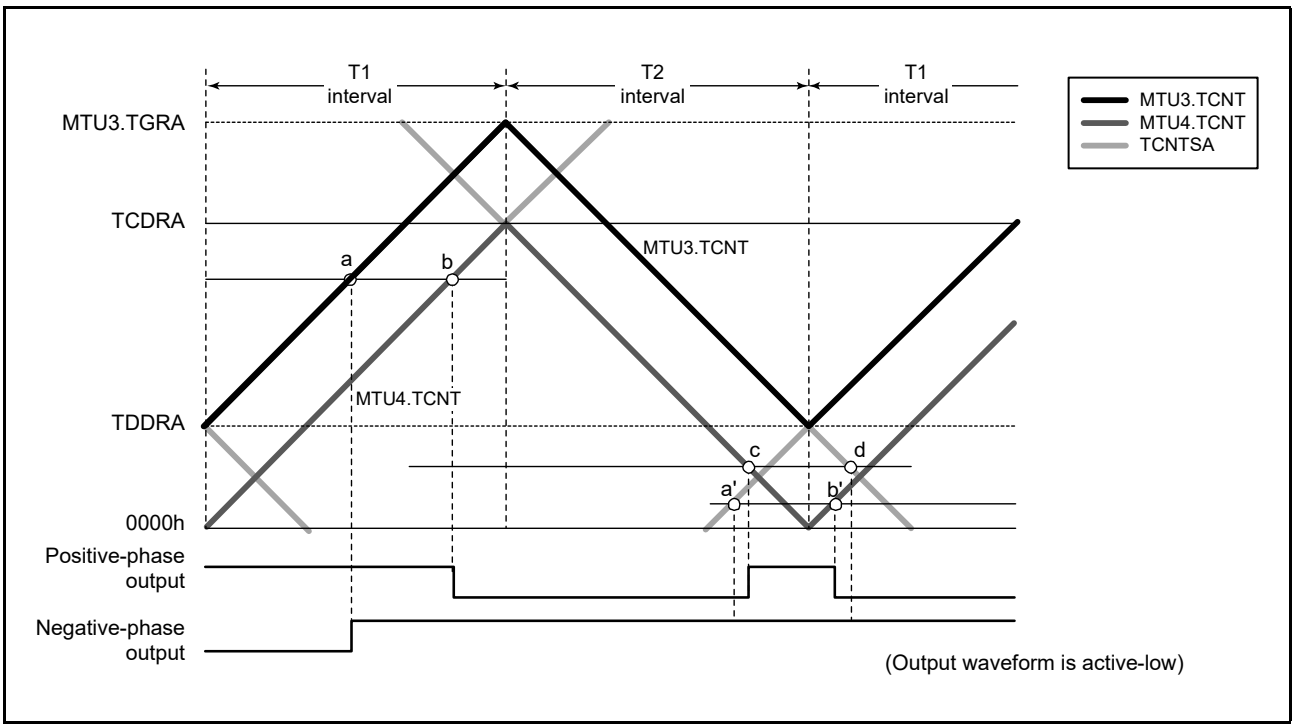

Figure 19.58 Example of Waveform Output in Complementary PWM Mode (MTU3 and MTU4) (3)

(k) 0% and 100% Duty Ratio Output in Complementary PWM Mode

In complementary PWM mode, 0% and 100% duty PWM waveforms can be output as required. Figure 19.59 to Figure 19.63 show output examples.

A 100% duty waveform is output when the compare register value is set to 0000h. The waveform in this case has a positive phase with a 100% on-state. A 0% duty waveform is output when the compare register value is set to the same value as MTU3.TGRA (MTU6.TGRA). The waveform in this case has a positive phase with a 100% off-state.

On and off compare matches occur simultaneously, but if a turn-on compare match and turn-off compare match for the same phase occur simultaneously, both compare matches are ignored and the waveform does not change.

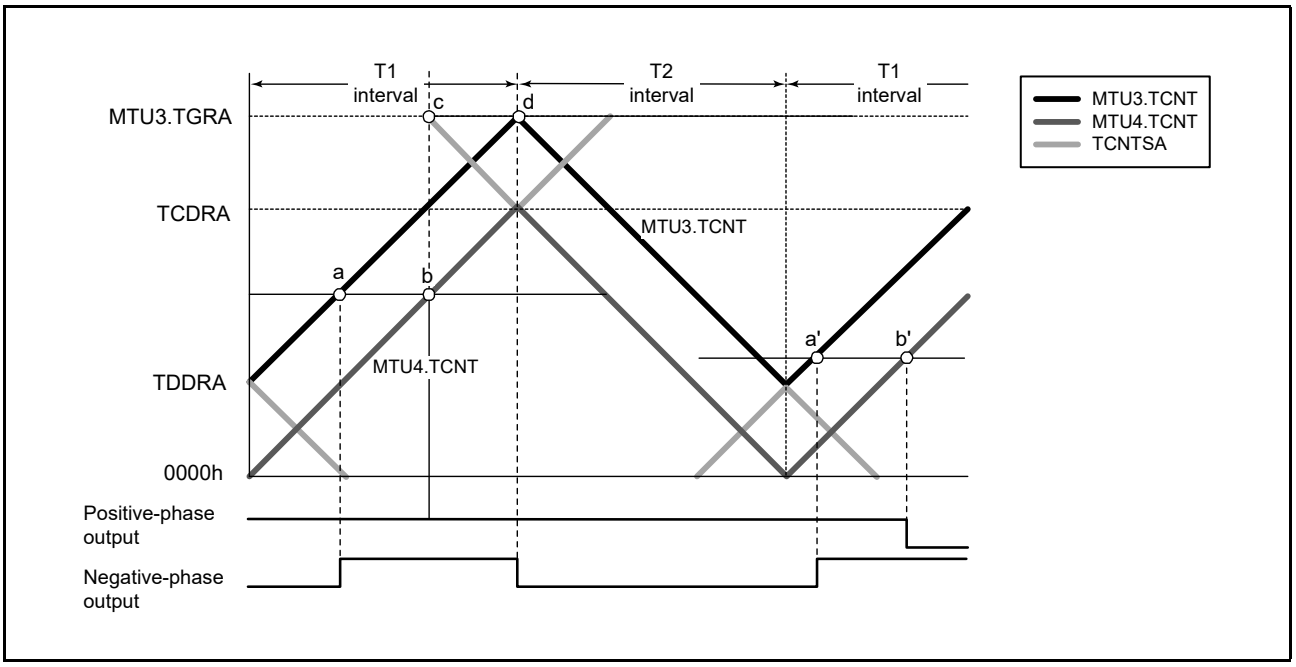

Figure 19.59 Example of 0% and 100% Waveform Output in Complementary PWM Mode (MTU3 and MTU4) (1)

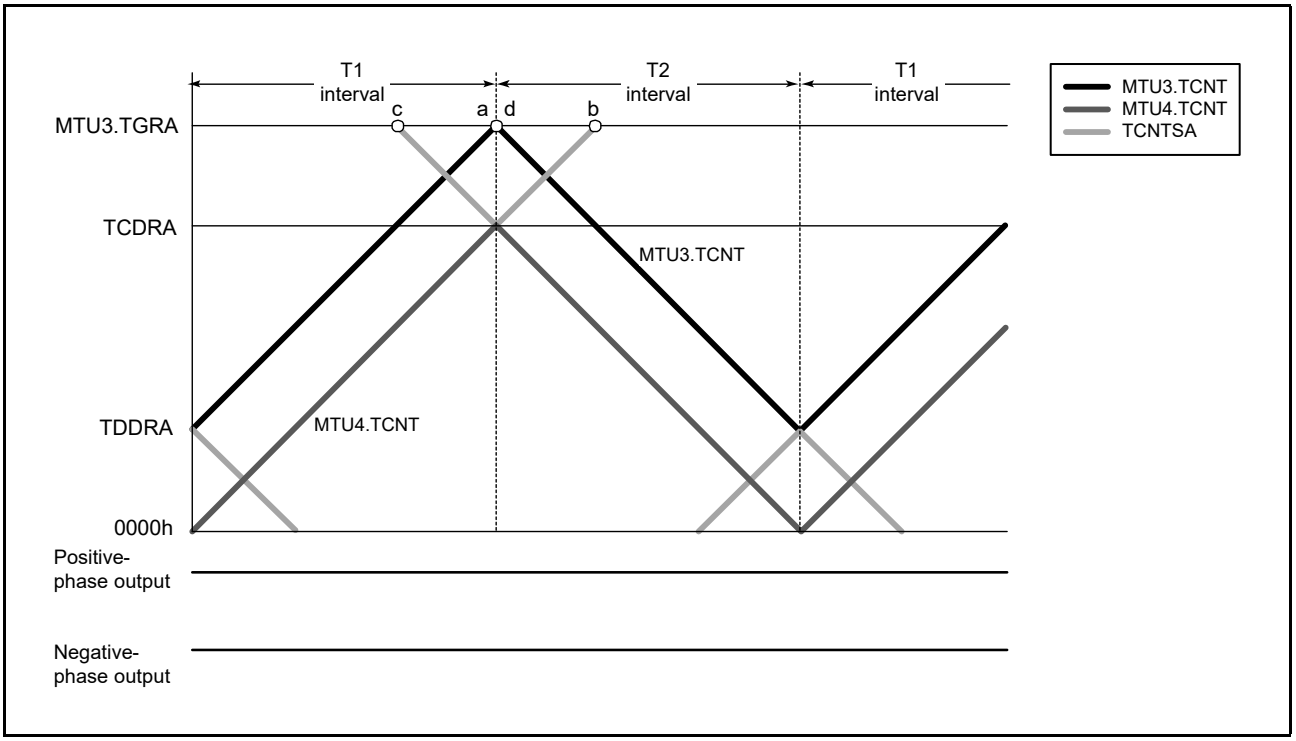

Figure 19.63 Example of 0% and 100% Waveform Output in Complementary PWM Mode (MTU3 and MTU4) (5)

(l) Toggle Output Synchronized with PWM Cycle

In complementary PWM mode, toggle output in synchronization with the PWM carrier cycle can be generated by setting the PSYE bit to 1 in the timer output control register 1 (TOCR1A or TOCR1B). An example of a toggle output waveform is shown in Figure 19.64.

This output is toggled by a compare match between MTU3.TCNT and MTU3.TGRA (MTU6.TCNT and MTU6.TGRA) and a compare match between MTU4.TCNT (MTU7.TCNT) and 0000h.

The MTIOC3A (MTIOC6A) pin is assigned for this toggle output. The initial output is High.

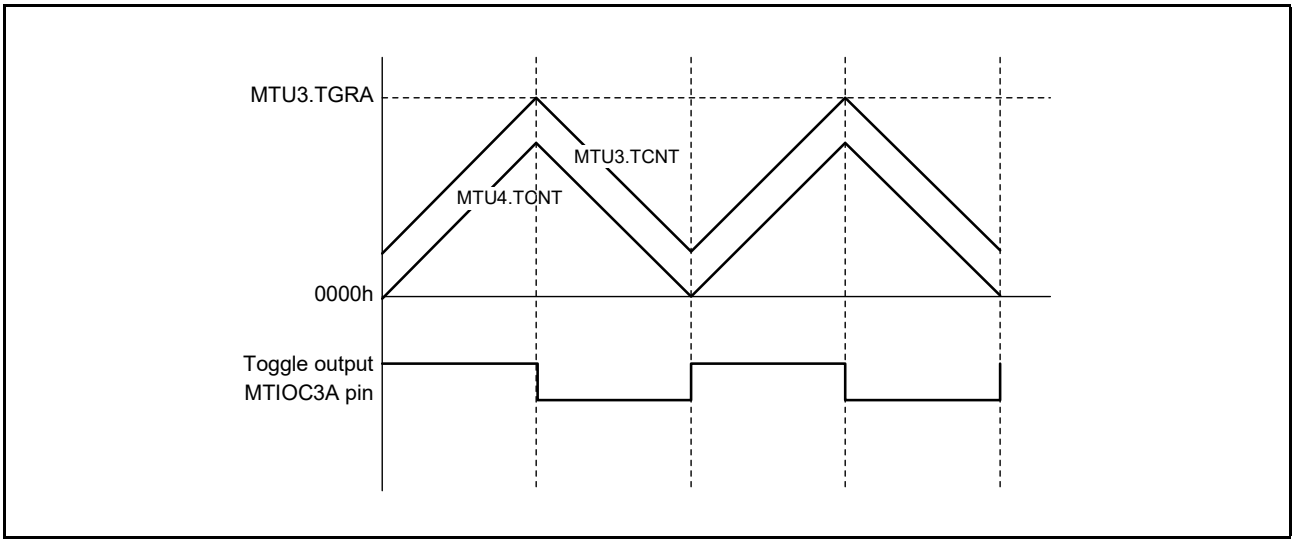

Figure 19.64 Example of Toggle Output Waveform Synchronized with PWM Output (MTU3 and MTU4)

(m) Counter Clearing by Another Channel

In complementary PWM mode, MTU3.TCNT, MTU4.TCNT, and TCNTSA (MTU6.TCNT, MTU7.TCNT, and TCNTSB) can be cleared by another channel when a mode for synchronization with another channel is specified through the timer synchronous register (TSYRA or TSYRB) and synchronous clearing is selected with bits CCLR[2:0] in the timer control register (TCR).

Figure 19.65 illustrates an example of this operation.

Use of this function enables a counter to be cleared and restarted through an external signal.

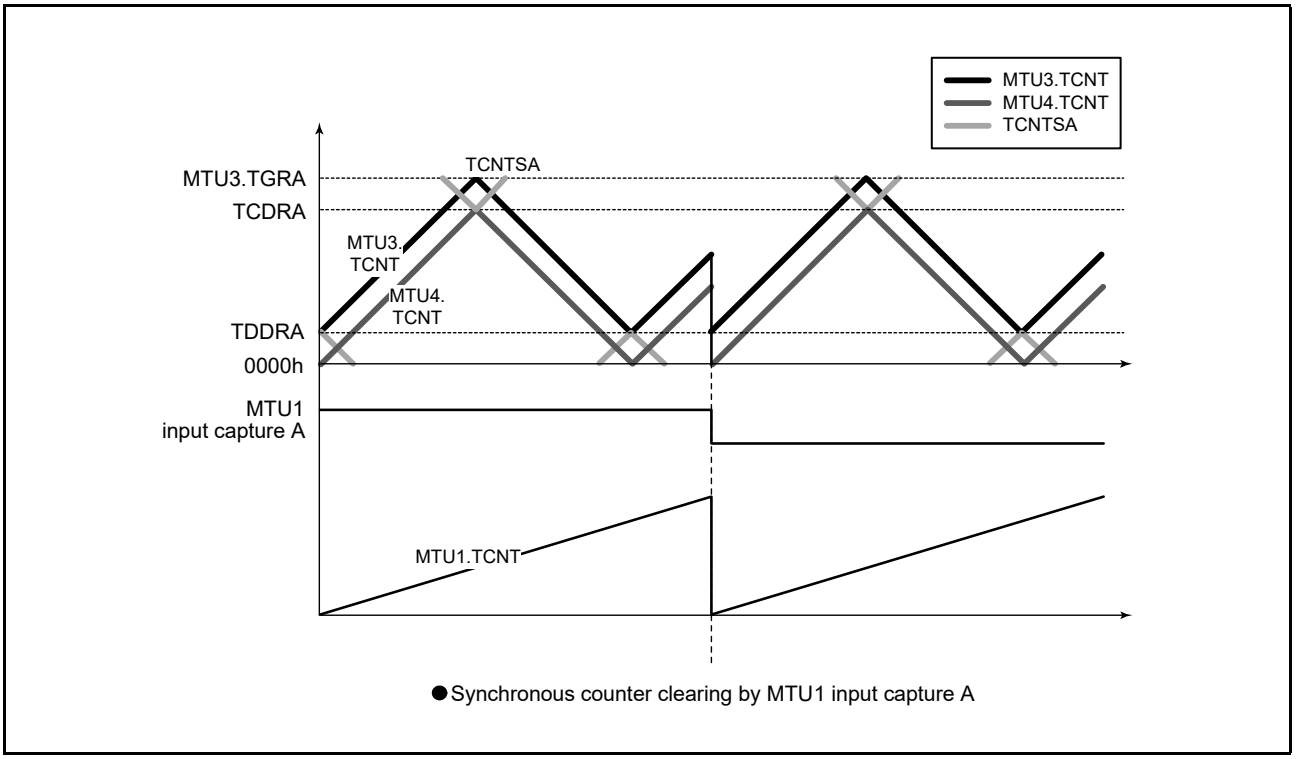

Figure 19.65 Counter Clearing Synchronized with Another Channel (MTU3 and MTU4)

(n) Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode

Setting the WRE bit in TWCRA (TWCRB) to 1 suppresses initial output when synchronous counter clearing occurs in the Tb interval at the trough in complementary PWM mode and controls abrupt change in duty cycle at synchronous counter clearing.

Initial output suppression through the WRE bit = 1 is applicable only when synchronous clearing occurs in the Tb interval at the trough as indicated by (10) or (11) in Figure 19.66. When synchronous clearing occurs outside that interval, the initial value specified by the OLSN and OLSP bits in TOCR1A (TOCR1B) is output. Even in the Tb interval at the trough, if synchronous clearing occurs in the initial value output period (indicated by (1) in Figure 19.66) immediately after the counters start operation, initial value output is not suppressed.

This function can be used in both channel combinations of MTU 3 and MTU4, or MTU6 and MTU7. In MTU3 and MTU4, synchronous clearing generated in MTU0 to MTU2 can cause counter clearing; in MTU6 and MTU7, compare match or input capture generated in MTU0 to MTU2 can cause counter clearing.

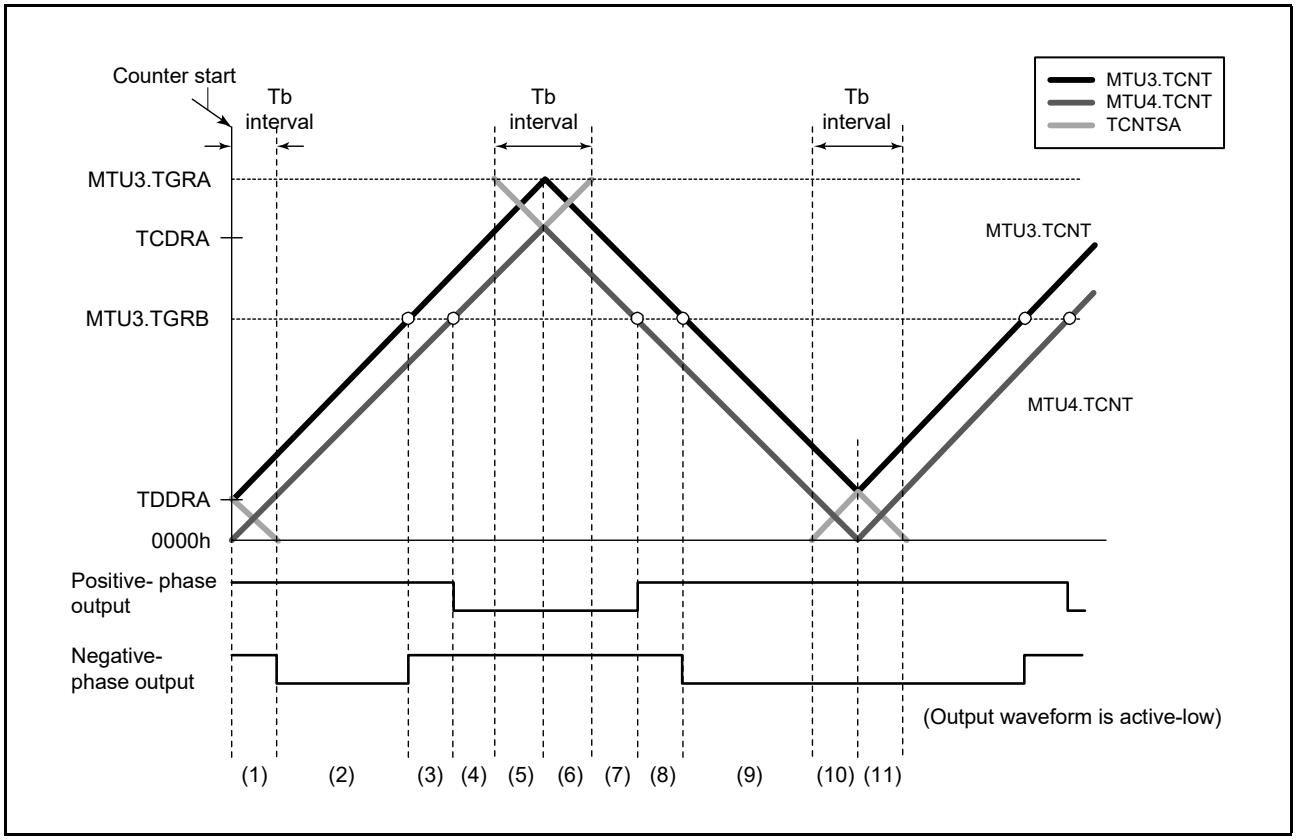

Figure 19.66 Timing for Synchronous Counter Clearing (MTU3 and MTU4)

- Example of Procedure for Setting Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode.

An example of the procedure for setting output waveform control at synchronous counter clearing in complementary PWM mode is shown in Figure 19.67.

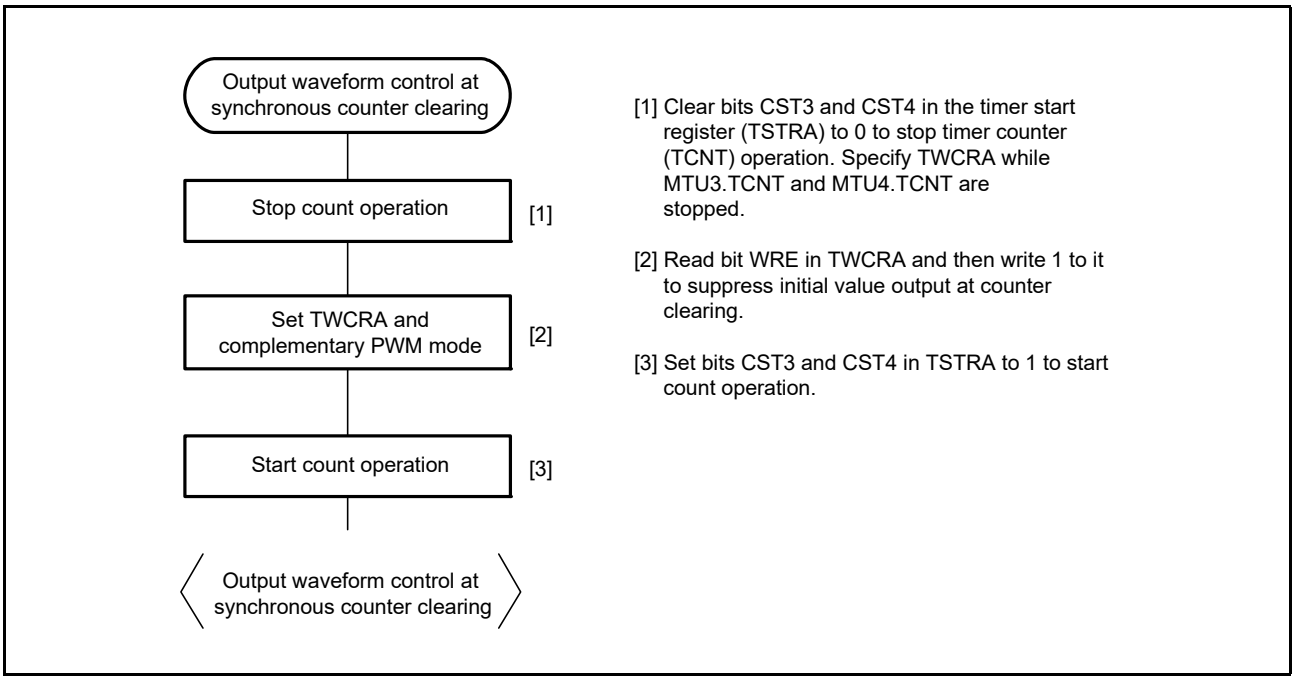

Figure 19.67 Example of Procedure for Setting Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode (MTU3 and MTU4)

- Examples of Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode

Figure 19.68 to Figure 19.71 show examples of output waveform control in which MTU3 and MTU4 operate in complementary PWM mode and synchronous counter clearing is generated while the WRE bit in TWCRA is set to 1. In the examples shown in Figure 19.68 to Figure 19.71, synchronous counter clearing occurs at timing (3), (6), (8), and (11) shown in Figure 19.66, respectively.

In MTU6 and MTU7, these examples are equivalent to the cases when MTU6 and MTU7 operate in complementary PWM mode and synchronous counter clearing is generated while the SCC bit is cleared to 0 and the WRE bit is set to 1 in TWCRB.

(o) Suppressing Synchronous Counter Clearing for MTU0 to MTU2, and MTU6 and MTU7

In MTU6 and MTU7, setting the SCC bit in TWCRB to 1 suppresses synchronous counter clearing caused by MTU0, MTU1, and MTU2.

Synchronous counter clearing caused by MTU0, MTU1, and MTU2 is suppressed only within the interval shown in Figure 19.72.

When using this function, MTU6 and MTU7 should be set to complementary PWM mode.

For details of synchronous clearing caused by MTU0, MTU1, and MTU2, see section 19.3.10 (2) Synchronous Counter Clearing for MTU6 and MTU7.

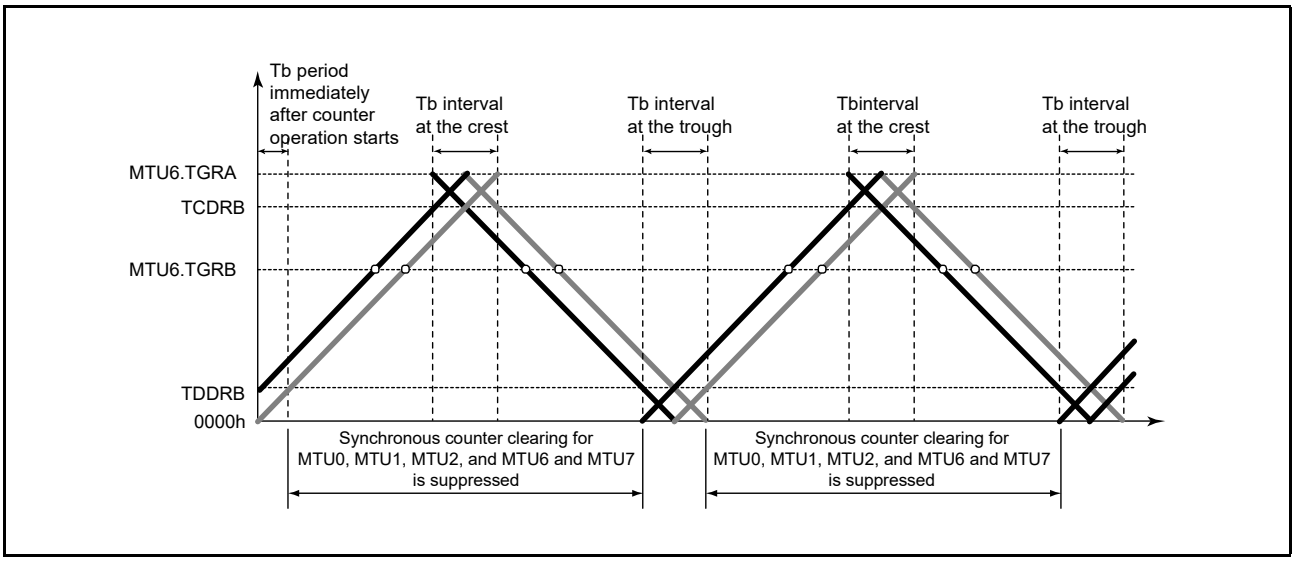

Figure 19.72 Synchronous Clearing-Suppressed Interval Specified by SCC Bit in TWCRB for MTU0 to MTU2, and MTU6 and MTU7

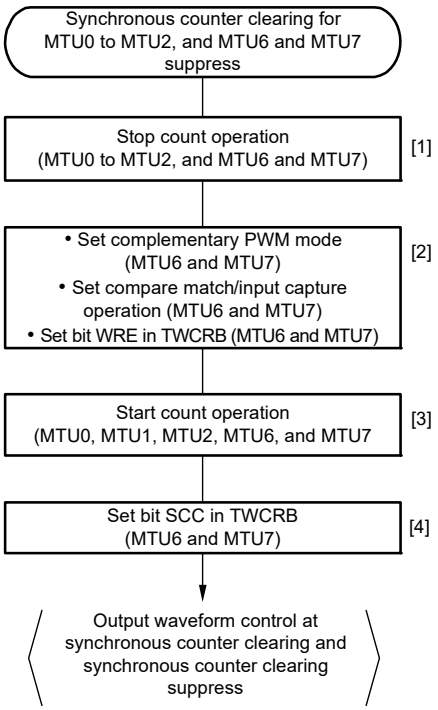
- Example of Procedure for Suppressing Synchronous Counter Clearing for MTU0 to MTU2, and MTU6 and MTU7

An example of the procedure for suppressing synchronous counter clearing for MTU0 to MTU2, and MTU6 and MTU7 is shown in Figure 19.73.



[1] Clear bits CST of the timer start register (TSTRB) in MTU6 and MTU7 to 0, and stop count operation. Clear bits CST of TSTRA in MTU0, MTU1, and MTU2 to 0, and stop count operation.

[2] Set the complementary PWM mode in MTU6 and MTU7 and compare match/input capture operation in MTU0, MTU1, and MTU2. When bit WRE in TWCRA or TWCRB should be set, make appropriate setting here.

[3] Set bits CST6 and CST7 in MTU6 and MTU7 to 1 to start count operation. For synchronous counter clearing for MTU0, MTU1, MTU2 to MTU6, and MTU7, set bits CST of TSTRA in MTU0, MTU1, and MTU2 to 1 to start count operation in any one of MTU0.TCNT to MTU2.TCNT.

[4] Read TWCRB and then set bit SCC in TWCRB to 1 to suppress synchronous counter clearing for MTU0 to MTU2, and MTU6 and MTU7*1. Here, do not modify the CCE and WRE bit values in TWCRB of MTU6 and MTU7. Synchronous counter clearing for MTU0 to MTU2, and MTU6 and MTU7 is suppressed in the synchronous counter clearing-suppressed periods.

Note 1. The TWCRB.SCC bit value can be modified during counter operation. However, if a synchronous clearing occurs when bit TWCRB.SCC is modified from 0 to 1, the synchronous clearing may not be suppressed. If a synchronous clearing occurs when bit TWCRB.SCC is modified from 1 to 0, the synchronous clearing may be suppressed.

Figure 19.73 Example of Procedure for Suppressing Synchronous Counter Clearing for MTU0 to MTU2, and MTU6 and MTU7

- Examples of Suppression of Synchronous Counter Clearing for MTU0 to MTU2, and MTU6 and MTU7

Figure 19.74 to Figure 19.77 show examples of operation in which MTU6 and MTU7 operate in complementary PWM mode and synchronous counter clearing for MTU0 to MTU2, and MTU6 and MTU7 is suppressed by setting the SCC bit in TWCRB in MTU6 and MTU7 to 1. In the examples shown in Figure 19.74 to Figure 19.77, synchronous counter clearing occurs at timing (3), (6), (8), and (11) shown in Figure 19.66, respectively. In these examples, the WRE bit in TWCRB in MTU6 and MTU7 is set to 1.

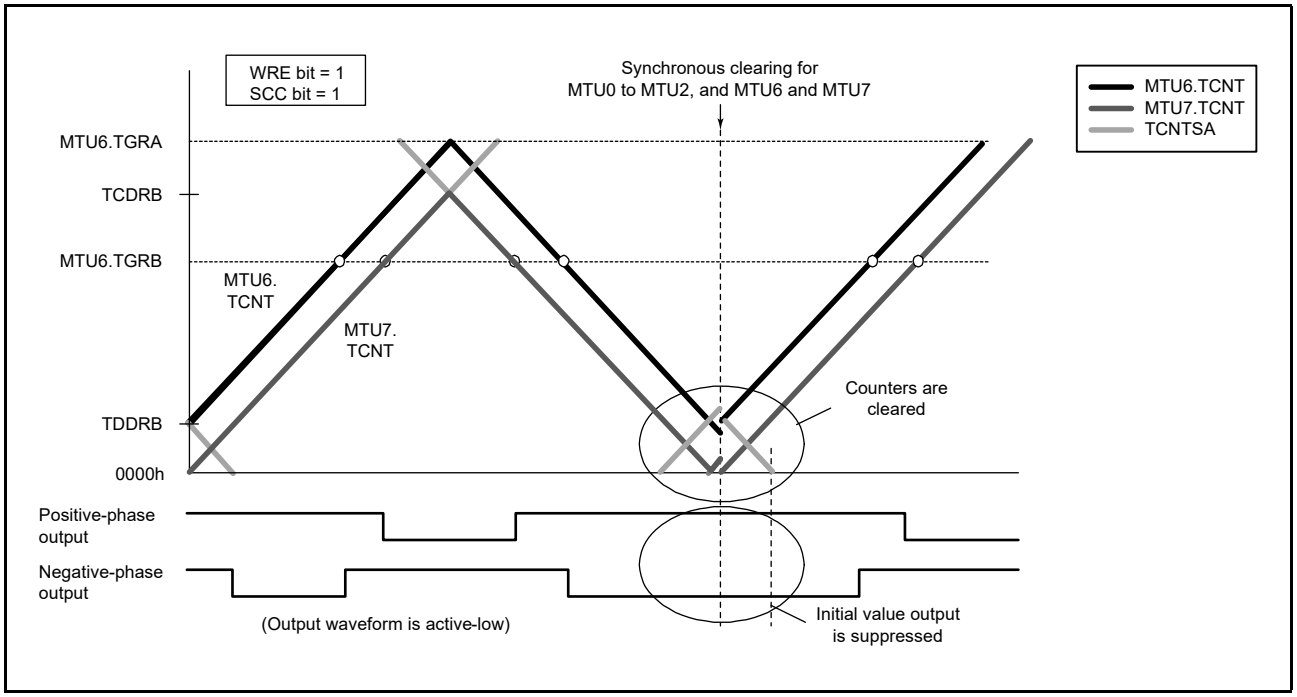

Figure 19.77 Example of Synchronous Clearing in Interval Tb at Trough (Timing (11) in Figure 19.66; Bit WRE is 1 and Bit SCC is 1 in TWCRB in MTU6 and MTU7)

(p) Counter Clearing by MTU3.TGRA (MTU6.TGRA) Compare Match

In complementary PWM mode, MTU3.TCNT, MTU4.TCNT, and TCNTSA (MTU6.TCNT, MTU7.TCNT, and TCNTSB) can be cleared by MTU3.TGRA (MTU6.TGRA) compare match when the CCE bit is set in the timer waveform control register (TWCRA or TWCRB).
Figure 19.78 illustrates an operation example.

Note 1. Use this function only in complementary PWM mode 1 (transfer at crest).
Note 2. Do not specify synchronous clearing by another channel (do not set 1 in the SYNC0 to SYNC4 or SYNC6 to SYNC7 bits in the timer synchronous register (TSYRA or TSYRB) and the CE0A to CE0D, CE1A and CE1B, or CE2A and CE2B bits in TSYCR).
Note 3. Do not set the PWM duty value to 0000h.
Note 4. Do not set the PSYE bit in timer output control register 1 (TOCR1A or TOCR1B) to 1.

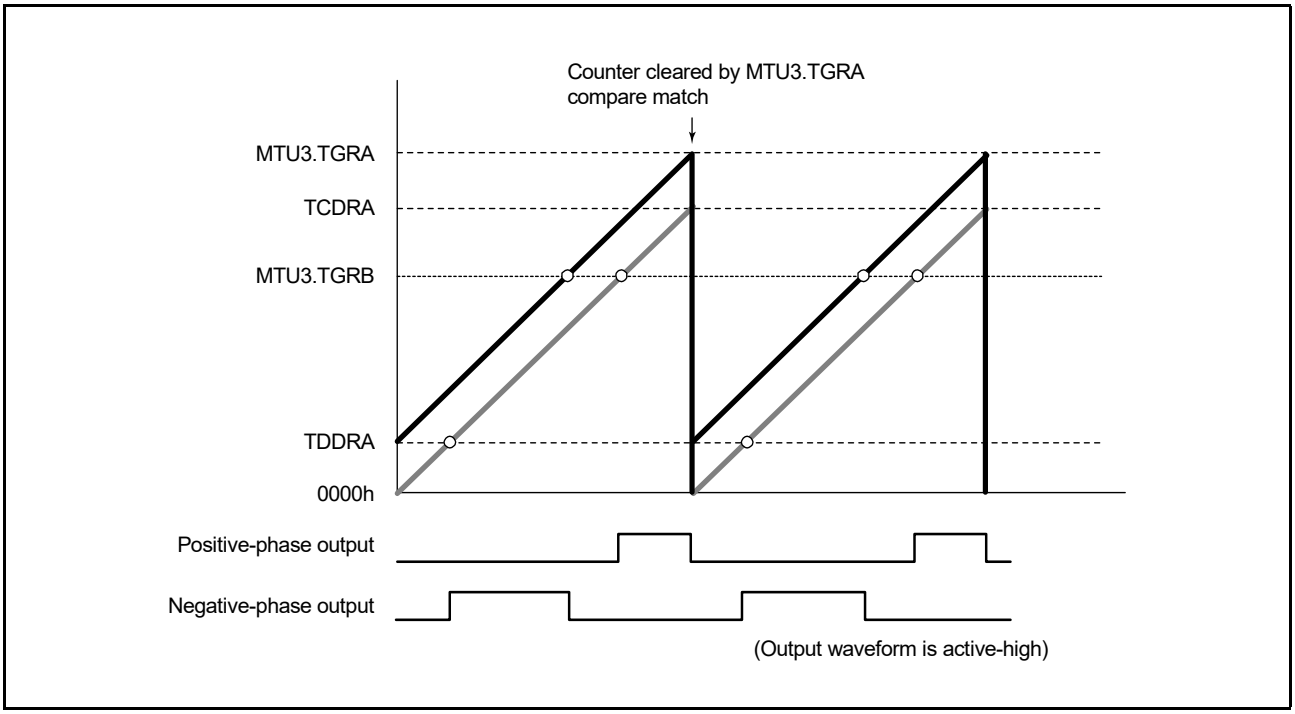

Figure 19.78 Example of Counter Clearing Operation by MTU3.TGRA Compare Match

(q) Example of Waveform Output for Driving AC Synchronous Motor (Brushless DC Motor)

In complementary PWM mode, a brushless DC motor can easily be controlled using the timer gate control register (TGCRA). Figure 19.79 to Figure 19.82 show examples of brushless DC motor driving waveforms created using TGCRA.

To switch the output phases for a 3-phase brushless DC motor by means of external signals detected with a Hall element, etc., clear the TGCRA.FB bit to 0. In this case, the external signals indicating the magnetic pole position should be input to timer input pins MTIOC0A, MTIOC0B, and MTIOC0C in MTU0 (make appropriate settings with the MPC and port mode registers (PMR) of the I/O ports). When an edge is detected at pin MTIOC0A, MTIOC0B, or MTIOC0C, the output on/off state is switched automatically.

When the TGCRA.FB bit is 1, the output on/off state is switched when the UF, VF, or WF bit in TGCRA is cleared to 0 or set to 1.

The driving waveforms are output from the 6-phase output pins for complementary PWM mode.

With this 6-phase output, while the output is turned on, chopping output is available through complementary PWM mode output function by setting the N bit or P bit in TGCRA to 1. When the N bit or P bit is 0, the level output is selected.

The active level of the 6-phase output (on output level) can be set with the OLSN and OLSP bits in the timer output control register 1A (TOCR1A) regardless of the setting of the N and P bits.

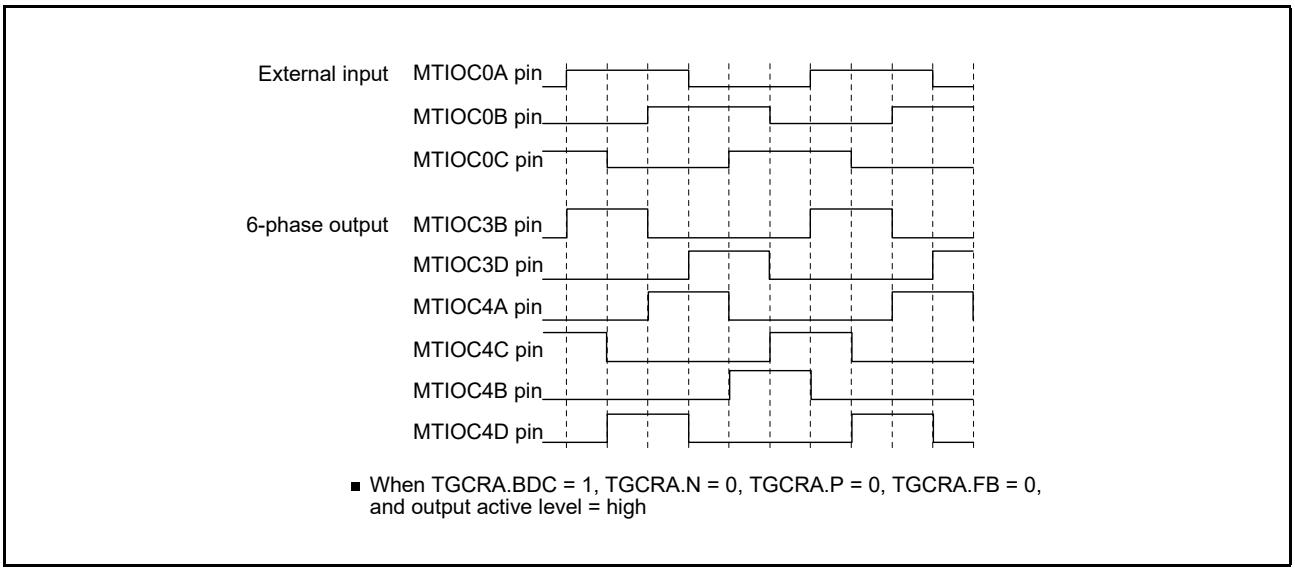

Figure 19.79 Example of Output Phase Switching by External Input (1)

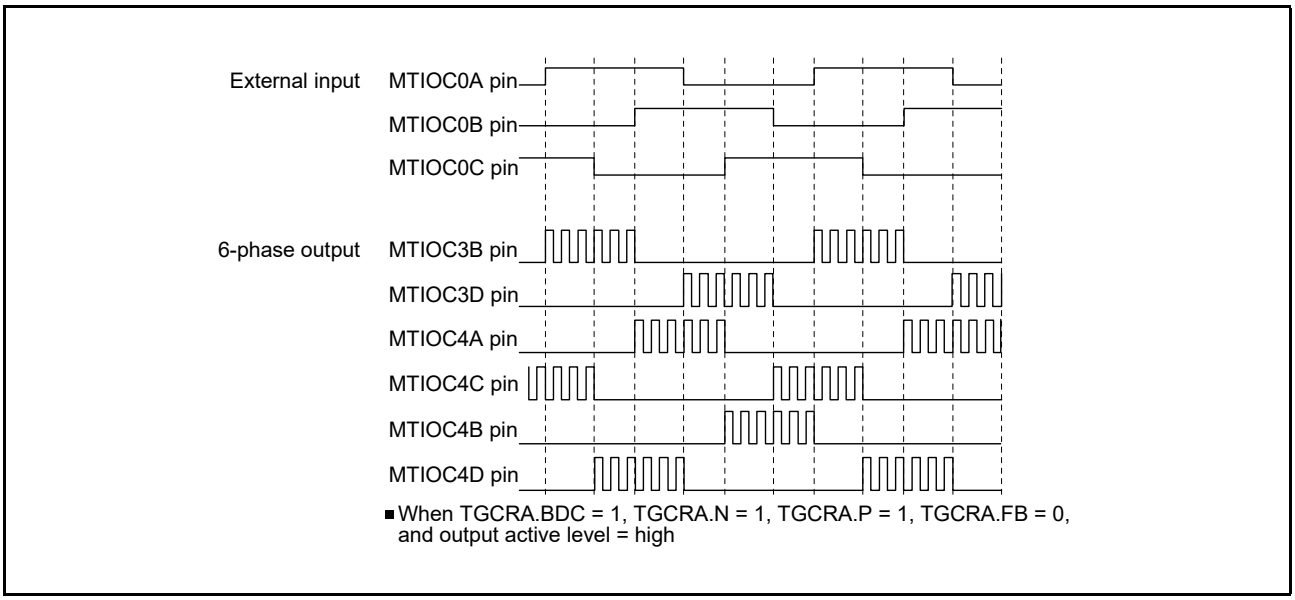

Figure 19.80 Example of Output Phase Switching by External Input (2)

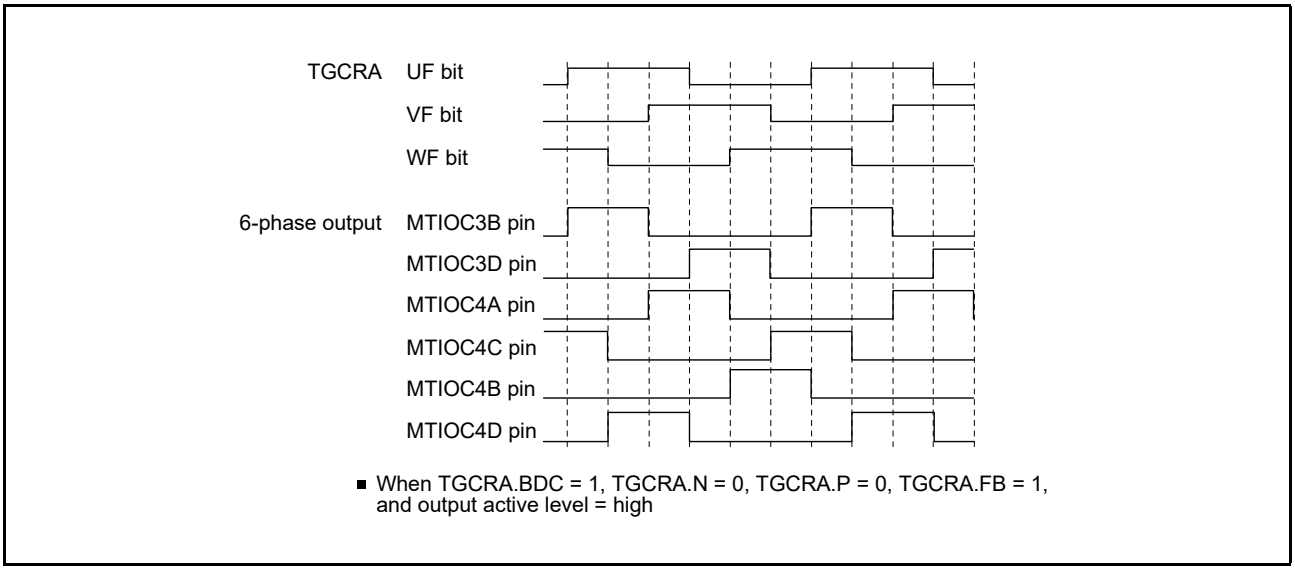

Figure 19.81 Example of Output Phase Switching through UF, VF, and WF Bit Settings (1)

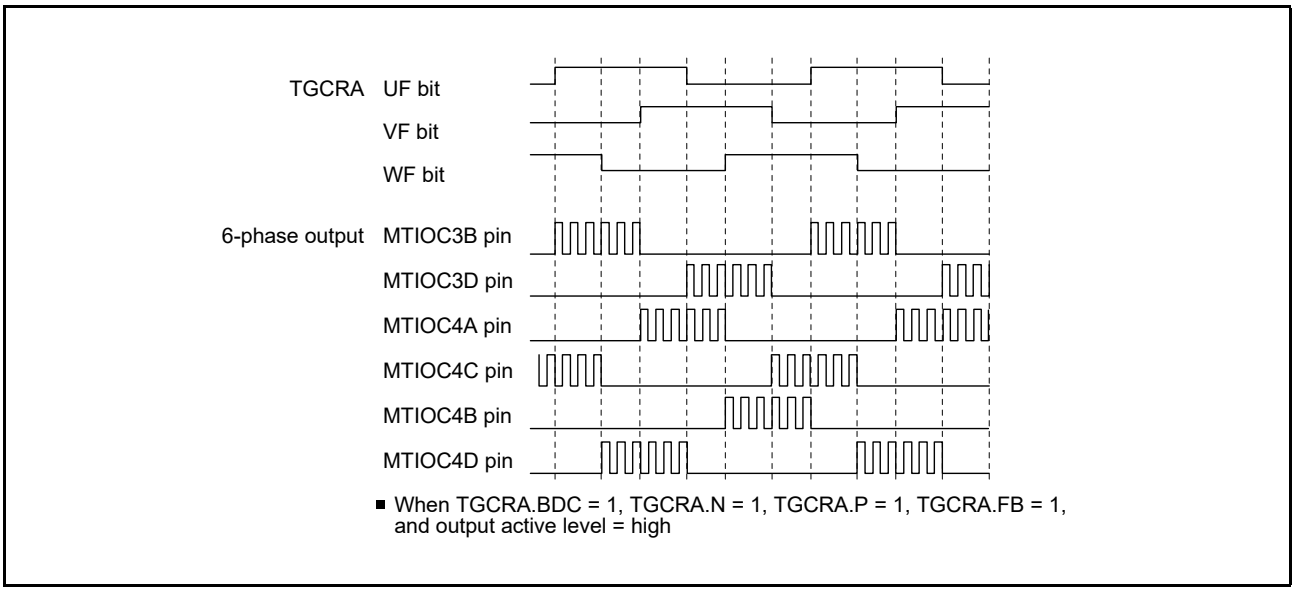

Figure 19.82 Example of Output Phase Switching through UF, VF, and WF Bit Settings (2)

(r) A/D Converter Start Request Setting

In complementary PWM mode, an A/D converter start request can be issued using MTU3.TGRA (MTU6.TGRA) compare match, MTU4.TCNT (MTU7.TCNT) underflow (trough), or compare match on a channel other than MTU3 and MTU4 (MTU6 and MTU7).
When start requests using MTU3.TGRA (MTU6.TGRA) compare match are specified, A/D conversion can be started at the crest of the MTU3.TCNT (MTU6.TCNT) count.
A/D converter start requests can be specified by setting the TTGE bit to 1 in the timer interrupt enable register (TIER).
To issue an A/D converter start request at an MTU4.TCNT (MTU7.TCNT) underflow (trough), set the TTGE2 bit in MTU4.TIER (MTU7.TIER) to 1.

(s) Double Buffer Function in Complementary PWM Mode

In complementary PWM mode 3 (transfer at the crest and trough), the PWM output setting resolution can be improved from ±2 to ±1 by setting the DRS bit in timer mode register 2 (TMDR2A or TMDR2B) to 1.
When setting buffer registers A (MTU3.TGRD, MTU4.TGRC, and MTU4.TGRD), set also buffer registers B (MTU3.TGRE, MTU4.TGRE, and MTU4.TGRF) at the same time. Each buffer register B should be set to the buffer register A value or (buffer register A value – 1). For details of the setting procedure, see section 19.3.8 (1) Example of Complementary PWM Mode Setting Procedure.

Note: When a buffer register B is set to the buffer register A value, symmetric PWM waveforms are output. When a buffer register B is set to (buffer register A value – 1), asymmetric PWM waveforms are output.

Figure 19.83 shows an example of double buffer operation.
Each register data is transferred as follows.

- After MTU4.TGRD (buffer A) is written to, data is transferred from MTU4.TGRD (buffer A) to Temp3A (temporary A) and from MTU4.TGRF (buffer B) to Temp3B (temporary B).
- With timing (1) in the figure, data is transferred from Temp3A (temporary A) to MTU4.TGRB (compare).
- With timing (2) in the figure, data is transferred from Temp3B (temporary B) to MTU4.TGRB (compare).

In the crest interval (Tb interval at crest), the compare register and temporary register A are valid; in the trough interval (Tb interval at trough), the compare register and temporary register B are valid.

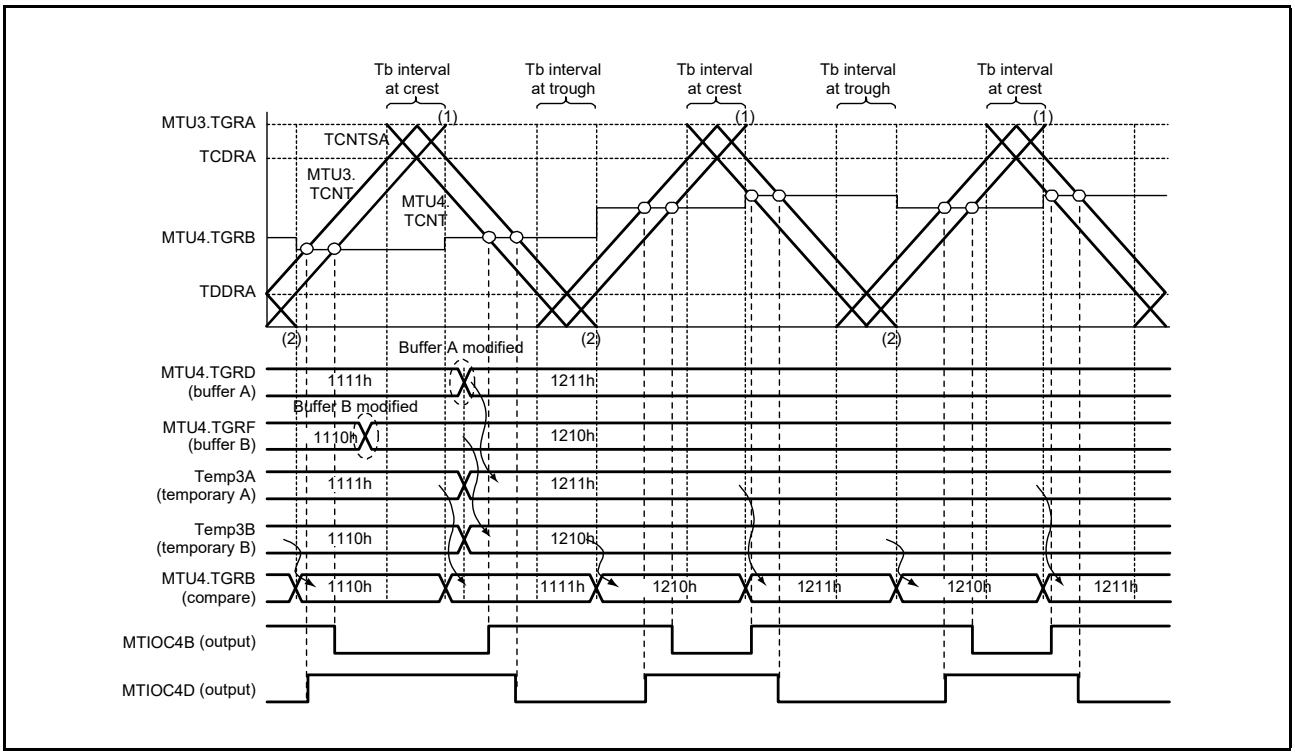

Figure 19.83 Example of Double Buffer Operation

Figure 19.84 shows an example when the buffer write value is smaller than the TDDRA value, and Figure 19.85 shows an example when the write value is greater than TCDRA.
In the crest interval, the output is controlled according to the compare match with the compare register or temporary register A; in the trough interval, the output is controlled according to the compare match with the compare register or temporary register B.

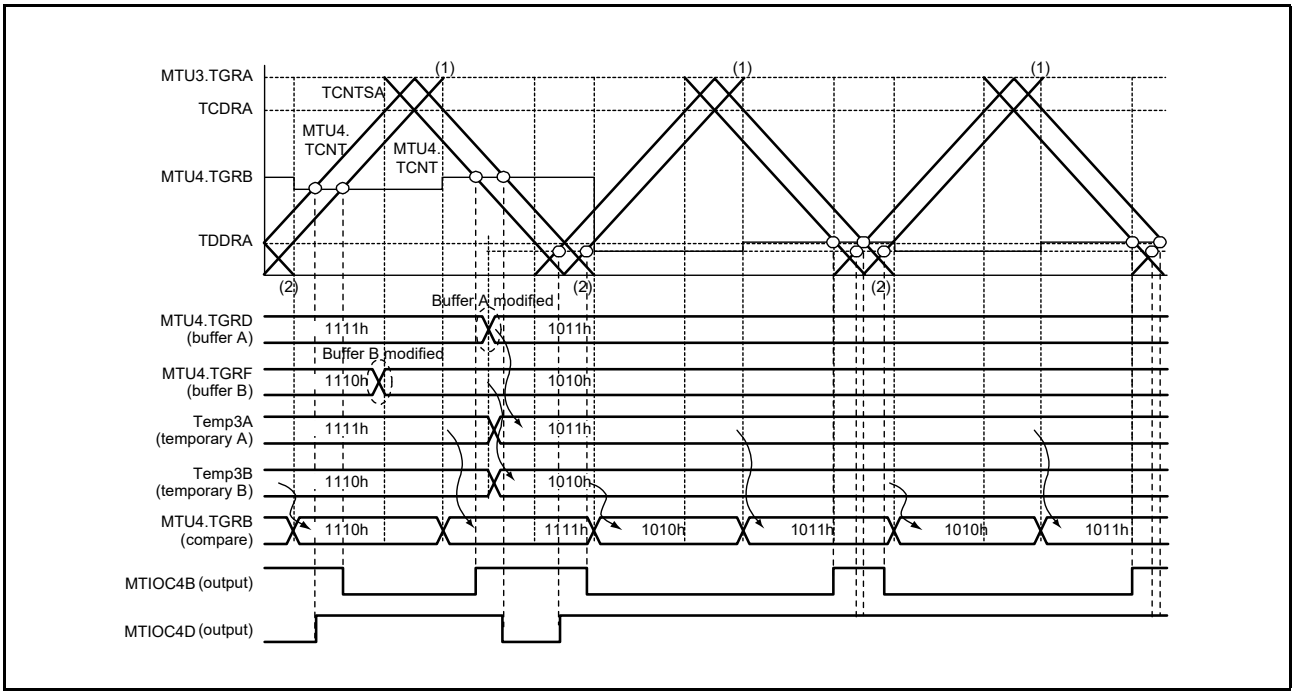

Figure 19.84 Example of Double Buffer Operation (Buffer Write Value is Smaller than TDDRA)

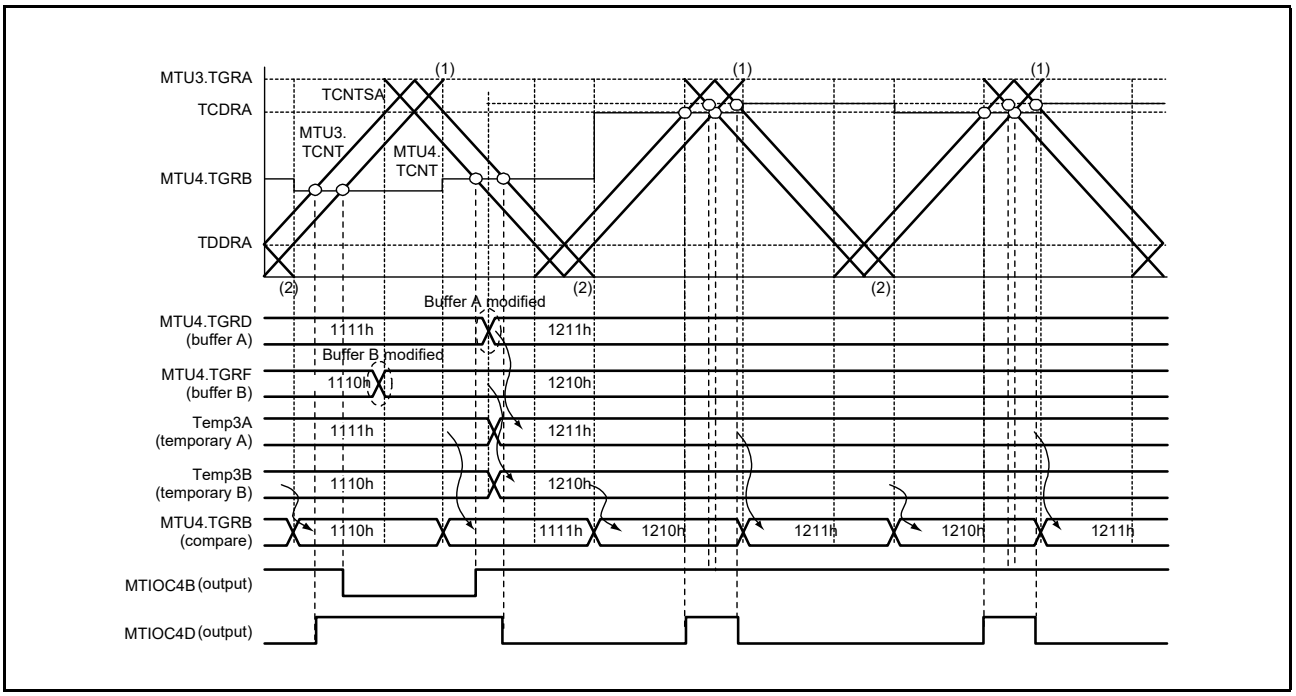

Figure 19.85 Example of Double Buffer Operation (Buffer Write Value is Greater than TCDRA)

(3) Interrupt Skipping Function 1 in Complementary PWM Mode

Interrupts TGIA3 (TGIA6) (at the crest) and TCIV4 (TCIV7) (at the trough) in MTU3 and MTU4 (MTU6 and MTU7) can be skipped up to seven times by making settings in the timer interrupt skipping set register 1 (TITCR1A or TITCR1B).

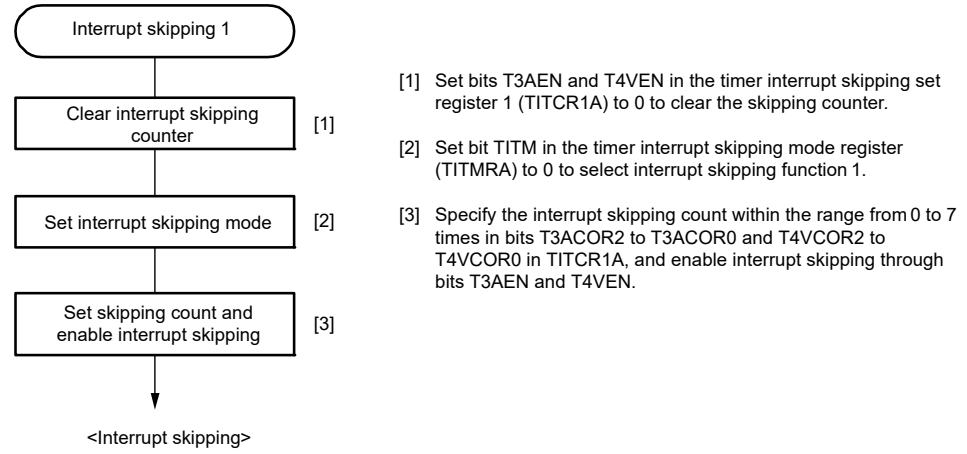
Transfers from a buffer register to a temporary register or a compare register can be skipped in coordination with interrupt skipping by making settings in the timer buffer transfer register (TBTERA or TBTERB). For the linkage with buffer registers, see section (c), Buffer Transfer Control Linked with Interrupt Skipping below.

A/D converter start requests generated by the A/D converter start request delaying function can also be skipped in coordination with interrupt skipping by making settings in the timer A/D converter request control register (MTU4.TADCR or MTU7.TADCR). For the linkage with the A/D converter start request delaying function, see section 19.3.9, A/D Converter Start Request Delaying Function.

The timer interrupt skipping setting register 1 (TITCR1A or TITCR1B) should be set while interrupt skipping function 1 is selected by setting the TITM bit to 0 in the timer interrupt skipping mode register (TITMRA or TITMRB), TGIA3 (TGIA6) and TCIV4 (TCIV7) interrupt requests are disabled by the settings of MTU3.TIER and MTU4.TIER (MTU6.TIER and MTU7.TIER), and a compare match is not generated. Before changing the skipping count, be sure to clear the T3AEN (T6AEN) and T4VEN (T7VEN) bits to 0 to clear the skipping counter.

(a) Example of Interrupt Skipping Function 1 Setting Procedure

Figure 19.86 shows an example of the interrupt skipping function 1 setting procedure. Figure 19.87 shows the periods during which interrupt skipping count can be changed.



Note: The setting of TITCR1A must be done while the TGIA3 and TCIV4 interrupt requests are disabled by the settings of MTU3.TIER and MTU4.TIER under the conditions in which a compare match is not generated. Before changing the skipping count, be sure to clear the T3AEN and T4VEN bits to 0 to clear the skipping counter.

Figure 19.86 Example of Interrupt Skipping Function 1 Setting Procedure

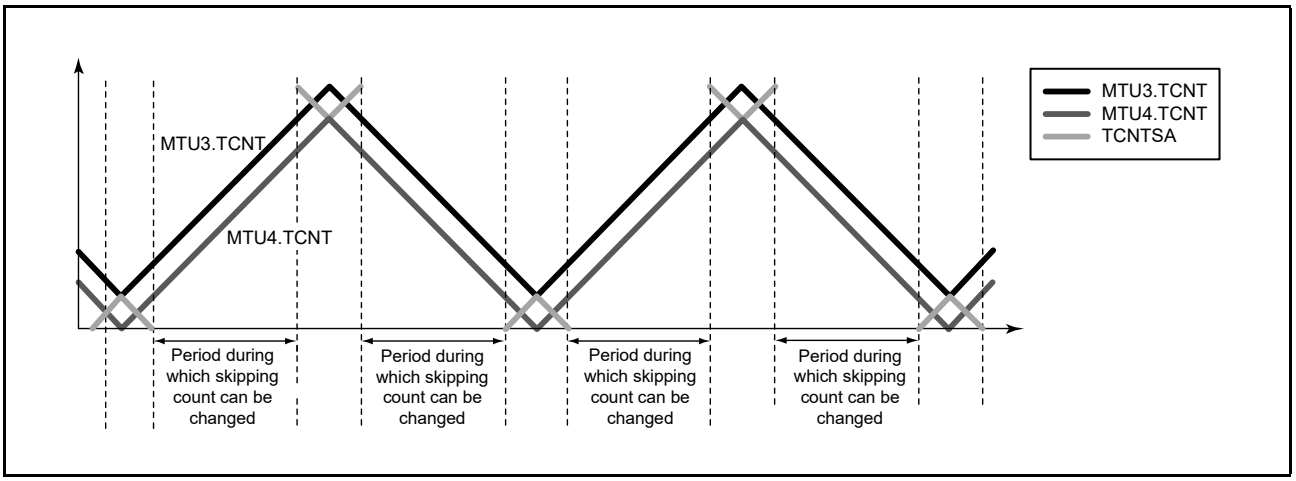


Figure 19.87 Periods during which Interrupt Skipping Count can be Changed

(b) Example of Interrupt Skipping Function 1

Figure 19.88 shows an example of TGIA3 (TGIA6) interrupt skipping in which the interrupt skipping count is set to three by the T3ACOR (T6ACOR) bits and the T3AEN (T6AEN) bit is set to 1 in the timer interrupt skipping set register 1 (TITCR1A or TITCR1B).

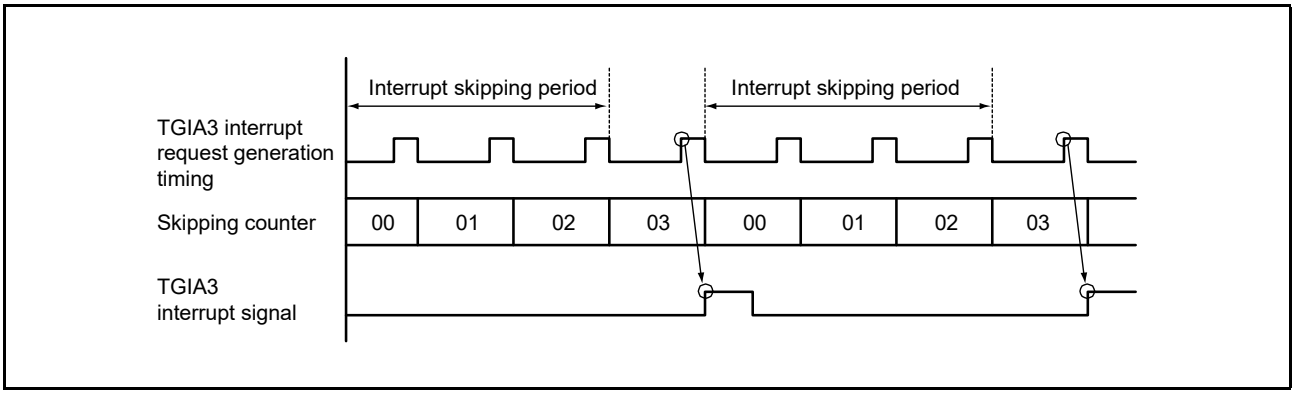

Figure 19.88 Example of Interrupt Skipping Function 1

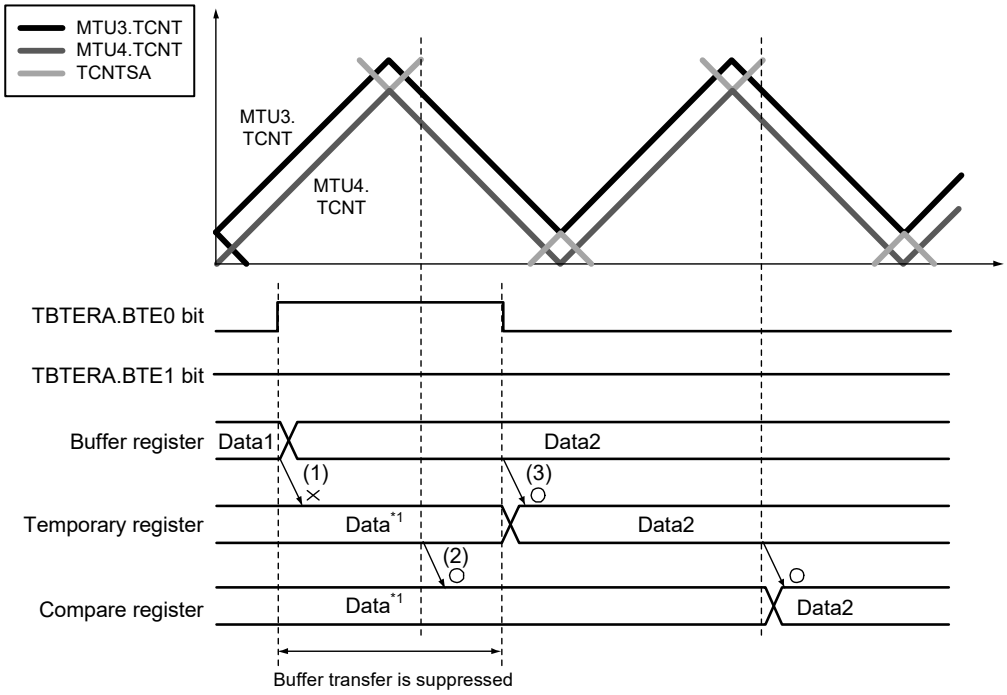
(c) Buffer Transfer Control Linked with Interrupt Skipping

In complementary PWM mode, whether to transfer data from a buffer register to a temporary register and whether to link the transfer with interrupt skipping can be specified with the BTE[1:0] bits in the timer buffer transfer set register (TBTERA or TBTERB).

Figure 19.89 shows an example of operation when buffer transfer is disabled (BTE[1:0] = 01b). While this setting is valid, data is not transferred from the buffer register to the temporary register.

Figure 19.90 shows an example of operation when buffer transfer is linked with interrupt skipping (BTE[1:0] = 10b). While this setting is valid, data is not transferred from the buffer register outside the buffer transfer-enabled period. Note that the buffer transfer-enabled period depends on the T3AEN (T6AEN) and T4VEN (T7VEN) bit settings in the timer interrupt skipping set register 1 (TITCR1A or TITCR1B). Figure 19.91 shows the relationship between the T3AEN (T6AEN) and T4VEN (T7VEN) bit settings in TITCR1A (TITCR1B) and buffer transfer-enabled period.

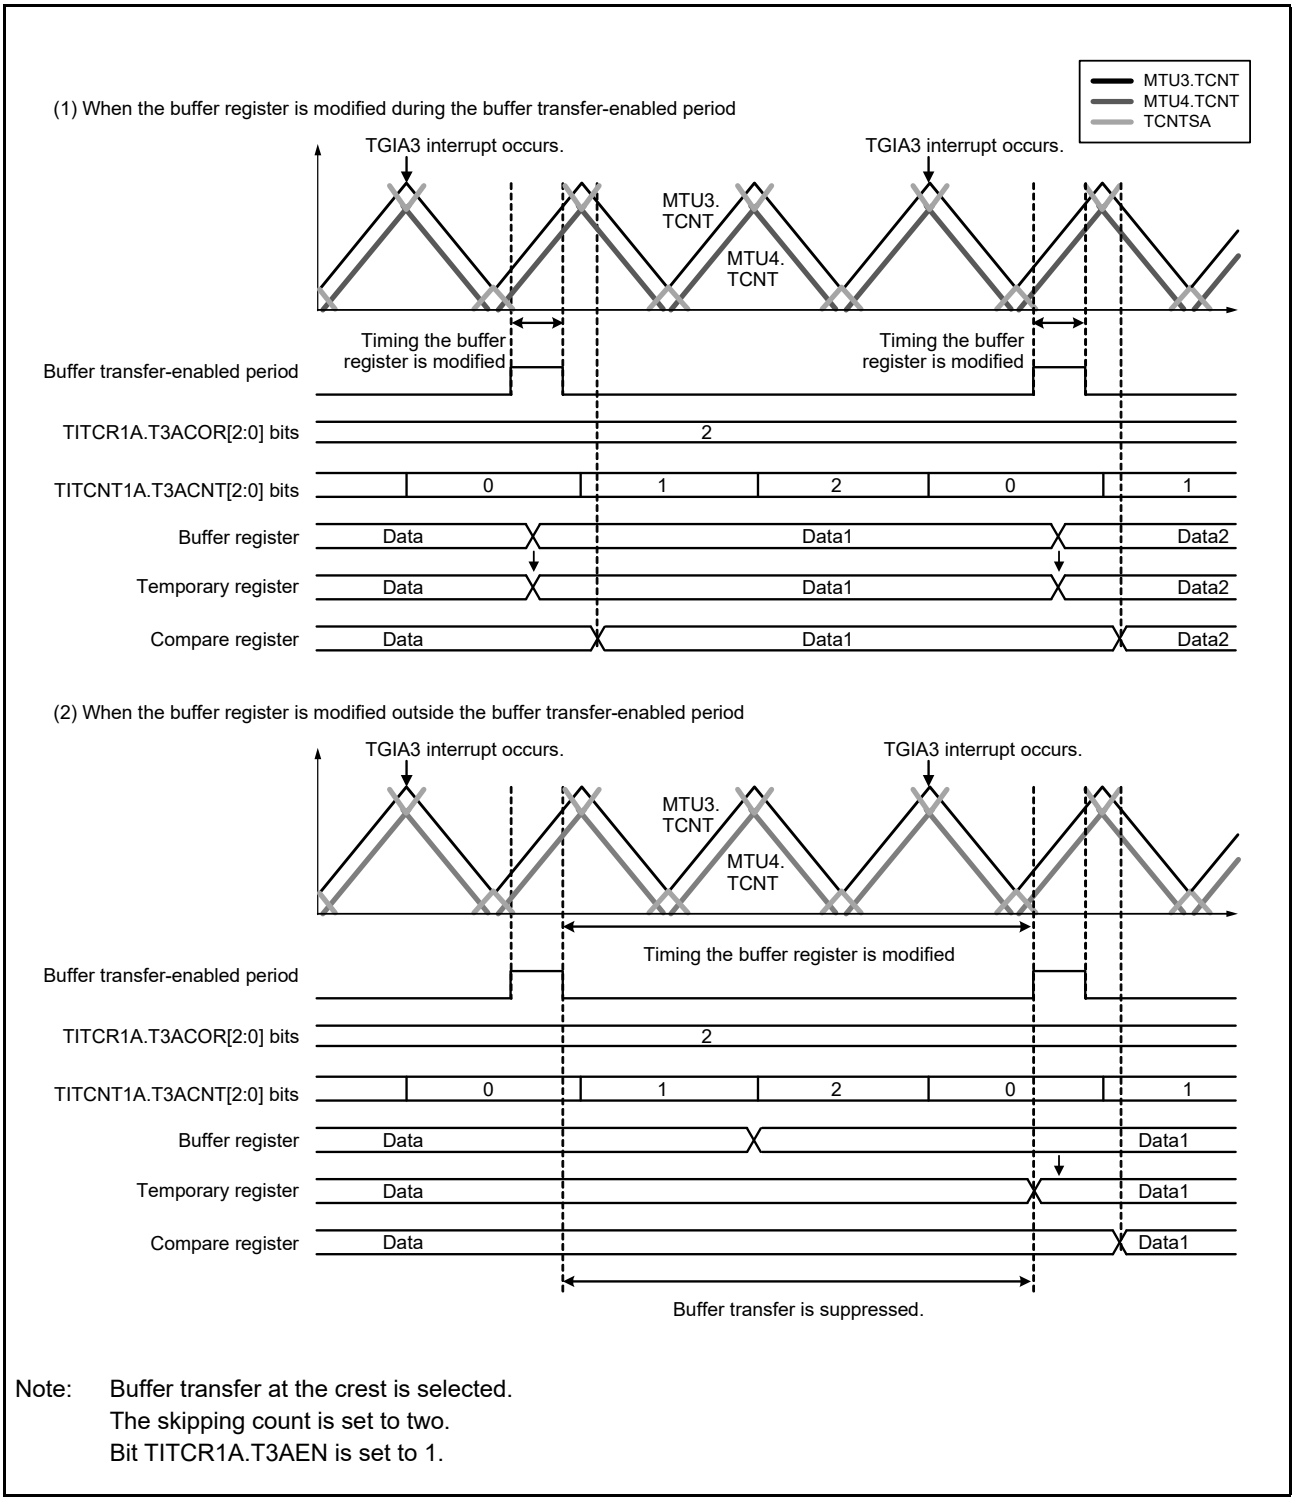
Note: This function must always be used in combination with interrupt skipping function 1.
When interrupt skipping is disabled (the T3AEN and T4VEN (T6AEN and T7VEN) bits in the timer interrupt skipping set register 1 (TITCR1A or TITCR1B) are cleared to 0 or the skipping count set bits (T3ACOR and T4VCOR (T6ACOR and T7VCOR)) in TITCR1A (TITCR1B) are cleared to 0), make sure that buffer transfer is not linked with interrupt skipping (clear the BTE1 bit in TBTERA or TBTERB to 0).
If buffer transfer is linked with interrupt skipping while interrupt skipping is disabled, buffer transfer is never performed.



[Legend]
(1) No data is transferred from the buffer register to the temporary register in the buffer transfer-disabled period (bits BTE[1:0] in TBTERA are set to 01b).
(2) Data is transferred from the temporary register to the compare register even in the buffer transfer-disabled period.
(3) After buffer transfer is enabled, data is transferred from the buffer register to the temporary register.

Note 1. When buffer transfer at the crest is selected.

Figure 19.89 Example of Operation when Buffer Transfer is Disabled (BTE[1:0] = 01b)



Note: Buffer transfer at the crest is selected.
The skipping count is set to two.
Bit TITCR1A.T3AEN is set to 1.

Note: The skipping count is set to three.
Buffer transfer at the crest and trough is selected.

Figure 19.91 Relationship between Bits T3AEN and T4VEN in TITCR1A and Buffer Transfer-Enabled Period

(4) Complementary PWM Mode Output Protection Functions

The MTU provides the following protection functions for complementary PWM mode output.

(a) Register and Counter Miswrite Prevention Function

With the exception of the buffer registers, which can be modified, access by the CPU can be enabled or disabled for the mode registers, control registers, compare registers, and counters used in complementary PWM mode by means of the RWE bit in the timer read/write enable register (TRWERA or TRWERB). The applicable registers are some of the registers in MTU3, MTU4, MTU6, and MTU7 shown below:

43 registers in total
MTU3.TCR, MTU4.TCR, MTU3.TMDR1, MTU4.TMDR1, MTU3.TIORH,
MTU4.TIORH, MTU3.TIORL, MTU4.TIORL, MTU3.TIER, MTU4.TIER,
MTU3.TCNT, MTU4.TCNT, MTU3.TGRA, MTU4.TGRA, MTU3.TGRB, MTU4.TGRB,
TOERA, TOCR1A, TOCR2A, TGCRA, TCDRA, TDDRA
MTU6.TCR, MTU7.TCR, MTU6.TMDR1, MTU7.TMDR1, MTU6.TIORH, MTU7.TIORH,
MTU6.TIORL, MTU7.TIORL, MTU6.TIER, MTU7.TIER, MTU6.TCNT, MTU7.TCNT,
MTU6.TGRA, MTU7.TGRA, MTU6.TGRB, MTU7.TGRB,
TOERB, TOCR1B, TOCR2B, TCDRB, and TDDRB

This function can disable CPU access to the mode registers, control registers, and counters to prevent miswriting due to CPU runaway. In the access-disabled state, the applicable registers are read as undefined and writing to these registers is ignored.

(b) Halting of PWM Output by External Signal

The 6-phase PWM output pins can be set to the high-impedance state automatically by inputting specified external signals.

See section 20, Port Output Enable 3 (POE3), for details.

(c) Halting of PWM Output when Oscillator is Stopped

Upon detecting that the clock input to this MCU has stopped, the 6-phase PWM output pins are automatically set to the high-impedance state. Note that the pin states are not guaranteed when the clock is restarted.

See section 7.4, Oscillation Stop Detection Function.

19.3.9 A/D Converter Start Request Delaying Function

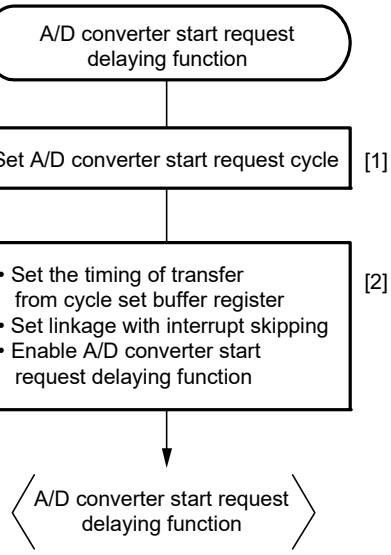
A/D converter start requests can be issued in MTU4 or MTU7 by making settings in the timer A/D converter start request control register (MTU4.TADCR or MTU7.TADCR), timer A/D converter start request cycle set registers (MTU4.TADCORA and MTU4.TADCORB, or MTU7.TADCORA and MTU7.TADCORB), and timer A/D converter start request cycle set buffer registers (MTU4.TADCOBRA and MTU4.TADCOBRB, or MTU7.TADCOBRA and MTU7.TADCOBRB).

The A/D converter start request delaying function compares MTU4.TCNT with MTU4.TADCORA or MTU4.TADCORB (MTU7.TCNT with MTU7.TADCORA or MTU7.TADCORB), and when their values match, the function issues a respective A/D converter start request (TRG4AN or TRG4BN (TRG7AN or TRG7BN)).

A/D converter start requests (TRG4AN and TRG4BN (TRG7AN and TRG7BN)) can be skipped in coordination with interrupt skipping by making settings in the ITA3AE, ITA4VE, ITB3AE, and ITB4VE bits in MTU4.TADCR (the ITA6AE, ITA7VE, ITB6AE, and ITB7VE bits in MTU7.TADCR).

(1) Example of Procedure for Specifying A/D Converter Start Request Delaying Function

Figure 19.92 shows an example of procedure for specifying the A/D converter start request delaying function.



[1] Set the cycle in the timer A/D converter start request cycle buffer register (MTU4.TADCOBRA or MTU4.TADCOBRB) and timer A/D converter start request cycle register (MTU4.TADCORA or MTU4.TADCORB).
(When the timing of transfer from the cycle buffer register to cycle register is set to the trough, or both trough and crest in step [2] below, the same initial value must be specified in the cycle buffer register and cycle register because transfer is performed immediately after counting starts.)

[2] Use bits BF1 and BF2 in the timer A/D converter start request control register (MTU4.TADCR) to specify the timing of transfer from the timer A/D converter start request cycle buffer register to A/D converter start request cycle register.
- Specify whether to link with interrupt skipping through bits ITA3AE, ITA4VE, ITB3AE, and ITB4VE.
- Use bits UT4AE, DT4AE, UT4BE, and DT4BE to enable A/D converter start requests (TRG4AN or TRG4BN).

Note: Perform MTU4.TADCR setting while MTU4.TCNT is stopped.
Note: Do not set MTU4.TADCR.BF1 to 1 when complementary PWM mode is not selected.
Note: Do not set ITA3AE, ITA4VE, ITB3AE, ITB4VE, DT4AE, or DT4BE to 1 when complementary PWM mode is not selected.

Figure 19.92 Example of Procedure for Specifying A/D Converter Start Request Delaying Function (MTU3 and MTU4)

(2) Basic Example of A/D Converter Start Request Delaying Function Operation

Figure 19.93 shows a basic example of A/D converter start request signal (TRG4AN (TRG7AN)) operation when the trough of MTU4.TCNT (MTU7.TCNT) is specified for the buffer transfer timing and an A/D converter start request signal is output during MTU4.TCNT (MTU7.TCNT) down-counting.

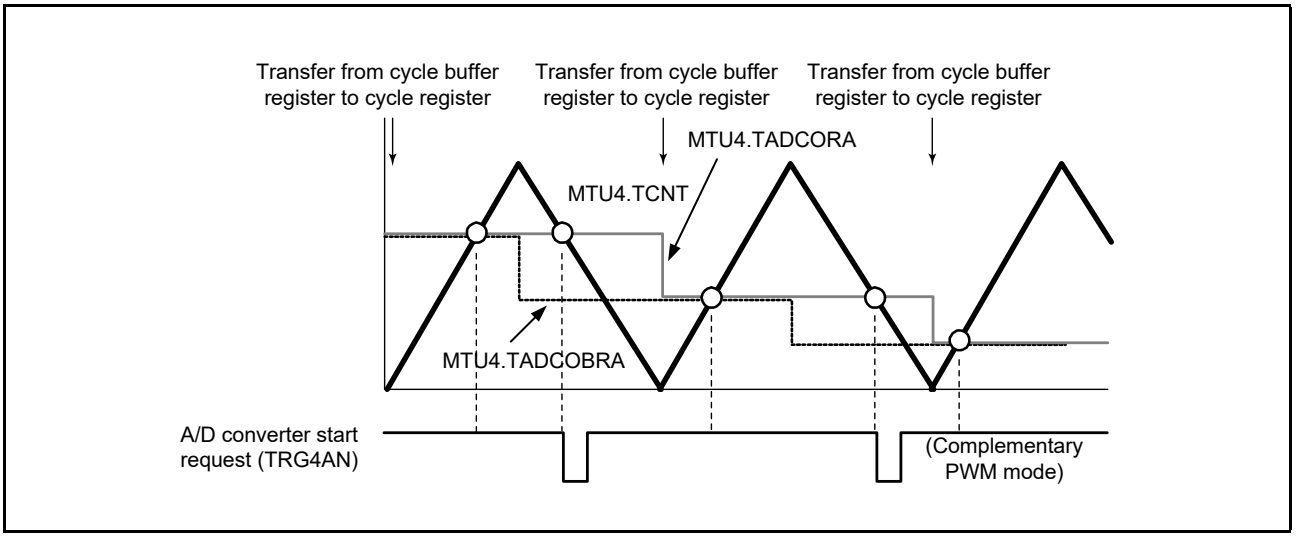


Figure 19.93 Basic Example of A/D Converter Start Request Signal (TRG4AN) Operation

(3) Buffer Transfer

The data in the timer A/D converter start request cycle set registers (MTU4.TADCORA and MTU4.TADCORB, or MTU7.TADCORA and MTU7.TADCORB) is updated by writing data to the timer A/D converter start request cycle set buffer registers (MTU4.TADCOBRA and MTU4.TADCOBRB, or MTU7.TADCOBRA and MTU7.TADCOBRB). Data is transferred from the buffer registers to the respective cycle set registers at the timing selected with the BF[1:0] bits in the timer A/D converter start request control register (MTU4.TADCR or MTU7.TADCR).
In complementary PWM mode, data is also transferred from the timer A/D converter start request cycle set buffer registers to the timer A/D converter start request cycle set registers when timer general register D (MTU4.TGRD or MTU7.TGRD) is updated.

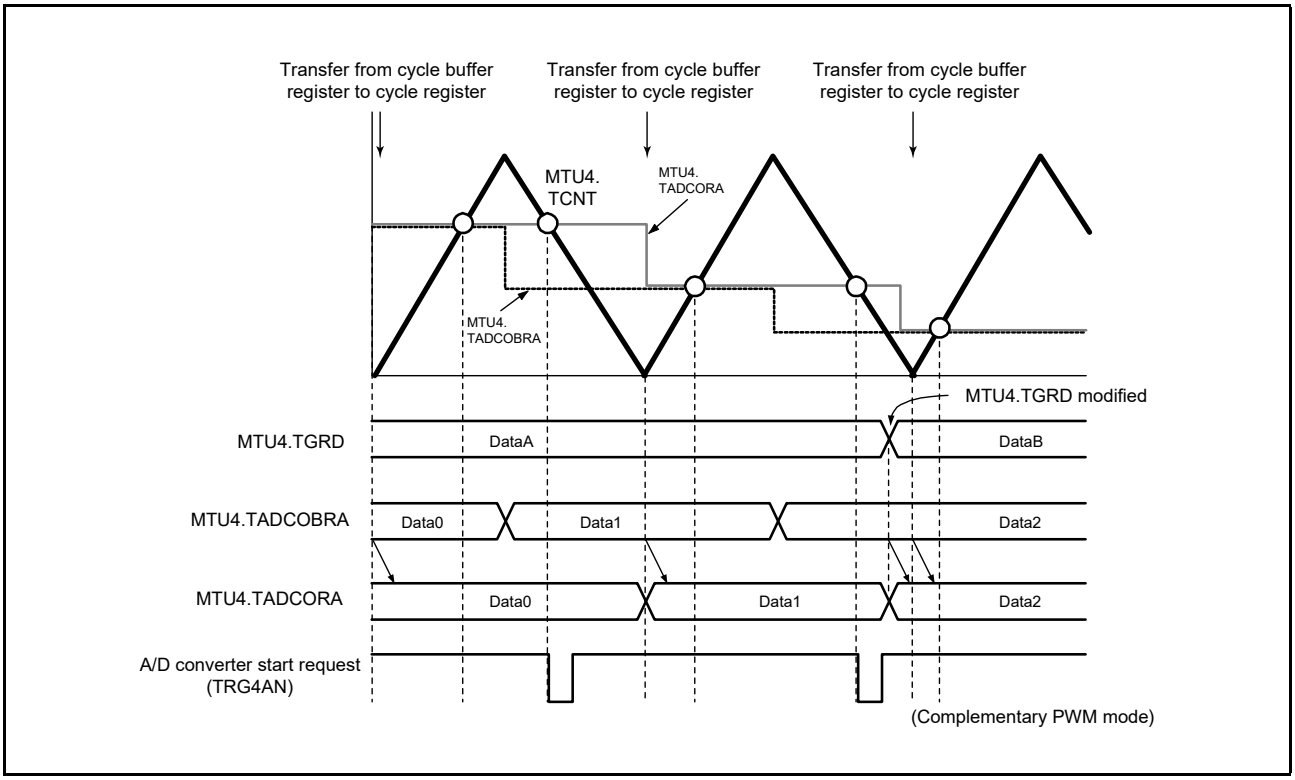

Figure 19.94 Example of A/D Converter Start Request Signal (TRG4AN) and Buffer Transfer Operation

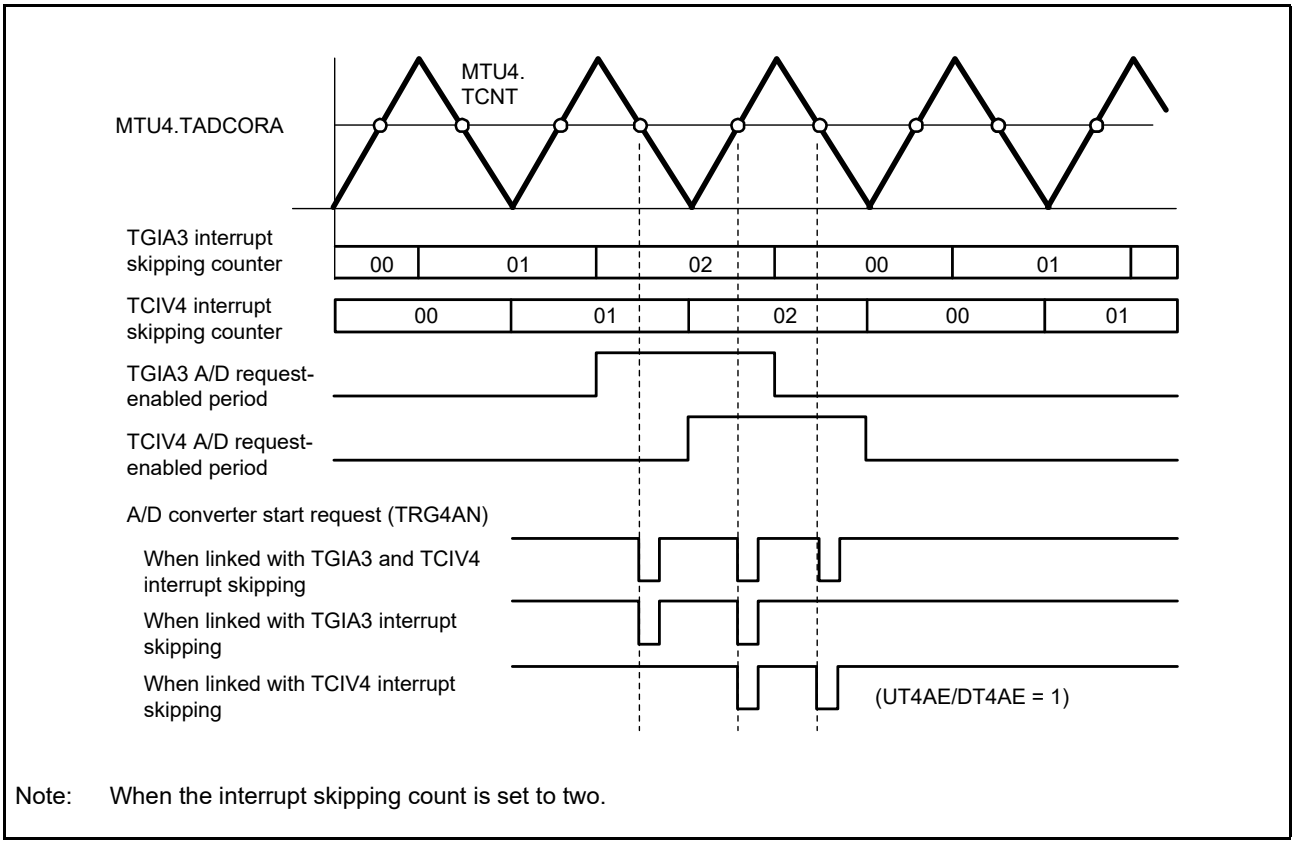
(4) A/D Converter Start Request Delaying Function Linked with Interrupt Skipping Function 1

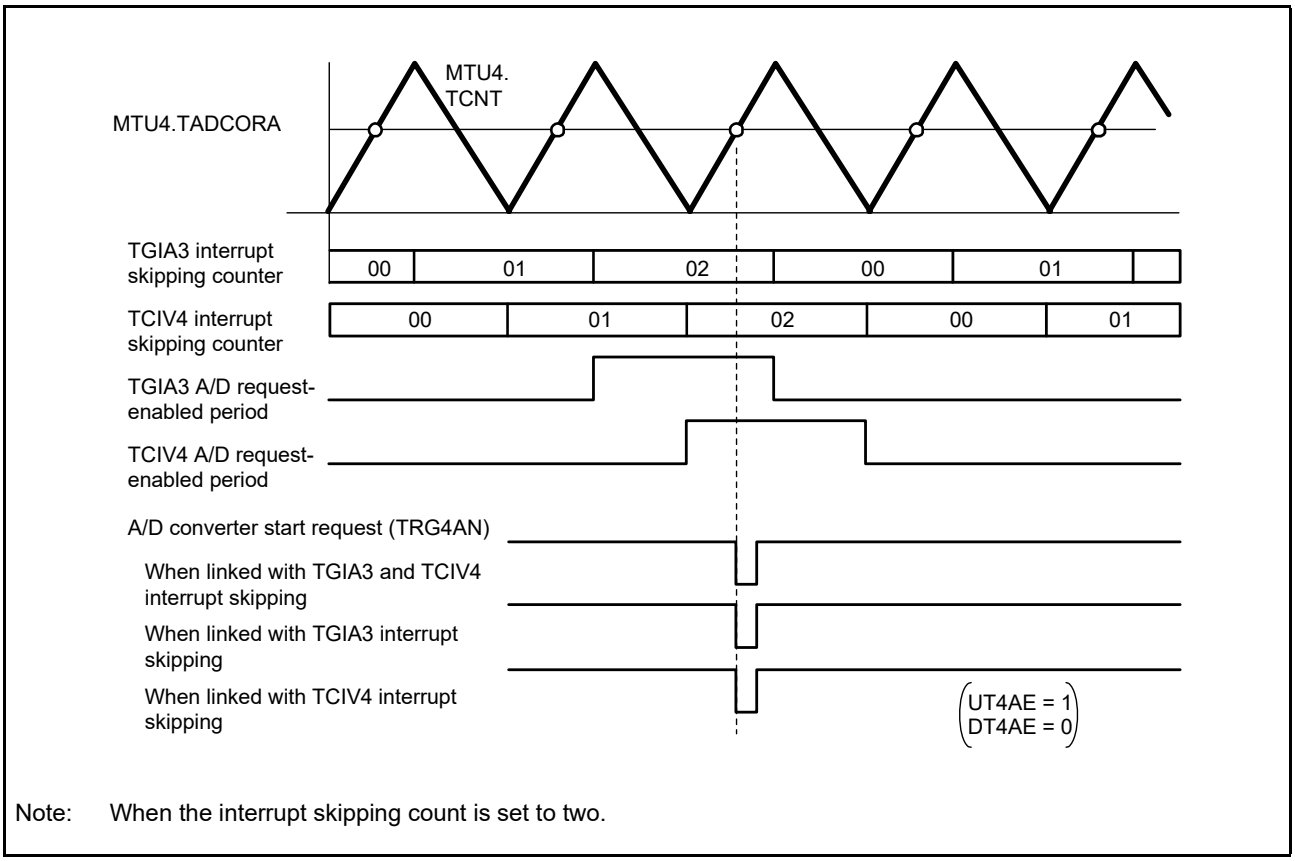
A/D converter start requests (TRG4AN and TRG4BN (TRG7AN and TRG7BN)) can be issued in coordination with interrupt skipping 1 by making settings in the ITA3AE, ITA4VE, ITB3AE, and ITB4VE (ITA6AE, ITA7VE, ITB6AE, and ITB7VE) bits in the timer A/D converter start request control register (MTU4.TADCR or MTU7.TADCR).
Figure 19.95 shows an example of A/D converter start request signal (TRG4AN (TRG7AN)) operation when TRG4AN (TRG7AN) output is enabled during MTU4.TCNT (MTU7.TCNT) up-counting and down-counting and A/D converter start requests are linked with interrupt skipping 1.
Figure 19.96 shows another example of A/D converter start request signal (TRG4AN (TRG7AN)) operation when TRG4AN (TRG7AN) output is enabled during MTU4.TCNT (MTU7.TCNT) up-counting and A/D converter start requests are linked with interrupt skipping 1.

Note: This function should be used in combination with interrupt skipping 1.
When interrupt skipping is disabled (the T3AEN and T4VEN (T6AEN and T7VEN) bits in the timer interrupt skipping set register (TITCR1A (TITCR1B)) are cleared to 0 or the skipping count set bits (T3ACOR and T4VCOR (T6ACOR and T7VCOR)) in TITCR1A (TITCR1B) are cleared to 0), make sure that A/D converter start requests are not linked with interrupt skipping 1 (clear the ITA3AE, ITA4VE, ITB3AE, and ITB4VE (ITA6AE, ITA7VE, ITB6AE, and ITB7VE) bits in the timer A/D converter start request control register (MTU4.TADCR (MTU7.TADCR)) to 0).
When this function is used, MTU4.TADCORA and MTU4.TADCORB (MTU7.TADCORA and MTU7.TADCORB) should be set with the value ranging 0002h to the value set in TCDRA minus 2 (value set in TCDRB minus 2).



Note: When the interrupt skipping count is set to two.

Figure 19.95 Example of A/D Converter Start Request Signal (TRG4AN) Operation Linked with Interrupt Skipping Function 1 (UT4AE and DT4AE = 1)



Note: When the interrupt skipping count is set to two.

Figure 19.96 Example of A/D Converter Start Request Signal (TRG4AN) Operation Linked with Interrupt Skipping Function 1 (UT4AE = 1, DT4AE = 0)

(5) A/D Converter Start Request Delaying Function Linked with Interrupt Skipping Function 2

By setting the TITM bit to 1 in the timer interrupt skipping mode register (TITMRA or TITMRB), the counter starts down-counting from the value (0 to 7) set in the TRG4COR[2:0] (TRG7COR[2:0]) bits in timer interrupt skipping set register 2 (TITCR2A (TITCR2B)) every time an A/D converter start trigger (TGR4AN or TRG4BN (TGR7AN or TRG7BN)) is generated. When the counter value reaches 0 and is reloaded, the TRG4AN and TRG4BN (TRG7AN and TRG7BN) interrupts become valid and an A/D converter start request signal (TRG4ABN (TRG7ABN)) is output.
This function is valid only when the A/D converter request delaying function is enabled.

(a) Example of Procedure for Setting Interrupt Skipping Function 2

Figure 19.97 shows an example of procedure for setting interrupt skipping function 2.

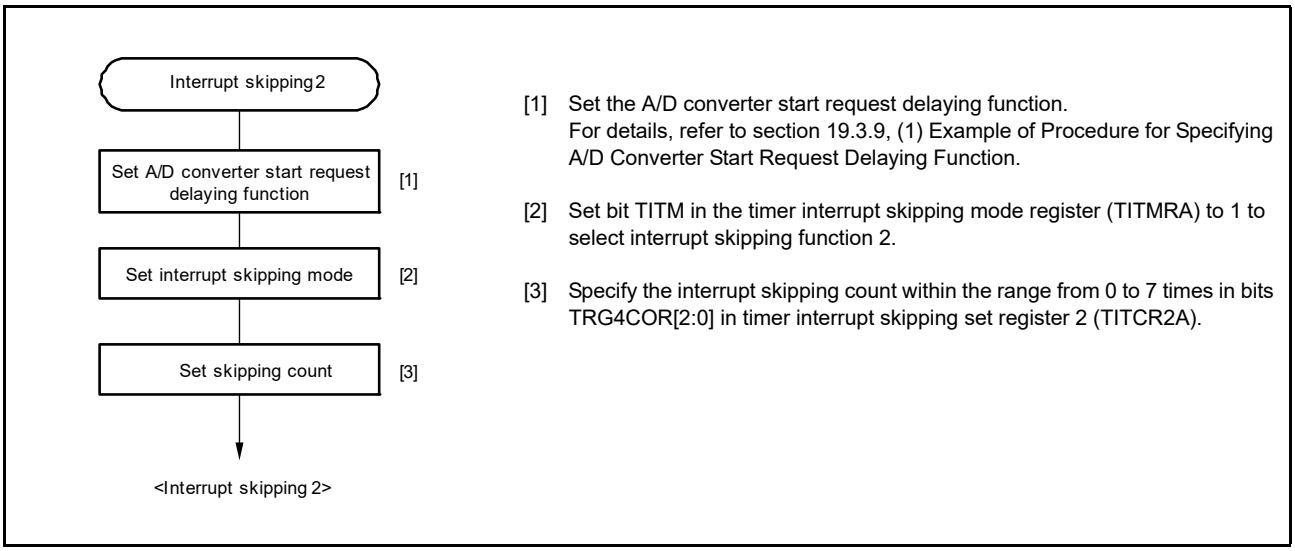


Figure 19.97 Example of Procedure for Setting Interrupt Skipping Function 2

(b) Example of Interrupt Skipping Function 2 Operation

Figure 19.98 shows an example of interrupt skipping 2 operation.

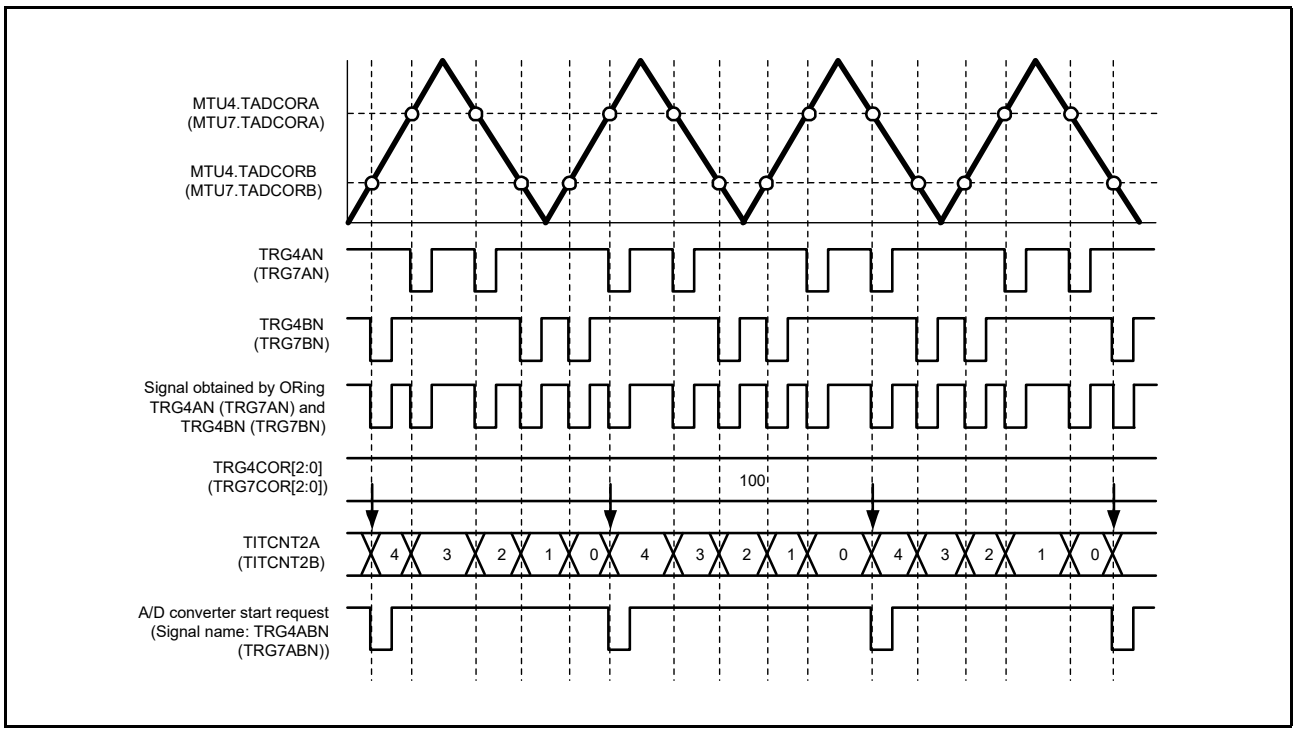

Figure 19.98 Example of Interrupt Skipping 2 Operation (Skipping Count is Set to Four)

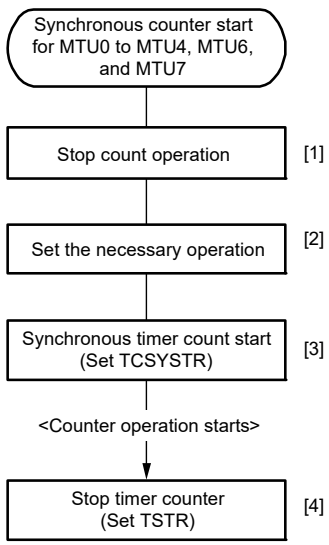
19.3.10 Synchronous Operation of MTU0 to MTU4, MTU6, and MTU7

(1) Synchronous Counter Start for MTU0 to MTU4, MTU6, and MTU7

The counters in MTU0 to MTU4, MTU6, and MTU7 can be started synchronously by making the TCSYSTR settings.

(a) Example of Procedure for Setting Synchronous Counter Start for MTU0 to MTU 4, MTU6, and MTU7

Figure 19.99 shows an example of synchronous counter start setting procedure.



[1] Set TSTRA and TSTRB to stop the counters used for synchronous start operation.

[2] Specify the necessary operation with appropriate registers such as TCR, TMDR1, and TMDR2.

[3] In TCSYSTR, set the bits corresponding to the counters to be started synchronously to 1 at the same time. When TCSYSTR is set, TSTRA and TSTRB for the target timer counters are automatically set appropriately, the counters start synchronously, and TCSYSTR is automatically cleared.

[4] To stop a timer counter, set the bit in TSTRA or TSTRB that corresponds to the counter to 0.

Note: Even if a bit in TCSYSTR corresponding to an operating counter is cleared to 0, the counter will not stop.

Note: To start counters synchronously in reset-synchronized PWM mode or complementary PWM mode using MTU3 and MTU4 or MTU6 and MTU7, set the bits in TCSYSTR that correspond to MTU 3, MTU4, MTU6, and MTU7 to 1 at the same time.

Figure 19.99 Example of Synchronous Counter Start Setting Procedure

(b) Examples of Synchronous Counter Start Operation

Figure 19.100 shows an example of synchronous counter start operation for MTU0 to MTU4, MTU6, and MTU7.

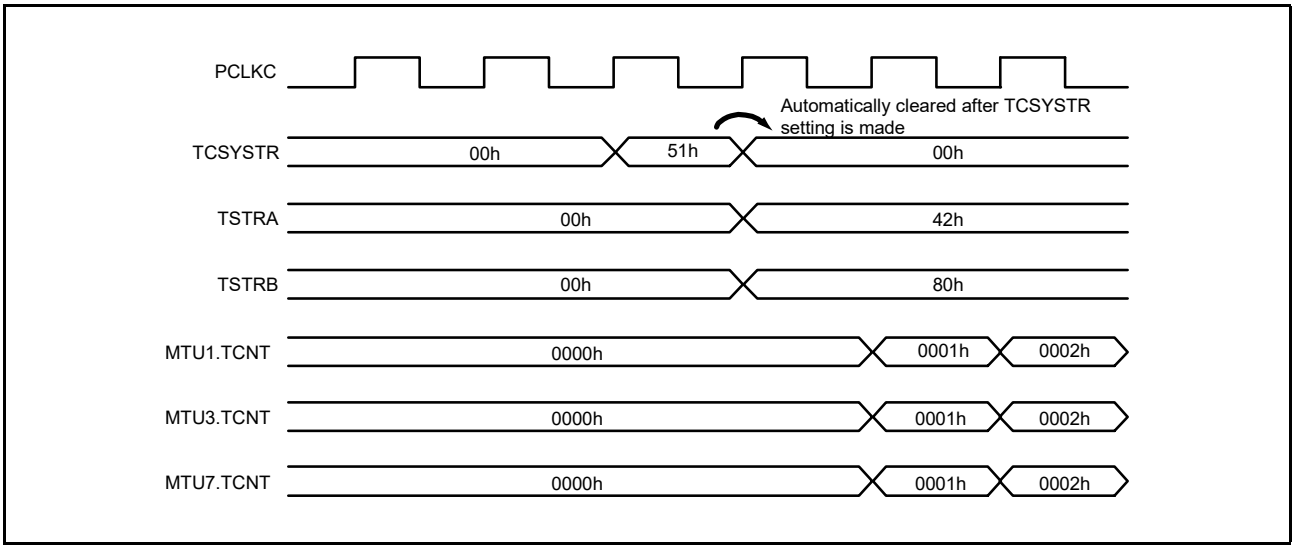


Figure 19.100 Example of Synchronous Counter Start Operation

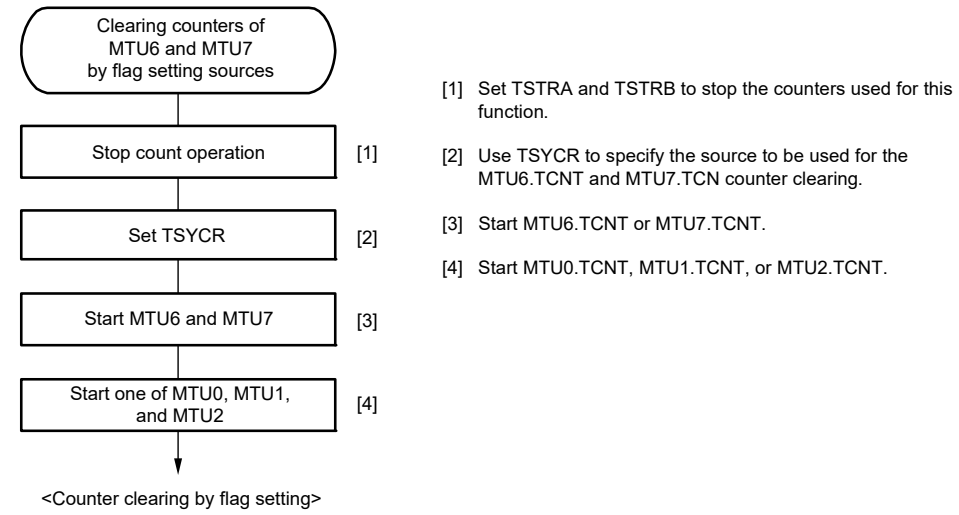
(2) Synchronous Counter Clearing for MTU6 and MTU7

The counters in MTU6 and MTU7 can be cleared by the TGImn interrupt generation timing (m = A to D; n = 0 to 2) through the TSYCR setting.

(a) Example of Procedure for Specifying Synchronous Counter Clearing for MTU6 and MTU7

Figure 19.101 shows an example of procedure for specifying synchronous counter clearing for MTU6 and MTU7 by flag setting sources.



Note: The TSYCR setting is ignored while the counter is stopped. The setting becomes valid after MTU6.TCNT or MTU7.TCNT is started.

Figure 19.101 Example of Procedure for Specifying Synchronous Counter Clearing for MTU6 and MTU7

(b) Examples of Synchronous Counter Clearing for MTU6 and MTU7

Figure 19.102 and Figure 19.103 show examples of synchronous counter clearing for MTU6 and MTU7 by flag setting sources.

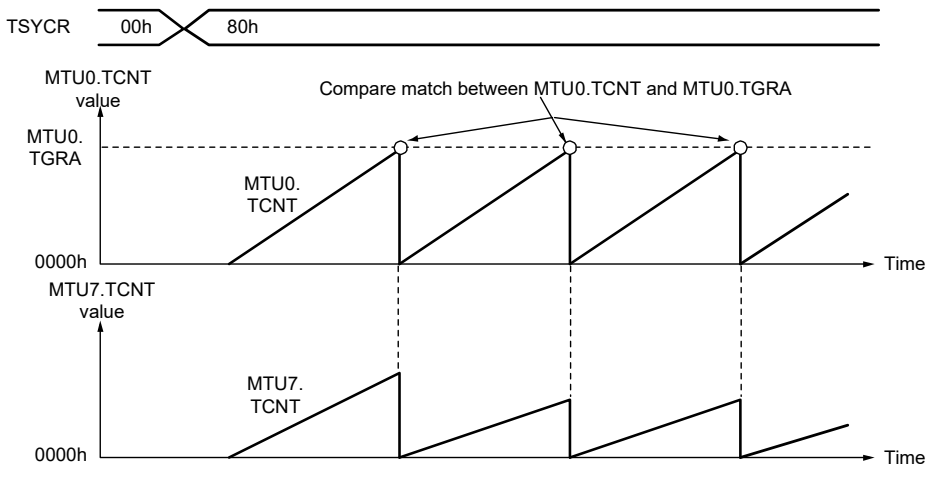


Figure 19.102 Example of Synchronous Counter Clearing for MTU6 and MTU7 (1)

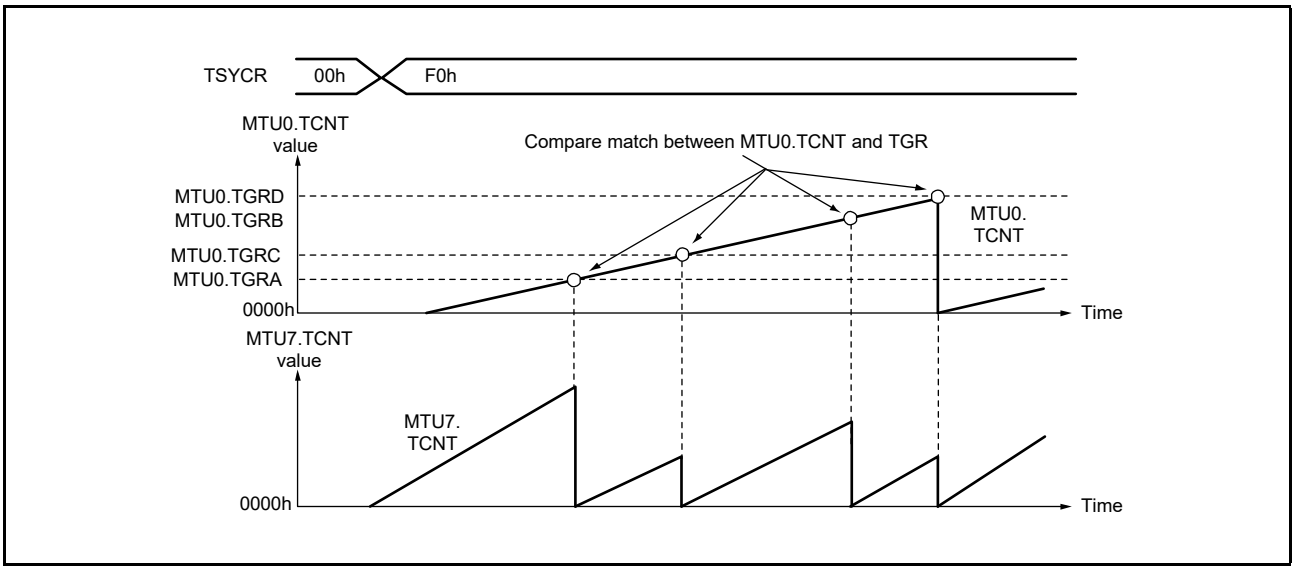

Figure 19.103 Example of Synchronous Counter Clearing for MTU6 and MTU7 (2)

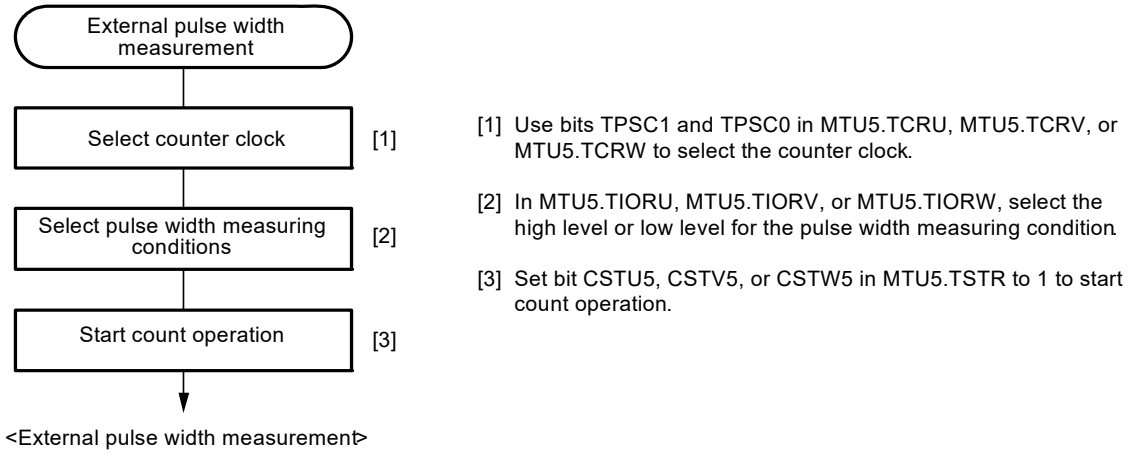
19.3.11 External Pulse Width Measurement

The pulse widths of up to three external input lines can be measured in MTU5.

(1) Example of External Pulse Width Measurement Setting Procedure



[1] Use bits TPSC1 and TPSC0 in MTU5.TCRU, MTU5.TCRV, or MTU5.TCRW to select the counter clock.

[2] In MTU5.TIORU, MTU5.TIORV, or MTU5.TIORW, select the high level or low level for the pulse width measuring condition.

[3] Set bit CSTU5, CSTV5, or CSTW5 in MTU5.TSTR to 1 to start count operation.

Note: Do not set bit CMPCLR5U, CMPCLR5V, or CMPCLR5W in TCNTCMPCLR to 1.
Note: Do not set bit TGIE5U, TGIE5V, or TGIE5W in MTU5.TIER to 1.
Note: The value in TCNT is not captured in TGR.

Figure 19.104 Example of External Pulse Width Measurement Setting Procedure

(2) Example of External Pulse Width Measurement

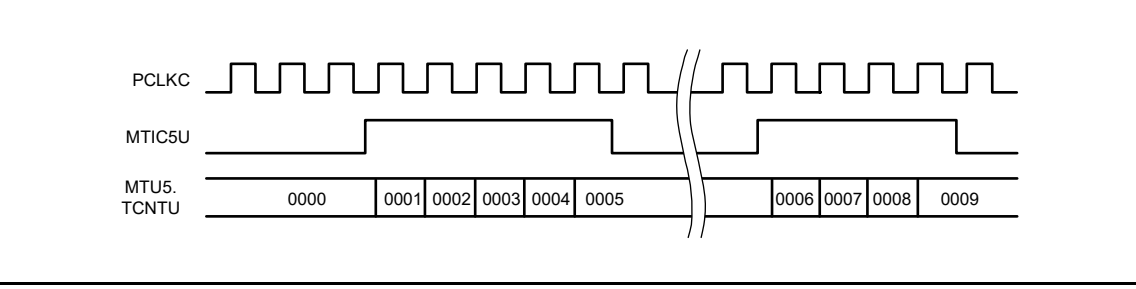


Figure 19.105 Example of External Pulse Width Measurement (Measuring High Pulse Width)

19.3.12 Dead Time Compensation

By measuring the delay of the output waveform and reflecting it to duty ratio, the external pulse width measurement function can be used as the dead time compensation function while the complementary PWM is in operation.

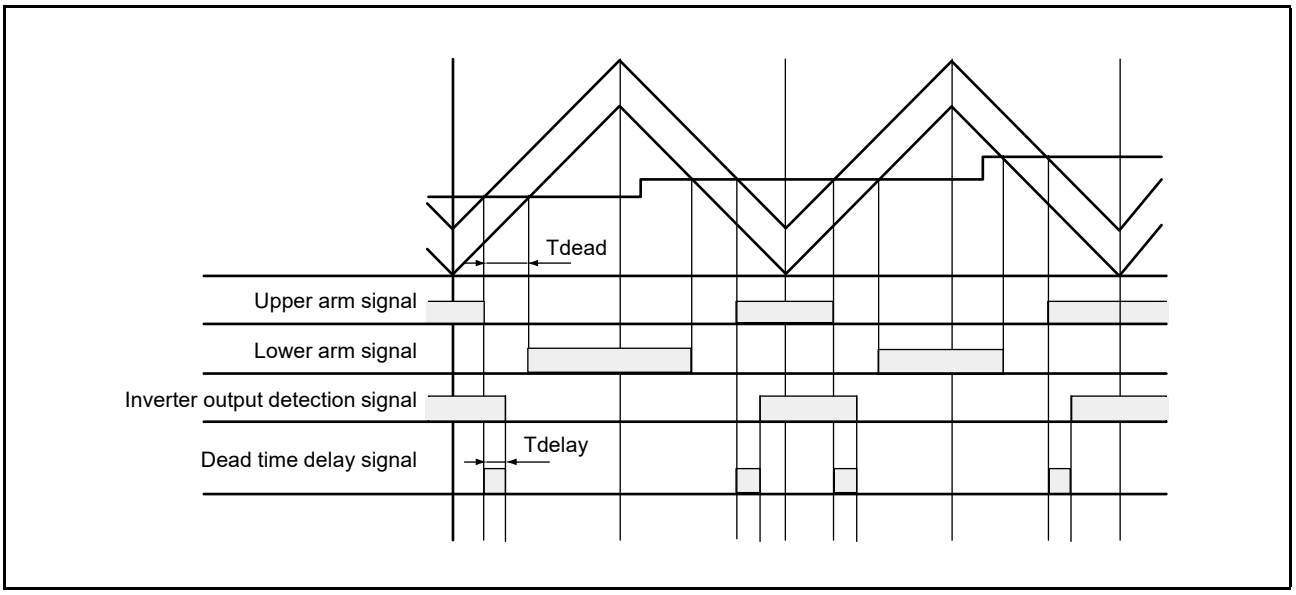

Figure 19.106 Delay in Dead Time in Complementary PWM Operation

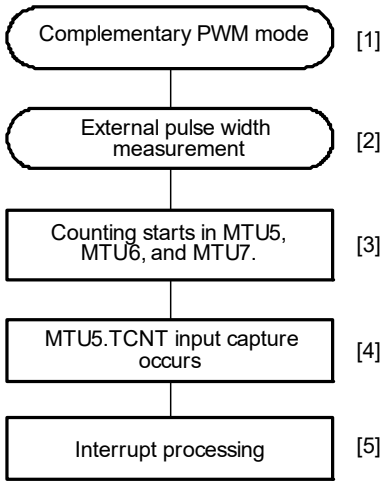
(1) Example of Dead Time Compensation Setting Procedure

Figure 19.107 shows an example of dead time compensation setting procedure by using three counters in MTU5.



[1] Set MTU6 and MTU7 to complementary PWM mode.
For details, refer to section 19.3.8, Complementary PWM Mode.

[2] Specify the external pulse width measurement function for the target TIOR in MTU5. For details, refer to section 19.3.11, External Pulse Width Measurement.

[3] Set bits CST6 and CST7 in TSTRB and bits CSTU5, CSTV5, and CSTW5 in MTU5.TSTR to 1 to start count operation.

[4] When the capture condition specified in TIOR is satisfied, the MTU5.TCNT value is captured in MTU5.TGR. To prevent the generation of the MTU5.TGIm5 interrupt (m = U, V, W) request under the capture condition specified in TIOR, do not enable interrupt requests in MTU5.TIER.

[5] For U-phase dead time compensation, when an interrupt is generated at the crest (TGIA6) or trough (TCIV7) in complementary PWM mode, read the MTU5.TGRU value, calculate the difference in time between MTU6.TGRB and MTU5.TGRU, and write the corrected value to MTU6.TGRD in the interrupt processing. For the V phase and W phase, read the MTU5.TGRV and MTU5.TGRW values and write the corrected values to MTU7.TGRC and TGRD, respectively, in the same way as for U-phase compensation. The MTU5.TCNT value should be cleared through the TCNTCMPCLR setting or by software.

Note: The MPC and port mode registers (PMR) of the I/O ports should be set up in advance. Do not set MTU5.TIER to enable interrupt requests because the interrupt flag is set when the capture conditions set in TIOR are satisfied.

Figure 19.107 Example of Dead Time Compensation Setting Procedure

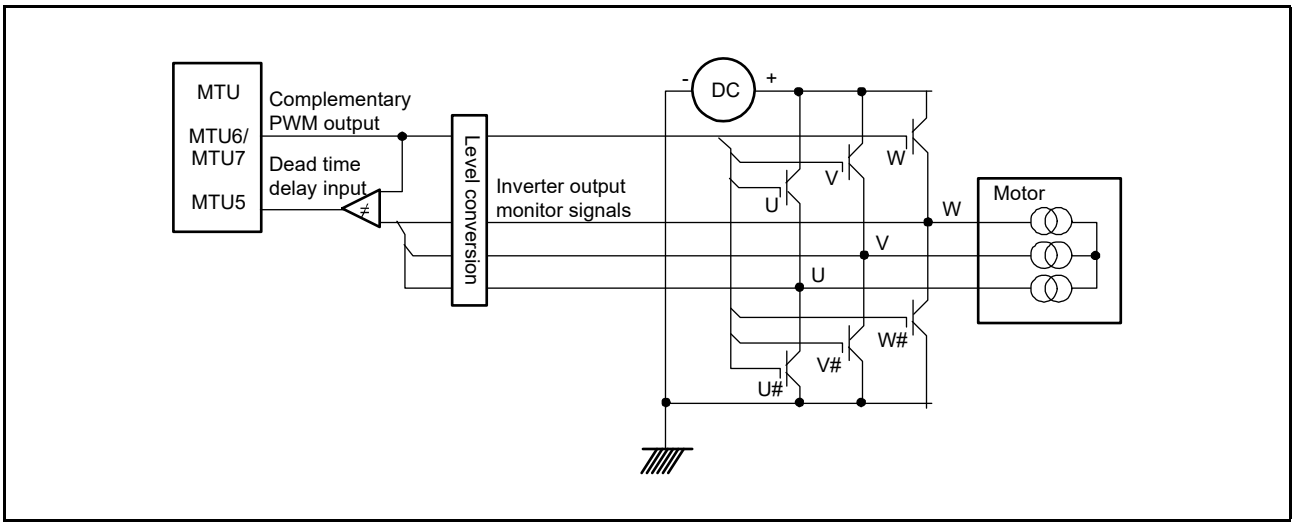


Figure 19.108 Example of Motor Control Circuit Configuration

19.3.13 TCNT Capture at Crest and/or Trough in Complementary PWM Operation

The TCNT value is captured in TGR at either the crest or trough or at both the crest and trough during complementary PWM operation. The timing for capturing in TGR can be selected by TIOR.

Figure 19.109 is an operating example in which TCNT is used as a free-running counter without being cleared, and the TCNT value is captured in TGR at the specified timing (either crest or trough, or both crest and trough).

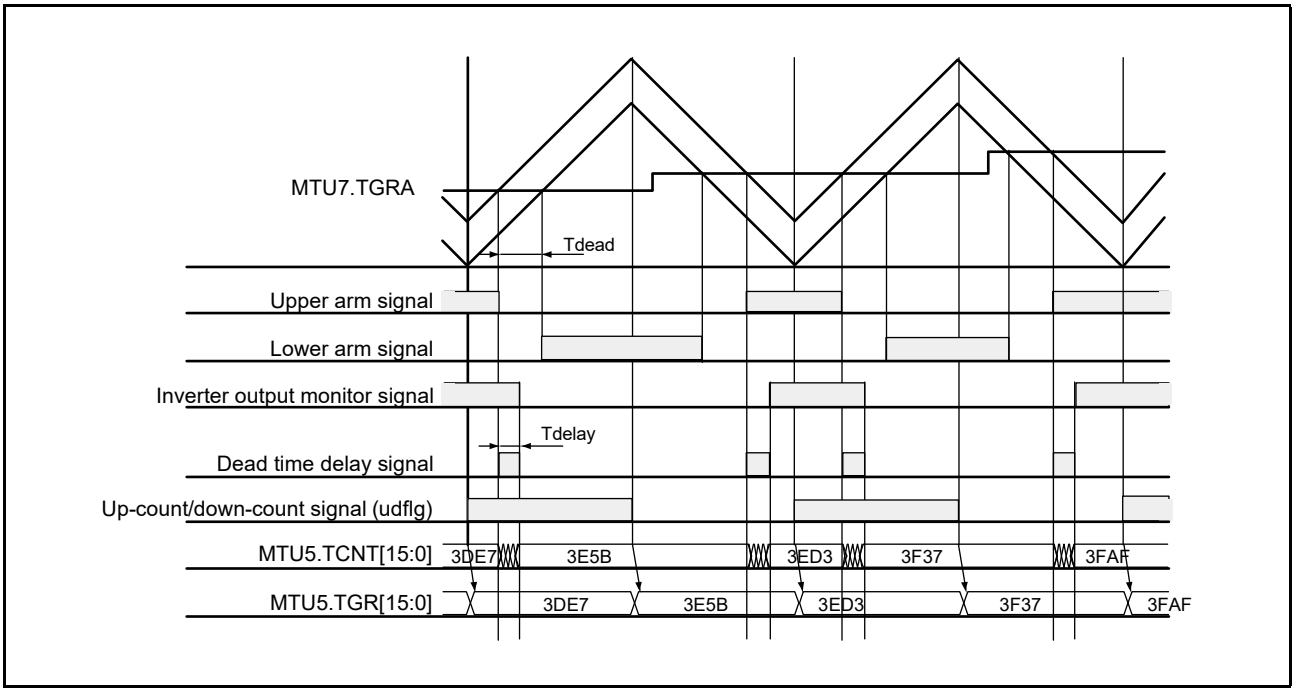

Figure 19.109 TCNT Capture at Crest and/or Trough in Complementary PWM Operation

19.3.14 Noise Filtering Function

The input capture input pins and external clock input pins have a noise filtering function. Use the NFCRn register (n = 0 to 8, or C) to enable or disable noise filtering and to set the sampling clock. Noise filtering can be enabled or disabled for each pin, and the sampling clock can be set for each channel. Figure 19.110 shows the timing of noise filtering.

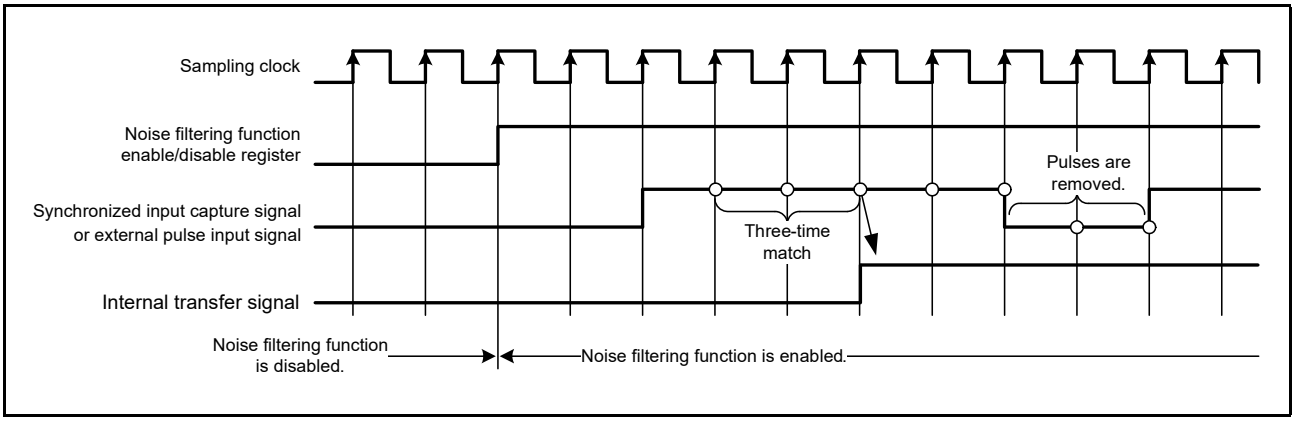

Figure 19.110 Timing of Noise Filtering

19.4 Interrupt Sources

19.4.1 Interrupt Sources and Priorities

There are three kinds of MTU interrupt source; TGR input capture/compare match, TCNT overflow, and TCNT underflow. Each interrupt source has its own enable/disable bit, allowing the generation of interrupt request signals to be enabled or disabled individually.

When an interrupt source is generated, if the corresponding enable/disable bit in TIER is set to 1, an interrupt is requested.

Relative interrupt priorities can be changed by the interrupt controller. For details, see section 12, Interrupt Controller (ICUA). Table 19.77 lists the MTU interrupt sources.

Table 19.77 MTU Interrupt Sources

Channel	Name	Interrupt Source	DMAC Activation	Priority
MTU0	TGIA0	ch0 input capture/compare match A interrupt	Possible	High
	TGIB0	ch0 input capture/compare match B interrupt	Possible	
	TGIC0	ch0 input capture/compare match C interrupt	Possible	
	TGID0	ch0 input capture/compare match D interrupt	Possible	
	TCIV0	ch0 overflow interrupt	Not possible	
	TGIE0	ch0 compare match E interrupt	Not possible	
	TGIF0	ch0 compare match F interrupt	Not possible	
MTU1	TGIA1	ch1 input capture/compare match A interrupt	Possible	
	TGIB1	ch1 input capture/compare match B interrupt	Possible	
	TCIV1	ch1 overflow interrupt	Not possible	
	TCIU1	ch1 underflow interrupt	Not possible	
MTU2	TGIA2	ch2 input capture/compare match A interrupt	Possible	
	TGIB2	ch2 input capture/compare match B interrupt	Possible	
	TCIV2	ch2 overflow interrupt	Not possible	
	TCIU2	ch2 underflow interrupt	Not possible	
MTU3	TGIA3	ch3 input capture/compare match A interrupt	Possible	
	TGIB3	ch3 input capture/compare match B interrupt	Possible	
	TGIC3	ch3 input capture/compare match C interrupt	Possible	
	TGID3	ch3 input capture/compare match D interrupt	Possible	
	TCIV3	ch3 overflow interrupt	Not possible	
MTU4	TGIA4	ch4 input capture/compare match A interrupt	Possible	
	TGIB4	ch4 input capture/compare match B interrupt	Possible	
	TGIC4	ch4 input capture/compare match C interrupt	Possible	
	TGID4	ch4 input capture/compare match D interrupt	Possible	
	TCIV4	ch4 overflow/underflow interrupt*1	Possible	
MTU5	TGIU5	ch5 input capture/compare match U interrupt	Possible	
	TGIV5	ch5 input capture/compare match V interrupt	Possible	
	TGIW5	ch5 input capture/compare match W interrupt	Possible	
MTU6	TGIA6	ch6 input capture/compare match A interrupt	Possible	
	TGIB6	ch6 input capture/compare match B interrupt	Possible	
	TGIC6	ch6 input capture/compare match C interrupt	Possible	
	TGID6	ch6 input capture/compare match D interrupt	Possible*2	
	TCIV6	ch6 overflow interrupt	Not possible	
MTU7	TGIA7	ch7 input capture/compare match A interrupt	Possible	
	TGIB7	ch7 input capture/compare match B interrupt	Possible	
	TGIC7	ch7 input capture/compare match C interrupt	Possible	
	TGID7	ch7 input capture/compare match D interrupt	Possible	
	TCIV7	ch7 overflow/underflow interrupt*1	Possible	
MTU8	TGIA8	ch8 input capture/compare match A interrupt	Possible	
	TGIB8	ch8 input capture/compare match B interrupt	Possible	
	TGIC8	ch8 input capture/compare match C interrupt	Possible	
	TGID8	ch8 input capture/compare match D interrupt	Possible	
	TCIV8	ch8 overflow interrupt	Not Possible	Low

Note: This table shows the initial state immediately after a reset. The relative channel priorities can be changed by the interrupt controller.

Note 1. Only in complementary PWM mode
Note 2. Interrupts are generated in response to requests for DMA transfer, but there are no interrupts on completion of transfer. Poll the END bit of the CHSTAT_n register to confirm the completion of DMA transfer.

(1) Input Capture/Compare Match Interrupt

If the TIER.TGIE bit is set to 1 when a TGR input capture/compare match occurs on a channel, an interrupt is requested. The MTU has 33 input capture/compare match interrupts (six for MTU0, four each for MTU3, MTU4, MTU6, MTU7, and MTU8, two each for MTU1 and MTU2, and three for MTU5). The MTU0.TGFE and MTU0.TGFF flags in MTU0 are not set to 1 by the occurrence of an input capture.

(2) Overflow Interrupt

If the TIER.TCIEV bit is set to 1 when a TCNT overflow occurs on a channel, an interrupt is requested. The MTU has eight overflow interrupts one for each channel.

(3) Underflow Interrupt

If the TIER.TCIEU bit is set to 1 when a TCNT underflow occurs on a channel, an interrupt is requested. The MTU has two underflow interrupts (one each for MTU1 and MTU2).

19.4.2 DMAC Activation

(1) DMAC Activation

The DMAC can be activated by the TGRA input capture/compare match interrupt and the overflow interrupt in MTU4 and MTU7. For details, see section 15, DMA Controller (DMACAa).
The MTU provides a total of 33 input capture/compare match interrupts that can be used as DMAC activation sources: four each for MTU0, MTU3, MTU6, and MTU8, two each for MTU1 and MTU2, five each for MTU4 and MTU7, and three for MTU5.

19.4.3 A/D Converter Activation

The A/D converter can be activated by one of the following three methods in the MTU. Table 19.78 shows the relationship between interrupt sources and A/D converter start request signals.

(1) A/D Converter Activation by MTUn.TGRA (n = 0 to 4, 6, 7) Input Capture/Compare Match or at MTUm.TCNT (m = 4 or 7) Trough in Complementary PWM Mode

The A/D converter can be activated by the occurrence of a TGRA input capture/compare match in channels 0 to 4, 6, and 7. In addition, if complementary PWM operation is performed while the TTGE2 bit in MTUm.TIER is set to 1, the A/D converter can be activated at the trough of MTUm.TCNT count (MTUm.TCNT = 0000h) (m = 4 or 7).
A/D converter start request signal TRGAnN is issued to the A/D converter under either of the following conditions (n = 0 to 4, 6, or 7).

- When a TGRA input capture/compare match occurs on a channel while the TIER.TTG bit is set to 1
- When the MTUm.TCNT count reaches the trough (MTUm.TCNT = 0000h) during complementary PWM operation while the TTGE2 bit in MTUm.TIER is set to 1

When either condition is satisfied, if A/D converter start signal TRGAnN from the MTU is selected as the trigger in the A/D converter, A/D conversion will start.

(2) A/D Converter Activation by Compare Match between MTU0.TCNT and MTU0.TGRE

A/D converter start request signal TRG0N is issued to the A/D converter when a compare match occurs between MTU0.TCNT and MTU0.TGRE in MTU0.
When a compare match occurs between MTU0.TCNT and MTU0.TGRE in MTU0 while the TTGE2 bit in MTU0.TIER2 is set to 1, A/D converter start request TGR0N is issued to the A/D converter. If A/D converter start signal TRG0N from the MTU is selected as the trigger in the A/D converter, A/D conversion will start.

(3) A/D Converter Activation by A/D Converter Start Request Delaying Function (MTU4 and MTU7)

The A/D converter can be activated by generating TRGmAN or TRGmBN when the MTUm.TCNT count matches the MTUm.TADCORA or MTUm.TADCORB value if the UTmAE, DTmAE, UTmBE, or DTmBE bit in the A/D converter start request control register (MTUm.TADCR) is set to 1 (m = 4 or 7). The A/D converter can also be activated by outputting TRGmABN when TRGmAN or TRGmBN is generated, or by outputting TRG4ABN (TRG7ABN) when TRG4AN (TRG7AN) or TRG4BN (TRG7BN) is generated. For details, see section 19.3.9, A/D Converter Start Request Delaying Function.
A/D conversion will start when TRGmAN is generated if A/D converter start signal TRGmAN from the MTU is selected as the trigger in the A/D converter, when TRGmBN is generated if TRGmBN from the MTU is selected as the trigger in the A/D converter, or when TRGmABN is generated if TRGmABN from the MTU is selected as the trigger in the A/D converter (m = 4 or 7).

Table 19.78 Interrupt Sources and A/D Converter Start Request Signals

Target Registers	Interrupt Source	A/D Converter Start Request Signal
MTU0.TGRA and MTU0.TCNT	Input capture/compare match	TRGA0N
MTU1.TGRA and MTU1.TCNT		TRGA1N
MTU2.TGRA and MTU2.TCNT		TRGA2N
MTU3.TGRA and MTU3.TCNT		TRGA3N
MTU4.TGRA and MTU4.TCNT*1		TRGA4N
MTU4.TCNT	MTU4.TCNT trough in complementary PWM mode	
MTU6.TGRA and MTU6.TCNT	Input capture/compare match	TRGA6N
MTU7.TGRA and MTU7.TCNT*1		TRGA7N
MTU7.TCNT	MTU7.TCNT trough in complementary PWM mode	
MTU0.TGRE and MTU0.TCNT	Compare match	TRG0N
MTU4.TADCORA and MTU4.TCNT	Compare match	TRG4AN
MTU4.TADCORB and MTU4.TCNT		TRG4BN
MTU7.TADCORA and MTU7.TCNT		TRG7AN
MTU7.TADCORB and MTU7.TCNT		TRG7BN
MTU4.TADCORA and MTU4.TCNT, MTU4.TADCORB and MTU4.TCNT	Compare match (interrupt skipping function 2)	TRG4ABN
MTU7.TADCORA and MTU7.TCNT, MTU7.TADCORB and MTU7.TCNT		TRG7ABN

Note 1. Since PWM waveforms are generated in complementary PWM mode, MTU4.TGRA (MTU7.TGRA) compare match not only with MTU4.TCNT (MTU7.TCNT) but also with MTU3.TCNT (MTU6.TCNT) and TCNTSA (TCNTSB) is detected. Accordingly, when compare match with MTU3.TCNT (MTU6.TCNT) and TCNTSA (TCNTSB) occurs, TRGA4N (TRGA7N) is also generated. When MTU3 and MTU 4 (MTU 6 and MTU7) are made to operate in complementary PWM mode for generating an A/D converter start request, use the A/D converter start request by compare match between MTU4.TCNT (MTU7.TCNT) and MTU4.TADCORA/B (MTU7.TADCORA/B).

19.5 Operation Timing

19.5.1 Input/Output Timing

(1) TCNT Count Timing

Figure 19.111 and Figure 19.112 show the TCNT count timing in internal clock operation, Figure 19.113 shows the TCNT count timing in external clock operation (normal mode), and Figure 19.114 shows the TCNT count timing in external clock operation (phase counting mode).

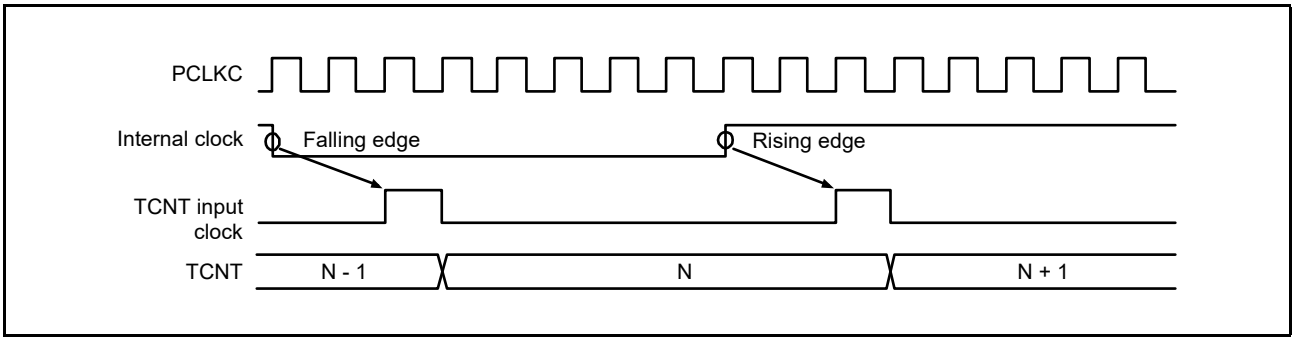

Figure 19.111 Count Timing in Internal Clock Operation (MTU0 to MTU4 and MTU6 to MTU8)

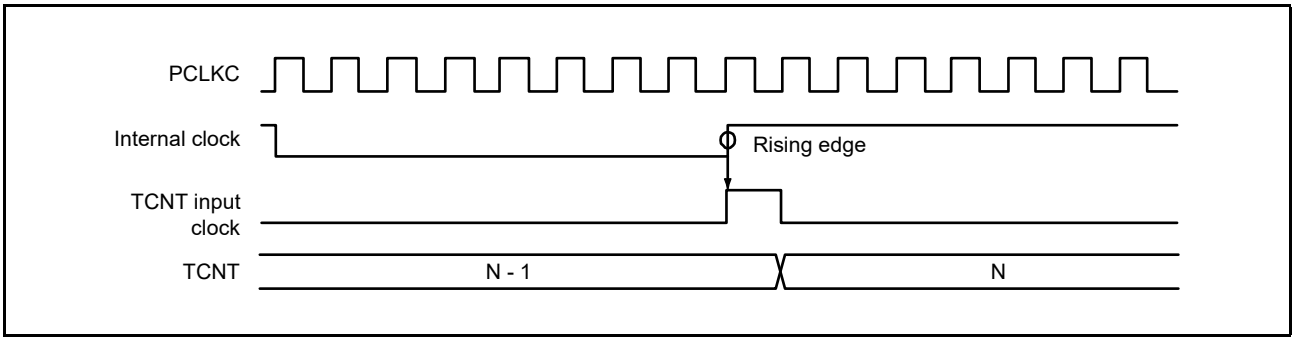

Figure 19.112 Count Timing in Internal Clock Operation (MTU5)

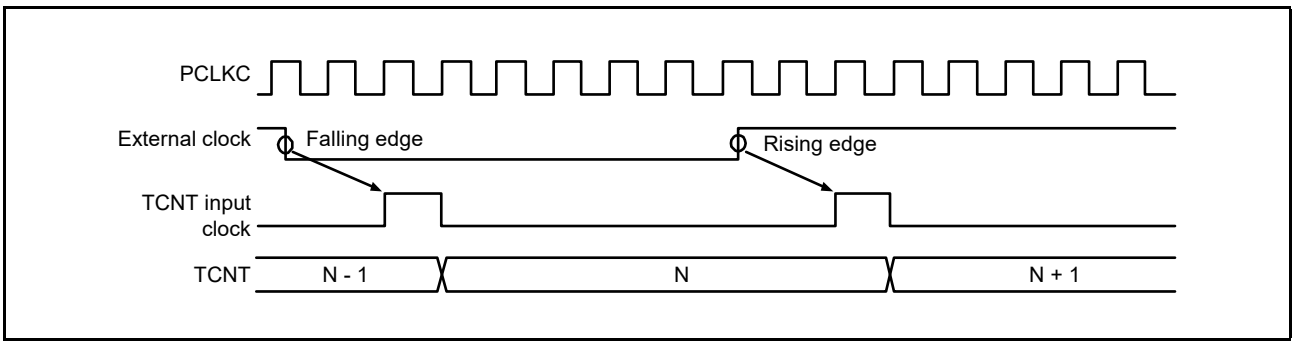

Figure 19.113 Count Timing in External Clock Operation (MTU0 to MTU4 and MTU8)

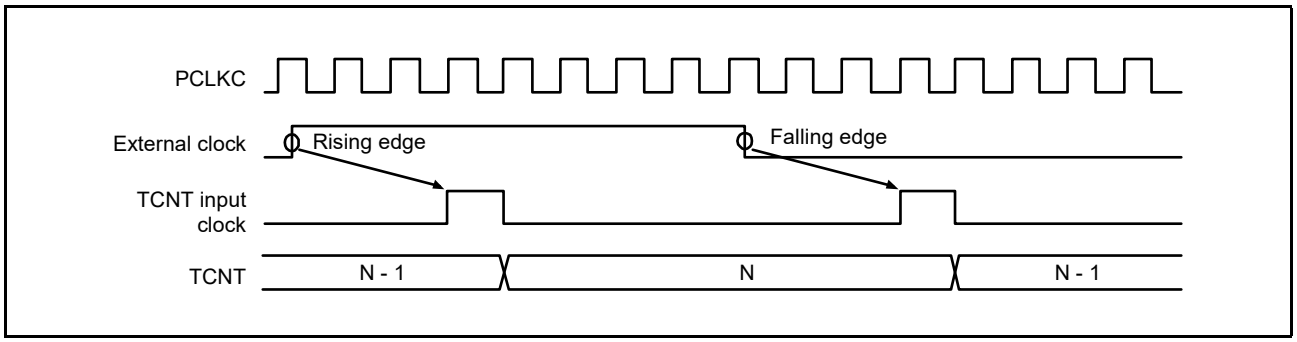

Figure 19.114 Count Timing in External Clock Operation (Phase Counting Mode)

(2) Output Compare Output Timing

A compare match signal is generated in the final state in which TCNT and TGR match (the point at which the count value matched by TCNT is updated). When a compare match signal is generated, the value set in TIOR is output from the MTIOCnm pin (n = 0 to 4, 6, 7, or 8; m = A to D). After a match between TCNT and TGR, the compare match signal is not generated until the TCNT input clock is generated.

Figure 19.115 shows the output compare output timing (normal mode or PWM mode) and Figure 19.116 shows the output compare output timing (complementary PWM mode or reset-synchronized PWM mode).

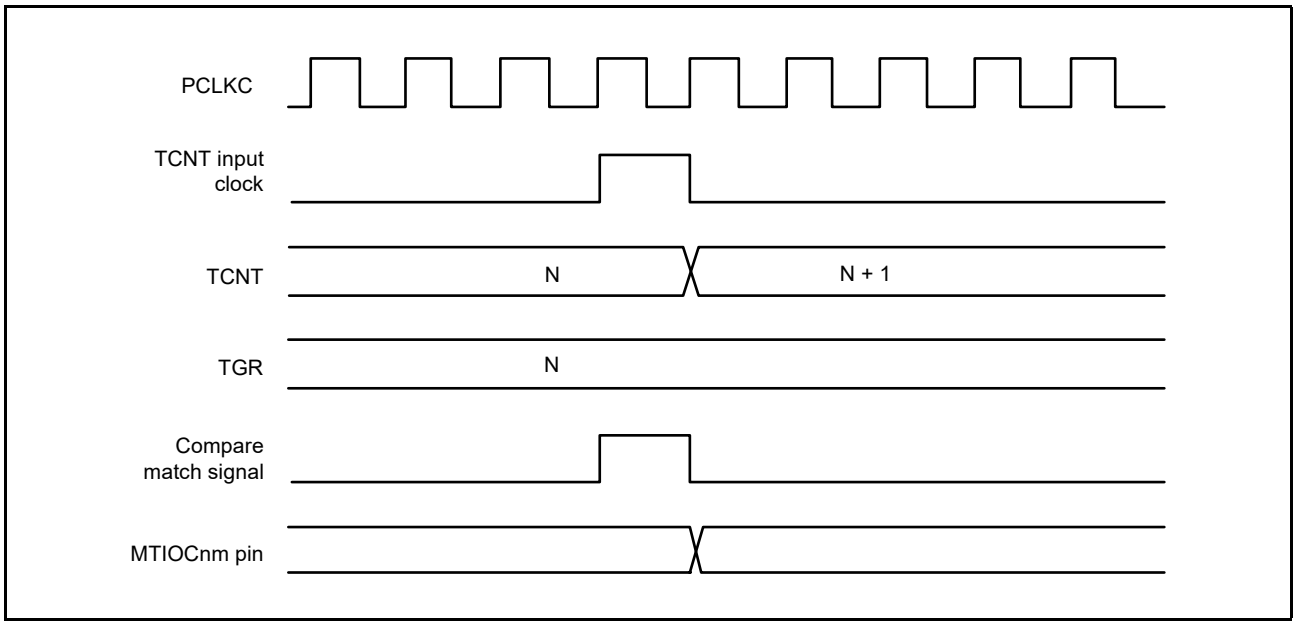

Figure 19.115 Output Compare Output Timing (Normal Mode or PWM Mode) (n = 0 to 4, 6, 7, or 8, m = A to D)

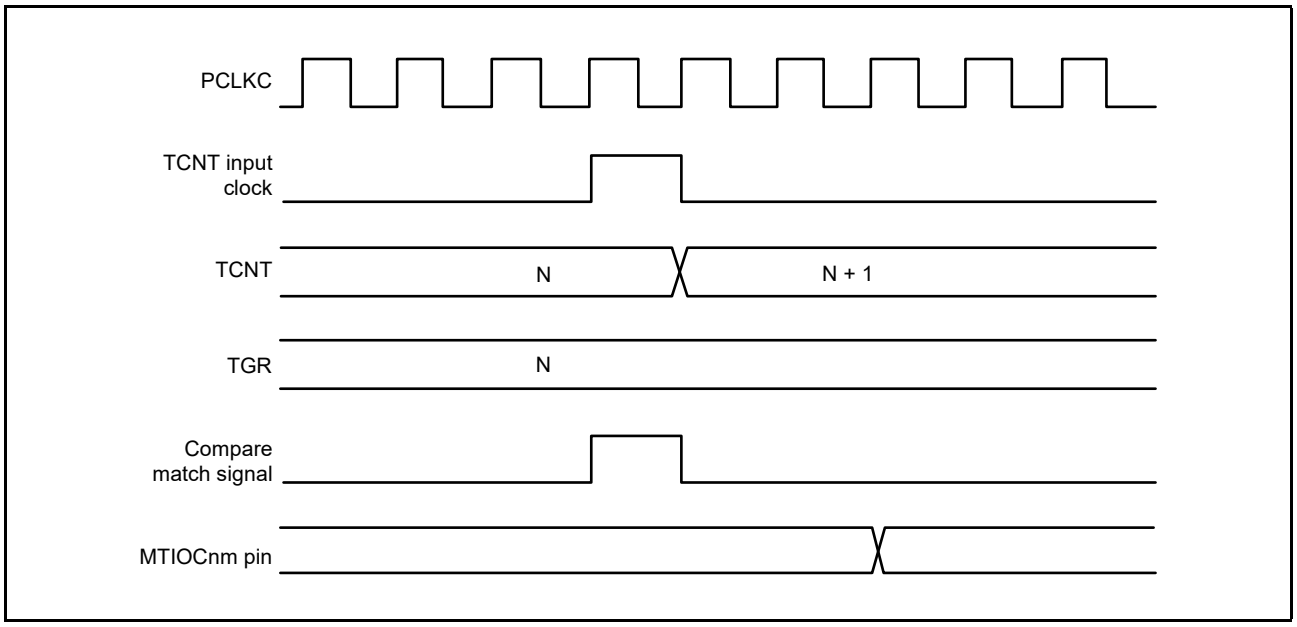

Figure 19.116 Output Compare Output Timing (Complementary PWM Mode or Reset-Synchronized PWM Mode) (n = 0 to 4, 6, 7, or 8, m = A to D)

(3) Input Capture Signal Timing

Figure 19.117 shows the input capture signal timing.

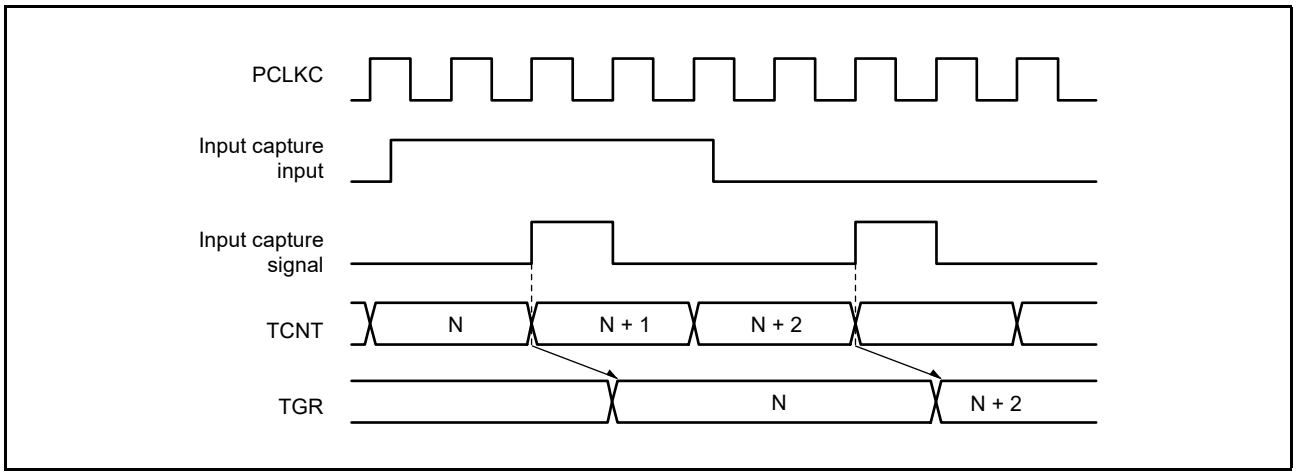

Figure 19.117 Input Capture Input Signal Timing

(4) Timing for Counter Clearing by Compare Match/Input Capture

Figure 19.118 and Figure 19.119 show the timing when counter clearing on compare match is specified, and Figure 19.120 shows the timing when counter clearing on input capture is specified.

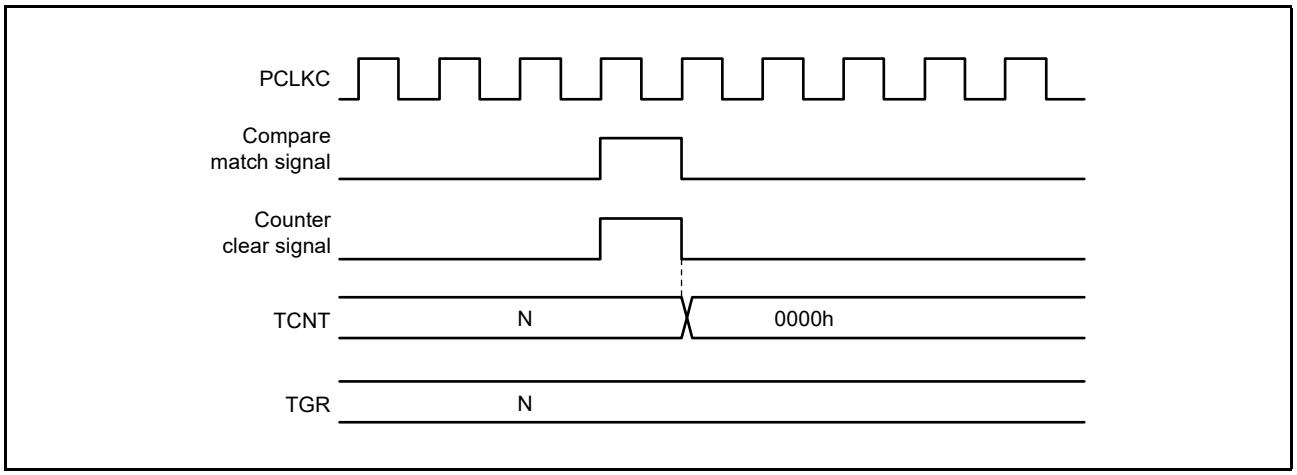

Figure 19.118 Counter Clear Timing (Compare Match) (MTU0 to MTU4 and MTU6 to MTU8)

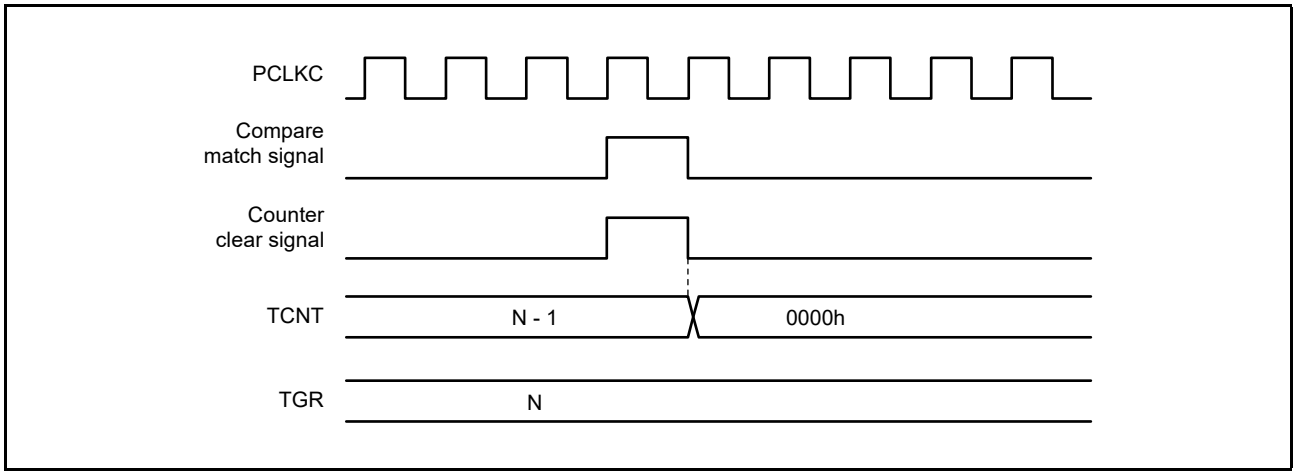

Figure 19.119 Counter Clear Timing (Compare Match) (MTU5)

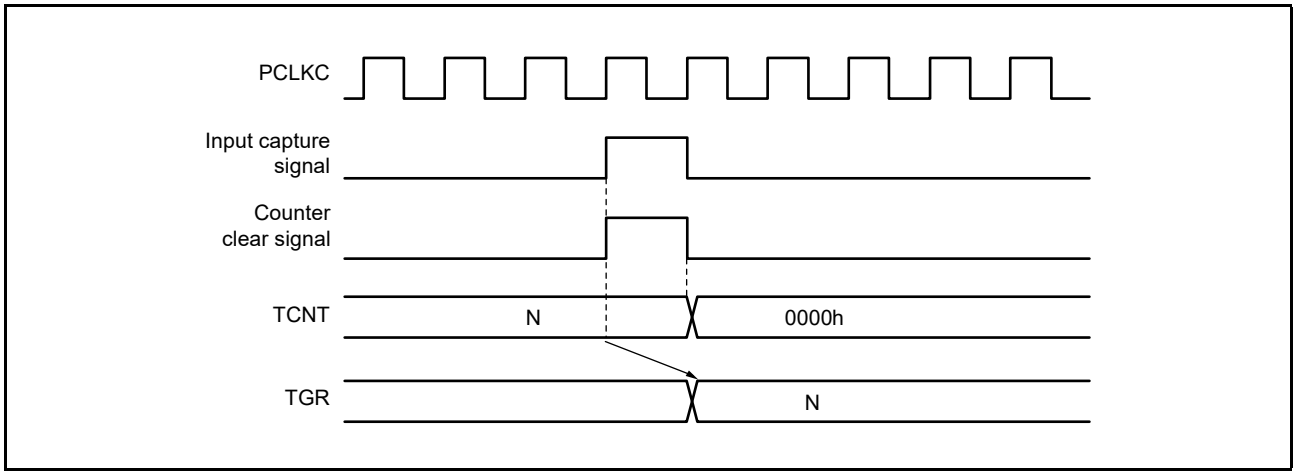

Figure 19.120 Counter Clear Timing (Input Capture) (MTU0 to MTU8)

(5) Buffer Operation Timing

Figure 19.121 to Figure 19.123 show the timing in buffer operation.

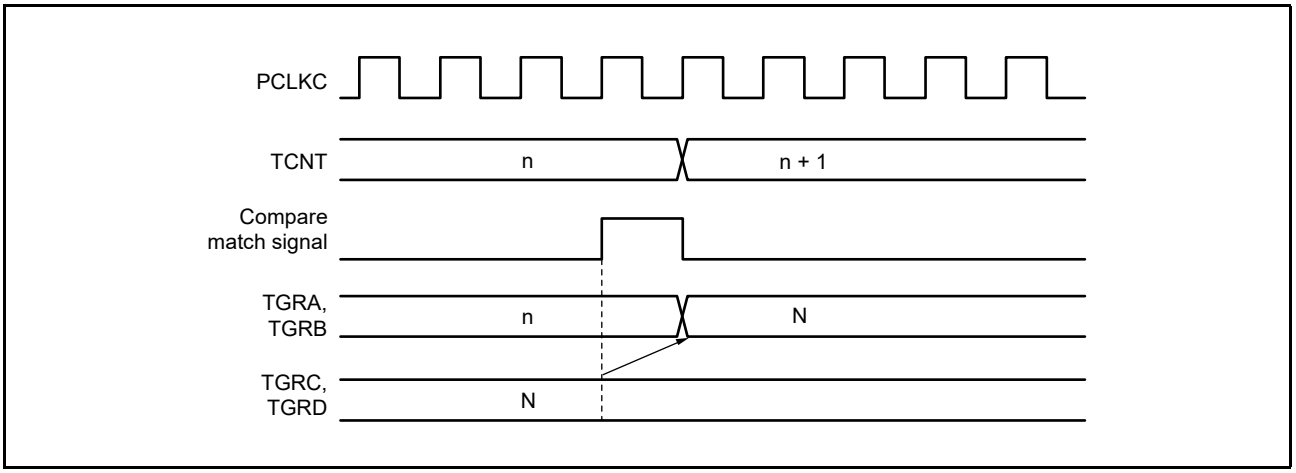

Figure 19.121 Buffer Operation Timing (Compare Match)

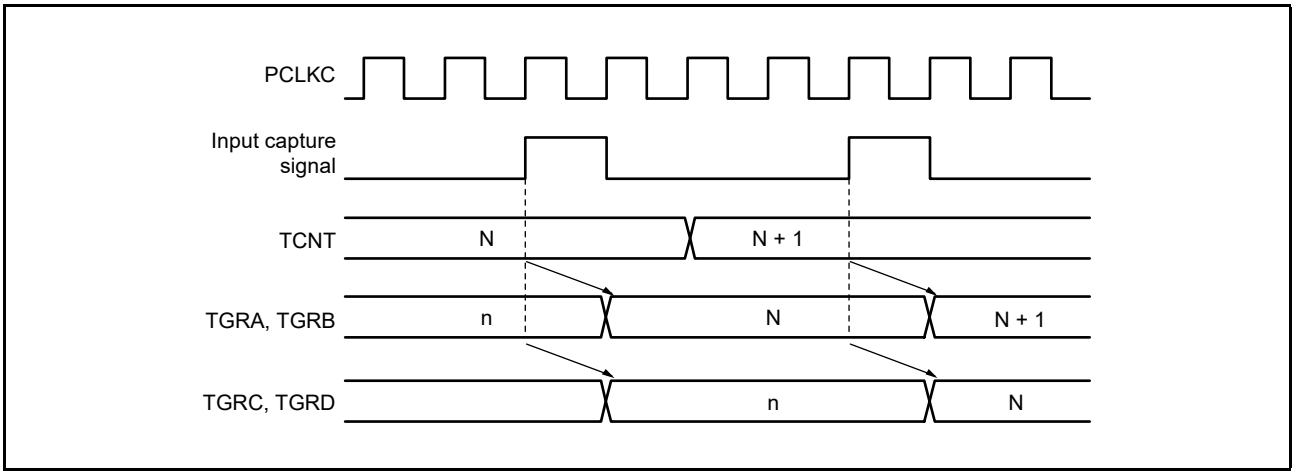

Figure 19.122 Buffer Operation Timing (Input Capture)

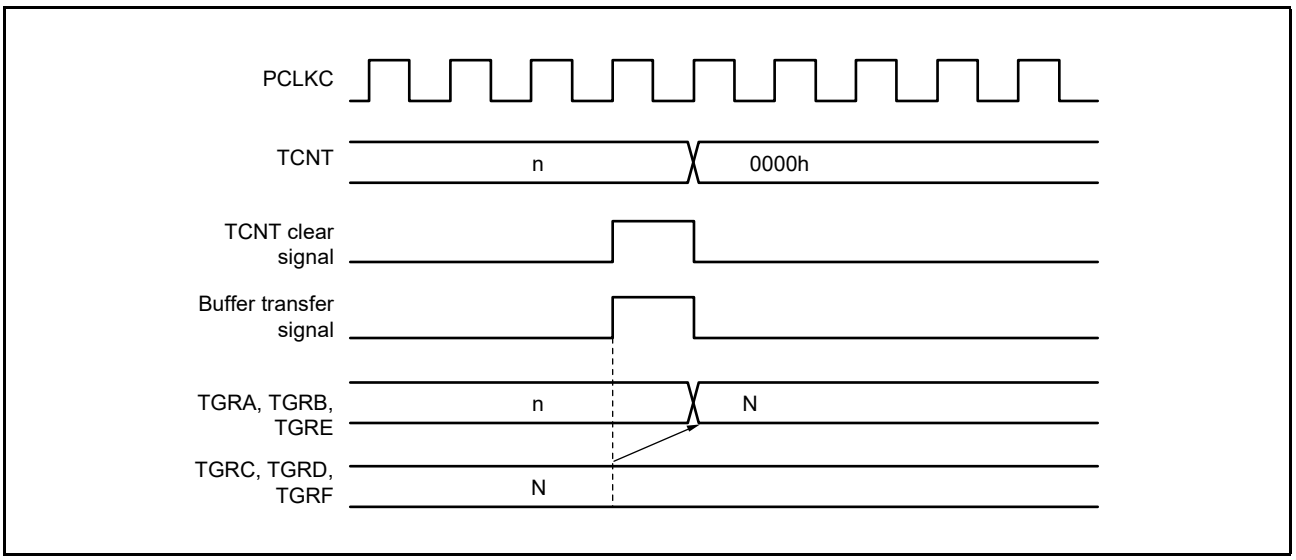

Figure 19.123 Buffer Operation Timing (when TCNT Cleared)

(6) Buffer Transfer Timing (Complementary PWM Mode)

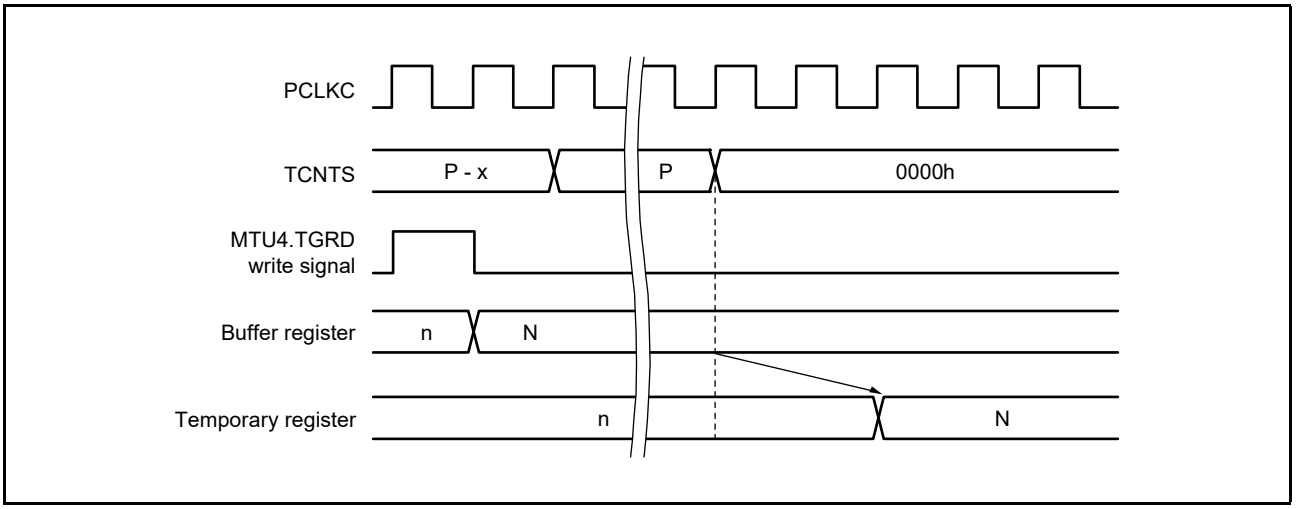

Figure 19.125 Transfer Timing from Buffer Register to Temporary Register (TCNTSA Operating)

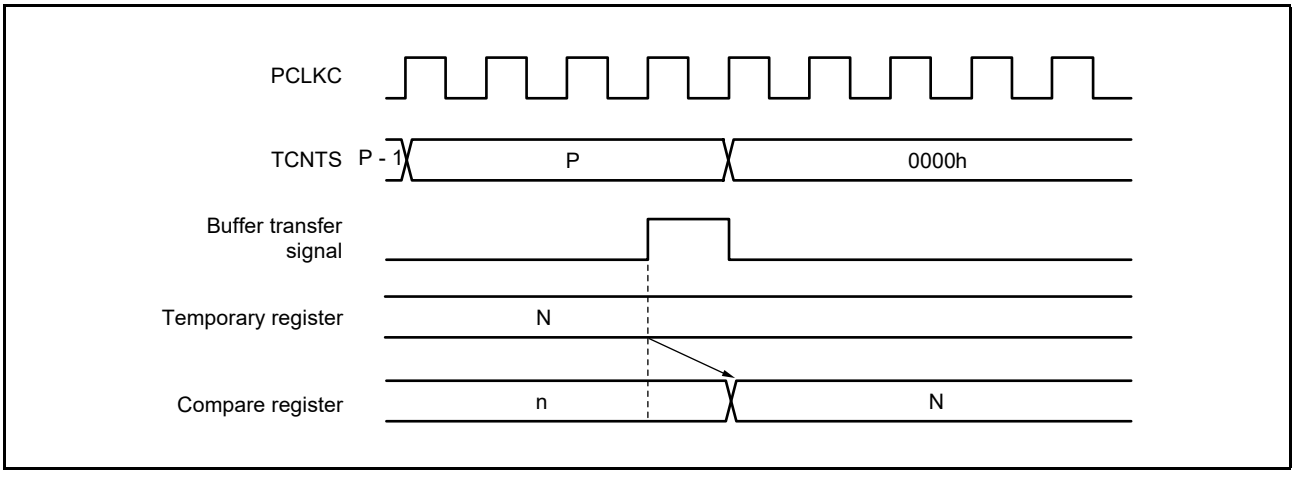

Figure 19.126 Transfer Timing from Temporary Register to Compare Register

19.5.2 Interrupt Signal Timing

(1) TGI Interrupt Timing by Compare Match

Figure 19.127 and Figure 19.128 show the TGI interrupt request signal timing when a compare match occurs.

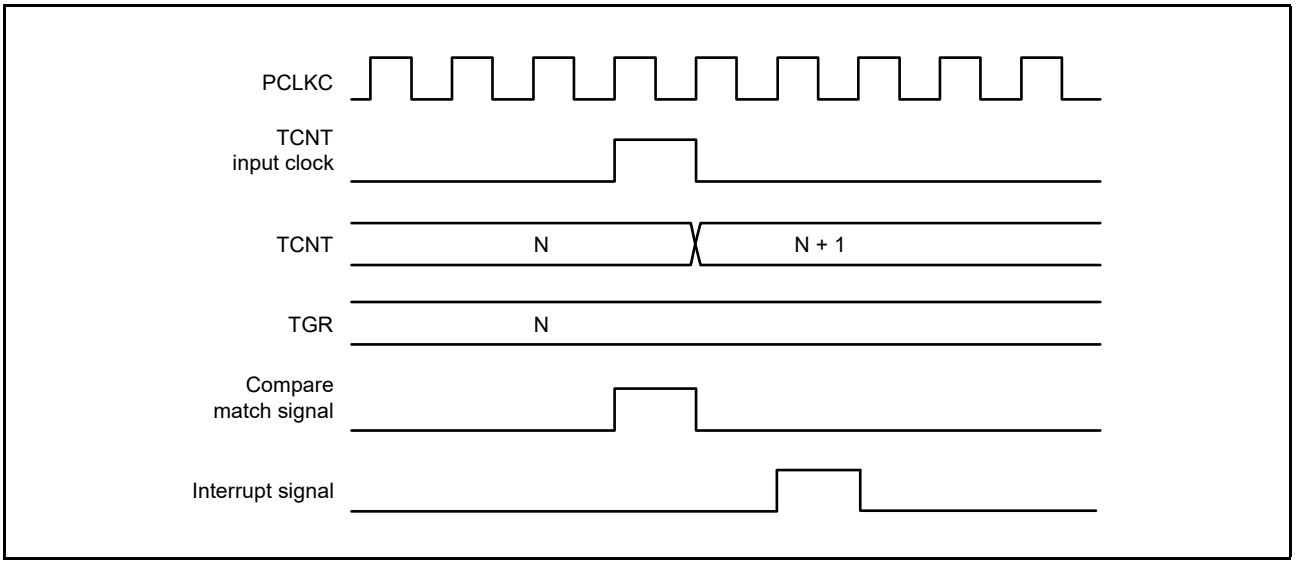

Figure 19.127 TGI Interrupt Timing (Compare Match) (MTU0 to MTU4 and MTU6 to MTU8)

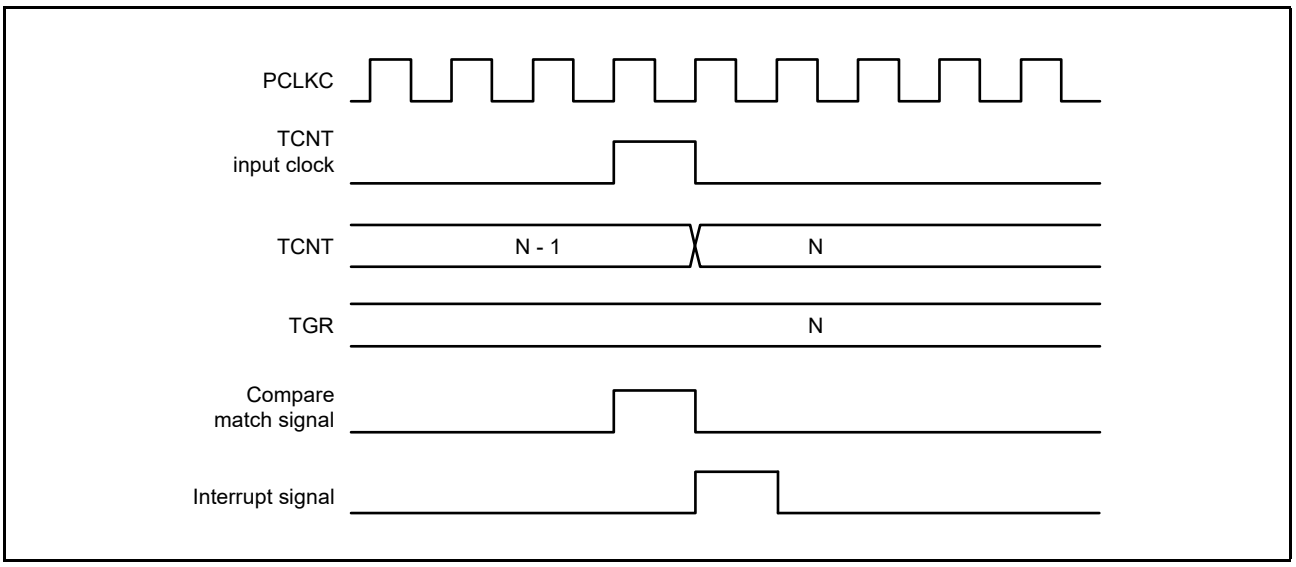

Figure 19.128 TGI Interrupt Timing (Compare Match) (MTU5)

(2) TGI Interrupt Timing by Input Capture

Figure 19.129 and Figure 19.130 show the TGI interrupt request signal timing when an input capture occurs.

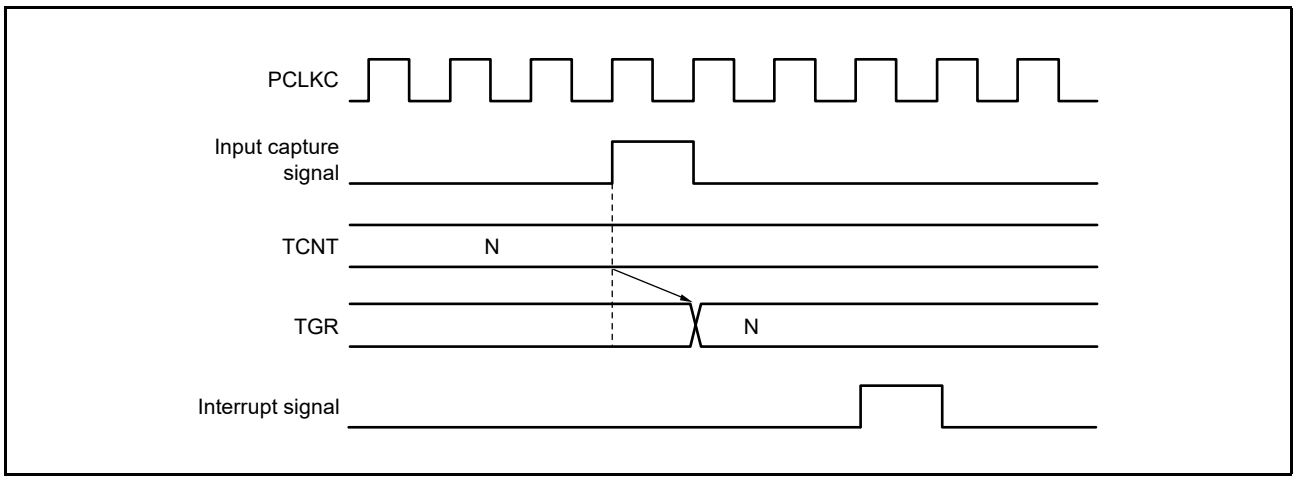

Figure 19.129 TGI Interrupt Timing (Input Capture) (MTU0 to MTU4 and MTU6 to MTU8)

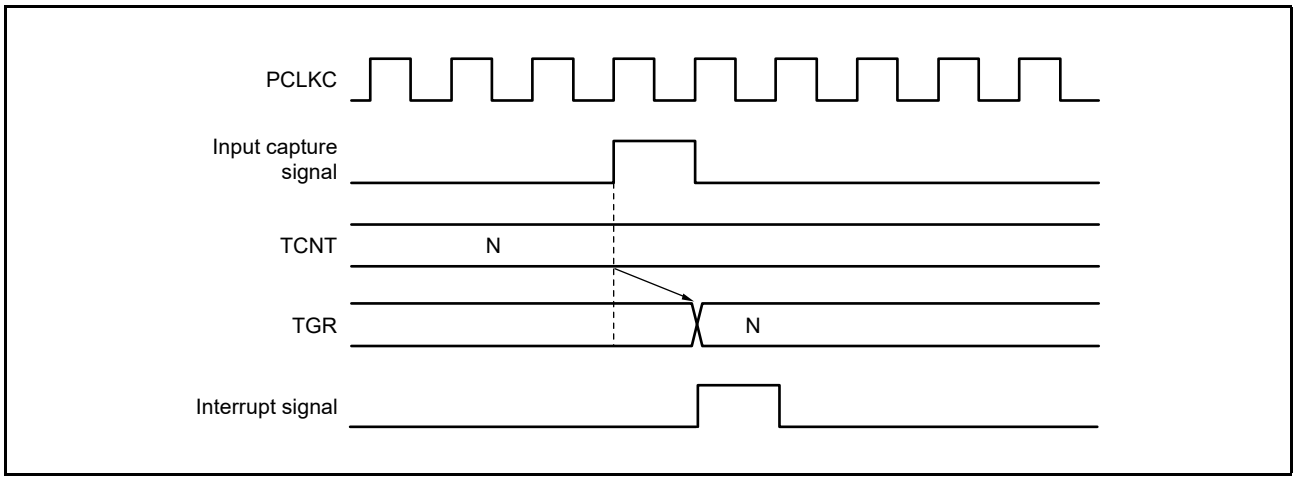

Figure 19.130 TGI Interrupt Timing (Input Capture) (MTU5)

(3) TCFV and TCFU Interrupt Request Timing on Overflow/Underflow

Figure 19.131 shows the TCIV interrupt request signal timing when an overflow is generated.
Figure 19.132 shows the TCIU interrupt request signal timing when an underflow is generated.

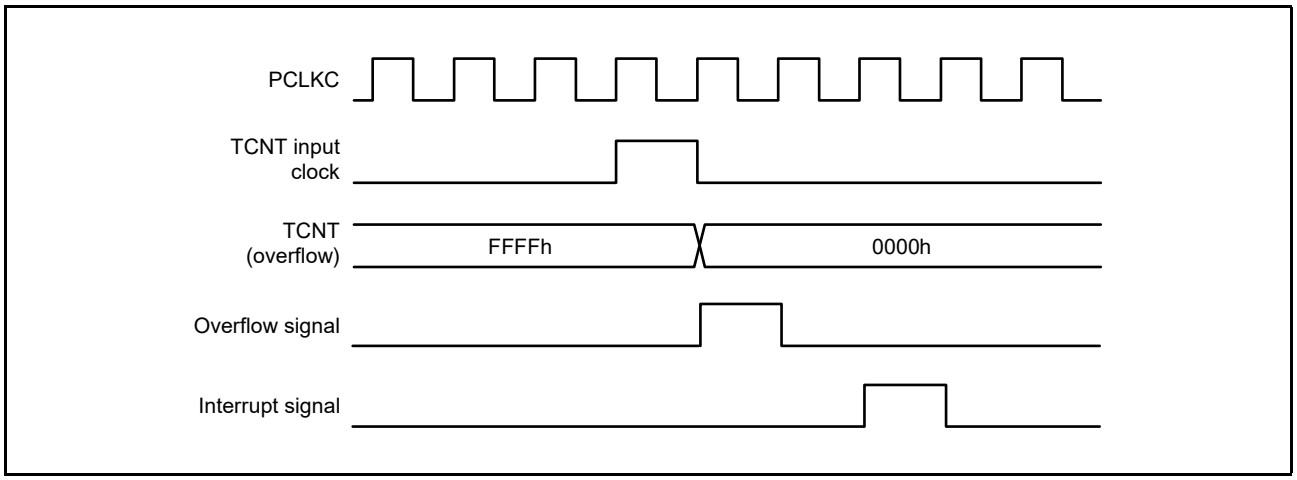

Figure 19.131 TCIV Interrupt Timing

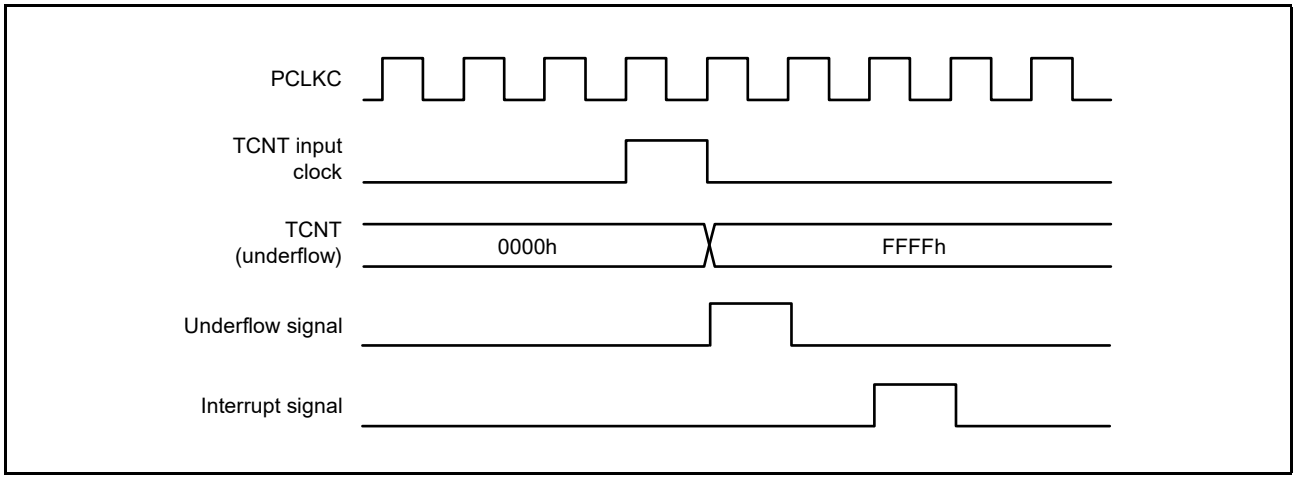

Figure 19.132 TCIU Interrupt Timing

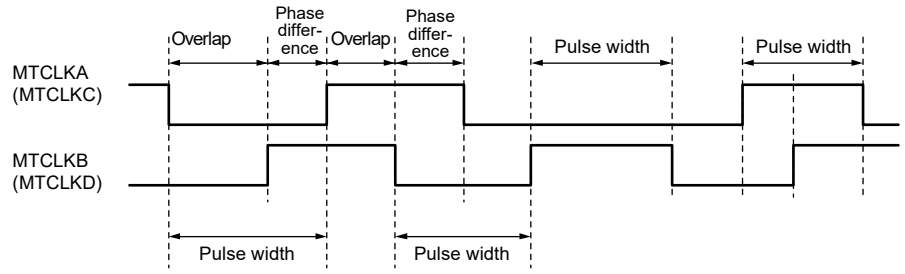
19.6 Usage Notes

19.6.1 Module Stop Function Setting

MTU operation can be disabled or enabled using the module stop control register. MTU operation is stopped with the initial setting. Register access is enabled by clearing the module clock stop status. For details, see section 9, Low-Power Consumption Function.

19.6.2 Input Clock Restrictions

The input clock pulse width must be at least 3 cycles of the PCLKC clock for single-edge detection, and at least 5 cycles of the PCLKC clock for both-edge detection. The MTU will not operate properly at narrower pulse widths.
In phase counting mode, the phase difference and overlap between the 2 input clocks must be at least 3 cycles of the PCLKC clock, and the pulse width must be at least 5 cycles of the PCLKC clock. Figure 19.133 shows the input clock conditions in phase counting mode.



Note: Phase difference and overlap: 3 PCLKC cycles or more
Pulse width: 5 PCLKC cycles or more

Figure 19.133 Phase Difference, Overlap, and Pulse Width in Phase Counting Mode

19.6.3 Note on Cycle Setting

When counter clearing on compare match is set, TCNT is cleared in the final state in which it matches the TGR value (the point at which TCNU updates the matched count value). Consequently, the actual counter frequency is given by the following formula:

- MTU0 to MTU4 and MTU6 to MTU8

$$f = \frac{CNTCLK}{(N + 1)}$$

- MTU5

$$f = \frac{CNTCLK}{N}$$

f: Counter frequency
CNTCLK: The counter-clock frequency set by TCR.TPSC[2:0] and TCR2.TPSC2[2:0]
N: TGR setting

19.6.4 Contention between TCNT Write and Clear Operations

If the counter clear signal is generated in the T2 state of a TCNT write cycle, TCNT clearing takes precedence and TCNT write operation is not performed.

Figure 19.134 shows the timing in this case.

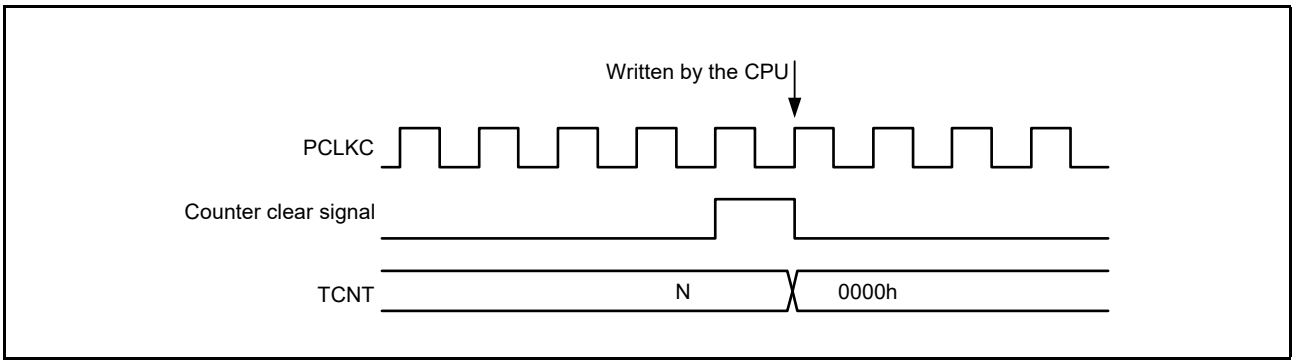


Figure 19.134 Contention between TCNT Write and Clear Operations

19.6.5 Contention between TCNT Write and Increment Operations

If incrementing occurs in the T2 state of a TCNT write cycle, TCNT write operation takes precedence and TCNT is not incremented.

Figure 19.135 shows the timing in this case.

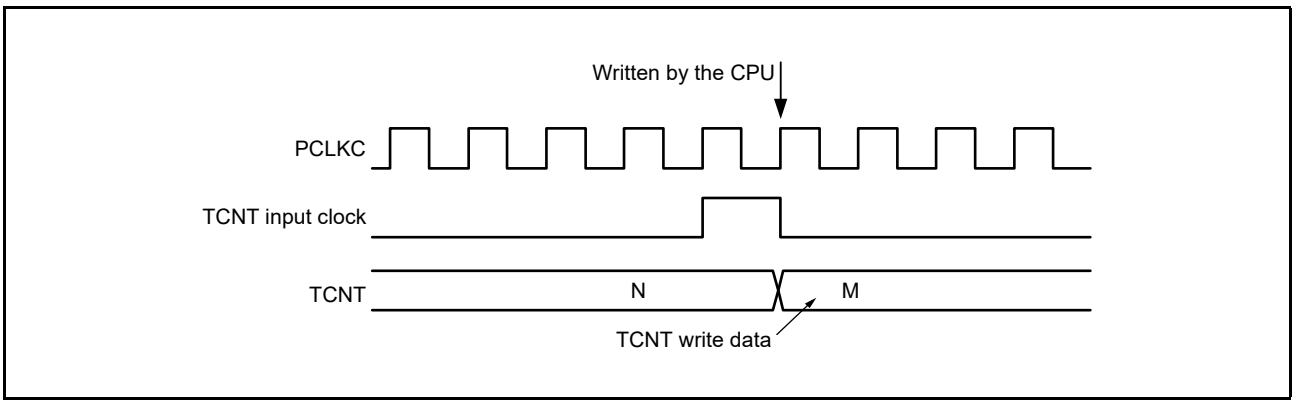

Figure 19.135 Contention between TCNT Write and Clear Operations

19.6.6 Contention between TGR Write Operation and Compare Match

If a compare match occurs in a TGR write cycle, TGR write operation is executed and the compare match signal is also generated.

Figure 19.136 shows the timing in this case.

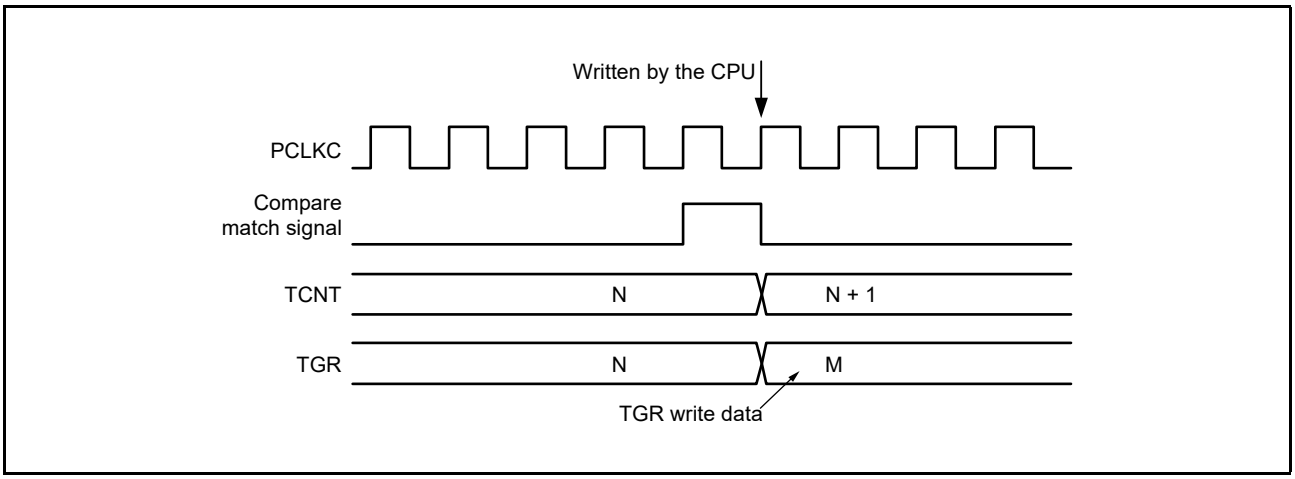

Figure 19.136 Contention between TGR Write Operation and Compare Match

19.6.7 Contention between Buffer Register Write Operation and Compare Match

If a compare match occurs in a TGR write cycle, the data before write operation is transferred to TGR by the buffer operation.

Figure 19.137 shows the timing in this case.

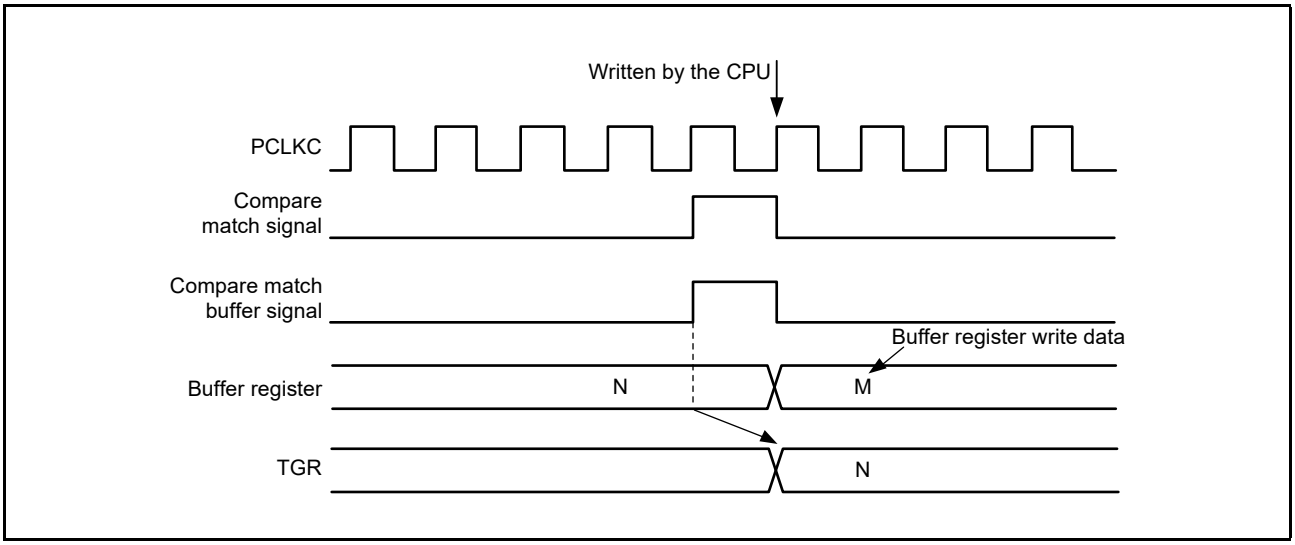

Figure 19.137 Contention between Buffer Register Write Operation and Compare Match

19.6.8 Contention between Buffer Register Write and TCNT Clear Operations

When the buffer transfer timing is set at the TCNT clear timing by the timer buffer operation transfer mode register (TBTM), if TCNT clearing occurs in the T2 state in a TGR write cycle, the data before write operation is transferred to TGR by the buffer operation.

Figure 19.138 shows the timing in this case.

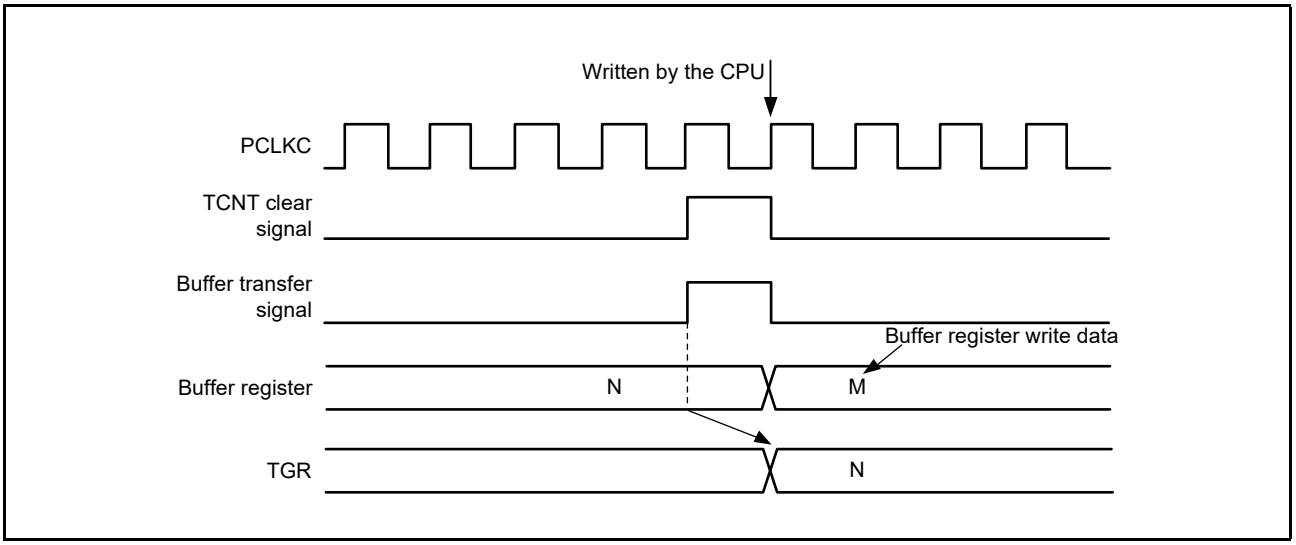

Figure 19.138 Contention between Buffer Register Write and TCNT Clear Operations

19.6.9 Contention between TGR Read Operation and Input Capture

If an input capture signal is generated in the T1 state in a TGR read cycle, the data before input capture transfer is read. Figure 19.139 shows the timing in this case.

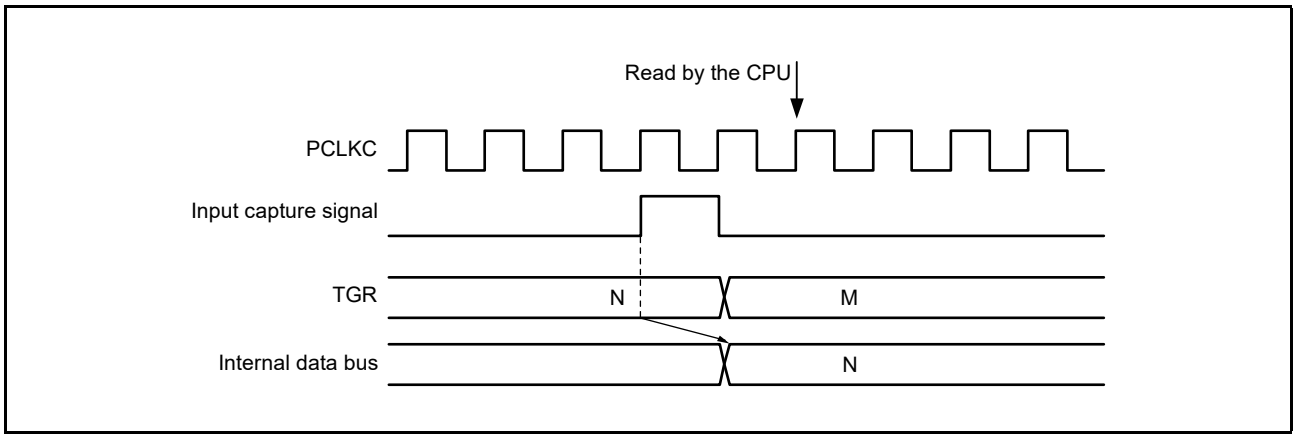

Figure 19.139 Contention between TGR Read Operation and Input Capture (MTU0 to MTU8)

19.6.10 Contention between TGR Write Operation and Input Capture

If an input capture signal is generated in a TGR write cycle, the input capture operation takes precedence and the TGR write operation is not performed in MTU0 to MTU4 and MTU6 to MTU8. In MTU5, the TGR write operation is performed and the input capture signal is generated.
Figure 19.140 and Figure 19.141 show the timing in this case.

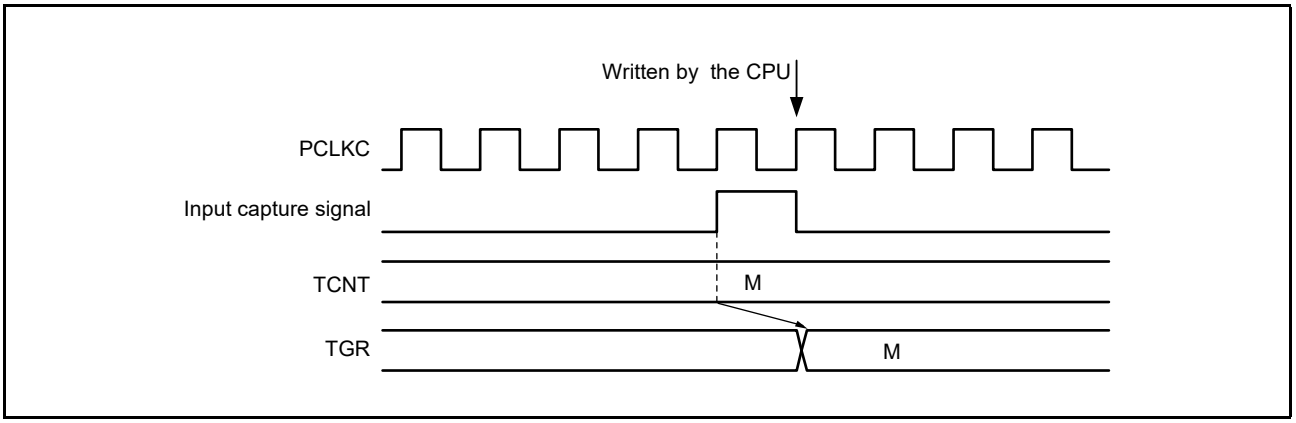

Figure 19.140 Contention between TGR Write Operation and Input Capture (MTU0 to MTU4 and MTU6 to MTU8)

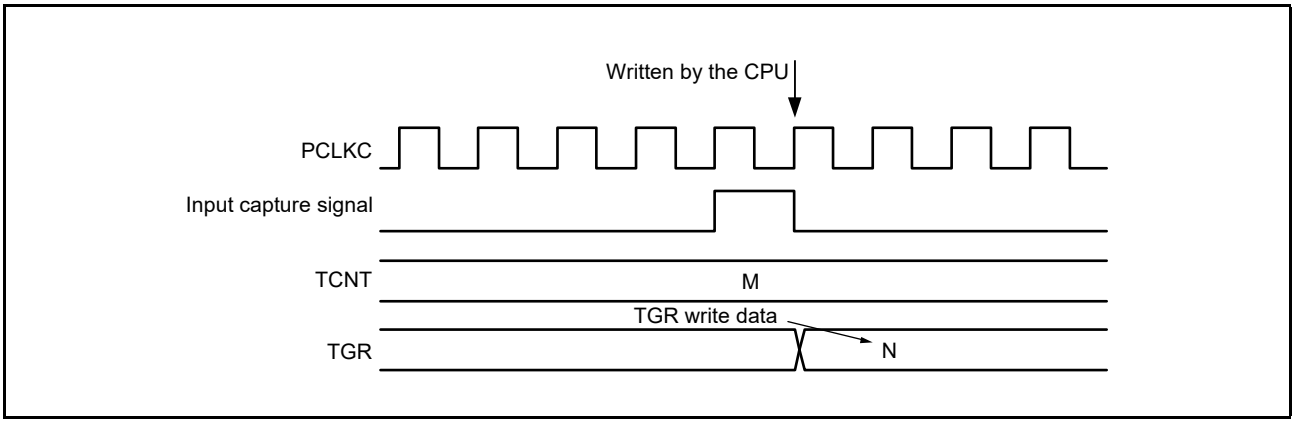

Figure 19.141 Contention between TGR Write Operation and Input Capture (MTU5)

19.6.11 Contention between Buffer Register Write Operation and Input Capture

If an input capture signal is generated in a buffer register write cycle, the buffer operation takes precedence and the buffer register write operation is not performed.

Figure 19.142 shows the timing in this case.

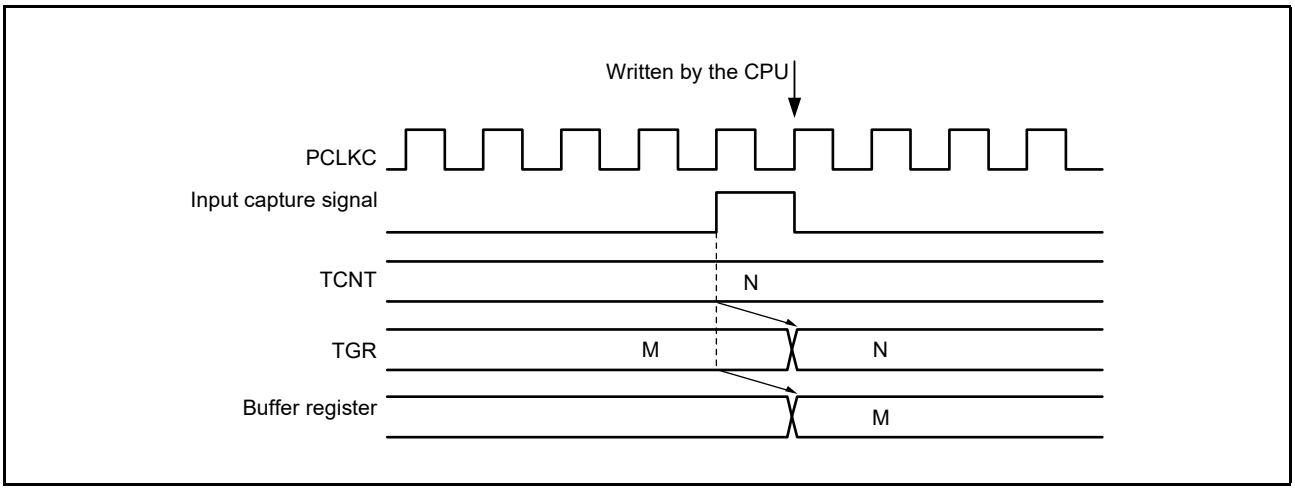

Figure 19.142 Contention between Buffer Register Write Operation and Input Capture

19.6.12 Contention between MTU2.TCNT Write Operation and Overflow/Underflow in Cascaded Operation

With timer counters MTU1.TCNT and MTU2.TCNT in a cascade, when a contention occurs between MTU1.TCNT counting (an MTU2.TCNT overflow/underflow) and the MTU2.TCNT writing, the MTU2.TCNT write operation is performed and the MTU1.TCNT count signal is disabled. In this case, if MTU1.TGRA works as a compare match register and there is a match between the MTU1.TGRA and MTU1.TCNT values, a compare match signal is issued. Furthermore, when the MTU1.TCNT count clock is selected as the input capture source of MTU0, MTU0.TGRA to MTU0.TGRD work in input capture mode. In addition, when the MTU0.TGRC compare match/input capture is selected as the input capture source of MTU1.TGRB, MTU1.TGRB works in input capture mode.

Figure 19.143 shows the timing in this case.

When setting the TCNT clearing function in cascaded operation, be sure to synchronize MTU1 and MTU2.

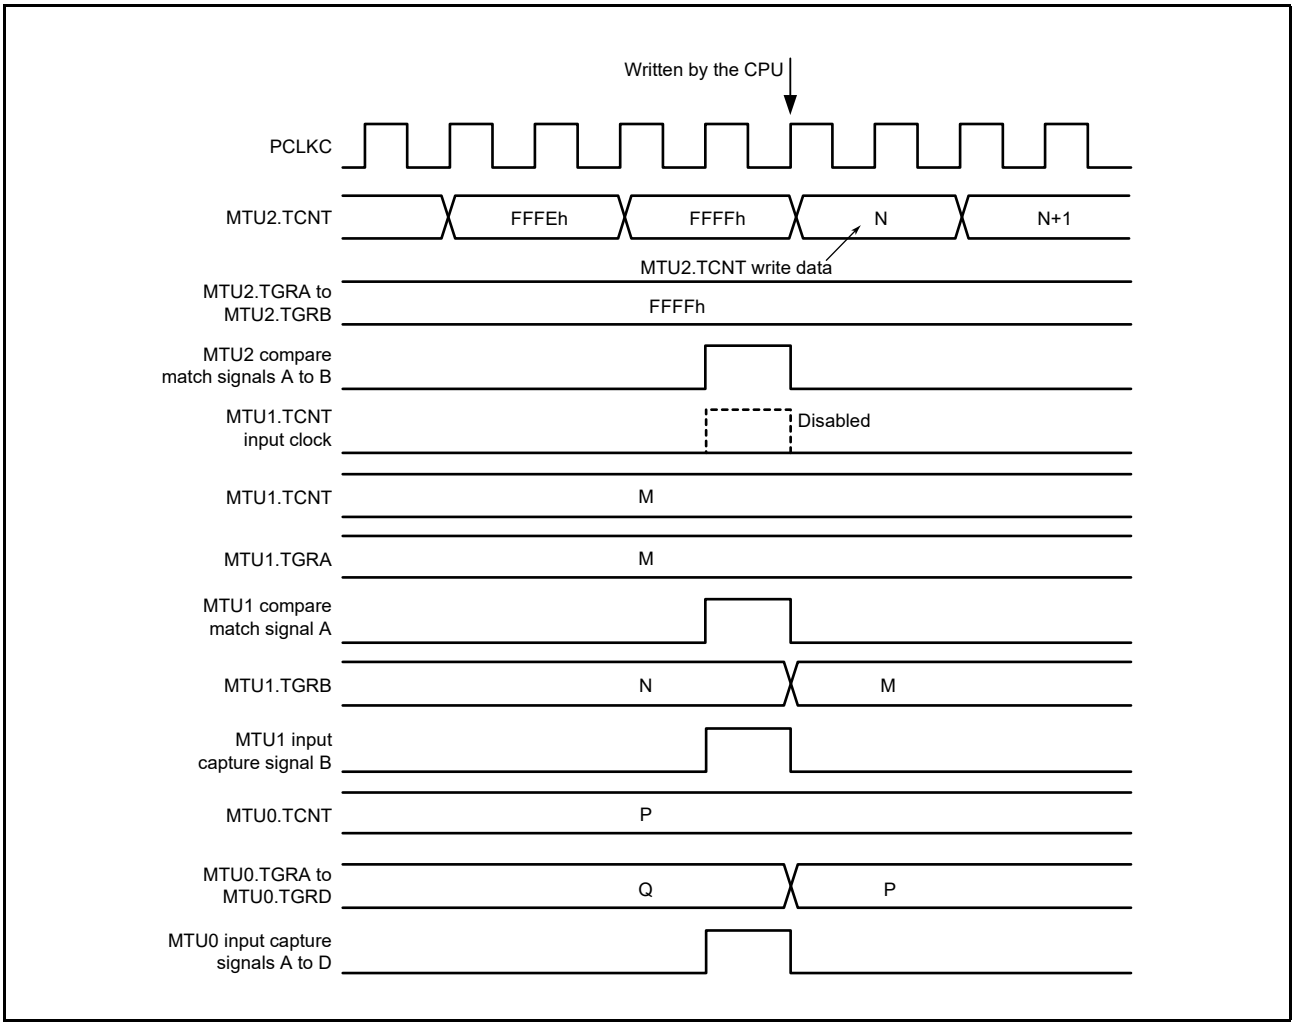

Figure 19.143 Contention between MTU2.TCNT Write Operation and Overflow/Underflow in Cascaded Operation

19.6.13 Counter Value when Stopped in Complementary PWM Mode

When counting operation in MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) is stopped in complementary PWM mode, the MTU3.TCNT (MTU6.TCNT) value is set to the timer dead time register (TDDRA (TDDRB)) value and MTU4.TCNT (MTU7.TCNT) is set to 0000h.
When operation is restarted in complementary PWM mode, counting begins automatically from the initial setting state. Figure 19.144 shows this operation.
When counting begins in another operating mode, be sure to make initial settings in MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT).

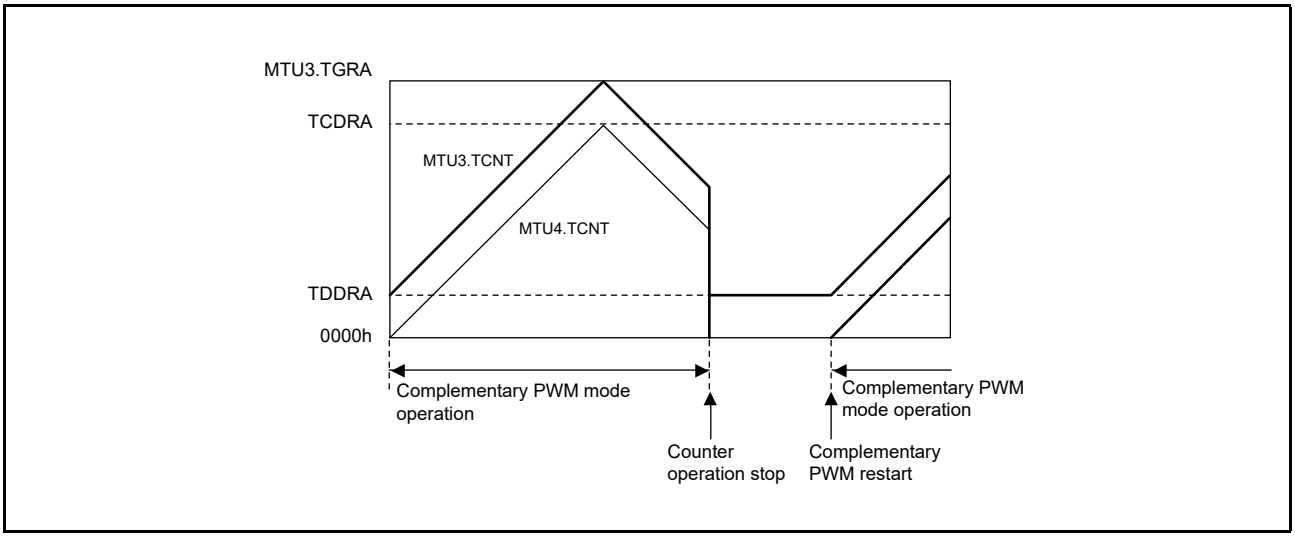

Figure 19.144 Counter Value when Stopped in Complementary PWM Mode

19.6.14 Buffer Operation Setting in Complementary PWM Mode

When modifying the PWM cycle set register (MTU3.TGRA or MTU6.TGRA), timer cycle data register (TCDRA or TCDRB), and duty set registers (MTU3.TGRB, MTU4.TGRA, and MTU4.TGRB (MTU6.TGRB, MTU7.TGRA, and MTU7.TGRB)) in complementary PWM mode, be sure to use buffer operation.
In addition, set the BFA and BFB bits in MTU4.TMDR1 (MTU7.TMDR1) to 0. The MTIOC4C (MTIOC7C) pin cannot output waveforms if the BFA bit in MTU4.TMDR1 (MTU7.TMDR1) is set to 1. Likewise, the MTIOC4D (MTIOC7D) pin cannot output waveforms if the BFB bit in MTU4.TMDR1 (MTU7.TMDR1) is set to 1.
In complementary PWM mode, buffer operation in MTU3 and MTU4 (or MTU6 and MTU7) depends on the settings in bits BFA and BFB of MTU3.TMDR1 (MTU6.TMDR1). When the BFA bit in MTU3.TMDR1 (MTU6.TMDR1) is set to 1, MTU3.TGRC (MTU6.TGRC) functions as a buffer register for MTU3.TGRA (MTU6.TGRA). At the same time, MTU4.TGRC (MTU7.TGRC) functions as a buffer register for MTU4.TGRA (MTU7.TGRA), and TCBRA (TCBRB) functions as a buffer register for TCDRA (TCDRB).

19.6.15 Buffer Operation and Compare Match in Reset-Synchronized PWM Mode

When setting buffer operation in reset-synchronized PWM mode, set the BFA and BFB bits in MTU4.TMDR1 (MTU7.TMDR1) to 0. The MTIOC4C (MTIOC7C) pin cannot output waveforms if the BFA bit in MTU4.TMDR1 (MTU7.TMDR1) is set to 1.

Likewise, the MTIOC4D (MTIOC7D) pin cannot output waveforms if the BFB bit in MTU4.TMDR1 (MTU7.TMDR1) is set to 1.

In reset-synchronized PWM mode, buffer operation in MTU3 and MTU4 (or MTU 6 and MTU7) depends on the settings in the BFA and BFB bits of MTU3.TMDR1 (MTU6.TMDR1). For example, if the BFA bit in MTU3.TMDR1 (MTU6.TMDR1) is set to 1, MTU3.TGRC (MTU6.TGRC) functions as a buffer register for MTU3.TGRA (MTU6.TGRA). At the same time, MTU4.TGRC (MTU7.TGRC) functions as a buffer register for MTU4.TGRA (MTU7.TGRA).

While the MTU3.TGRC (MTU6.TGRC) and MTU3.TGRD (MTU6.TGRD) are operating as buffer registers, a TGImn interrupt (m = C, D; n = 3, 4, or 6, 7) is not generated.

Figure 19.145 shows an example of MTU3.TGR (MTU6.TGR), MTU4.TGR (MTU7.TGR), MTIOC3 (MTIOC6), and MTIOC4 (MTIOC7) operation with the BFA and BFB bits in MTU3.TMDR1 (MTU6.TMDR1) set to 1 and the BFA and BFB bits in MTU4.TMDR1 (MTU7.TMDR1) set to 0.

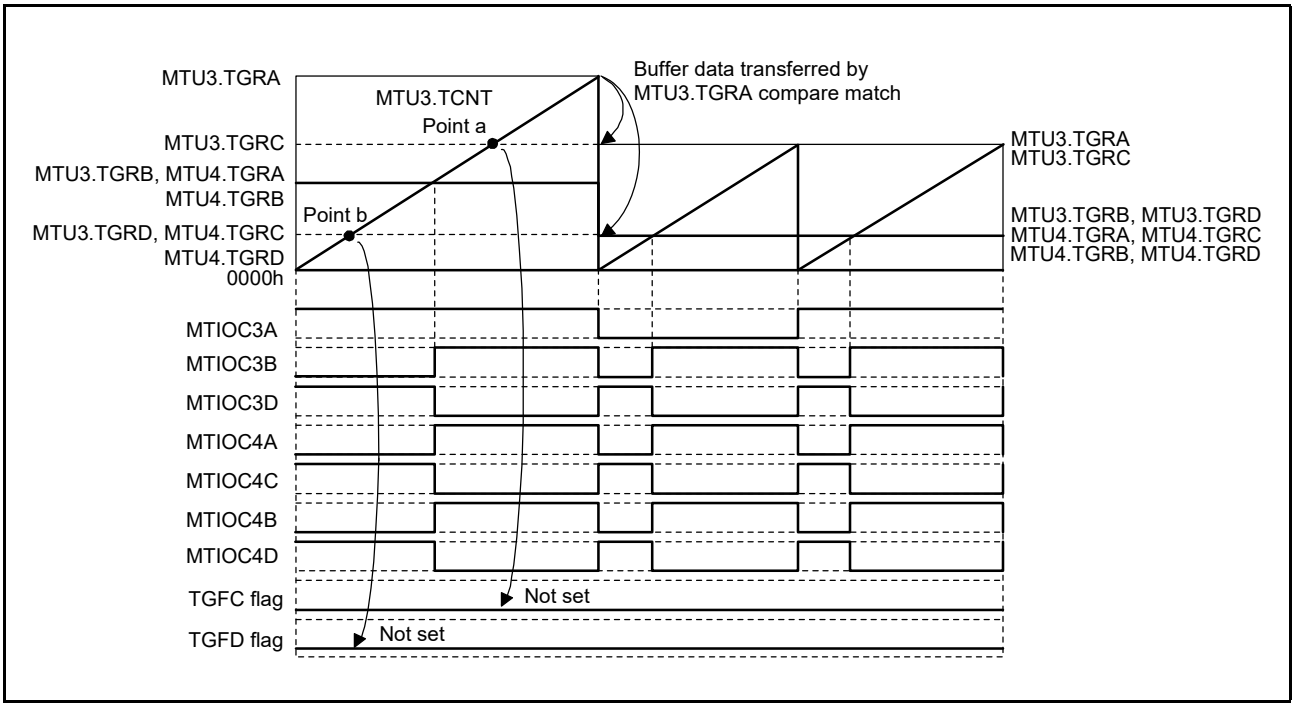

Figure 19.145 Buffer Operation and Compare Match in Reset-Synchronized PWM Mode

19.6.16 Overflow in Reset-Synchronized PWM Mode

After reset-synchronized PWM mode is selected, MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) start counting when the CST3 (CST6) bit of TSTRA (TSTRB) is set to 1. In this state, the MTU4.TCNT (MTU7.TCNT) count clock source and count edge are determined by the MTU3.TCR (MTU6.TCR) setting.
In reset-synchronized PWM mode, with cycle register MTU3.TGRA (MTU6.TGRA) set to FFFFh and the MTU3.TGRA (MTU6.TGRA) compare match selected as the counter clearing source, MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) count up to FFFFh, then a compare match occurs with MTU3.TGRA (MTU6.TGRA), and MTU3.TCNT and MTU4.TCNT (MTU6.TCNT and MTU7.TCNT) are both cleared. In this case, a TCIVn interrupt (n = 3, 4, or 6, 7) is not generated.
Figure 19.146 shows an example of TCFV flag operation in reset-synchronized PWM mode with cycle register MTU3.TGRA (MTU6.TGRA) set to FFFFh and the MTU3.TGRA (MTU6.TGRA) compare match specified for the counter clearing source.

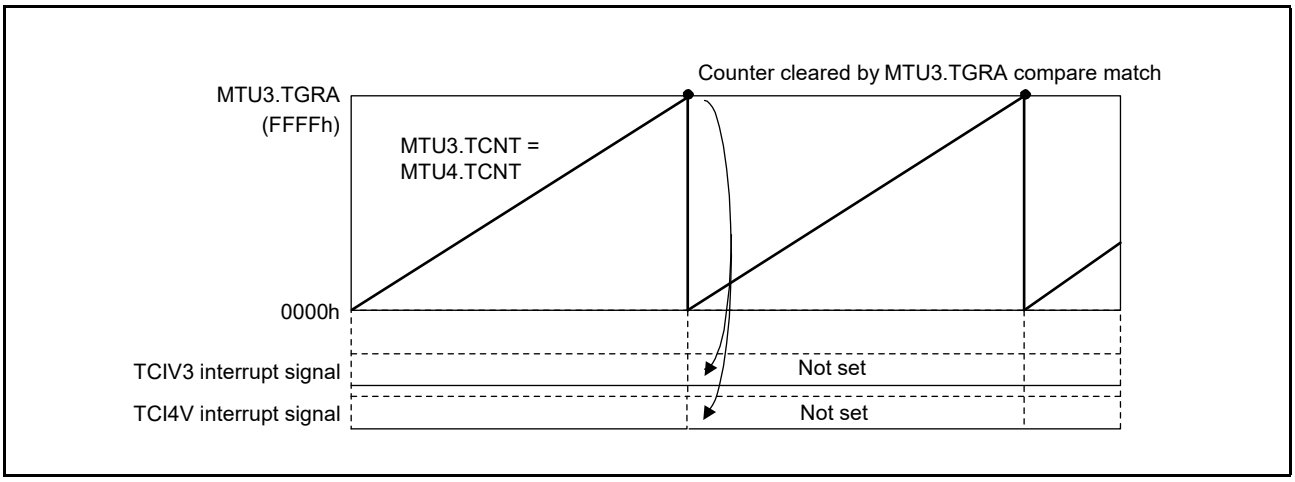

Figure 19.146 Overflow in Reset-Synchronized PWM Mode

19.6.17 Contention between Overflow/Underflow and Counter Clearing

If an overflow/underflow and counter clearing occur simultaneously, a TCIVn interrupt (n = 0 to 4, 6 to 8) nor a TCIUn interrupt (n = 1 or 2) is generated and TCNT clearing takes precedence.
Figure 19.147 shows the operation timing when a TGR compare match is specified as the clearing source and TGR is set to FFFFh.

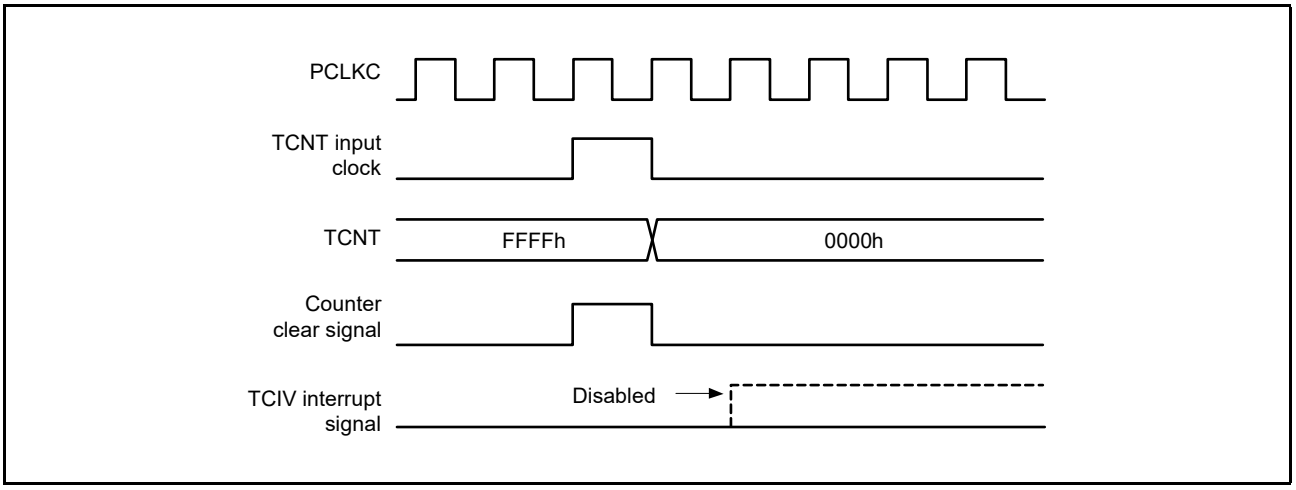

Figure 19.147 Contention between Overflow and Counter Clearing

19.6.18 Contention between TCNT Write Operation and Overflow/Underflow

If TCNT counts up or down in a TCNT write cycle and an overflow or an underflow occurs, the TCNT write operation takes precedence. A TCIVn interrupt (n = 0 to 4, 6 to 8) nor a TCIUn interrupt (n = 1 or 2) is generated.
Figure 19.148 shows the operation timing when there is contention between TCNT write operation and overflow.

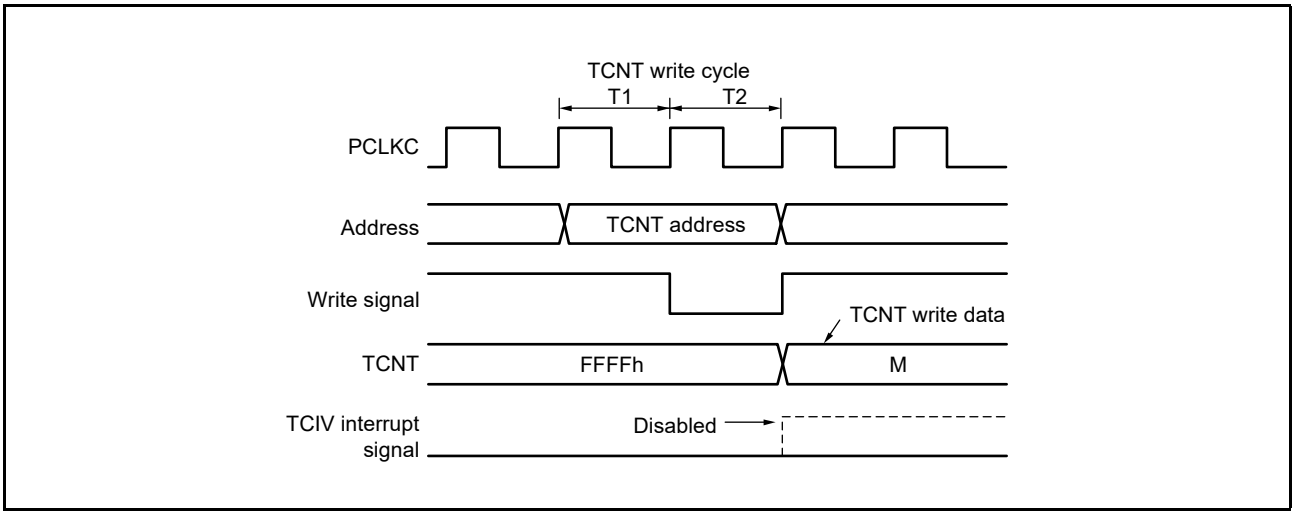

Figure 19.148 Contention between TCNT Write Operation and Overflow

19.6.19 Note on Transition from Normal Mode or PWM Mode 1 to Reset-Synchronized PWM Mode

When making a transition from normal operation or PWM mode 1 to reset-synchronized PWM mode in MTU3 and MTU4 (or MTU6 and MTU7), if the counter is stopped while the output pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, MTIOC4D, MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, and MTIOC7D) are held at a high level and then operation is started after a transition to reset-synchronized PWM mode, the initial pin output will not be correct.
When making a transition from normal mode to reset-synchronized PWM mode, write 11h to MTU3.TIORH, MTU3.TIORL, MTU4.TIORH, and MTU4.TIORL (MTU6.TIORH, MTU6.TIORL, MTU7.TIORH, and MTU7.TIORL) to initialize the output pin state to a low level, then set the registers to the initial value (00h) before making the mode transition.
When making a transition from PWM mode 1 to reset-synchronized PWM mode, switch to normal mode, initialize the output pin state to a low level, and then set the registers to the initial value (00h) before making the transition to reset-synchronized PWM mode.

19.6.20 Output Level in Complementary PWM Mode and Reset-Synchronized PWM Mode

When MTU3 and MTU4 (or MTU6 and MTU7) are in complementary PWM mode or reset-synchronized PWM mode, the PWM waveform output level is determined by the OLSP and OLSN bits in TOCR1A and TOCR1B. In complementary PWM mode or reset-synchronized PWM mode, TIOR should be set to 00h.
The output level in negative phase when the TDERA.TDER or TDERB.TDER bit is set to 0 in complementary PWM mode (the dead time is not generated) does not depend on the setting of the TOCR1A.OLSN or TOCR1B.OLSN bit. It is equivalent to the inverted level of positive phase output based on the setting of the TOCR1A.OLSP or TOCR1B.OLSP bit.

19.6.21 Simultaneous Input Capture in MTU1.TCNT and MTU2.TCNT in Cascade Connection

When timer counters 1 and 2 (MTU1.TCNT and MTU2.TCNT) operate as a 32-bit counter in cascade connection, the cascaded counter value cannot be captured successfully in some cases even if input-capture input is simultaneously done to MTIOC1A and MTIOC2A or to MTIOC1B and MTIOC2B. This is because the input timing of MTIOC1A and MTIOC2A or to MTIOC1B and MTIOC2B may not be the same when external input-capture signals input into MTU1.TCNT and MTU2.TCNT are taken in synchronization with the internal clock.
For example, MTU1.TCNT (the counter for upper 16 bits) does not capture the count-up value by an overflow from MTU2.TCNT (the counter for lower 16 bits) but captures the count value before the up-counting. In this case, the values of MTU1.TCNT = FFF1h and MTU2.TCNT = 0000h should be transferred to MTU1.TGRA and MTU2.TGRA or to MTU1.TGRB and MTU2.TGRB, but the values of MTU1.TCNT = FFF0h and MTU2.TCNT = 0000h are erroneously transferred.
The MTU has a new function that allows simultaneous capture of MTU1.TCNT and MTU2.TCNT with a single input capture input as the trigger. This function allows reading of the 32-bit counter such that MTU1.TCNT and MTU2.TCNT are captured at the same time. For details, see section 19.2.11, Timer Input Capture Control Register (TICCR).

19.6.22 Interrupt-Skipping Function 2

When interrupt-skipping function 2 is in use and the difference between the values in MTU4.TADCORA and MTU4.TADCORB is small, correct counting of the number skipped may not be possible, in which case requests for A/D conversion will not be generated with the expected timing. The conditions listed below thus apply to these settings.
For MTU6 and MTU7, the same conditions apply to the settings of MTU7.TADCORA and MTU7.TADCORB.

(1) When the number skipped is zero for skipping function 2

- The difference between the values in MTU4.TADCORA and MTU4.TADCORB must be at least four.
- The interval of comparison for MTU4.TADCORA must be at least four cycles of PCLKC (the updated value of MTU4.TADCORA is set to the previous value plus or minus at least four).
- The interval of comparison for MTU4.TADCORB must be at least four cycles of PCLKC (the updated value of MTU4.TADCORB is set to the previous value plus or minus at least four).

(2) When the number skipped is one or more for skipping function 2

- The difference between the values in MTU4.TADCORA and MTU4.TADCORB must be at least two.
- The interval of comparison for MTU4.TADCORB must be at least two cycles of PCLKC (the updated value of MTU4.TADCORB is set to the previous value plus or minus at least two).

19.6.23 Notes when Complementary PWM Mode Output Protection Function is not Used

The complementary PWM mode output protection function is initially enabled. If it is not used, write 00h in the POE2.POECR1 and POE2.POECR2 registers.

19.6.24 Notes Regarding Timer Counter (MTU5.TCNT) and Timer General Register (MTU5.TGR)

Do not set an MTU5.TGRj (j = U, V, W) bit to the value of the corresponding MTU5.TCNTj (j = U, V, W) plus one while counting by the MTU5.TCNTj (j = U, V, W) register is stopped. If an MTU5.TGRj (j = U, V, W) bit is set to the value of the corresponding MTU5.TCNTj (j = U, V, W) plus one while counting by the MTU5.TCNTj (j = U, V, W) is stopped, a compare-match will be generated even though counting is stopped.
In this case, if the compare match enable bit (MTU5.TIER.TGIE5j (j = U, V, W)) is set to 1 (enabling interrupts), a compare-match interrupt will also be generated. If the value of the timer compare match clear register is 1 (enabled), the timer is automatically cleared to 0000h when the compare-match is generated, regardless of whether interrupts from the MTU5.TCNTj (j = U, V, W) are enabled or disabled.

19.6.25 Points for Caution to Prevent Malfunctions in Synchronous Clearing for Complementary PWM Mode

If control of the output waveform is enabled (TWCR.WRE bit = 1) at the time of synchronous counter clearing in complementary PWM mode, satisfaction of either condition 1 or 2 below has the following effects.

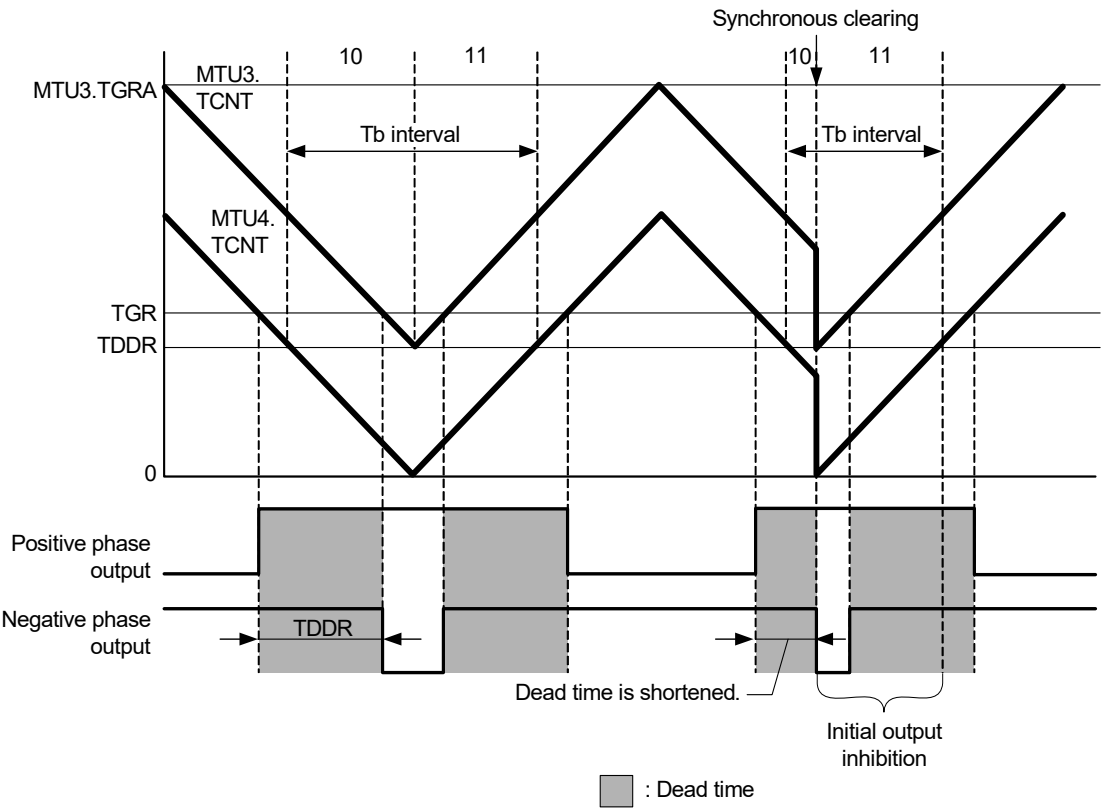
- Dead time on the PWM output pins is shortened (or disappears).
- The active level is output on the PWM negative phase output pins beyond the period for active-level output.

Condition 1: In portion (10) of the initial output inhibition period in Figure 19.149, when synchronous clearing occurs within the dead-time period for PWM output.

Condition 2: In portions (10) and (11) of the initial output inhibition period in Figure 19.150, synchronous clearing occurs when any condition from among MTU3.TGRB (MTU6.TGRB) ≤ TDDRA (TDDRB), MTU4.TGRA (MTU7.TGRA) ≤ TDDRA (TDDRB), or MTU4.TGRB (MTU7.TGRB) is satisfied.

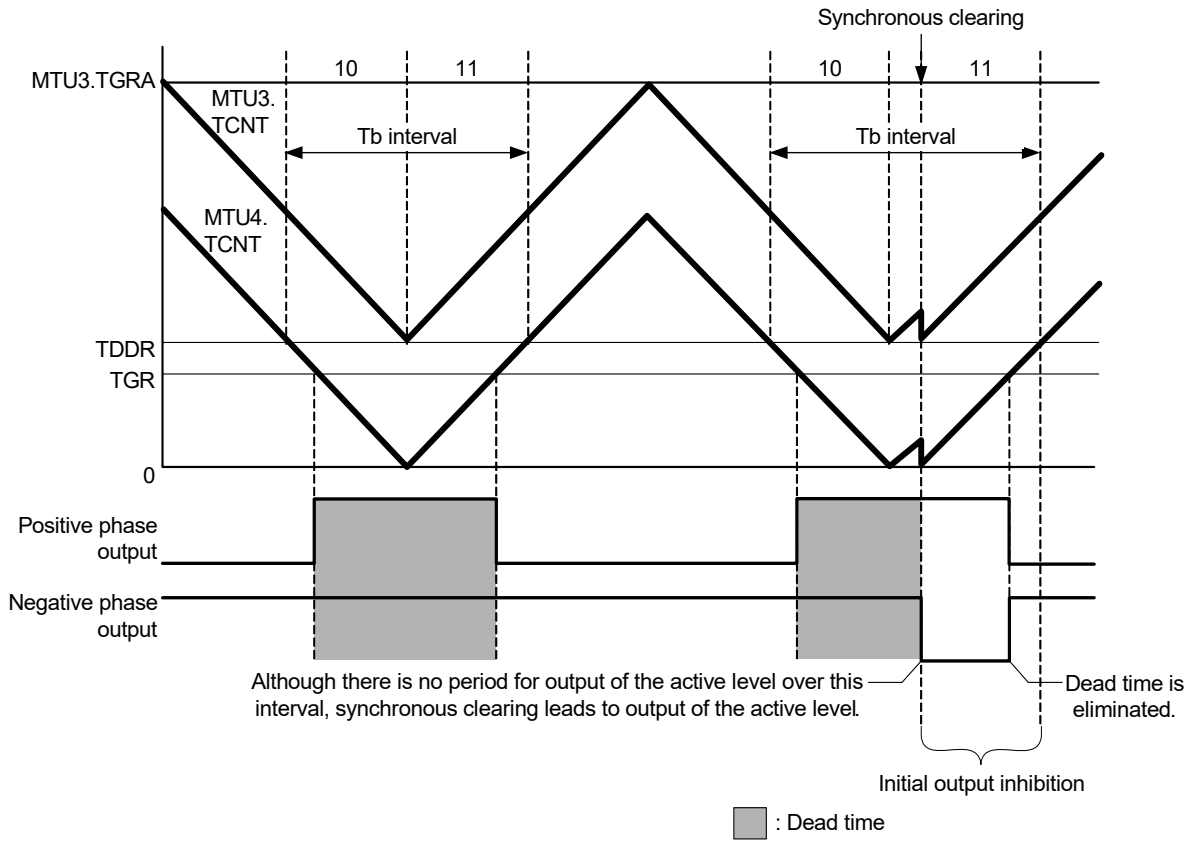
The following method avoids the above phenomena.

Ensure that synchronous clearing proceeds with the value of each of comparison registers MTU3.TGRB (MTU6.TGRB), MTU4.TGRA (MTU7.TGRA), and MTU4.TGRB (MTU7.TGRB) set to at least double the value of the TDDRA register (TDDRB register).



Note: PWM output is active low over the dead time.

Figure 19.149 Example of Synchronous Clearing (when Condition 1 Applies)



Note: PWM output is active low.

Figure 19.150 Example of Synchronous Clearing (when Condition 2 Applies)

19.6.26 Notes on Timer Mode Register Setting for ELC Event Input

When MTU is used in ELC operation, set the timer mode register (TMDR) of the relevant channel to its initial value (00h).

19.6.27 Continuous Output of Interrupt Signal in Response to a Compare Match

When the TGR register is set to 0000h, PCLK/1 clock is set as the counter clock, and compare match is set as the trigger for clearing of the counter clock, the value of the TCNT counter remains 0000h, and the interrupt signal will be output continuously (i.e. its level will be flat) rather than output over a single cycle. Consequently, interrupts will not be detected in response to second and subsequent compare matches.

Figure 19.151 shows the timing for continuous output of the interrupt signal in response to a compare match.

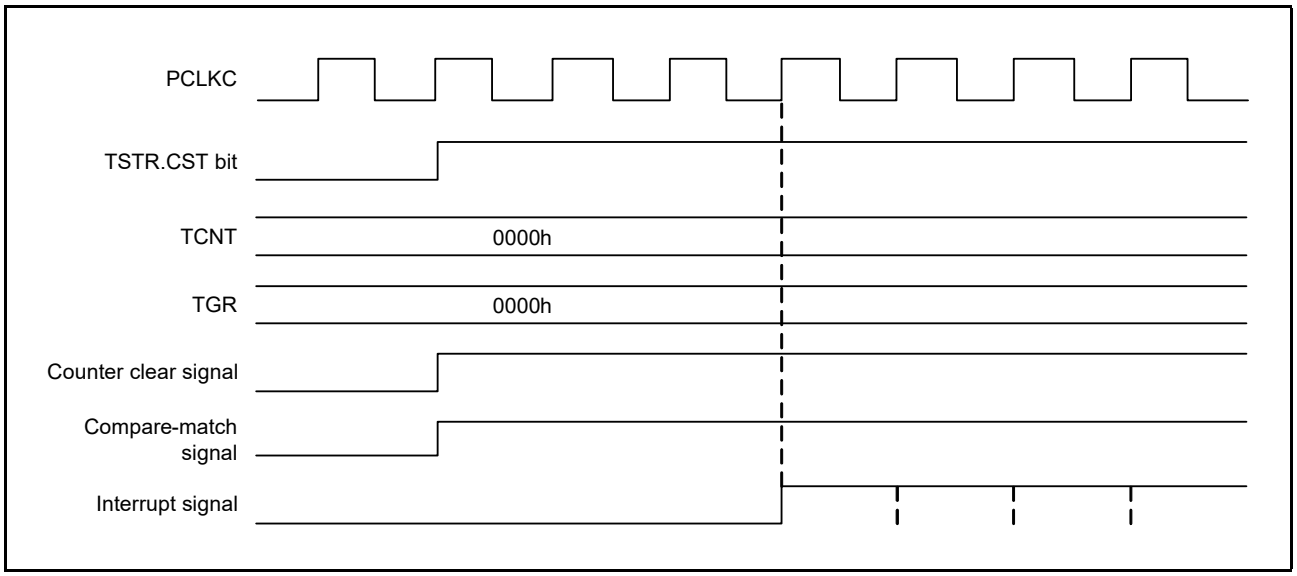


Figure 19.151 Continuous Output of Interrupt Signal in Response to a Compare Match

19.6.28 Notes on Port Settings in Complementary PWM Mode or Reset-Synchronized PWM Mode

When complementary PWM mode or reset-synchronized PWM mode is to be used, set the port pins for use as the 6-phase PWM output pins for channels 3 and 4 (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4C, MTIOC4B, and MTIOC4D) and channels 6 and 7 (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7C, MTIOC7B, and MTIO7D) in the groups in Table 19.79 and Table 19.80.
For the port settings, see section 18, Multi-Function Pin Controller (MPC).

Table 19.79 Output Pins for Channels 3 and 4

	Specified Port					
Port Group	**MTIOC3B**	**MTIOC3D**	**MTIOC4A**	**MTIOC4C**	**MTIOC4B**	**MTIOC4D**
1*1	P16	P15	P14	P13	P12	P11
2*2	PA2	PA1	PA0	P77	P76	P75
3*2	PB7	PF6	PF5	P87	P86	PD7

Table 19.80 Output Pins for Channels 6 and 7

	Specified Port					
Port Group	**MTIOC6B**	**MTIOC6D**	**MTIOC7A**	**MTIOC7C**	**MTIOC7B**	**MTIOC7D**
1*1	PS5	PS4	PS3	PS2	PS1	PS0
2*3	PA7	P70	PE7	P42	P22	PH6

Note 1. This port group is only available in 320-pin devices.
Note 2. This port group is available in both 320- and 176-pin devices.
Note 3. This port group is available in both 320- and 176-pin devices. Also, these pins are not under Hi-Z control by POE3.

19.7 MTU Output Pin Initialization

19.7.1 Operating Modes

The MTU has the following six operating modes. Waveforms can be output in any of these modes.

- Normal mode (MTU0 to MTU4 and MTU6 to MTU8)
- PWM mode 1 (MTU0 to MTU4, MTU6, and MTU7)
- PWM mode 2 (MTU0 to MTU2)
- Phase counting modes 1 to 5 (MTU1 and MTU2)
- Complementary PWM mode (MTU3, MTU4, MTU6, and MTU7)
- Reset-synchronized PWM mode (MTU3, MTU4, MTU6, and MTU7)

This section describes how to initialize the MTU output pins in each of these modes.

19.7.2 Operation in Case of Re-Setting Due to Error during Operation

If an error occurs during MTU operation, MTU output should be cut off by the system. The output can be cut off by allowing non-active level output from the pins by setting the pins as general output ports using the port direction registers (PDR), port output data registers (PODR), and port mode registers (PMR) of the I/O ports. MTU output can be disabled through TIOR settings. Complementary PWM output (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4B, MTIOC4C, MTIOC4D, MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7B, MTIOC7C, and MTIOC7D) should be specified through TOERA and TOERB settings. For PWM output pins, output can also be cut by hardware, using port output enable 3 (POE3). The pin initialization procedures for re-setting due to an error during operation and the procedures for restarting in a different mode after re-setting are described below.

The MTU has six operating modes, as stated above. There are thus 36 mode transition combinations, but some transitions are not available with certain channel and mode combinations. Available mode transition combinations are shown in Table 19.81.

Table 19.81 Mode Transition Combinations

	Normal	PWM1	PWM2	PCM	CPWM	RPWM
Normal	(1)	(2)	(3)	(4)	(5)	(6)
PWM1	(7)	(8)	(9)	(10)	(11)	(12)
PWM2	(13)	(14)	(15)	(16)	Not available	Not available
PCM	(17)	(18)	(19)	(20)	Not available	Not available
CPWM	(21)	(22)	Not available	Not available	(23) (24)	(25)
RPWM	(26)	(27)	Not available	Not available	(28)	(29)

Normal: Normal mode
PWM1: PWM mode 1
PWM2: PWM mode 2
PCM: Phase counting modes 1 to 5
CPWM: Complementary PWM mode
RPWM: Reset-synchronized PWM mode

19.7.3 Overview of Initialization Procedures and Mode Transitions in Case of Error during Operation

- When making a transition to a mode (Normal, PWM1, PWM2, or PCM) in which the pin output level is selected by the timer I/O control register (TIOR) setting, initialize the pins by means of TIOR setting.
- In PWM mode 1, waveforms are not output to the MTIOCnB and MTIOCnD (n = 3, 4, 6, or 7) pins. If no other module outputs signals through these pins, they enter high-impedance state. To output a specified level, make necessary settings for general output ports in the port direction registers (PDR), port output data registers (PODR), and port mode registers (PMR) of the I/O ports.
- In PWM mode 2, waveforms are not output to the cycle register pins. If no other module outputs signals through these pins, they enter high-impedance state. To output a specified level, make necessary settings for general output ports in the port direction registers (PDR), port output data registers (PODR), and port mode registers (PMR) of the I/O ports.
- In normal mode or PWM mode 2, if TGRC and TGRD operate as buffer registers, waveforms are not output to the corresponding pins. If no other module outputs signals through these pins, they enter high-impedance state. To output a specified level, make necessary settings for general output ports in the port direction registers (PDR), port output data registers (PODR), and port mode registers (PMR) of the I/O ports.
- In PWM mode 1, if either TGRC or TGRD operates as a buffer register, waveforms are not output to the corresponding pins. If no other module outputs signals through these pins, they enter high-impedance state. To output a specified level, make necessary settings for general output ports in the port direction registers (PDR), port output data registers (PODR), and port mode registers (PMR) of the I/O ports.
- When making a transition to a mode (CPWM or RPWM) in which the pin output level is selected by the timer output control register (TOCR1A, TOCR2A, TOCR1B, or TOCR2B) setting, temporarily disable output in MTU3 and MTU4 (or MTU6 and MTU7) with the timer output master enable register (TOERA or TOERB). At this time, if no other module outputs signals through these pins, they enter high-impedance state. To output a specified level, make necessary settings for general output ports in the port direction registers (PDR), port output data registers (PODR), and port mode registers (PMR) of the I/O ports. Switch to normal mode, perform initialization with TIOR, restore TIOR to its initial value, then operate the MTU in accordance with the mode setting procedure (TOCR1A setting, TOCR2A setting, TMDR1 setting, and TOERA setting (TOCR1B setting, TOCR2B setting, TMDR1 setting, and TOERB setting)).

Note: Channel number is substituted for “n” indicated in this section, unless otherwise stated.

Pin initialization procedures are described below for the numbered combinations in Table 19.81. The active level is assumed to be low.

(1) Operation when Error Occurs in Normal Mode and Operation is Restarted in Normal Mode

Figure 19.152 shows a case in which an error occurs in normal mode and operation is restarted in normal mode after re-setting.

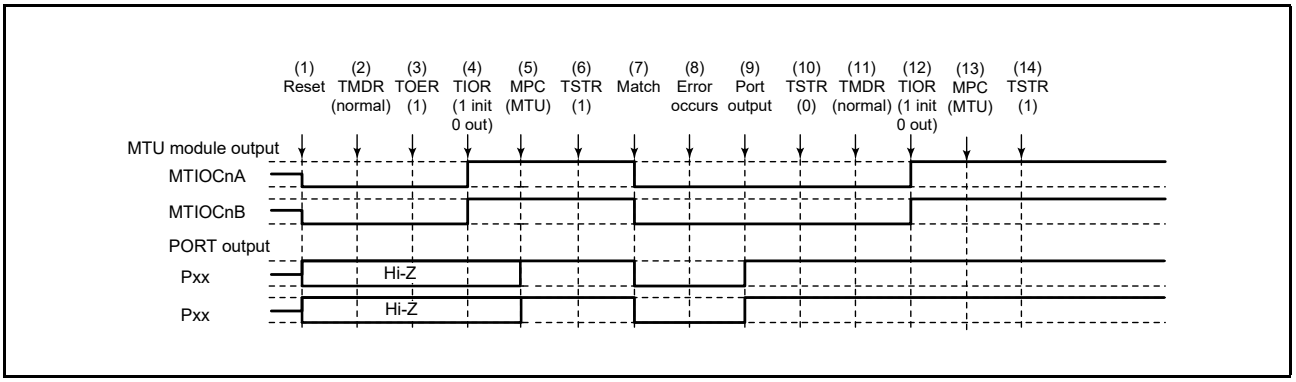

Figure 19.152 Error Occurrence in Normal Mode, Recovery in Normal Mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.
(2) After a reset, the TMDR1 setting is for normal mode.
(3) For MTU3 and MTU4, enable output with TOERA before initializing the pins with TIOR.
(4) Initialize the pins with TIOR. (In the example, the initial output is a high level, and a low level is output on compare match occurrence.)
(5) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
(6) Start count operation by setting TSTRA.
(7) Output goes low on compare match occurrence.
(8) An error occurs.
(9) Allow non-active level output by setting the pins as general output ports using the port direction registers (PDR), port output data registers (PODR), and port mode registers (PMR) of the I/O ports.
(10) Stop count operation by setting TSTRA.
(11) This step is not necessary when restarting in normal mode.
(12) Initialize the pins with TIOR.
(13) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
(14) Restart operation by setting TSTRA.

(2) Operation when Error Occurs in Normal Mode and Operation is Restarted in PWM Mode 1

Figure 19.153 shows a case in which an error occurs in normal mode and operation is restarted in PWM mode 1 after re-setting.

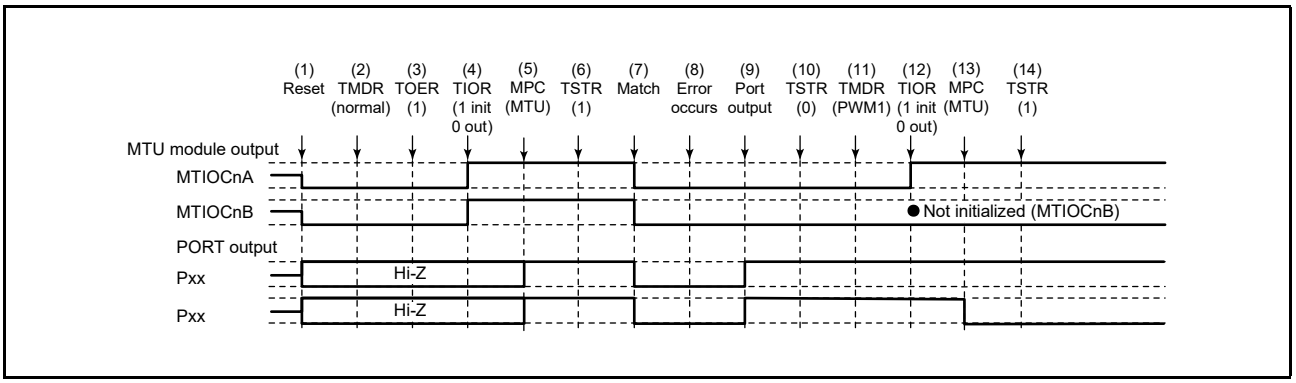

Figure 19.153 Error Occurrence in Normal Mode, Recovery in PWM Mode 1

(1) to (10) are the same as in Figure 19.152.
(11) Set PWM mode 1.
(12) Initialize the pins with TIOR. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port direction registers (PDR) and port output data registers (PODR) of the I/O ports.)
(13) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
(14) Restart operation by setting TSTRA.

(3) Operation when Error Occurs in Normal Mode and Operation is Restarted in PWM mode 2

Figure 19.154 shows a case in which an error occurs in normal mode and operation is restarted in PWM mode 2 after re-setting.

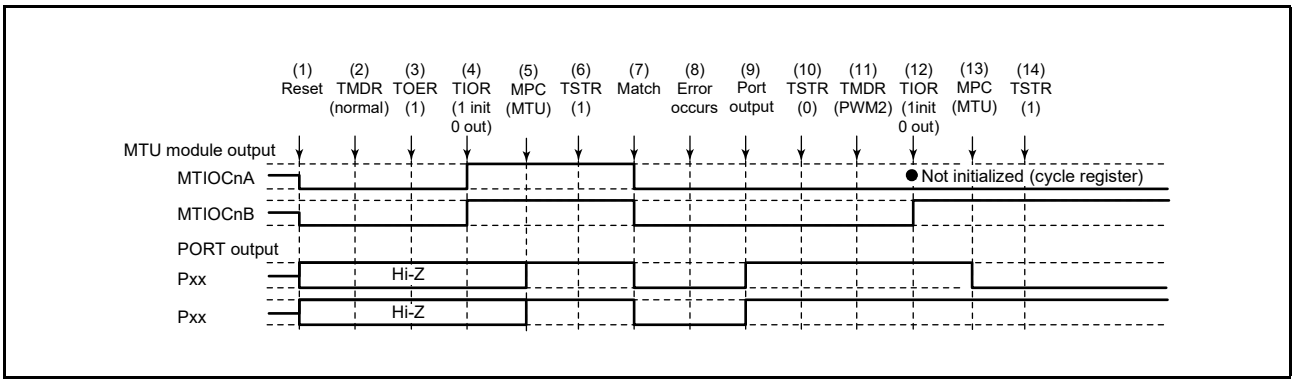

Figure 19.154 Error Occurrence in Normal Mode, Recovery in PWM Mode 2

(1) to (10) are the same as in Figure 19.152.
(11) Set PWM mode 2.
(12) Initialize the pins with TIOR. (In PWM mode 2, waveforms are not output to the cycle register pins. To output a specified level, make necessary settings for general output ports in the port direction registers (PDR) and port output data registers (PODR) of the I/O ports.)
(13) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
(14) Restart operation by setting TSTRA.

Note: PWM mode 2 can only be selected for MTU0 to MTU2, and therefore TOERA setting is not necessary.

(4) Operation when Error Occurs in Normal Mode and Operation is Restarted in Phase Counting Mode

Figure 19.155 shows a case in which an error occurs in normal mode and operation is restarted in phase counting mode after re-setting.

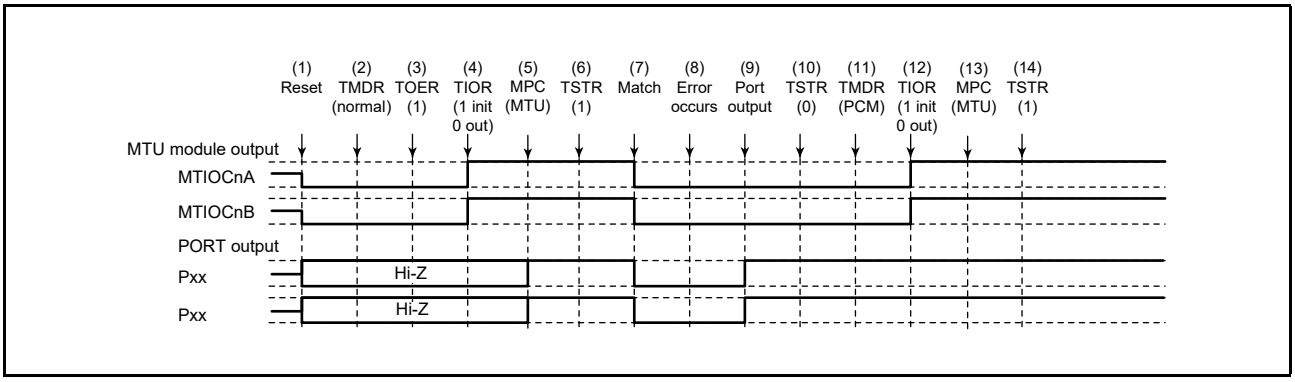

Figure 19.155 Error Occurrence in Normal Mode, Recovery in Phase Counting Mode

(1) to (10) are the same as in Figure 19.152.
(11) Set the phase counting mode.
(12) Initialize the pins with TIOR.
(13) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
(14) Restart operation by setting TSTRA.

Note: The phase counting mode can only be selected for MTU1 and MTU2, and therefore TOERA setting is not necessary.

(5) Operation when Error Occurs in Normal Mode and Operation is Restarted in Complementary PWM Mode

Figure 19.156 shows a case in which an error occurs in normal mode and operation is restarted in complementary PWM mode after re-setting.

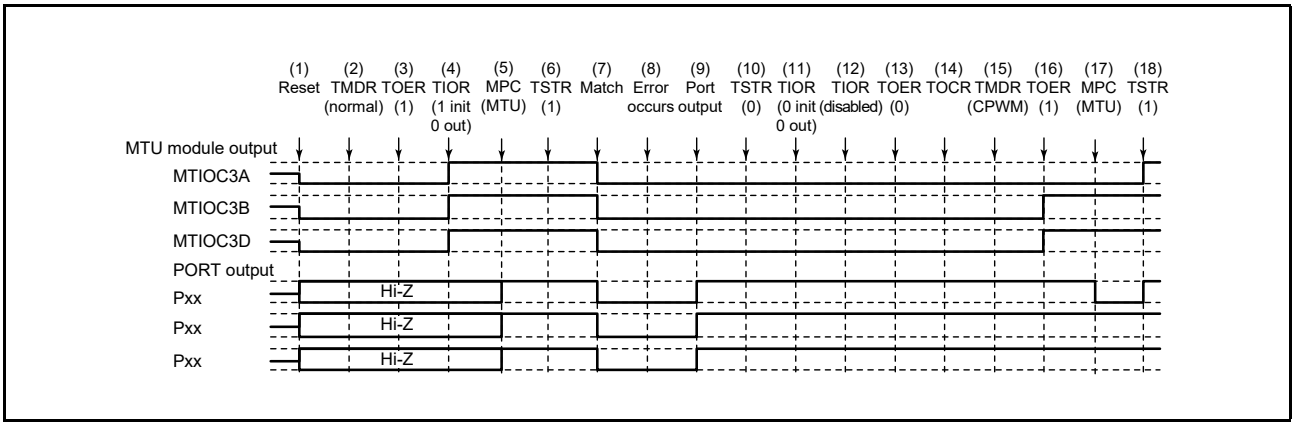

Figure 19.156 Error Occurrence in Normal Mode, Recovery in Complementary PWM Mode

(1) to (10) are the same as in Figure 19.152.
(11) Initialize the normal mode waveform generation section with TIOR.
(12) Disable operation of the normal mode waveform generation section with TIOR.
(13) Disable output in MTU3 and MTU4 with TOERA.
(14) Select the complementary PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A.
(15) Set complementary PWM mode.
(16) Enable output in MTU3 and MTU4 with TOERA.
(17) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
(18) Restart operation by setting TSTRA.

(6) Operation when Error Occurs in Normal Mode and Operation is Restarted in Reset-Synchronized PWM Mode

Figure 19.157 shows a case in which an error occurs in normal mode and operation is restarted in reset-synchronized PWM mode after re-setting.

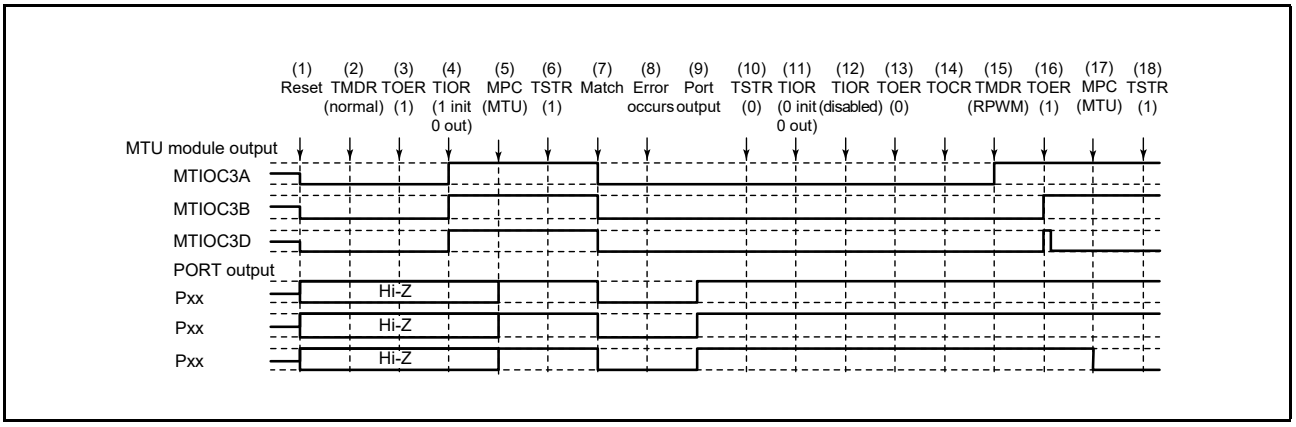

Figure 19.157 Error Occurrence in Normal Mode, Recovery in Reset-Synchronized PWM Mode

(1) to (13) are the same as in Figure 19.152.
(14) Select the reset-synchronized PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A.
(15) Set reset-synchronized PWM mode.
(16) Enable output in MTU3 and MTU4 with TOERA.
(17) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
(18) Restart operation by setting TSTRA.

(7) Operation when Error Occurs in PWM Mode 1 and Operation is Restarted in Normal Mode

Figure 19.158 shows a case in which an error occurs in PWM mode 1 and operation is restarted in normal mode after re-setting.

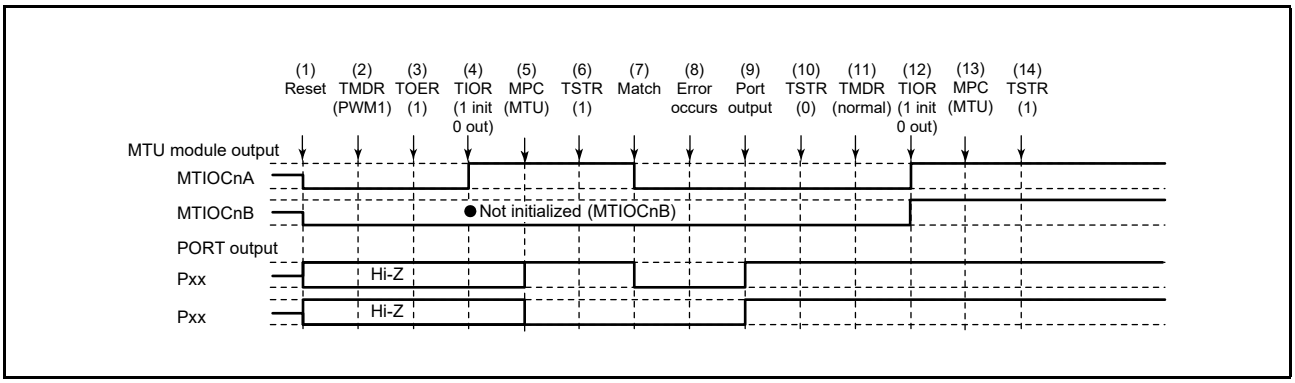

Figure 19.158 Error Occurrence in PWM Mode 1, Recovery in Normal Mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.
(2) Set PWM mode 1.
(3) For MTU3 and MTU4, enable output with TOERA before initializing the pins with TIOR.
(4) Initialize the pins with TIOR. (In the example, the initial output is a high level, and a low level is output on compare match occurrence. In PWM mode 1, the MTIOCnB side is not initialized.)
(5) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
(6) Start count operation by setting TSTRA.
(7) Output goes low on compare match occurrence.
(8) An error occurs.
(9) Allow non-active level output by setting the pins as general output ports using the port direction registers (PDR), port output data registers (PODR), and port mode registers (PMR) of the I/O ports.
(10) Stop count operation by setting TSTRA.
(11) Set normal mode.
(12) Initialize the pins with TIOR.
(13) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
(14) Restart operation by setting TSTRA.

(8) Operation when Error Occurs in PWM Mode 1 and Operation is Restarted in PWM mode 1

Figure 19.159 shows a case in which an error occurs in PWM mode 1 and operation is restarted in PWM mode 1 after re-setting.

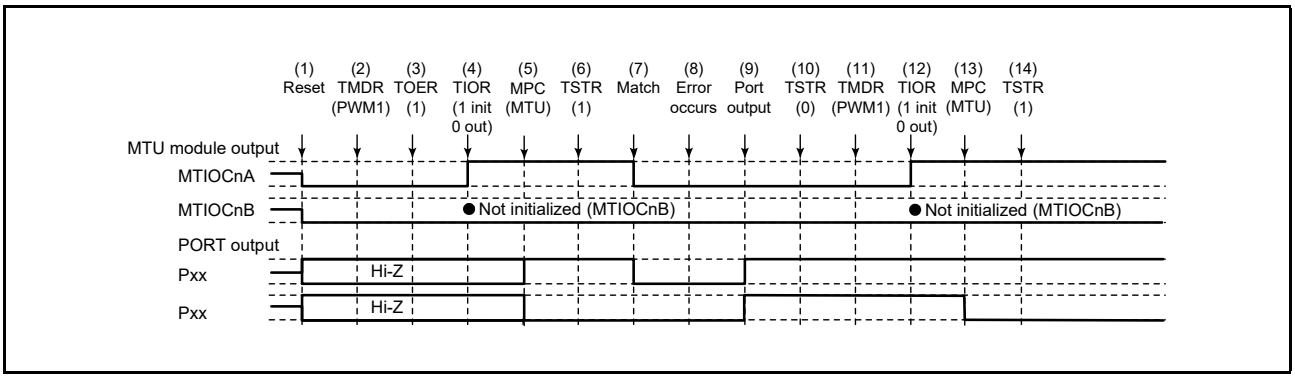

Figure 19.159 Error Occurrence in PWM Mode 1, Recovery in PWM Mode 1

(1) to (10) are the same as in Figure 19.158.
(11) This step is not necessary when restarting in PWM mode 1.
(12) Initialize the pins with TIOR. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port direction registers (PDR) and port output data registers (PODR) of the I/O ports.)
(13) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
(14) Restart operation by setting TSTRA.

(9) Operation when Error Occurs in PWM Mode 1 and Operation is Restarted in PWM mode 2

Figure 19.160 shows a case in which an error occurs in PWM mode 1 and operation is restarted in PWM mode 2 after re-setting.

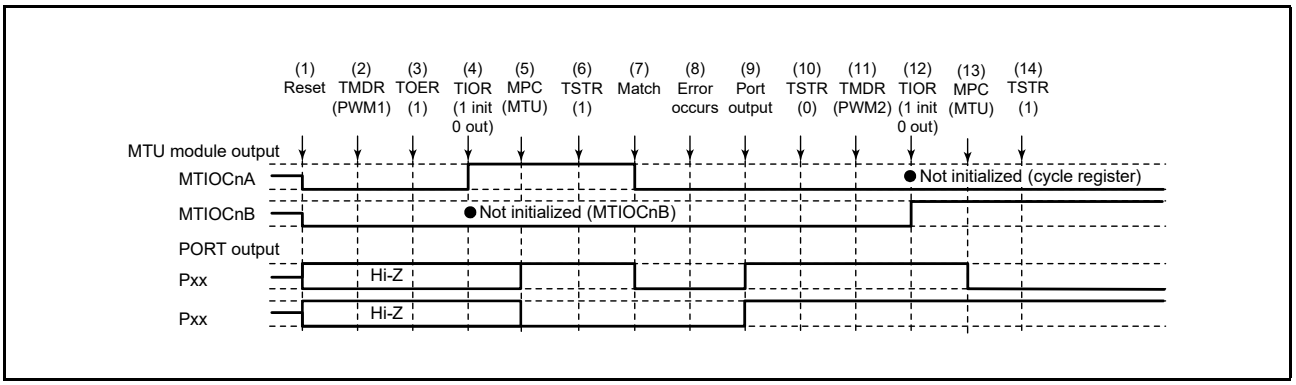

Figure 19.160 Error Occurrence in PWM Mode 1, Recovery in PWM Mode 2

(1) to (10) are the same as in Figure 19.158.
(11) Set PWM mode 2.
(12) Initialize the pins with TIOR. (In PWM mode 2, waveforms are not output to the cycle register pins. To output a specified level, make necessary settings for general output ports in the port direction registers (PDR) and port output data registers (PODR) of the I/O ports.)
(13) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
(14) Restart operation by setting TSTRA.

Note: PWM mode 2 can only be selected for MTU0 to MTU2, and therefore TOERA setting is not necessary.

(10) Operation when Error Occurs in PWM Mode 1 and Operation is Restarted in Phase Counting Mode

Figure 19.161 shows a case in which an error occurs in PWM mode 1 and operation is restarted in phase counting mode after re-setting.

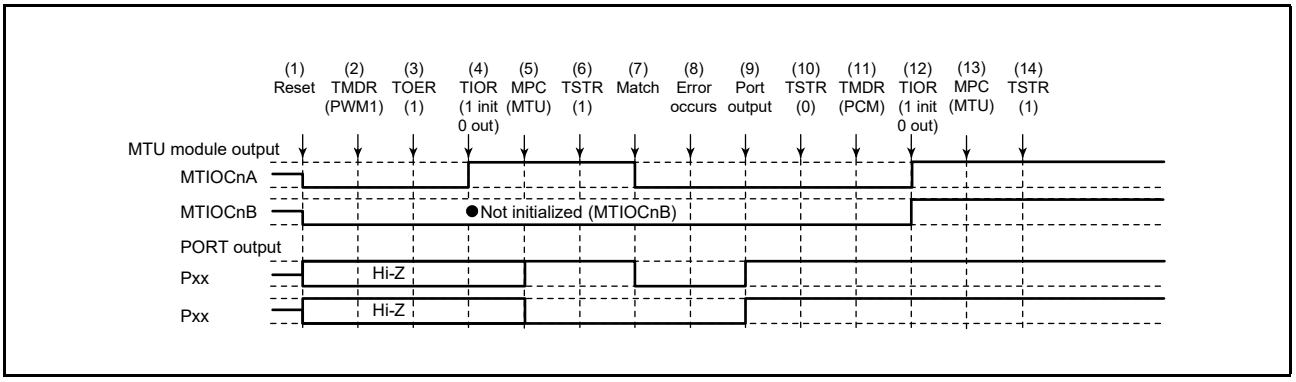

Figure 19.161 Error Occurrence in PWM Mode 1, Recovery in Phase Counting Mode

(1) to (10) are the same as in Figure 19.158.
(11) Set the phase counting mode.
(12) Initialize the pins with TIOR.
(13) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
(14) Restart operation by setting TSTRA.

Note: The phase counting mode can only be selected for MTU1 and MTU2, and therefore TOERA setting is not necessary.

(11) Operation when Error Occurs in PWM Mode 1 and Operation is Restarted in Complementary PWM Mode

Figure 19.162 shows a case in which an error occurs in PWM mode 1 and operation is restarted in complementary PWM mode after re-setting.

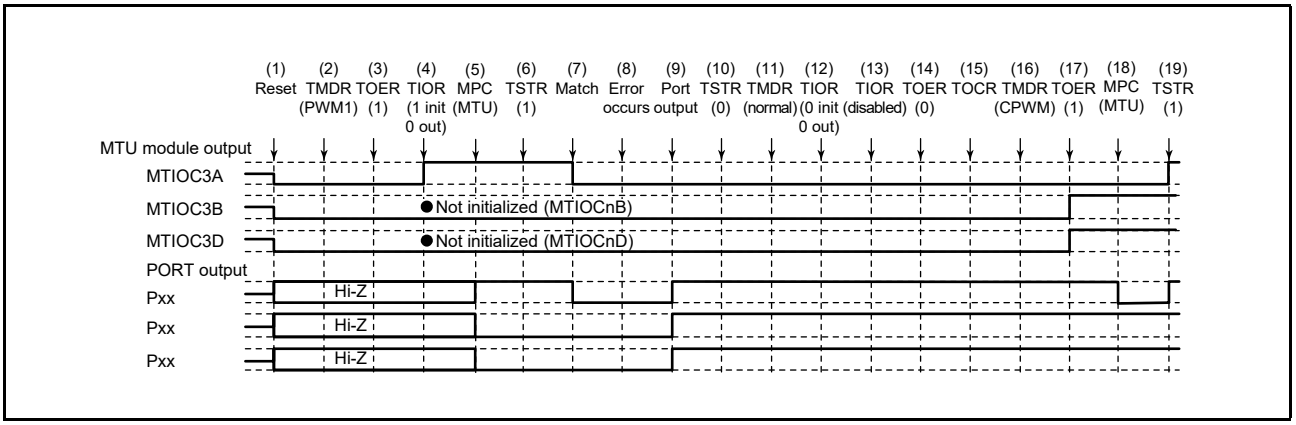

Figure 19.162 Error Occurrence in PWM Mode 1, Recovery in Complementary PWM Mode

(1) to (10) are the same as in Figure 19.158.
(11) Set normal mode to initialize the normal mode waveform generation section.
(12) Initialize the PWM mode 1 waveform generation section with TIOR.
(13) Disable operation of the PWM mode 1 waveform generation section with TIOR
(14) Disable output in MTU3 and MTU4 with TOERA.
(15) Select the complementary PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A.
(16) Set complementary PWM mode.
(17) Enable output in MTU3 and MTU4 with TOERA.
(18) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
(19) Restart operation by setting TSTRA.

(12) Operation when Error Occurs in PWM Mode 1 and Operation is Restarted in Reset-Synchronized PWM Mode

Figure 19.163 shows a case in which an error occurs in PWM mode 1 and operation is restarted in reset-synchronized PWM mode after re-setting.

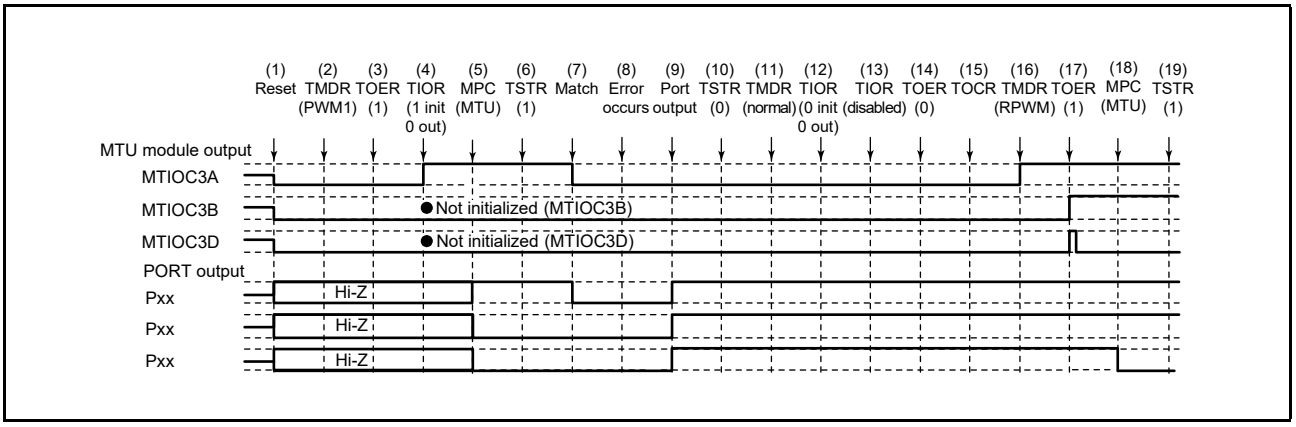

Figure 19.163 Error Occurrence in PWM Mode 1, Recovery in Reset-Synchronized PWM Mode

(1) to (14) are the same as in Figure 19.162.
(15) Select the reset-synchronized PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A.
(16) Set reset-synchronized PWM mode.
(17) Enable output in MTU3 and MTU4 with TOERA.
(18) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
(19) Restart operation by setting TSTRA.

(13) Operation when Error Occurs in PWM Mode 2 and Operation is Restarted in Normal Mode

Figure 19.164 shows a case in which an error occurs in PWM mode 2 and operation is restarted in normal mode after re-setting.

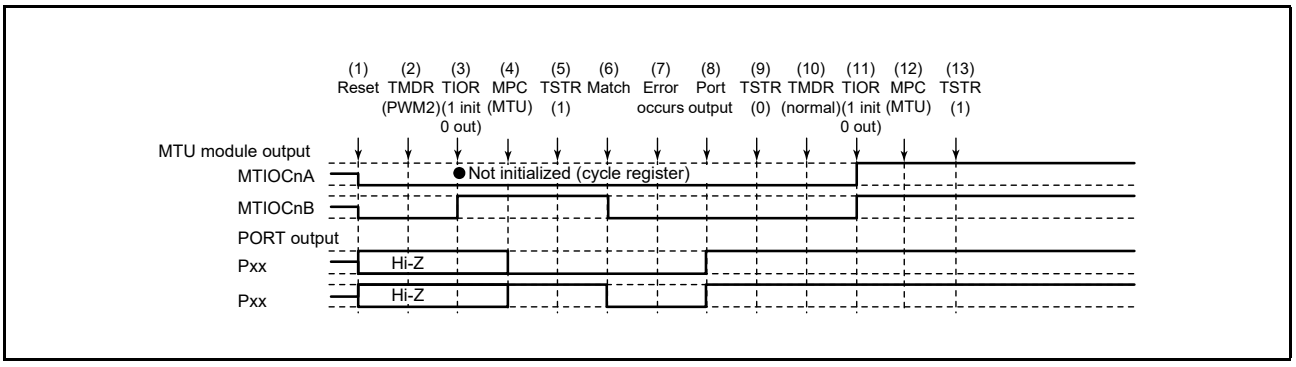

Figure 19.164 Error Occurrence in PWM Mode 2, Recovery in Normal Mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.
(2) Set PWM mode 2.
(3) Initialize the pins with TIOR. (In the example, the initial output is a high level, and a low level is output on compare match occurrence. In PWM mode 2, the cycle register pins are not initialized. In the example, MTIOCnA is the cycle register.)
(4) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
(5) Start count operation by setting TSTRA.
(6) Output goes low on compare match occurrence.
(7) An error occurs.
(8) Allow non-active level output by setting the pins as general output ports using the port direction registers (PDR), port output data registers (PODR), and port mode registers (PMR) of the I/O ports.
(9) Stop count operation by setting TSTRA.
(10) Set normal mode.
(11) Initialize the pins with TIOR.
(12) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
(13) Restart operation by setting TSTRA.

(14) Operation when Error Occurs in PWM Mode 2 and Operation is Restarted in PWM Mode 1

Figure 19.165 shows a case in which an error occurs in PWM mode 2 and operation is restarted in PWM mode 1 after re-setting.

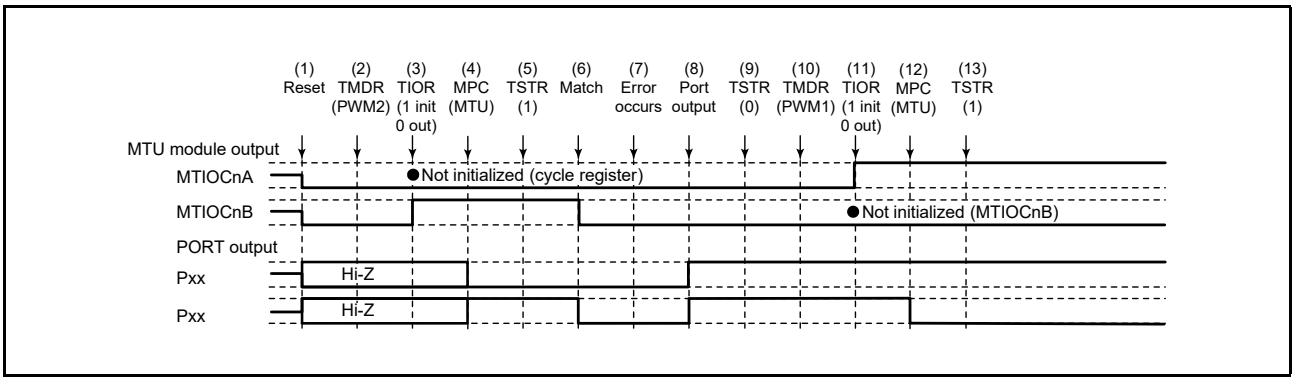

Figure 19.165 Error Occurrence in PWM Mode 2, Recovery in PWM Mode 1

(1) to (9) are the same as in Figure 19.164.
(10) Set PWM mode 1.
(11) Initialize the pins with TIOR. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port direction registers (PDR) and port output data registers (PODR) of the I/O ports.)
(12) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
(13) Restart operation by setting TSTRA.

(15) Operation when Error Occurs in PWM Mode 2 and Operation is Restarted in PWM Mode 2

Figure 19.166 shows a case in which an error occurs in PWM mode 2 and operation is restarted in PWM mode 2 after re-setting.

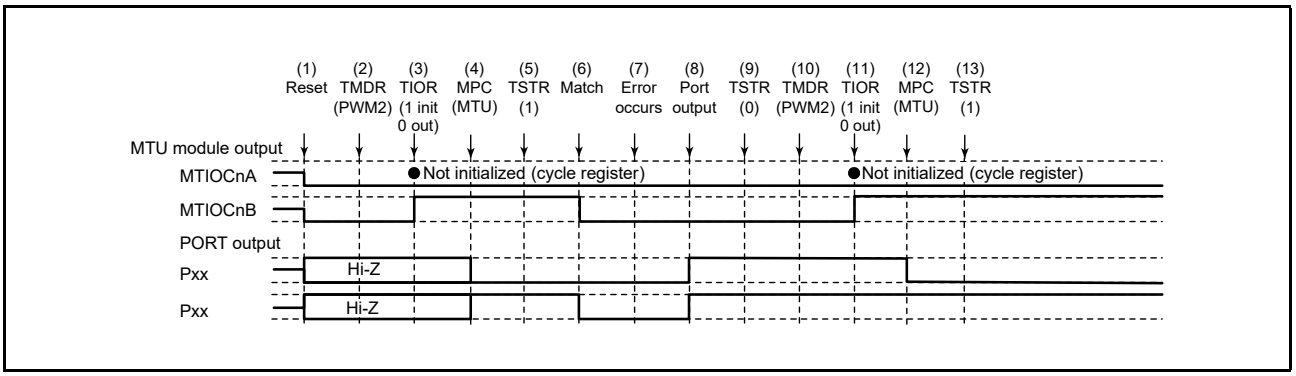

Figure 19.166 Error Occurrence in PWM Mode 2, Recovery in PWM Mode 2

(1) to (9) are the same as in Figure 19.164.
(10) This step is not necessary when restarting in PWM mode 2.
(11) Initialize the pins with TIOR. (In PWM mode 2, waveforms are not output to the cycle register pins. To output a specified level, make necessary settings for general output ports in the port direction registers (PDR) and port output data registers (PODR) of the I/O ports.)
(12) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
(13) Restart operation by setting TSTRA.

(16) Operation when Error Occurs in PWM Mode 2 and Operation is Restarted in Phase Counting Mode

Figure 19.167 shows a case in which an error occurs in PWM mode 2 and operation is restarted in phase counting mode after re-setting.

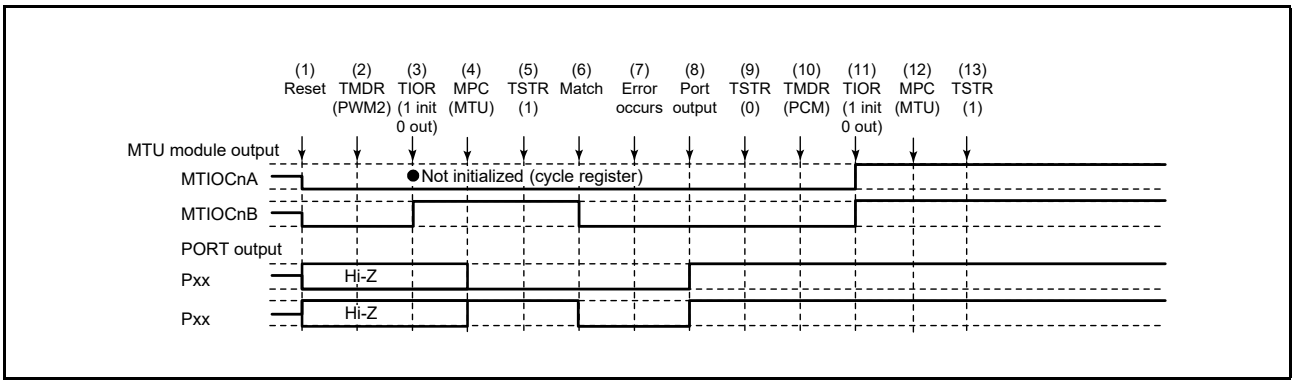

Figure 19.167 Error Occurrence in PWM Mode 2, Recovery in Phase Counting Mode

(1) to (9) are the same as in Figure 19.164.
(10) Set the phase counting mode.
(11) Initialize the pins with TIOR.
(12) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
(13) Restart operation by setting TSTRA.

(17) Operation when Error Occurs in Phase Counting Mode and Operation is Restarted in Normal Mode

Figure 19.168 shows a case in which an error occurs in phase counting mode and operation is restarted in normal mode after re-setting.

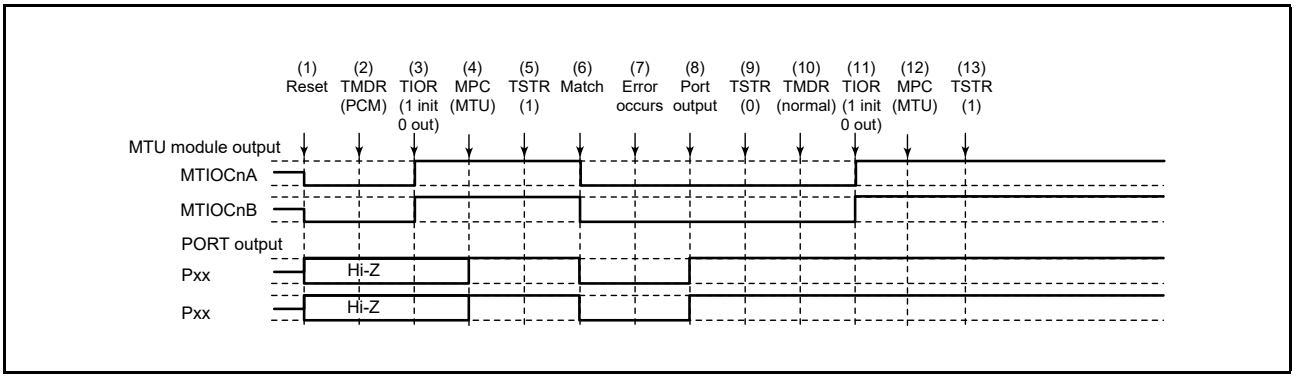

Figure 19.168 Error Occurrence in Phase Counting Mode, Recovery in Normal Mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.
(2) Set phase counting mode.
(3) Initialize the pins with TIOR. (In the example, the initial output is a high level, and a low level is output on compare match occurrence.)
(4) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
(5) Start count operation by setting TSTRA.
(6) Output goes low on compare match occurrence.
(7) An error occurs.
(8) Allow non-active level output by setting the pins as general output ports using the port direction registers (PDR), port output data registers (PODR), and port mode registers (PMR) of the I/O ports.
(9) Stop count operation by setting TSTRA.
(10) Set normal mode.
(11) Initialize the pins with TIOR.
(12) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
(13) Restart operation by setting TSTRA.

(18) Operation when Error Occurs in Phase Counting Mode and Operation is Restarted in PWM Mode 1

Figure 19.169 shows a case in which an error occurs in phase counting mode and operation is restarted in PWM mode 1 after re-setting.

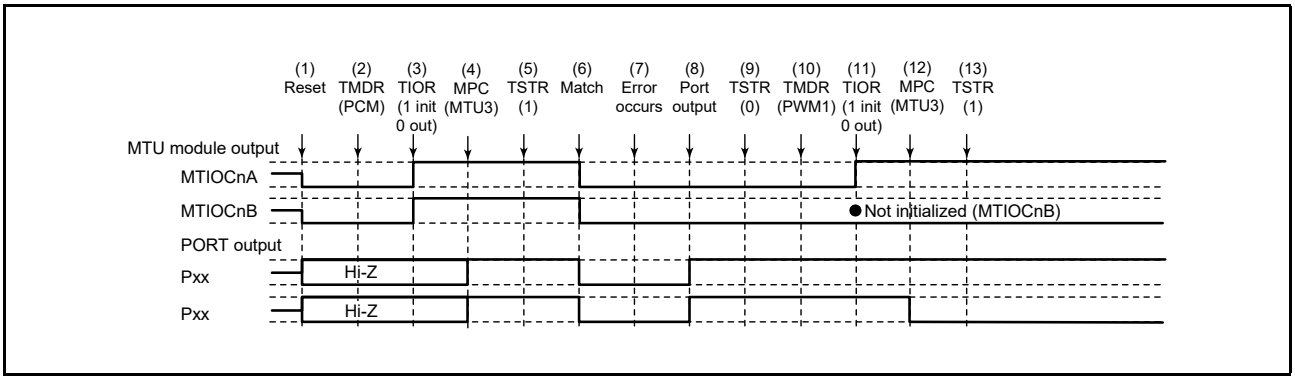

Figure 19.169 Error Occurrence in Phase Counting Mode, Recovery in PWM Mode 1

(1) to (9) are the same as in Figure 19.168.
(10) Set PWM mode 1.
(11) Initialize the pins with TIOR. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port direction registers (PDR) and port output data registers (PODR) of the I/O ports.)
(12) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
(13) Restart operation by setting TSTRA.

(19) Operation when Error Occurs in Phase Counting Mode and Operation is Restarted in PWM Mode 2

Figure 19.170 shows a case in which an error occurs in phase counting mode and operation is restarted in PWM mode 2 after re-setting.

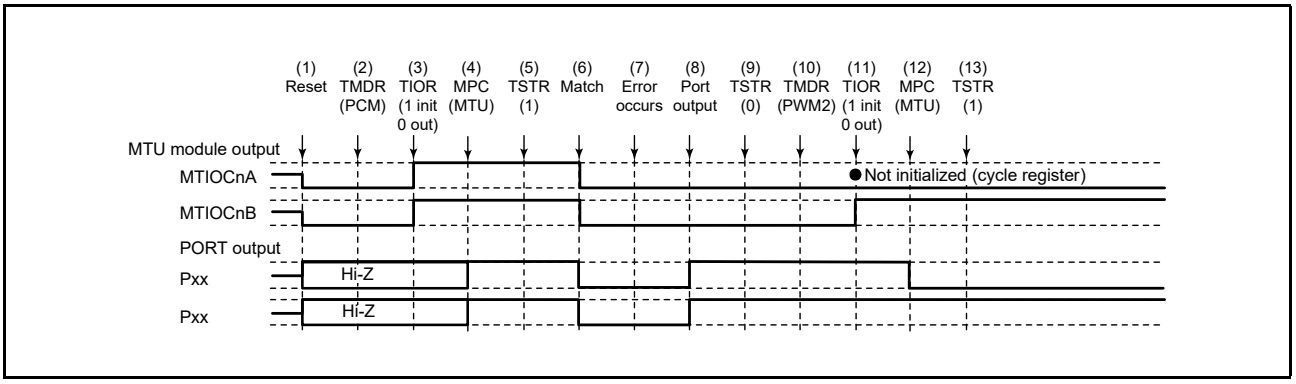

Figure 19.170 Error Occurrence in Phase Counting Mode, Recovery in PWM Mode 2

(1) to (9) are the same as in Figure 19.168.
(10) Set PWM mode 2.
(11) Initialize the pins with TIOR. (In PWM mode 2, waveforms are not output to the cycle register pins. To output a specified level, make necessary settings for general output ports in the port direction registers (PDR) and port output data registers (PODR) of the I/O ports.)
(12) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
(13) Restart operation by setting TSTRA.

(20) Operation when Error Occurs in Phase Counting Mode and Operation is Restarted in Phase Counting Mode

Figure 19.171 shows a case in which an error occurs in phase counting mode and operation is restarted in phase counting mode after re-setting.

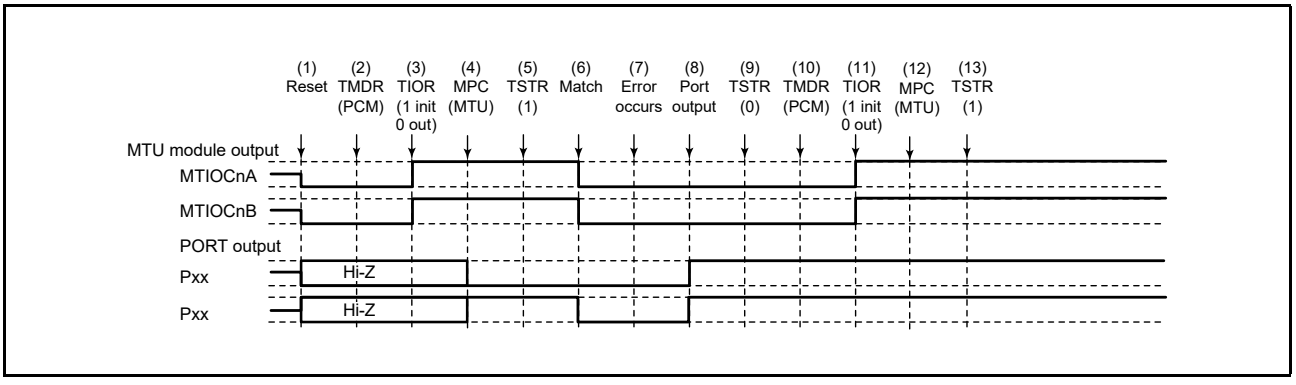

Figure 19.171 Error Occurrence in Phase Counting Mode, Recovery in Phase Counting Mode

(1) to (9) are the same as in Figure 19.168.
(10) This step is not necessary when restarting in phase counting mode.
(11) Initialize the pins with TIOR.
(12) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
(13) Restart operation by setting TSTRA.

(21) Operation when Error Occurs in Complementary PWM Mode and Operation is Restarted in Normal Mode

Figure 19.172 shows a case in which an error occurs in complementary PWM mode and operation is restarted in normal mode after re-setting.

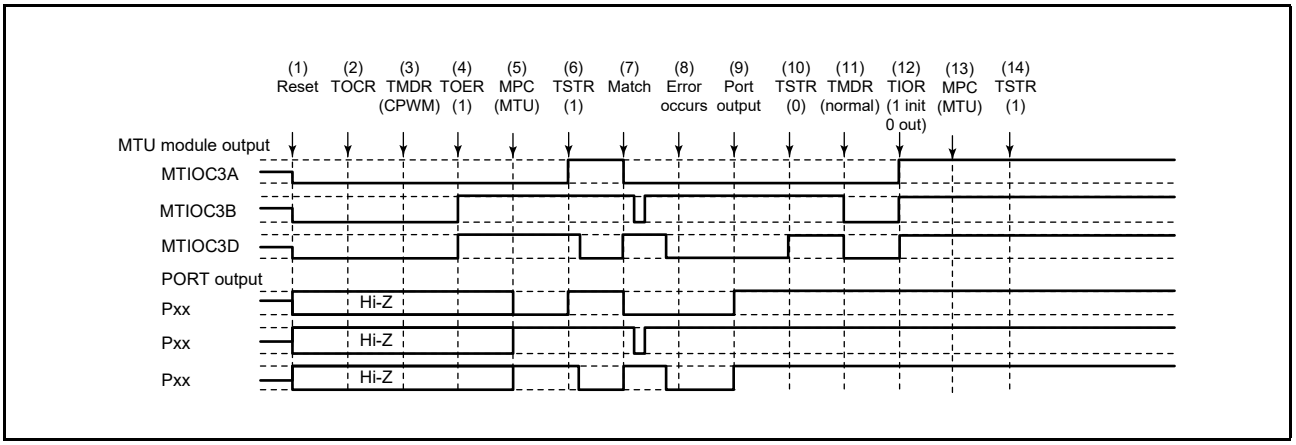

Figure 19.172 Error Occurrence in Complementary PWM Mode, Recovery in Normal Mode

(1) After a reset, the MTU3 output goes low and the ports enter high-impedance state.
(2) Select the complementary PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A.
(3) Set complementary PWM mode.
(4) Enable output in MTU3 and MTU4 with TOERA.
(5) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
(6) Start count operation by setting TSTRA.
(7) The complementary PWM waveform is output on compare match occurrence.
(8) An error occurs.
(9) Allow non-active level output by setting the pins as general output ports using the port direction registers (PDR), port output data registers (PODR), and port mode registers (PMR) of the I/O ports.
(10) Stop count operation by setting TSTRA. (MTU output becomes the initial complementary PWM output value).
(11) Set normal mode (MTU output goes low).
(12) Initialize the pins with TIOR.
(13) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
(14) Restart operation by setting TSTRA.

(22) Operation when Error Occurs in Complementary PWM Mode and Operation is Restarted in PWM Mode 1

Figure 19.173 shows a case in which an error occurs in complementary PWM mode and operation is restarted in PWM mode 1 after re-setting.

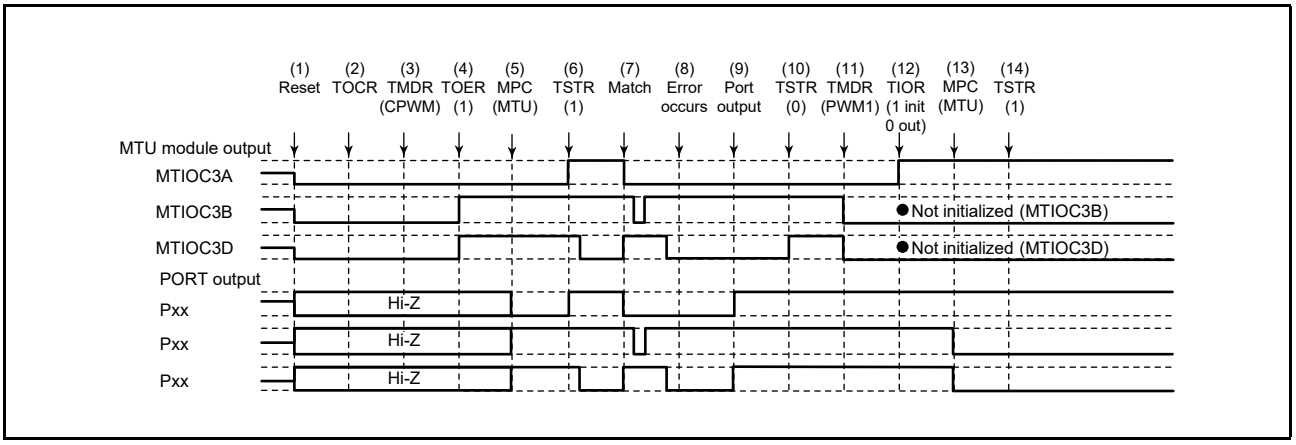

Figure 19.173 Error Occurrence in Complementary PWM Mode, Recovery in PWM Mode 1

(1) to (10) are the same as in Figure 19.172.
(11) Set PWM mode 1 (MTU output goes low).
(12) Initialize the pins with TIOR. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port direction registers (PDR) and port output data registers (PODR) of the I/O ports.)
(13) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
(14) Restart operation by setting TSTRA.

(23) Operation when Error Occurs in Complementary PWM Mode and Operation is Restarted in Complementary PWM Mode

Figure 19.174 shows a case in which an error occurs in complementary PWM mode and operation is restarted in complementary PWM mode after re-setting (when operation is restarted using the cycle and duty settings at the time of stopping the counter).

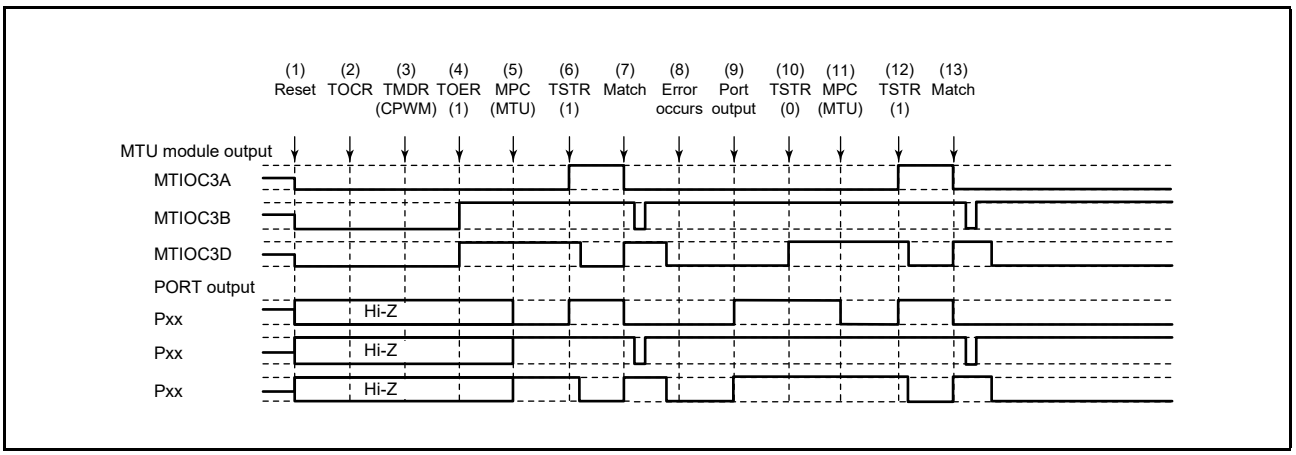

Figure 19.174 Error Occurrence in Complementary PWM Mode, Recovery in Complementary PWM Mode (1)

(1) to (10) are the same as in Figure 19.172.
(11) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
(12) Restart operation by setting TSTRA.
(13) The complementary PWM waveform is output on compare match occurrence.

(24) Operation when Error Occurs in Complementary PWM Mode and Operation is Restarted in Complementary PWM Mode with New Settings

Figure 19.175 shows a case in which an error occurs in complementary PWM mode and operation is restarted in complementary PWM mode after re-setting (operation is restarted using new cycle and duty ratio settings).

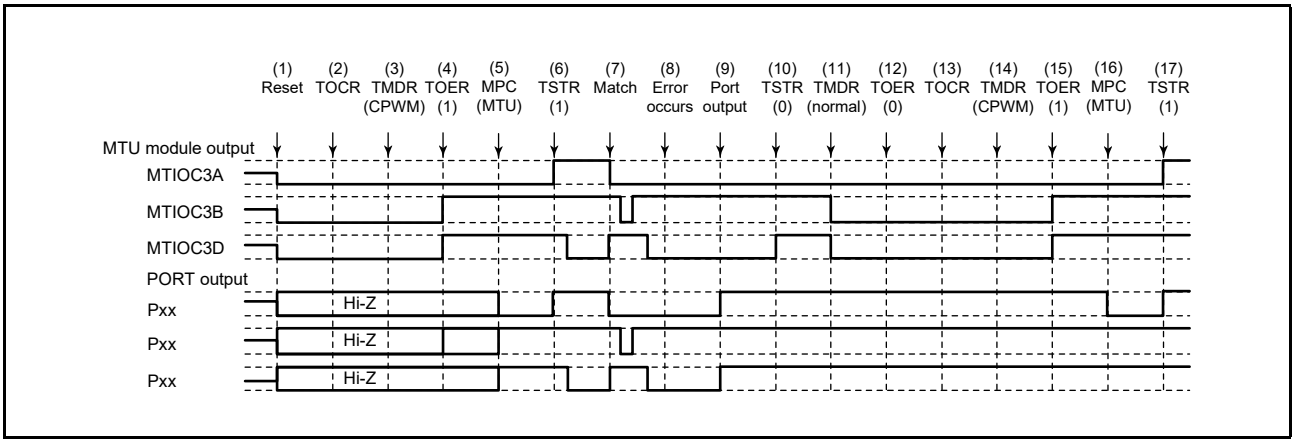

Figure 19.175 Error Occurrence in Complementary PWM Mode, Recovery in Complementary PWM Mode (2)

(1) to (10) are the same as in Figure 19.172.
(11) Set normal mode and make new settings (MTU output goes low).
(12) Disable output in MTU3 and MTU4 with TOERA.
(13) Select the complementary PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A.
(14) Set complementary PWM mode.
(15) Enable output in MTU3 and MTU4 with TOERA.
(16) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
(17) Restart operation by setting TSTRA.

(25) Operation when Error Occurs in Complementary PWM Mode and Operation is Restarted in Reset-Synchronized PWM Mode

Figure 19.176 shows a case in which an error occurs in complementary PWM mode and operation is restarted in reset-synchronized PWM mode after re-setting.

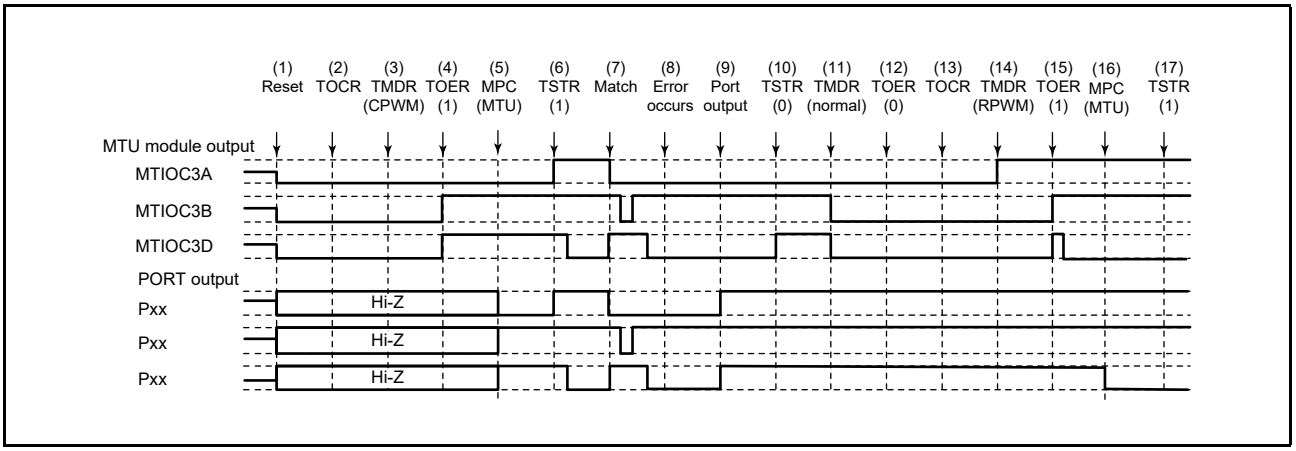

Figure 19.176 Error Occurrence in Complementary PWM Mode, Recovery in Reset-Synchronized PWM Mode

(1) to (10) are the same as in Figure 19.172.
(11) Set normal mode (MTU output goes low).
(12) Disable output in MTU3 and MTU4 with TOERA.
(13) Select the reset-synchronized PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A.
(14) Set reset-synchronized PWM mode.
(15) Enable output in MTU3 and MTU4 with TOERA.
(16) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
(17) Restart operation by setting TSTRA.

(26) Operation when Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in Normal Mode

Figure 19.177 shows a case in which an error occurs in reset-synchronized PWM mode and operation is restarted in normal mode after re-setting.

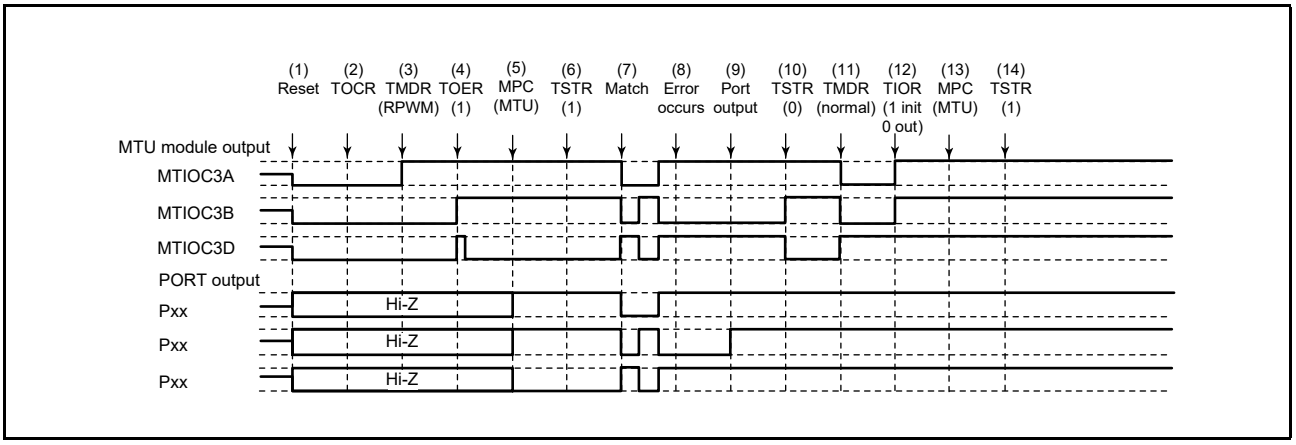

Figure 19.177 Error Occurrence in Reset-Synchronized PWM Mode, Recovery in Normal Mode

(1) After a reset, the MTU output goes low and the ports enter high-impedance state.
(2) Select the reset-synchronized PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A.
(3) Set reset-synchronized PWM mode.
(4) Enable output in MTU3 and MTU4 with TOERA.
(5) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
(6) Start count operation by setting TSTRA.
(7) The reset-synchronized PWM waveform is output on compare match occurrence.
(8) An error occurs.
(9) Allow non-active level output by setting the pins as general output ports using the port direction registers (PDR), port output data registers (PODR), and port mode registers (PMR) of the I/O ports.
(10) Stop count operation by setting TSTRA. (MTU output becomes the initial reset-synchronized PWM output value.)
(11) Set normal mode (positive-phase MTU output goes low, and negative-phase output goes high).
(12) Initialize the pins with TIOR.
(13) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
(14) Restart operation by setting TSTRA.

(27) Operation when Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in PWM Mode 1

Figure 19.178 shows a case in which an error occurs in reset-synchronized PWM mode and operation is restarted in PWM mode 1 after re-setting.

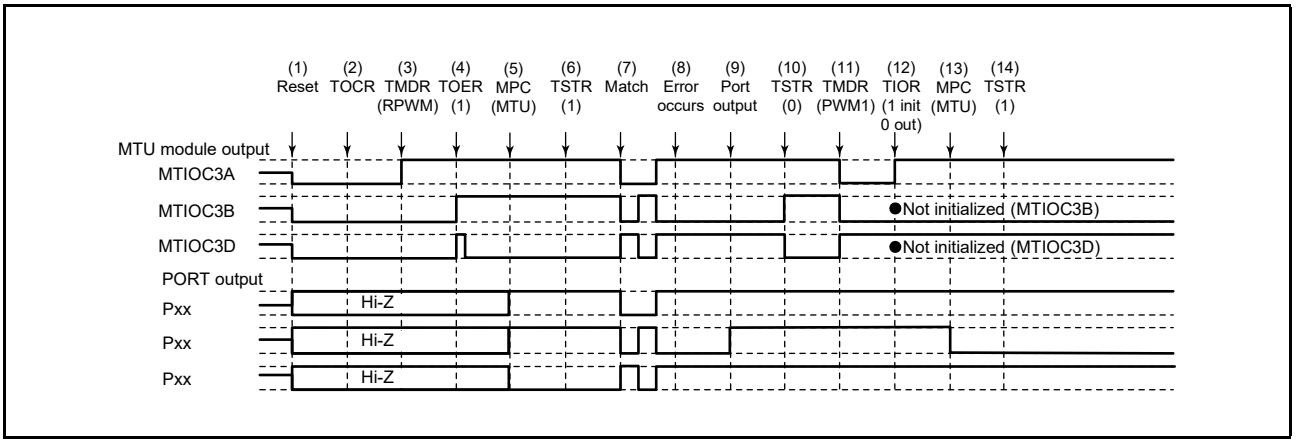

Figure 19.178 Error Occurrence in Reset-Synchronized PWM Mode, Recovery in PWM Mode 1

(1) to (10) are the same as in Figure 19.177.
(11) Set PWM mode 1 (positive-phase MTU output goes low, and negative-phase output goes high).
(12) Initialize the pins with TIOR. (In PWM mode 1, waveforms are not output to the MTIOCnB (MTIOCnD) pins. To output a specified level, make necessary settings for general output ports in the port direction registers (PDR) and port output data registers (PODR) of the I/O ports.)
(13) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
(14) Restart operation by setting TSTRA.

(28) Operation when Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in Complementary PWM Mode

Figure 19.179 shows a case in which an error occurs in reset-synchronized PWM mode and operation is restarted in complementary PWM mode after re-setting.

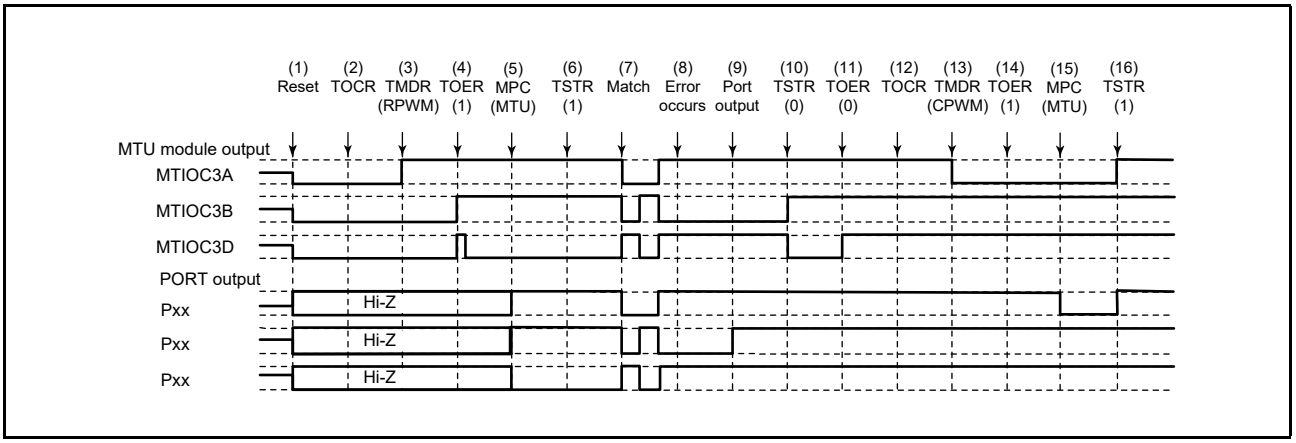

Figure 19.179 Error Occurrence in Reset-Synchronized PWM Mode, Recovery in Complementary PWM Mode

(1) to (10) are the same as in Figure 19.177.
(11) Disable output in MTU3 and MTU4 with TOERA.
(12) Select the complementary PWM output level and enable or disable cyclic output with TOCR1A and TOCR2A.
(13) Set complementary PWM mode (MTU cyclic output pin goes low).
(14) Enable output in MTU3 and MTU4 with TOERA.
(15) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
(16) Restart operation by setting TSTRA.

(29) Operation when Error Occurs in Reset-Synchronized PWM Mode and Operation is Restarted in Reset-Synchronized PWM Mode

Figure 19.180 shows a case in which an error occurs in reset-synchronized PWM mode and operation is restarted in reset-synchronized PWM mode after re-setting.

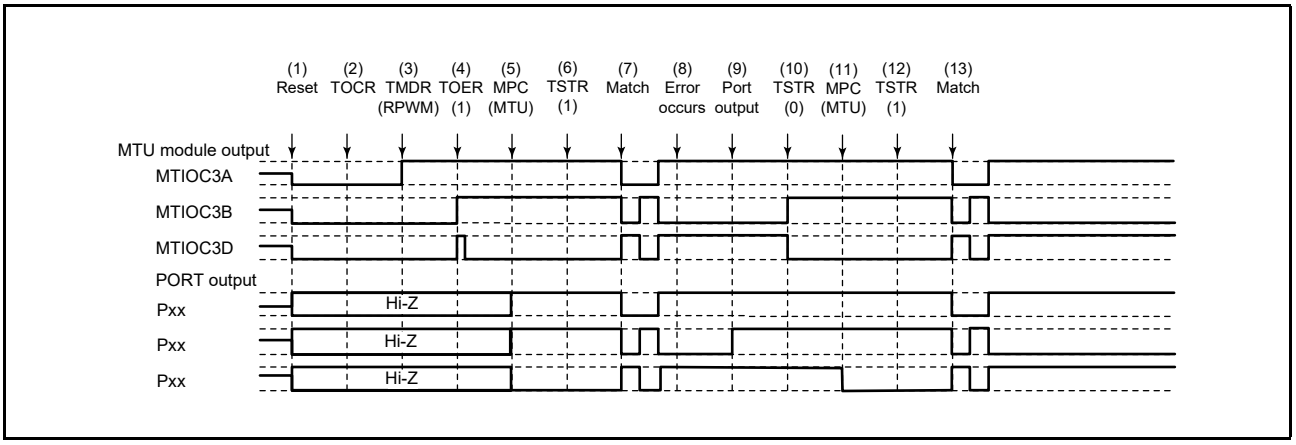

Figure 19.180 Error Occurrence in Reset-Synchronized PWM Mode, Recovery in Reset-Synchronized PWM Mode

(1) to (10) are the same as in Figure 19.177.
(11) Set MTU output using the MPC and port mode registers (PMR) corresponding to the I/O ports.
(12) Restart operation by setting TSTRA.
(13) The reset-synchronized PWM waveform is output on compare match occurrence.

19.8 Operations Linked by the ELC

19.8.1 Event Signal Output to the ELC

The MTU is capable of operation linked with another module set in advance when its interrupt request signal is used as an event signal by the event link controller (ELC).
The MTU outputs the event signal regardless of the setting of the corresponding interrupt request enable bit.

19.8.2 MTU Operations in Response to Receiving Event Signals from the ELC

The MTU can perform the following operations in response to the event set in advance in the ELSRn register of the event link controller (ELC).

(1) Start Counting Operation

Counting by the MTU starts in response to the event when this is selected by the setting of the ELOPA or ELOPB register of the ELC. The ELOPA register handles control for MTU0 and MTU3 and the ELOPB register handles control for MTU4. When the event specified in the ELSRn register occurs, the CSTn bit in the TSTR register (timer start register) shown in Table 19.82 is set to 1, and the MTU counter starts.
However, when the specified event is generated while the CSTn bit in the TSTR register (timer start register) has already been set to 1, the event has no effect. Table 19.82 lists the TSTR register bits used for each channel.

Table 19.82 Operation of the TSTR register (timer start register) in response to the ELC

Channel No.	TSTR register (timer start register)
MTU0	TSTRA.CST0 bit
MTU3	TSTRA.CST3 bit
MTU4	TSTRA.CST4 bit

(2) Input Capture Operation

Input capture by the MTU proceeds when this is selected by the setting of the ELOPA or ELOPB register of the ELC. The ELOPA register handles control for MTU0 and MTU3 and the ELOPB register handles control for MTU4. When the event specified in the ELSRn register occurs, the TGR register (timer general register) captures the value of the TCNT register (timer counter register). When using input capture in response to an event, the corresponding bit of the TIOR register (timer I/O control register) in the MTU should be set for input capture and the CSTn bit of TSTR register (timer start register) should be set to 1 to start counting by the counter.
In this case, the TIOCnA pin (input capture pin) input has no effect.
Table 19.83 lists the timer general register and timer I/O control register used for each channel in input capture operations in response to the ELC.

Table 19.83 Timer General Register and Timer I/O Control Register Used in the Input Capture Operation

Channel No.	Timer General Register Name	Timer I/O Control Register Bit Name
MTU0	MTU0.TGRA	MTU0.TIORH.IOA[3:0] bits
MTU3	MTU3.TGRA	MTU3.TIORH.IOA[3:0] bits
MTU4	MTU4.TGRA	MTU4.TIORH.IOA[3:0] bits

(3) Clear Counting Operation

MTU counters are cleared by using the ELOPA and ELOPB registers of the ELC. The ELOPA register handles control for MTU0 and MTU3 and the ELOPB register handles control for MTU4. At this time, when the event specified in the ELSRn register occurs, the TCNT register (timer counter register) is returned to its initial value. If the corresponding CSTn bit in the TSTR register (timer start register) is set to 1, counting will continue, in other words, counting restarts. For the CSTn bits in the TSTR register (timer start register), see Table 19.83.

19.8.3 Usage Notes on MTU Operation by Event Signal Reception from ELC

The following notes on usage apply when the MTU is used in event link operation.

(1) Start Counting

If the event specified in the ELSRn register occurs during a cycle of writing to a CSTn bit in the TSTRA/TSTRB register, writing to the CSTn bit in the TSTRA/TSTRB register does not proceed because setting of the bit to 1 due to the event takes priority.

(2) Restart [Clear] Counting

If the event specified in the ELSRn register occurs during a cycle of writing to the TCNT counter, writing to the TCNT counter does not proceed because initialization of the counter's value due to the event takes priority.
In addition, for MTU3 and MTU4 in complementary PWM mode, disable the counter clearing by the ELC.

20. Port Output Enable 3 (POE3)

The port output enable 3 (POE3) register can be used to place output pins for the MTU3a and output pins for the GPT in the high-impedance state under various conditions.

20.1 Overview

Table 20.1 lists the specifications of the POE3, and Figure 20.1 shows a block diagram of the POE3.

Table 20.1 POE3 Specifications

Item	Description
Target pins to be placed in the high-impedance state	• MTU3a output pins MTU0 pin (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D) MTU3 pin (MTIOC3B, MTIOC3D) MTU4 pin (MTIOC4A, MTIOC4B, MTIOC4C, MTIOC4D) MTU6 pin (MTIOC6B, MTIOC6D) MTU7 pin (MTIOC7A, MTIOC7B, MTIOC7C, MTIOC7D) • GPT output pins GPT0 pin (GTIOC0A, GTIOC0B) GPT1 pin (GTIOC1A, GTIOC1B) GPT2 pin (GTIOC2A, GTIOC2B) GPT3 pin (GTIOC3A, GTIOC3B)
Conditions for the high-impedance state	• Setting pins as inputs: setting the POE0#, POE4#, POE8#, or POE10# pins as inputs (falling edge or low-level sampling). • Short-circuits between output pins: A match (short circuit) between the output signal levels at the active level over one or more cycle on (the following combination of pins)

	MTU complementary PWM output pins
1	MTIOC3B and MTIOC3D
2	MTIOC4A and MTIOC4C
3	MTIOC4B and MTIOC4D
4	MTIOC6B and MTIOC6D
5	MTIOC7A and MTIOC7C
6	MTIOC7B and MTIOC7D

	GPT output pins
1	GTIOC0A and GTIOC0B
2	GTIOC1A and GTIOC1B
3	GTIOC2A and GTIOC2B

	• SPOER register setting being made • Detection that the clock generation circuit had stopped oscillating or the oscillation is abnormal (CLMA0/1)
Function	• Each of the POE0#, POE4#, POE8#, and POE10# input pins can be set for falling edge, PCLKD/4 × 16, PCLKD/16 × 16, or PCLKD/128 × 16 low-level sampling. • Pins for the MTU complementary PWM output, and MTU0 and GPT0 to GPT3 output pins can be placed in high-impedance state by POE0#, POE4#, POE8#, and POE10# pin falling-edge or low-level sampling. • Pins for the MTU complementary PWM output, and MTU0 and GPT0 to GPT3 output pins can be placed in high-impedance state when oscillation stoppage of the clock generation circuit or oscillation abnormality (CLMA0/1) has been detected. • Pins for the MTU complementary PWM output and GPT0 to GPT2 output pins can be placed in high-impedance state when output levels of the MTU complementary PWM output pins are compared and simultaneous active-level output continues for one cycle or more. • Pins for the MTU complementary PWM output, MTU0, and GPT0 to GPT3 output can be placed in the high-impedance state by modifying the settings of the SPOER register of POE3. • Interrupts can be generated by input-level sampling or output level comparison results.

The POE3 has input level detection circuits, pin selection circuits, output level comparison circuits, and a high-impedance request/interrupt request generating circuit as shown in Figure 20.1.

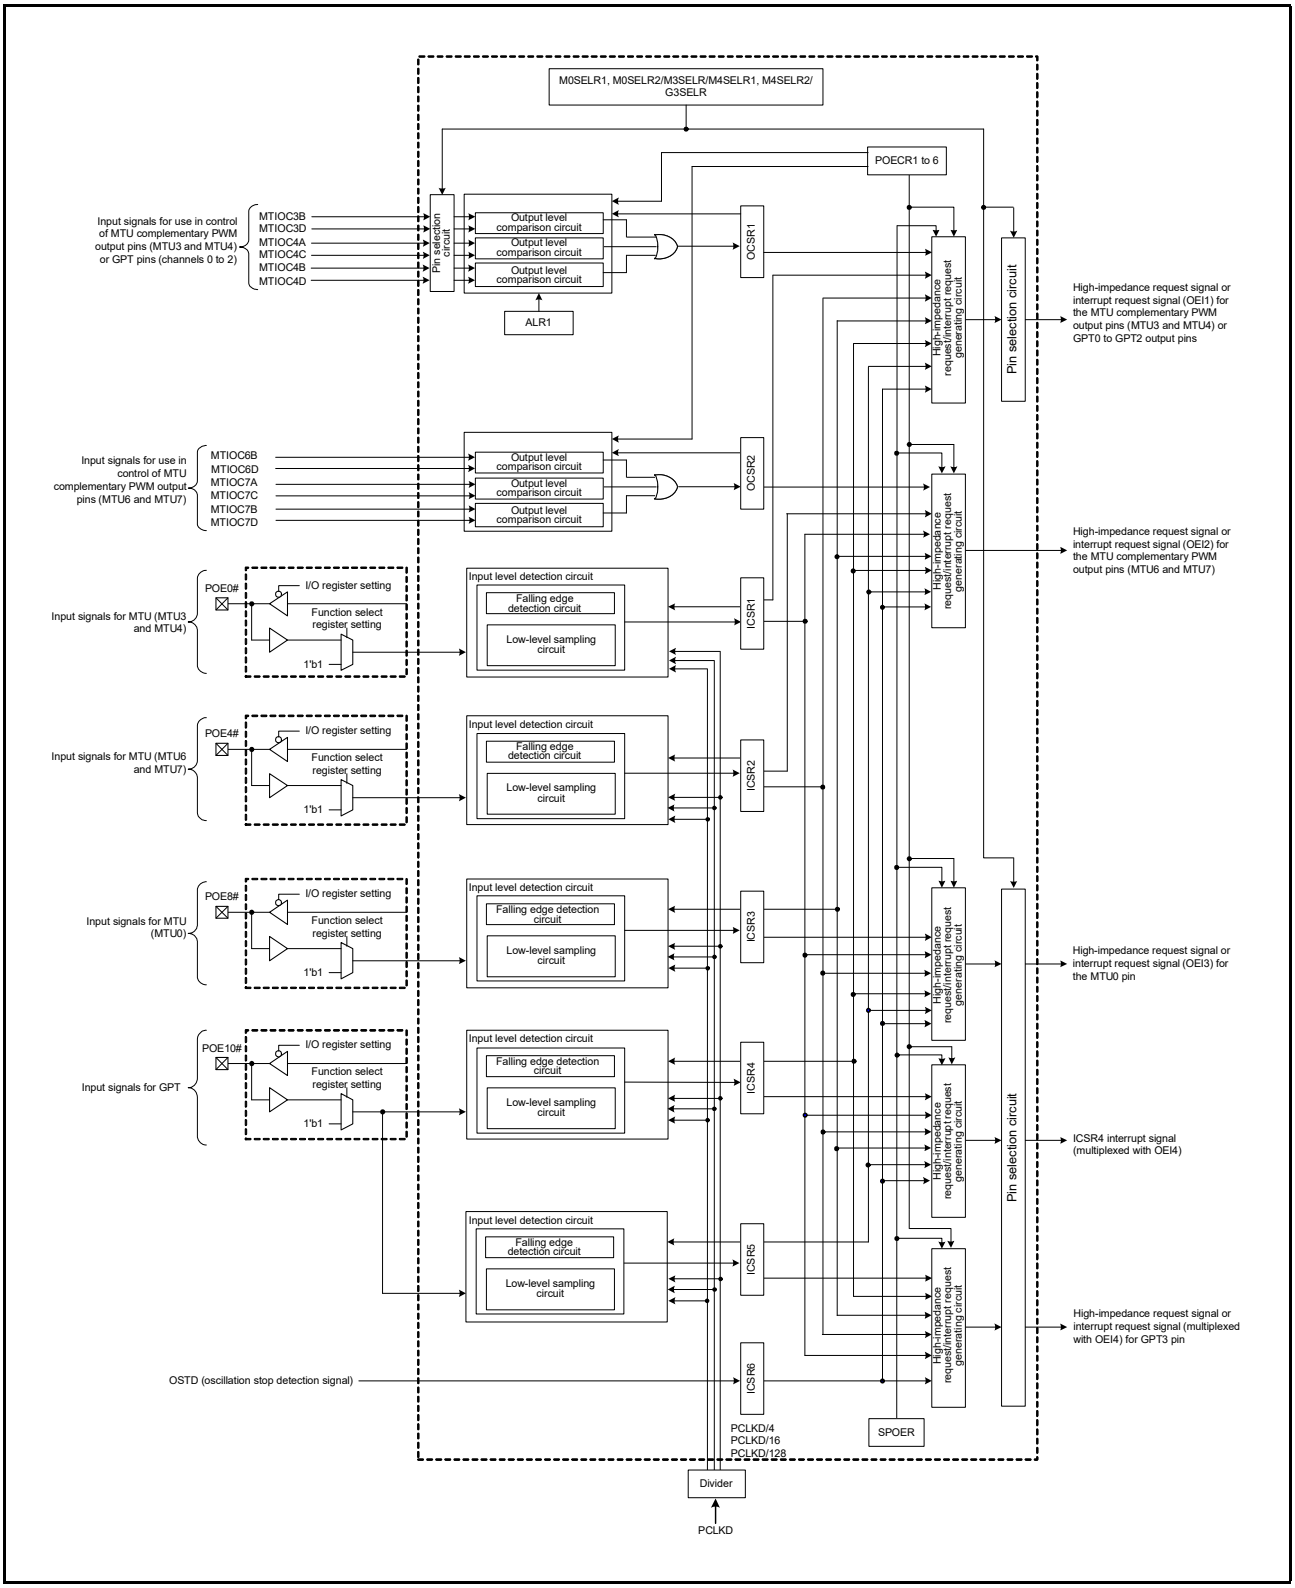

Figure 20.1 POE3 Block Diagram

Table 20.2 shows input/output pins to be used by the POE3.

Table 20.2 POE3 Input/Output Pins

Pin Name	I/O	Description
POE0#	Input	Input pin for the request signal to place the MTU3 and MTU4 pins for MTU complementary PWM output in high-impedance state. In accord with register settings, this pin is also capable of placing the MTU0, MTU6, MTU7, and GPT0 to GPT3 pins in the high-impedance state.
POE4#	Input	Input pin for the request signal to place the MTU6 and MTU7 pins for MTU complementary PWM output in high-impedance state. In accord with register settings, this pin is also capable of placing the MTU0, MTU3, MTU4, and GPT0 to GPT3 pins in the high-impedance state.
POE8#	Input	Input pin for the request signal to place the pins for MTU0 in high-impedance state. In accord with register settings, this pin is also capable of placing the MTU3 and MTU4 pins or MTU6 and MTU7 pins for MTU complementary PWM output, and GPT0 to GPT3 pins in high-impedance state.
POE10#	Input	Input pin for the request signal to place the GPT3 pins in high-impedance state. In accord with register settings, this pin is also capable of placing the MTU3 and MTU4 pins or MTU6 and MTU7 pins for MTU complementary PWM output, MTU0 pins, and GPT0 to GTP2 pins in high-impedance state.

Table 20.3 shows output level comparisons with pin combinations.

Table 20.3 Pin Combinations

Pin Combination	I/O	Description
MTIOC3B and MTIOC3D	Output	The MTU3 and MTU4 pins for MTU complementary PWM output set in the M3SELR, M4SELR1, and M4SELR2 registers are placed in high-impedance state when both pins of a pair simultaneously output the active level*1 for one or more cycles of the peripheral clock (PCLKD). Pin combinations for output comparison and high-impedance control can be selected by registers of POE3. Note: Whether the pins selected in the M3SELR, M4SELR1, and M4SELR2 registers are MTU3a pins or GPT pins is set on the MPC. Note 1. The low level is output when the OLSP bit in TOCR1A of MTUn is 0 with the TOCS bit in TOCR1A of MTUn cleared to 0, or the high level is output when the OLSP bit is 1. Otherwise, the low level is output when the OLS3N, OLS3P, OLS2N, OLS2P, OLS1N, and OLS1P bits in TOCR2A of MTUn are 0 with the TOCS bit in TOCR1A of MTUn set to 1, or the high level is output when these bits are 1.
MTIOC4A and MTIOC4C	Output	
MTIOC4B and MTIOC4D	Output	
MTIOC6B and MTIOC6D	Output	The MTU6 and MTU7 pins for MTU complementary PWM output are placed in high-impedance state when both pins of a pair simultaneously output the active level*1 for one or more cycles of the peripheral clock (PCLKD). Pin combinations for output comparison and high-impedance control can be selected by registers of POE3. Note 1. The low level is output when the OLSP bit in TOCR1B of MTUn is 0 with the TOCS bit in TOCR1B of MTUn cleared to 0, or the high level is output when the OLSP bit is 1. Otherwise, the low level is output when the OLS3N, OLS3P, OLS2N, OLS2P, OLS1N, and OLS1P bits in TOCR2B of MTUn are 0 with the TOCS bit in TOCR1B of MTUn set to 1, or the high level is output when these bits are 1.
MTIOC7A and MTIOC7C	Output	
MTIOC7B and MTIOC7D	Output	
GTIOC0A and GTIOC0B	Output	The GPT0 to GPT2 pins for the GPT output set in the M3SELR, M4SELR1, and M4SELR2 registers are placed in high-impedance state when all pins of a pair simultaneously output the active level (low level when the OLSG2B, OLSG2A, OLSG1B, OLSG1A, OLSG0B, and OLSG0A bits in ALR1 are 0 or high level when those bits are 1) for one or more cycles of the peripheral clock (PCLKD). Pin combinations for output comparison and high-impedance control can be selected by registers of POE3. Note: Whether the pins selected in the M3SELR, M4SELR1, and M4SELR2 registers are MTU3a pins or GPT pins is set on the MPC.
GTIOC1A and GTIOC1B	Output	
GTIOC2A and GTIOC2B	Output	

20.2 Register Descriptions

The POE3 registers are initialized by a reset.

20.2.1 Input Level Control/Status Register 1 (ICSR1)

ICSR1 selects the input modes for the POE0# pin, controls the enable/disable of interrupts, and indicates status.

Address(es): A008 0800h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	POE0F	—	—	—	PIE1	—	—	—	—	—	—	POE0M[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b1, b0	POE0M[1:0]	POE0 Mode Select	b1 b0 0 0: Accepts a request on the falling edge of POE0# input. 0 1: Accepts a request when POE0# input has been sampled 16 times at PCLKD/4 clock pulses and all are low level. 1 0: Accepts a request when POE0# input has been sampled 16 times at PCLKD/16 clock pulses and all are low level. 1 1: Accepts a request when POE0# input has been sampled 16 times at PCLKD/128 clock pulses and all are low level.	R/W*1
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	PIE1	Port Interrupt Enable 1	0: Interrupt requests disabled 1: Interrupt requests enabled	R/W
b11 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b12	POE0F	POE0 Flag	0: Indicates that a high-impedance request has not been input to the POE0# pin. 1: Indicates that a high-impedance request has been input to the POE0# pin.	R/(W)*2
b15 to b13	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.
Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

POE0M[1:0] Bits (POE0 Mode Select)

These bits select the input mode of the POE0# pin.

PIE1 Bit (Port Interrupt Enable 1)

This bit enables or disables interrupt requests when any one of the POE0F bit of the ICSR1 is set to 1.

POE0F Flag (POE0 Flag)

This flag indicates that a high-impedance request has been input to the POE0# pin.

[Setting condition]

- When the input set by POE0M[1:0] occurs at the POE0# pin

[Clearing condition]

- By writing 0 to POE0F after reading POE0F = 1

20.2.2 Input Level Control/Status Register 2 (ICSR2)

ICSR2 selects the input mode for the POE4# pin, controls the enable/disable of interrupts, and indicates status.

Address(es): A008 0804h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	POE4F	—	—	—	PIE2	—	—	—	—	—	—	POE4M[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b1, b0	POE4M[1:0]	POE4 Mode Select	b1 b0 0 0: Accepts a request on the falling edge of POE4# input 0 1: Accepts a request when POE4# input has been sampled 16 times at PCLKD/4 clock pulses and all are low level. 1 0: Accepts a request when POE4# input has been sampled 16 times at PCLKD/16 clock pulses and all are low level. 1 1: Accepts a request when POE4# input has been sampled 16 times at PCLKD/128 clock pulses and all are low level.	R/W*1
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	PIE2	Port Interrupt Enable 2	0: Interrupt requests disabled 1: Interrupt requests enabled	R/W
b11 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b12	POE4F	POE4 Flag	0: Indicates that a high-impedance request has not been input to the POE4# pin. 1: Indicates that a high-impedance request has been input to the POE4# pin.	R/(W) *2
b15 to b13	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.
Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

POE4M[1:0] Bits (POE4 Mode Select)

These bits select the input mode of the POE4# pin.

PIE2 Bit (Port Interrupt Enable 2)

This bit enables or disables interrupt requests when the POE4F flag in ICSR2 is set to 1.

POE4F Flag (POE4 Flag)

This flag indicates that a high-impedance request has been input to the POE4# pin.
[Setting condition]

- When the input set by POE4M[1:0] occurs at the POE4# pin

[Clearing condition]

- By writing 0 to POE4F after reading POE4F = 1

20.2.3 Input Level Control/Status Register 3 (ICSR3)

ICSR3 selects the input mode for the POE8# pin, controls the enable/disable of interrupts, and indicates status.

Address(es): A008 0808h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	POE8F	—	—	POE8E	PIE3	—	—	—	—	—	—	POE8M[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b1, b0	POE8M[1:0]	POE8 Mode Select	b1 b0 0 0: Accepts a request on the falling edge of POE8# input 0 1: Accepts a request when POE8# input has been sampled 16 times at PCLKD/4 clock pulses and all are low level. 1 0: Accepts a request when POE8# input has been sampled 16 times at PCLKD/16 clock pulses and all are low level. 1 1: Accepts a request when POE8# input has been sampled 16 times at PCLKD/128 clock pulses and all are low level.	R/W*1
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	PIE3	Port Interrupt Enable 3	0: Interrupt requests disabled 1: Interrupt requests enabled	R/W
b9	POE8E	POE8 High-Impedance Enable	0: Does not place the pin in high-impedance state. 1: Places the pin in high-impedance state.	R/W*1
b11, b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b12	POE8F	POE8 Flag	0: Indicates that a high-impedance request has not been input to the POE8# pin. 1: Indicates that a high-impedance request has been input to the POE8# pin.	R/(W)*2
b15 to b13	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.
Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

POE8M[1:0] Bits (POE8 Mode Select)

These bits select the input mode of the POE8# pin.

PIE3 Bit (Port Interrupt Enable 3)

This bit enables or disables interrupt requests when the POE8F bit in ICSR3 is set to 1.

POE8E Bit (POE8 High-Impedance Enable)

This bit specifies whether to place the corresponding pin in high-impedance state when the POE8F bit is set to 1.

POE8F Flag (POE8 Flag)

This flag indicates that a high-impedance request has been input to the POE8# pin.

[Setting condition]

- When the input set by POE8M[1:0] occurs at the POE8# pin

[Clearing condition]

- By writing 0 to POE8F after reading POE8F = 1

20.2.4 Input Level Control/Status Register 4 (ICSR4)

ICSR4 selects the POE10# pin input mode, controls the enable/disable of interrupts, and indicates status.

Address(es): A008 0816h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	POE10F	—	—	POE10E	PIE4	—	—	—	—	—	—	POE10M[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b1, b0	POE10M[1:0]	POE10 Mode Select	b1 b0 0 0: Accepts a request on the falling edge of POE10# input 0 1: Accepts a request when POE10# input has been sampled 16 times at PCLKD/4 clock pulses and all are low level. 1 0: Accepts a request when POE10# input has been sampled 16 times at PCLKD/16 clock pulses and all are low level. 1 1: Accepts a request when POE10# input has been sampled 16 times at PCLKD/128 clock pulses and all are low level.	R/W*1
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	PIE4	Port Interrupt Enable 4	0: Interrupt requests disabled 1: Interrupt requests enabled	R/W
b9	POE10E	POE10 High-Impedance Enable	0: Does not place the pin in high-impedance state. 1: Places the pin in high-impedance state.	R/W*1
b11, b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b12	POE10F	POE10 Flag	0: Indicates that a high-impedance request has not been input to the POE10# pin. 1: Indicates that a high-impedance request has been input to the POE10# pin.	R/(W)*2
b15 to b13	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.
Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

POE10M[1:0] Bits (POE10 Mode Select)

These bits select the input mode of the POE10# pin.

PIE4 Bit (Port Interrupt Enable 4)

This bit enables or disables interrupt requests when the POE10F bit is set to 1.

POE10E Bit (POE10 High-Impedance Enable)

This bit specifies whether to place the corresponding pin in high-impedance state when the POE10F bit is set to 1.

POE10F Bit (POE10 Flag)

This flag indicates that a request for the high-impedance state has been input to the POE10# pin.
[Setting condition]

- When the input set by POE10M[1:0] occurs at the POE10# pin

[Clearing condition]

- By writing 0 to POE10F after reading POE10F = 1

20.2.5 Input Level Control/Status Register 5 (ICSR5)

ICSR5 selects the POE10# pin input mode, controls the enable/disable of interrupts, and indicates status.

Address(es): A008 0818h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	POE10F	—	—	POE10E	PIE5	—	—	—	—	—	—	POE10M[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Note: For the ICSR5 register, set the values same as those in the ICSR4 register.

Bit	Symbol	Bit Name	Description	R/W
b1, b0	POE10M[1:0]	POE10 Mode Select	b1 b0 0 0: Accepts a request on the falling edge of POE10# input 0 1: Accepts a request when POE10# input has been sampled 16 times at PCLKD/4 clock pulses and all are low level. 1 0: Accepts a request when POE10# input has been sampled 16 times at PCLKD/16 clock pulses and all are low level. 1 1: Accepts a request when POE10# input has been sampled 16 times at PCLKD/128 clock pulses and all are low level.	R/W*1
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	PIE5	Port Interrupt Enable 5	0: Interrupt requests disabled 1: Interrupt requests enabled	R/W
b9	POE10E	POE10 High-Impedance Enable	0: Does not place the pin in high-impedance state. 1: Places the pin in high-impedance state.	R/W*1
b11, b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b12	POE10F	POE10 Flag	0: Indicates that a high-impedance request has not been input to the POE10# pin. 1: Indicates that a high-impedance request has been input to the POE10# pin.	R/(W)*2
b15 to b13	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.
Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

POE10M[1:0] Bits (POE10 Mode Select)

These bits select the input mode of the POE10# pin.

PIE5 Bit (Port Interrupt Enable 5)

This bit enables or disables interrupt requests when the POE10F bit is set to 1.

POE10E Bit (POE10 High-Impedance Enable)

This bit specifies whether to place the corresponding pin in high-impedance state when the POE10F bit is set to 1.
The interrupt output is multiplexed with OEI4.

POE10F Flag (POE10 Flag)

This flag indicates that a request for the high-impedance state has been input to the POE10# pin.
[Setting condition]

- When the input set by POE10M[1:0] occurs at the POE10# pin

[Clearing condition]

- By writing 0 to POE10F after reading POE10F = 1

20.2.6 Input Level Control/Status Register 6 (ICSR6)

ICSR6 controls the high-impedance for stopped oscillation or oscillation abnormality (CLMA0/1), and indicates status.

Address(es): A008 081Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	OSTSTF	—	—	OSTSTE	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b8 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b9	OSTSTE	OSTST High-Impedance Enable	0: Does not place the MTU complementary PWM output pins, MTU0 pins, or GPT pins in high-impedance state. 1: Places the MTU complementary PWM output pins, MTU0 pins, and GPT pins in high-impedance state.	R/W*1
b11, b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b12	OSTSTF	OSTST High-Impedance Flag	0: Indicates that a high-impedance request due to stopped oscillation or oscillation abnormality (CLMA0/1) has not been generated. 1: Indicates that a high-impedance request due to stopped oscillation or oscillation abnormality (CLMA0/1) has been generated.	R/W*2
b15 to b13	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.
Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

OSTSTE Bit (OSTST High-Impedance Enable)

This bit enables/disables the MTU complementary PWM output pins, MTU0 pins, and GPT0 to GPT3 pins to be placed in the high-impedance state when stopped oscillation or oscillation abnormality of the PLL (CLMA0/1) is detected.

OSTSTF Flag (OSTST High-Impedance Enable Flag)

This flag indicates that a stopped oscillation high-impedance request has been generated.
When stopped oscillation is detected, this flag is set to 1. When clearing this flag, write 0 while the detection signal for stopped oscillation or oscillation abnormality of the PLL is negated. Writing 0 to this flag while the detection signal for stopped oscillation or oscillation abnormality is asserted does not clear this flag to 0. After clearing this flag, confirm that the flag has actually been modified to 0.
[Setting condition]

- When stopped oscillation is detected

[Clearing condition]

- By writing 0 to OSTSTF after reading OSTSTF = 1

20.2.7 Output Level Control/Status Register 1 (OCSR1)

OCSR1 controls the enable/disable of output level comparison and interrupts, and indicates status.

Address(es): A008 0802h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	OSF1	—	—	—	—	—	OCE1	OIE1	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	OIE1	Output Short Interrupt Enable 1	0: Interrupt requests disabled 1: Interrupt requests enabled	R/W
b9	OCE1	Output Short High-Impedance Enable 1	0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.	R/W*1
b14 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b15	OSF1	Output Short Flag 1	0: Indicates that outputs have not simultaneously become an active level. 1: Indicates that outputs have simultaneously become an active level.	R/(W)*2

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.
Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

OIE1 Bit (Output Short Interrupt Enable 1)

This bit enables or disables interrupt requests when the OSF1 bit in OCSR1 is set to 1.

OCE1 Bit (Output Short High-Impedance Enable 1)

This bit specifies whether to place the pins in high-impedance state when the OSF1 bit in OCSR1 is set to 1.

OSF1 Flag (Output Short Flag 1)

This flag indicates that any one of the three pairs of two-phase MTU3 and MTU4 pins for MTU complementary PWM output or GPT0 to GPT2 pins for the GPT output to be compared has simultaneously become an active level.

[Setting condition]

- When any one of the three pairs of two-phase outputs has simultaneously become an active level

[Clearing condition]

- By writing 0 to OSF1 after reading OSF1 = 1

20.2.8 Output Level Control/Status Register 2 (OCSR2)

OCSR2 controls the enable/disable of output level comparison and interrupts, and indicates status.

Address(es): A008 0806h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	OSF2	—	—	—	—	—	OCE2	OIE2	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	OIE2	Output Short Interrupt Enable 2	0: Interrupt requests disabled 1: Interrupt requests enabled	R/W
b9	OCE2	Output Short High-Impedance Enable 2	0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.	R/W*1
b14 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b15	OSF2	Output Short Flag 2	0: Indicates that outputs have not simultaneously become an active level. 1: Indicates that outputs have simultaneously become an active level.	R/(W) *2

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.
Note 2. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

OIE2 Bit (Output Short Interrupt Enable 2)

This bit enables or disables interrupt requests when the OSF2 bit in OCSR2 is set to 1.

OCE2 Bit (Output Short High-Impedance Enable 2)

This bit specifies whether to place the pins in high-impedance state when the OSF2 bit in OCSR2 is set to 1.

OSF2 Flag (Output Short Flag 2)

This flag indicates that any one of the three pairs of two-phase MTU6 and MTU7 pins for MTU complementary PWM output to be compared has simultaneously become an active level.

[Setting condition]

- When any one of the three pairs of two-phase outputs has simultaneously become an active level

[Clearing condition]

- By writing 0 to OSF2 after reading OSF2 = 1

20.2.9 Active Level Setting Register 1 (ALR1)

ALR1 specifies the active levels of the MTU and GPT outputs selected by the MPC (multi-function pin controller), as the active levels for detection of short circuits of those outputs as reflected in OCSR1.)

Address(es): A008 081Ah

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	OLSEN	—	OLSG2B	OLSG2A	OLSG1B	OLSG1A	OLSG0B	OLSG0A
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	OLSG0A	MTIOC3B/GTIOC0A Active Level Setting	0: Active low 1: Active high	R/W*1
b1	OLSG0B	MTIOC3D/GTIOC0B Active Level Setting	0: Active low 1: Active high	R/W*1

b3	OLSG1B	MTIOC4C/GTIOC1B Active Level Setting	0: Active low 1: Active high	R/W*1
b4	OLSG2A	MTIOC4B/GTIOC2A Active Level Setting	0: Active low 1: Active high	R/W*1
b5	OLSG2B	MTIOC4D/GTIOC2B Active Level Setting	0: Active low 1: Active high	R/W*1
b6	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b7	OLSEN	Active Level Setting Enable	0: Disabled 1: Enabled	R/W*1
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

OLSG0A bit (MTIOC3B/GTIOC0A Active Level Setting)

This bit sets the active level of the MTIOC3B/GTIOC0A output. Specifically, setting the OLSG0A bit to 0 sets the low level and to 1 sets the high level as the active level for detection of short circuits.

OLSG0B bit (MTIOC3D/GTIOC0B Active Level Setting)

This bit sets the active level of the MTIOC3D/GTIOC0B output. Specifically, setting the OLSG0B bit to 0 sets the low level and to 1 sets the high level as the active level for detection of short circuits.

OLSG1A bit (MTIOC4A/GTIOC1A Active Level Setting)

This bit sets the active level of the MTIOC4A/GTIOC1A output. Specifically, setting the OLSG1A bit to 0 sets the low level and to 1 sets the high level as the active level for detection of short circuits.

OLSG1B bit (MTIOC4C/GTIOC1B Active Level Setting)

This bit sets the active level of the MTIOC4C/GTIOC1B output. Specifically, setting the OLSG1B bit to 0 sets the low level and to 1 sets the high level as the active level for detection of short circuits.

OLSG2A bit (MTIOC4B/GTIOC2A Active Level Setting)

This bit sets the active level of the MTIOC4B/GTIOC2A output. Specifically, setting the OLSG2A bit to 0 sets the low level and to 1 sets the high level as the active level for detection of short circuits.

OLSG2B bit (MTIOC4D/GTIOC2B Active Level Setting)

This bit sets the active level of the MTIOC4D/GTIOC2B output. Specifically, setting the OLSG2B bit to 0 sets the low level and to 1 sets the high level as the active level for detection of short circuits.

OLSEN bit (Active Level Setting)

This bit selects enabling or disabling of the active-level settings in the OLSGnm bits (n = 0 to 2, m = A, B). Clearing the OLSEN bit to 0 disables the OLSGnm bits, in which case the active levels of the MTU output are determined by the MTU.TOCR1A and MTU.TOCR2A registers. Setting the OLSEN bit to 1 enables the OLSGnm bits, in which case the active levels of the MTU output are as selected by the OLSGnm bits in this register.
Active levels for the GPT output can only be set when the OLSEN bit is 1. When output short-circuit detection is to be used on the GPT outputs, set the OLSEN bit to 1 and then use the OLSGnm bits to set the active levels for the GPT outputs.

20.2.10 Software Port Output Enable Register (SPOER)

SPOER controls high-impedance state of the pins.

Address(es): A008 080Ah

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	GPT3HIZ	—	MTUCH0HIZ	MTUCH67HIZ	MTUCH34HIZ
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	MTUCH34HIZ	MTU3, MTU4, GPT0, GPT1, or GPT2 Output High-Impedance Enable	0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.	R/W
b1	MTUCH67HIZ	MTU6 and MTU7 Output High-Impedance Enable	0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.	R/W
b2	MTUCH0HIZ	MTU0 Output High-Impedance Enable	0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.	R/W
b3	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b4	GPT3HIZ	GPT3 Output High-Impedance Enable	0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.	R/W
b7 to b5	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

MTUCH34HIZ Bit (MTU3, MTU4, GPT0, GPT1, or GPT2 Output High-Impedance Enable)

This bit specifies whether to place the MTU complementary PWM output pins (MTIOC3B, MTIOC3D, MTIOC4A, MTIOC4B, MTIOC4C, MTIOC4D, or the GPT output pins (GTIOC0A, GTIOC0B, GTIOC1A, GTIOC1B, GTIOC2A, GTIOC2B)) in high-impedance state.

[Setting condition]

- By writing 1 to MTUCH34HIZ

[Clearing conditions]

- Reset
- By writing 0 to MTUCH34HIZ after reading MTUCH34HIZ = 1*1

Note 1. To write 0 to this bit, be sure to read 1 and then write 0.

MTUCH67HIZ Bit (MTU6 and MTU7 Output High-Impedance Enable)

This bit specifies whether to place the MTU complementary PWM output pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7B, MTIOC7C, and MTIOC7D) in high-impedance state.

[Setting condition]

- By writing 1 to MTUCH67HIZ

[Clearing conditions]

- Reset
- By writing 0 to MTUCH67HIZ after reading MTUCH67HIZ = 1*1

Note 1. To write 0 to this bit, be sure to read 1 and then write 0.

MTUCH0HIZ Bit (MTU0 Output High-Impedance Enable)

This bit specifies whether to place the MTU0 pins in high-impedance state.

[Setting condition]

- By writing 1 to MTUCH0HIZ

[Clearing conditions]

- Reset
- By writing 0 to MTUCH0HIZ after reading MTUCH0HIZ = 1*1

Note 1. To write 0 to this bit, be sure to read 1 and then write 0.

GPT3HIZ Bit (GPT3 Output High-Impedance Enable)

This bit specifies whether to place the GPT3 pins (GTIOC3A, GTIOC3B) in high-impedance state.

[Setting condition]

- By writing 1 to GPT3HIZ

[Clearing conditions]

- Reset
- By writing 0 to GPT3HIZ after reading GPT3HIZ = 1*1

Note 1. To write 0 to this bit, be sure to read 1 and then write 0.

20.2.11 Port Output Enable Control Register 1 (POECR1)

POECR1 controls high-impedance state of the MTU0 pins.

Address(es): A008 080Bh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	MTU0DZE	MTU0CZE	MTU0BZE	MTU0AZE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	MTU0AZE	MTIOC0A High-Impedance Enable	0: Does not place the pin in high-impedance state. 1: Places the pin in high-impedance state.	R/W*1
b1	MTU0BZE	MTIOC0B High-Impedance Enable	0: Does not place the pin in high-impedance state. 1: Places the pin in high-impedance state.	R/W*1
b2	MTU0CZE	MTIOC0C High-Impedance Enable	0: Does not place the pin in high-impedance state. 1: Places the pin in high-impedance state.	R/W*1
b3	MTU0DZE	MTIOC0D High-Impedance Enable	0: Does not place the pin in high-impedance state. 1: Places the pin in high-impedance state.	R/W*1
b7 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

MTU0AZE Bit (MTIOC0A High-Impedance Enable)

This bit specifies whether to place the MTIOC0A output for the MTU0 pin in high-impedance state when any of the POE8F flag in ICSR3, MTUCH0HIZ bit in SPOER, OSTSTF flag in ICSR6 (when the OSTSTE bit is 1), or, as additionally specified in POECR5, the POEmF (n = 1, 2, 4, 5; m = 0, 4, 10) flag in ICSRn, is set to 1.

MTU0BZE Bit (MTIOC0B High-Impedance Enable)

This bit specifies whether to place the MTIOC0B output for the MTU0 pin in high-impedance state when any of the POE8F flag in ICSR3, MTUCH0HIZ bit in SPOER, OSTSTF flag in ICSR6 (when the OSTSTE bit is 1), or, as additionally specified in POECR5, the POEmF (n = 1, 2, 4, 5; m = 0, 4, 10) flag in ICSRn, is set to 1.

MTU0CZE Bit (MTIOC0C High-Impedance Enable)

This bit specifies whether to place the MTIOC0C output for the MTU0 pin in high-impedance state when any of the POE8F flag in ICSR3, MTUCH0HIZ bit in SPOER, OSTSTF flag in ICSR6 (when the OSTSTE bit is 1), or, as additionally specified in POECR5, the POEmF (n = 1, 2, 4, 5; m = 0, 4, 10) flag in ICSRn, is set to 1.

MTU0DZE Bit (MTIOC0D High-Impedance Enable)

This bit specifies whether to place the MTIOC0D output for the MTU0 pin in high-impedance state when any of the POE8F flag in ICSR3, MTUCH0HIZ bit in SPOER, OSTSTF flag in ICSR6 (when the OSTSTE bit is 1), or, as additionally specified in POECR5, the POEmF (n = 1, 2, 4, 5; m = 0, 4, 10) flag in ICSRn, is set to 1.

20.2.12 Port Output Enable Control Register 2 (POECR2)

POECR2 controls high-impedance state of the MTU complementary PWM output pins (MTU3, MTU4, MTU6, and MTU7 pins and the GPT pins (GPT0 to GPT2)).

Address(es): A008 080Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

b10	MTU3BDZE	MTIOC3B/3D and GTIOC0A/0B High-Impedance Enable	0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.	R/W*1
b15 to b11	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.
Note 2. Set this bit to 0 when MTU6 or MTU7 is not used.

MTU7BDZE Bit (MTIOC7B/7D High-Impedance Enable)

This bit specifies whether to place the MTIOC7B output and MTIOC7D output for the MTU3 pin in high-impedance state when any one of the OSF2 flag in OCSR2, POE4F flag in ICSR2, MTUCH67HIZ bit in SPOER, OSTSTF flag in ICSR6 (when the OSTSTE bit is 1), or, as additionally specified in POECR4, the POEmF (n = 1, 3 to 5; m = 0, 8, 10) flag in ICSRn, is set to 1.

MTU7ACZE Bit (MTIOC7A/7C High-Impedance Enable)

This bit specifies whether to place the MTIOC7A output and MTIOC7C output for the MTU3 pin in high-impedance state when any one of the OSF2 flag in OCSR2, POE4F flag in ICSR2, MTUCH67HIZ bit in SPOER, OSTSTF flag in ICSR6 (when the OSTSTE bit is 1), or, as additionally specified in POECR4, the POEmF (n = 1, 3 to 5; m = 0, 8, 10) flag in ICSRn, is set to 1.

MTU6BDZE Bit (MTIOC6B/6D High-Impedance Enable)

This bit specifies whether to place the MTIOC6B output and MTIOC6D output for the MTU3 pin in high-impedance state when any one of the OSF2 flag in OCSR2, POE4F flag in ICSR2, MTUCH67HIZ bit in SPOER, OSTSTF flag in ICSR6 (when the OSTSTE bit is 1), or, as additionally specified in POECR4, the POEmF (n = 1, 3 to 5; m = 0, 8, 10) flag in ICSRn, is set to 1.

MTU4BDZE Bit (MTIOC4B/4D and GTIOC2A/2B High-Impedance Enable)

This bit specifies whether to place the MTIOC4B output and MTIOC4D output for the MTU4 pin and the GTIOC2A output and GTIOC2B output for the GPT2 pin in high-impedance state when any one of the OSF1 flag in OCSR1, POE0F flag in ICSR1, MTUCH34HIZ bit in SPOER, OSTSTF flag in ICSR6 (when the OSTSTE bit is 1), or, as additionally specified in POECR4, the POEmF (n = 2 to 5; m = 4, 8, 10) flag in ICSRn, is set to 1.

MTU4ACZE Bit (MTIOC4A/4C and GTIOC1A/1B High-Impedance Enable)

This bit specifies whether to place the MTIOC4A output and MTIOC4C output for the MTU4 pin and the GTIOC1A output and GTIOC1B output for the GPT1 pin in high-impedance state when any one of the OSF1 flag in OCSR1, POE0F flag in ICSR1, MTUCH34HIZ bit in SPOER, OSTSTF flag in ICSR6 (when the OSTSTE bit is 1), or, as additionally specified in POECR4, the POEmF (n = 2 to 5; m = 4, 8, 10) flag in ICSRn, is set to 1.

MTU3BDZE Bit (MTIOC3B/3D and GTIOC0A/0B High-Impedance Enable)

This bit specifies whether to place the MTIOC3B output and MTIOC3D output for the MTU3 pin and the GTIOC0A output and GTIOC0B output for the GPT0 pin in high-impedance state when any one of the OSF1 flag in OCSR1, POE0F flag in ICSR1, MTUCH34HIZ bit in SPOER, OSTSTF flag in ICSR6 (when the OSTSTE bit is 1), or, as additionally specified in POECR4, the POEmF (n = 2 to 5; m = 4, 8, 10) flag in ICSRn, is set to 1.

20.2.13 Port Output Enable Control Register 3 (POECR3)

POECR3 controls high-impedance state of the GPT pin (GPT3).

Address(es): A008 080Eh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Value after reset:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b8 to b0	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b9	GPT3ABZE	GTIOC3A/3B High-Impedance Enable	0: Does not place the pins in high-impedance state. 1: Places the pins in high-impedance state.	R/W*1
b15 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

GPT3ABZE Bit (GTIOC3A/3B High-Impedance Enable)

This bit specifies whether to place the GTIOC3A and GTIOC3B outputs for the GPT3 pin when any one of the POE10F flag in ICSR5, GPT3HIZ bit in SPOER, OSTSTF flag in ICSR6 (when the OSTSTE bit is 1), or, as additionally specified in POECR6, the POEmF (n = 1 to 4; m = 0, 4, 8, 10) flag in ICSRn, is set to 1.

20.2.14 Port Output Enable Control Register 4 (POECR4)

The POECR4 is used to extend the control conditions of the high-impedance state for the MTU3, MTU4, MTU6, and MTU7 pins for the MTU complementary PWM output.
For details about the targets and conditions of high-impedance control, see Figure 20.2.

Address(es): A008 0810h

b15, b14	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

IC2ADDMT34ZE Bit (MTU3 and MTU4 High-Impedance POE4F Add)

Adds the POE4F flag in ICSR2 (POE4#) to the high-impedance control conditions for the MTU3 and MTU4 pins (MTIOC3B/MTIOC3D/MTIOC4A/MTIOC4C/MTIOC4B/MTIOC4D) or the GPT0 to GPT2 pins (GTIOC0A/GTIOC0B/GTIOC1A/GTIOC1B/GTIOC2A/GTIOC2B).

IC3ADDMT34ZE Bit (MTU3 and MTU4 High-Impedance POE8F Add)

Adds the POE8F flag in ICSR3 (POE8#) to the high-impedance control conditions for the MTU3 and MTU4 pins (MTIOC3B/MTIOC3D/MTIOC4A/MTIOC4C/MTIOC4B/MTIOC4D) or the GPT0 to GPT2 pins (GTIOC0A/GTIOC0B/GTIOC1A/GTIOC1B/GTIOC2A/GTIOC2B).

IC4ADDMT34ZE Bit (MTU3 and MTU4 High-Impedance POE10F Add)

Adds the POE10F flag in ICSR4 (POE10#) to the high-impedance control conditions for the MTU3 and MTU4 pins (MTIOC3B/MTIOC3D/MTIOC4A/MTIOC4C/MTIOC4B/MTIOC4D) or the GPT0 to GPT2 pins (GTIOC0A/GTIOC0B/GTIOC1A/GTIOC1B/GTIOC2A/GTIOC2B).

IC5ADDMT34ZE Bit (MTU3 and MTU4 High-Impedance POE10F Add)

Adds the POE10F flag in ICSR5 (POE10#) to the high-impedance control conditions for the MTU3 and MTU4 pins (MTIOC3B/MTIOC3D/MTIOC4A/MTIOC4C/MTIOC4B/MTIOC4D) or to the GPT0 to GPT2 pins (GTIOC0A/GTIOC0B/GTIOC1A/GTIOC1B/GTIOC2A/GTIOC2B).

Note: Set this bit to the same value as the IC4ADDMT34ZE bit.

IC1ADDMT67ZE Bit (MTU6 and MTU7 High-Impedance POE0F Add)

Adds the POE0F flag in ICSR1 (POE0#) to the high-impedance control conditions for the MTU6, and MTU4, and GPT0 to GPT2 pins (MTIOC3B/MTIOC3D/GTIOC0A/GTIOC0B/MTIOC4A/MTIOC4C/GTIOC1A/GTIOC1B/MTIOC4B/MTIOC4D/GTIOC2A/GTIOC2B).

IC3ADDMT67ZE Bit (MTU6 and MTU7 High-Impedance POE8F Add)

Adds the POE8F flag in ICSR3 (POE8#) to the high-impedance control conditions for the MTU6, and MTU7 pins (MTIOC6B, MTIOC6D, MTIOC7A, MTIOC7B, MTIOC7C, MTIOC7D).

IC4ADDMT67ZE Bit (MTU6 and MTU7 High-Impedance POE10F Add)

Adds the POE10F flag in ICSR4 (POE10#) to the high-impedance control conditions for the MTU6, and MTU7 pins (MTIOC6B/MTIOC6D/MTIOC7A/MTIOC7C/MTIOC7B/MTIOC7D).

IC5ADDMT67ZE Bit (MTU6 and MTU7 High-Impedance POE10F Add)

Adds the POE10F flag in ICSR5 (POE10#) to the high-impedance control conditions for the MTU6, and MTU7 pins (MTIOC6B/MTIOC6D/GTIOC0A/GTIOC0B/MTIOC7A/MTIOC7C/GTIOC1A/GTIOC1B/MTIOC7B/MTIOC7D/GTIOC2A/GTIOC2B).

Note: Set this bit to the same value as the IC4ADDMT67ZE bit.

20.2.15 Port Output Enable Control Register 5 (POECR5)

The POECR5 is used to extend the control conditions of the high-impedance for the MTU0 pin.
For details about the targets and conditions of high-impedance control, see Figure 20.2.

Address(es): A008 0812h

b5	IC5ADDMT0ZE	MTU0 High-Impedance POE10F Add	0: Does not add the pins to the high-impedance control conditions. 1: Adds the pins to the high-impedance control conditions. Note: Set this bit to the same value as the IC4ADDMT0ZE bit.	R/W*1
b15 to b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

IC1ADDMT0ZE Bit (MTU0 High-Impedance POE0F Add)

Adds the POE0F flag in ICSR1 (POE0#) to the high-impedance control conditions for the MTU0 pins (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D).

IC2ADDMT0ZE Bit (MTU0 High-Impedance POE4F Add)

Adds the POE4F flag in ICSR2 (POE4#) to the high-impedance control conditions for the MTU0 pins (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D).

IC4ADDMT0ZE Bit (MTU0 High-Impedance POE10F Add)

Adds the POE10F flag in ICSR4 (POE10#) to the high-impedance control conditions for the MTU0 pins (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D).

IC5ADDMT0ZE Bit (MTU0 High-Impedance POE10F Add)

Adds the POE10F flag in ICSR5 (POE10#) to the high-impedance control conditions for the MTU0 pins (MTIOC0A, MTIOC0B, MTIOC0C, MTIOC0D).

Note: Set this bit to the same value as the IC4ADDMT0ZE bit.

20.2.16 Port Output Enable Control Register 6 (POECR6)

The POECR6 is used to extend the control conditions of the high-impedance for the GPT3 pins.
For details about the targets and conditions of high-impedance control, see Figure 20.2.

Address(es): A008 0814h

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

IC1ADDGPT3ZE Bit (GPT3 High -Impedance POE0F Add)

Adds the POE0F flag in ICSR1 (POE0#) to the high-impedance control conditions for the GPT3 pins (GTIOC3A, GTIOC3B).

IC2ADDGPT3ZE Bit (GPT3 High-Impedance POE4F Add)

Adds the POE4F flag in ICSR2 (POE4#) to the high-impedance control conditions for the GPT3 pins (GTIOC3A, GTIOC3B).

IC3ADDGPT3ZE Bit GPT3 High -Impedance POE8F Add)

Adds the POE8F flag in ICSR3 (POE8#) to the high-impedance control conditions for the GPT3 pins (GTIOC3A, GTIOC3B).

IC4ADDGPT3ZE Bit (GPT3 High -Impedance POE10F Add)

Adds the POE10F flag in ICSR4 (POE10#) to the high-impedance control conditions for the GPT3 pins (GTIOC3A, GTIOC3B).

20.2.17 GPT3 Pin Select Register (G3SELR)

G3SELR is an 8-bit readable/writable register that selects the target pins for high-impedance control on GPT3.

Address(es): A008 0823h

	b7	b6	b5	b4	b3	b2	b1	b0
	G3BSEL[3:0]				G3ASEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	G3ASEL[3:0]	GPT3-A (GTIOC3A) Pin Select	b3 b0 0000: Controls the high-impedance state of PA6 when it is in use as the GTIOC3A pin. 0100: Controls the high-impedance state of P66 when it is in use as the GTIOC3A pin. Settings other than above are prohibited.	R/W*1
b7 to b4	G3BSEL[3:0]	GPT3-B (GTIOC3B) Pin Select	b7 b4 0000: Controls the high-impedance state of PA7 when it is in use as the GTIOC3B pin. 0100: Controls the high-impedance state of P67 when it is in use as the GTIOC3B pin. Settings other than above are prohibited.	R/W*1

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

G3ASEL[3:0] Bits (GPT3-A (GTIOC3A) Pin Select)

These bits select the target GTIOC3A pin for high-impedance control.

G3BSEL[3:0] Bits (GPT3-B (GTIOC3B) Pin Select)

These bits select the target GTIOC3B pin for high-impedance control.

20.2.18 MTU0 Pin Select Register 1 (M0SELR1)

M0SELR1 is an 8-bit readable/writable register that selects the A and B pins on MTU0 as targets for high-impedance control.

Address(es): A008 0824h

	b7	b6	b5	b4	b3	b2	b1	b0
	M0BSEL[3:0]				M0ASEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	M0ASEL[3:0]	MTU0-A (MTIOC0A) Pin Select	b3 b0 0000: Controls the high-impedance state of PE6 when it is in use as the MTIOC0A pin. 0010: Controls the high-impedance state of PP4 when it is in use as the MTIOC0A pin. Settings other than above are prohibited.	R/W*1
b7 to b4	M0BSEL[3:0]	MTU0-B (MTIOC0B) Pin Select	b7 b4 0000: Controls the high-impedance state of PP3 when it is in use as the MTIOC0B pin. 0001: Controls the high-impedance state of PE4 when it is in use as the MTIOC0B pin. Settings other than above are prohibited.	R/W*1

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

M0ASEL[3:0] Bits (MTU0-A (MTIOC0A) Pin Select)

These bits select the target MTIOC0A pin for high-impedance control.

M0BSEL[3:0] Bits (MTU0-B (MTIOC0B) Pin Select)

These bits select the target MTIOC0B pin for high-impedance control.

20.2.19 MTU0 Pin Select Register 2 (M0SELR2)

M0SELR2 is an 8-bit readable/writable register that selects the C and D pins on MTU0 as targets for high-impedance control.

Address(es): A008 0825h

	b7	b6	b5	b4	b3	b2	b1	b0
	M0DSEL[3:0]				M0CSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	M0CSEL[3:0]	MTU0-C (MTIOC0C) Pin Select	b3 b0 0000: Controls the high-impedance state of PE5 when it is in use as the MTIOC0C pin. 0010: Controls the high-impedance state of PP2 when it is in use as the MTIOC0C pin. Settings other than above are prohibited.	R/W*1
b7 to b4	M0DSEL[3:0]	MTU0-D (MTIOC0D) Pin Select	b7 b4 0000: Controls the high-impedance state of PE3 when it is in use as the MTIOC0D pin. 0010: Controls the high-impedance state of PP1 when it is in use as the MTIOC0D pin. Settings other than above are prohibited.	R/W*1

Note 1. Can be modified only once after a reset. After the bit is modified once, writing this bit does not modify its value until the register is reset.

M0CSEL[3:0] Bits (MTU0-C (MTIOC0C) Pin Select)

These bits select the target MTIOC0C pin for high-impedance control.

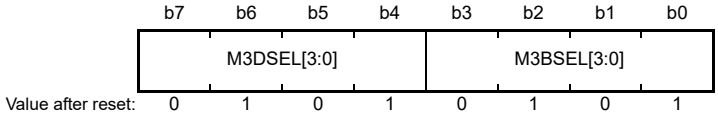
M0DSEL[3:0] Bits (MTU0-D (MTIOC0D) Pin Select)

These bits select the target MTIOC0D pin for high-impedance control.

20.2.20 MTU3 Pin Select Register (M3SELR)

M3SELR is an 8-bit readable/writable register that selects the B and D pins on MTU3 or the A and B pins on GPT channel 0 as targets for high-impedance control. MPC (multi-function pin controller) can be used to set which MTU3 or GPT pins are to be controlled.

Address(es): A008 0826h



Bit	Symbol	Bit Name	Description	R/W
b3 to b0	M3BSEL[3:0]	MTU3-B (MTIOC3B)/GPT Channel 0-A (GTIOC0A) Pin Select	b3 b0 0001: Controls the high-impedance state of P16. 0010: Controls the high-impedance state of PB7. 0011: Controls the high-impedance state of PA2. To control the high-impedance state, settings other than above are prohibited.	R/W*1
b7 to b4	M3DSEL[3:0]	MTU3-D (MTIOC3D)/GPT Channel 0-B (GTIOC0B) Pin Select	b7 b4 0001: Controls the high-impedance state of P15. 0011: Controls the high-impedance state of PF6. 0101: Controls the high-impedance state of PA1. To control the high-impedance state, settings other than above are prohibited.	R/W*1

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.

M3BSEL[3:0] Bits (MTU3-B (MTIOC3B)/GPT Channel 0-A (GTIOC0A) Pin Select)

These bits select the target MTIOC3B/GTIOC0A pin for high-impedance control.

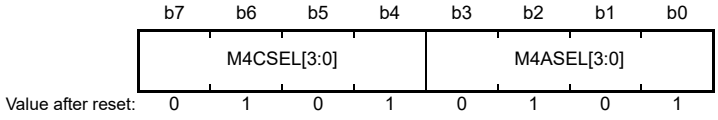
M3DSEL[3:0] Bits (MTU3-D (MTIOC3D)/GPT Channel 0-B (GTIOC0B) Pin Select)

These bits select the target MTIOC3D/GTIOC0B pin for high-impedance control.

20.2.21 MTU4 Pin Select Register 1 (M4SELR1)

M4SELR1 is an 8-bit readable/writable register that selects A and C pins on MTU4 or the A and B pins on GPT channel 1 as targets for high-impedance control. MPC (multi-function pin controller) can be used to set which MTU3 or GPT pins are to be controlled.

Address(es): A008 0827h



Bit	Symbol	Bit Name	Description	R/W
b3 to b0	M4ASEL[3:0]	MTU4-A (MTIOC4A)/GPT Channel 1-A (GTIOC1A) Pin Select	b3 b0 0001: Controls the high-impedance state of PA0. 0011: Controls the high-impedance state of PF5. 0101: Controls the high-impedance state of P14. Settings other than above are prohibited.	R/W*1
b7 to b4	M4CSEL[3:0]	MTU4-C (MTIOC4C)/GPT Channel 1-B (GTIOC1B) Pin Select	b7 b4 0001: Controls the high-impedance state of P77. 0011: Controls the high-impedance state of P87. 0101: Controls the high-impedance state of P13. Settings other than above are prohibited.	R/W*1

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.

M4ASEL[3:0] Bits (MTU4-A (MTIOC4A)/GPT Channel 1-A (GTIOC1A) Pin Select)

These bits select the target MTIOC4A/GTIOC1A pin for high-impedance control.

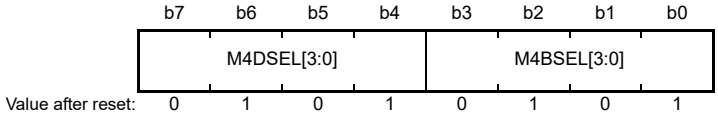
M4CSEL[3:0] Bits (MTU4-C (MTIOC4C)/GPT Channel 1-B (GTIOC1B) Pin Select)

These bits select the target MTIOC4C/GTIOC1B pin for high-impedance control.

20.2.22 MTU4 Pin Select Register 2 (M4SELR2)

M4SELR2 is an 8-bit readable/writable register that selects B and D pins on MTU4 or the A and B pins on GPT channel 2 as targets for high-impedance control. MPC (multi-function pin controller) can be used to set which MTU3 or GPT pins are to be controlled.

Address(es): A008 0828h



Bit	Symbol	Bit Name	Description	R/W
b3 to b0	M4BSEL[3:0]	MTU4-B (MTIOC4B)/GPT Channel 2-A (GTIOC2A) Pin Select	b3 b0 0000: Controls the high-impedance state of P86. 0011: Controls the high-impedance state of P76. 0101: Controls the high-impedance state of P12. Settings other than above are prohibited.	R/W*1
b7 to b4	M4DSEL[3:0]	MTU4-D (MTIOC4D)/GPT Channel 2-B (GTIOC2B) Pin Select	b7 b4 0001: Controls the high-impedance state of P75. 0011: Controls the high-impedance state of PD7. 0101: Controls the high-impedance state of P11. Settings other than above are prohibited.	R/W*1

Note 1. Can be modified only once after a reset. After the bits are modified once, writing these bits does not modify their values until the register is reset.

M4BSEL[3:0] Bits (MTU4-B (MTIOC4B)/GPT Channel 2-A (GTIOC2A) Pin Select)

These bits select the target MTIOC4B/GTIOC2A pin for high-impedance control.

M4DSEL[3:0] Bits (MTU4-D (MTIOC4D)/GPT Channel 2-B (GTIOC2B) Pin Select)

These bits select the target MTIOC4D/GTIOC2B pin for high-impedance control.

20.3 Operation

Table 20.4 shows the target pins for high-impedance control and conditions to place the pins in high-impedance state.

Table 20.4 Target Pins and Conditions for High-Impedance Control (1 / 2)

Pins	Conditions	Detailed Conditions
MTU3 or GPT0 pins (MTIOC3B and MTIOC3D, or GTIOC0A and GTIOC0B)	• Operation for detection of the POE0# input level • Operation for comparison of the output levels on the MTIOC3B and MTIOC3D or GTIOC0A and GTIOC0B pins • SPOER setting • Additional conditions of the POECR4 • Detection of stopped oscillation or oscillation abnormality*1	MTU3BDZE• ((POE0F) +(OSF1•OCE1) +(MTUCH34HIZ) +(IC2ADDMT34ZE•POE4F) +(IC3ADDMT34ZE•POE8E•POE8F) +(IC4ADDMT34ZE•ICSR4.POE10E•ICSR4.POE10F) +(IC5ADDMT34ZE•ICSR5.POE10E•ICSR5.POE10F) +(OSTSTE•OSTSTF))

MTU0 pin (MTIOC0D)	• Operation for detection of the POE8# input level • SPOER setting • Additional conditions of the POECR5 • Detection of stopped oscillation or oscillation abnormality*1	MTU0DZE• ((POE8F•POE8E) +(MTUCH0HIZ) +(IC1ADDMT0ZE•POE0F) +(IC2ADDMT0ZE•POE4F) +(IC4ADDMT0ZE•ICSR4.POE10E•ICSR4.POE10F) +(IC5ADDMT0ZE•ICSR5.POE10E•ICSR5.POE10F) +(OSTSTE•OSTSTF))
GPT3 pins (GTIOC3A and GTIOC3B)	• Operation for detection of the POE10# input level • SPOER setting • Additional conditions of the POECR6 • Detection of stopped oscillation or oscillation abnormality*1	GPT3ABZE• ((ICSR5.POE10F•ICSR5.POE10E) +(GPT3HIZ) +(IC1ADDGPT3ZE•POE0F) +(IC2ADDGPT3ZE•POE4F) +(IC3ADDGPT3ZE•POE8E•POE8F) +(IC4ADDGPT3ZE•ICSR4.POE10E•ICSR4.POE10F) +(OSTSTE•OSTSTF))

Note 1. The clock monitor circuit (CLMA0, CLMA1) can detect the oscillation abnormality.

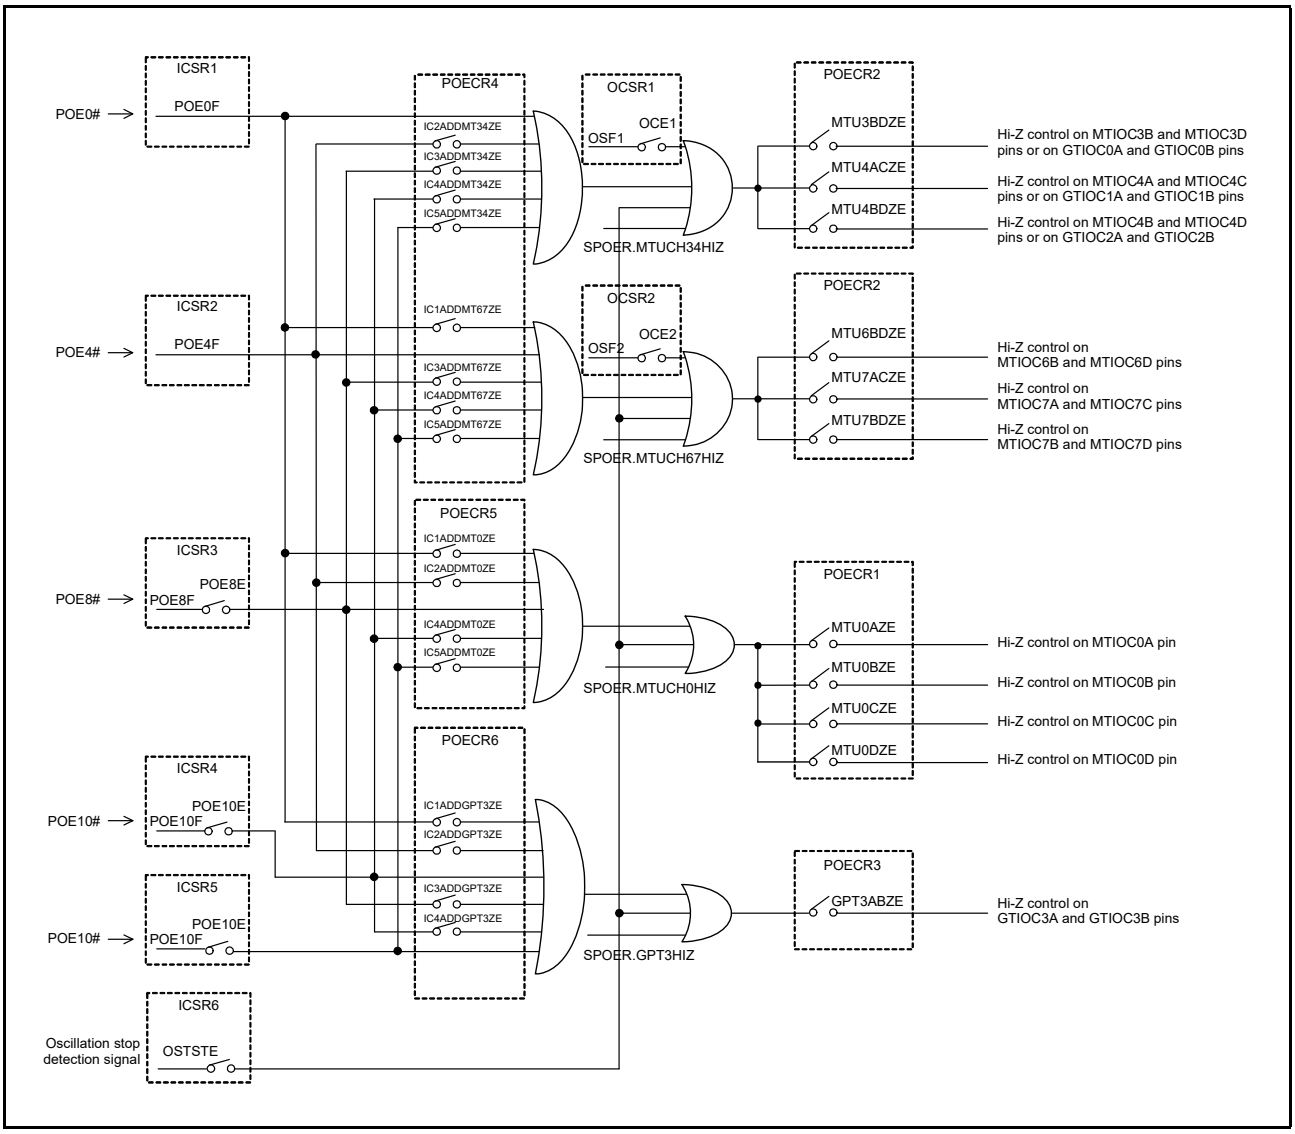

Figure 20.2 Target Pins and Conditions for High-Impedance Control

High-impedance requests to individual pins can be controlled by the settings in the POECR1 to POECR3 registers.

The following input pins can be added to high-impedance control conditions by the settings in the POECR4 to POECR6 registers: input pins other than the POE0# pin for the MTU3, MTU4, and GPT0 to GPT2 pins; input pins other than the POE4# pin for the MTU6 and MTU7 pins; input pins other than the POE8# pin for the MTU0 pins; input pins other than the POE10# pin for the GPT3 pins.

For example, setting the IC2ADDMT34ZE bit in POECR4 to 1 outputs high-impedance requests to the MTU3, MTU4, GPT0, GPT1, and GPT2 pins even when the POE4# input is detected.

High-impedance requests due to the detection of POE8# input, POE10# input, stopped oscillation, or oscillation abnormality (CLMA0/1) can be controlled by the settings in the ICSR3 to ICSR6 registers. (The ICSR1 and ICSR2 registers do not control enabling or disabling of output of high-impedance requests.)

High-impedance requests to the MTU3, MTU4, GPT0, GPT1, GPT2, MTU6, and MTU7 pins as the results of output level comparison can be controlled by the settings in the OCSR1 and OCSR2 registers.

20.3.1 MTU3/GPT Pin Selection

In RZ/T1, the pin functions for MTU and GPT are respectively assigned to multiple sets of port pins. The target pins for high-impedance control can be selected by the pin selection register in POE3 (G3SELR, M0SELR1, M0SELR2, M3SELR, M4SELR1, or M4SELR2 register). Table 20.5 shows the correspondence between MTU and GPT pins and selection registers.

Note that settings for pins to be used as MTU or GPT must be separately made in the registers of the multi-function pin controller (MPC). Take care so that there are no differences between the pins selected in the POE3 registers and the pins selected in the MPC registers. For details about MPC registers, see section 18, Multi-Function Pin Controller (MPC).

Table 20.5 Correspondence between MTU and GPT Pins

MTU/GPT Pin Functions	Corresponding Ports	Selection Registers
MTIOC0A	PP4*1 PE6	M0SELR1
MTIOC0B	PP3*1 PE4

Note 1. This is only selectable in 320-pin products.
Note 2. This is not a target for high-impedance control by POE3. The targets for high-impedance control are PS0 to PS5 pins.

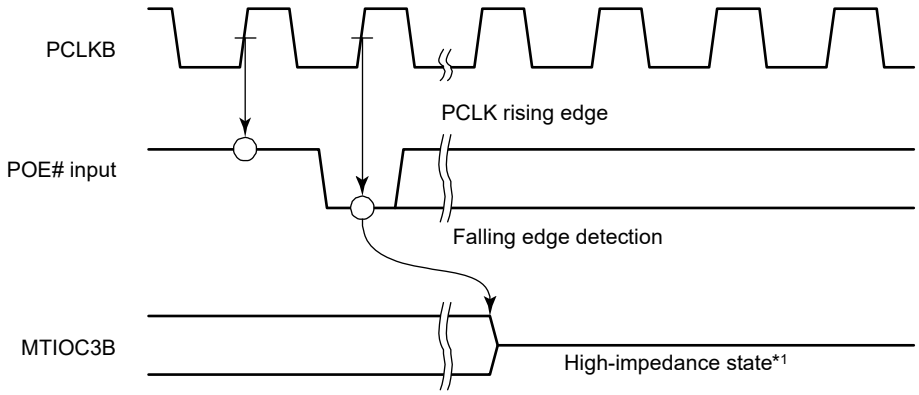
20.3.2 Input Level Detection Operation

If the input conditions set by ICSR1 to ICSR5 occur on the POE0#, POE4#, POE8#, and POE10# pins, the MTU3 and MTU4 or MTU6 and MTU7 pins for the MTU complementary PWM output, and MTU0 pins, and GPT pins are placed in high-impedance state. Note however, that these pins are still placed in the high-impedance state even when the GPT and MTU3 functions are not selected for the pins.

(1) Falling Edge Detection

When a change from a high to low level is input to the POE0#, POE4#, POE8#, and POE10# pins, the pins for the MTU complementary PWM output, and MTU0 pins, and pin functions multiplexed with the GPT pins are placed in high-impedance state.

Figure 20.3 shows a sample timing after the level changes in input to the POE0#, POE4#, POE8#, and POE10# pins until the respective pins enter high-impedance state.

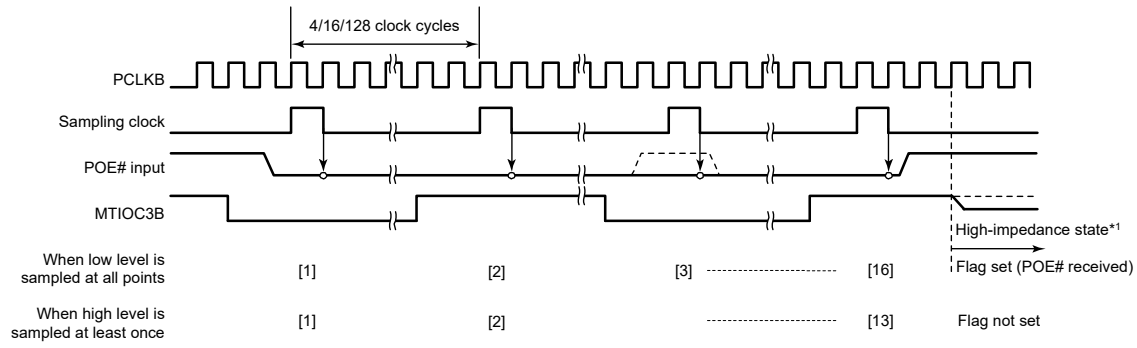


Note 1. Other pins also enter the high-impedance state at the same timing.

Figure 20.3 Falling Edge Detection

(2) Low-Level Detection

Figure 20.4 shows the low-level detection operation. Sixteen continuous low levels are sampled with the sampling clock selected by ICSR1 to ICSR5. If even one high level is detected during this interval, the low level is not accepted.
The timing when pins for the MTU complementary PWM output, and MTU0 pins and GPT pins enter the high-impedance state after the sampling clock is input is the same in both falling-edge detection and in low-level detection.



Note 1. Other pins also enter the high-impedance state at the same timing.

Figure 20.4 Low-Level Detection Operation

20.3.3 Output Level Compare Operation

Figure 20.5 shows an example of the output level compare operation for the combination of MTIOC3B and MTIOC3D. The operation is the same for the other pin combinations.

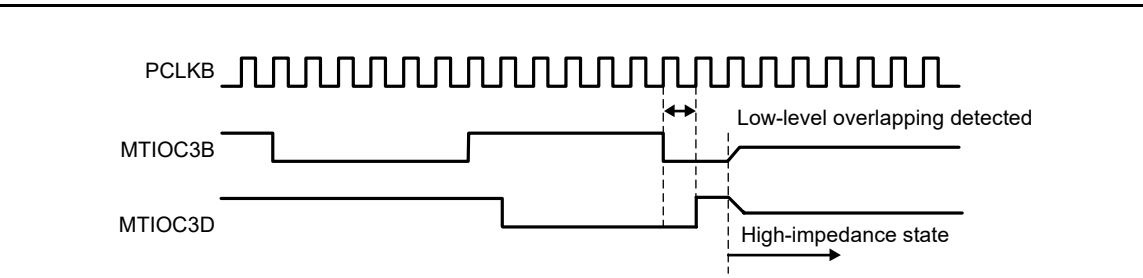


Figure 20.5 Output Level Compare Operation

20.3.4 High-Impedance Control Using Registers

The high-impedance state of the MTU pins (MTU0, MTU3, MTU4, MTU6, and MTU7) and the GPT pins can be directly controlled by using the software port output enable register (SPOER).
For instance, setting the MTUCH34HIZ bit in SPOER to 1 places the MTU3 and MTU4 pins specified by the port output enable control register 2 (POECR2) in the high-impedance state.
The high-impedance state of other pins can also be controlled by setting the appropriate bits in SPOER.

20.3.5 High-Impedance Control through Detection of Stopped Oscillation and Oscillation Abnormality

When the oscillation-stop detection circuit in the clock pulse generator detects the stopped oscillation or the clock monitor circuit (CLMA0, CLMA1) detects the oscillation abnormality, with the OSTSTE bit in ICSR6 being set, the MTU3 and MTU4 or MTU6 and MTU7 pins if specified in the port output enable control register 2 (POECR2), the MTU0 pins if specified in the port output enable control register 1 (POECR1), and the GPT pin if specified by the port enable register 3 (POECR3), can be placed in the high-impedance state.

20.3.6 Additional Functions for Controlling High-Impedance States

Settings in port enable registers 4 to 6 (POECR4 to POECR6) can add further high-impedance control conditions for the MTU complementary PWM output, MTU0, and GPT pins.
For instance, the settings listed below can be added as high-impedance control conditions for the MTU3 and MTU4 pins.

- Setting the IC2ADDMT34ZE bit in POECR4 to 1 adds the input level detection by the POE4#
- Setting the IC3ADDMT34ZE bit in POECR4 to 1 and adds the input level detection by the POE8#
- Setting the IC4ADDMT34ZE bit in POECR4 to 1 and adds the input level detection by the POE10# (ICSR4.POE10F)
- Setting the IC5ADDMT34ZE bit in POECR4 to 1 and adds the input level detection by the POE10# (ICSR5.POE10F)

The high-impedance state of other pins can also be controlled by setting the appropriate bits in the POECR4 to POECR6.

20.3.7 Release from High-Impedance State

MTU pins which have entered high-impedance state due to input-level detection can be released from the state either by returning them to their initial state with a reset, or by clearing all of the ICSR1.POE0F, ICSR2.POE4F, ICSR3.POE8F, ICSR4.POE10F, and ICSR5.POE10F flags. However, note that when low-level sampling is selected with the ICSR1.POE0M[1:0], ICSR2.POE4M[1:0], ICSR3.POE8M[1:0], ICSR4.POE10M[1:0], and ICSR5.POE10M[1:0] bits, just writing 0 to a flag is ignored (the flag is not cleared); flags can be cleared by writing 0 to it only after a high level is input to the POE0#, POE4#, POE8#, and POE10# pins and is sampled.
MTU pins which have entered high-impedance state due to output level detection can be released from the state either by returning them to their initial state with a reset, or by clearing the OCSR1.OSF1 flag or the OCSR2.OSF2 flag. When the OCSR1.OSF1 flag or the OCSR2.OSF2 flag is set to 0, the inactive level is output by setting the MTU, GRT and ALR1 registers.

20.4 POE3 Setting Procedure

Figure 20.6 shows the procedure for setting POE3. It illustrates an example of high-impedance control in response to comparison of the output levels on the GPT0 pins (GTIOC0A/GTIOC0B). In the figure, PA2 is selected as the GTIOC0A pin and PA1 is selected as the GTIOC0B pin.

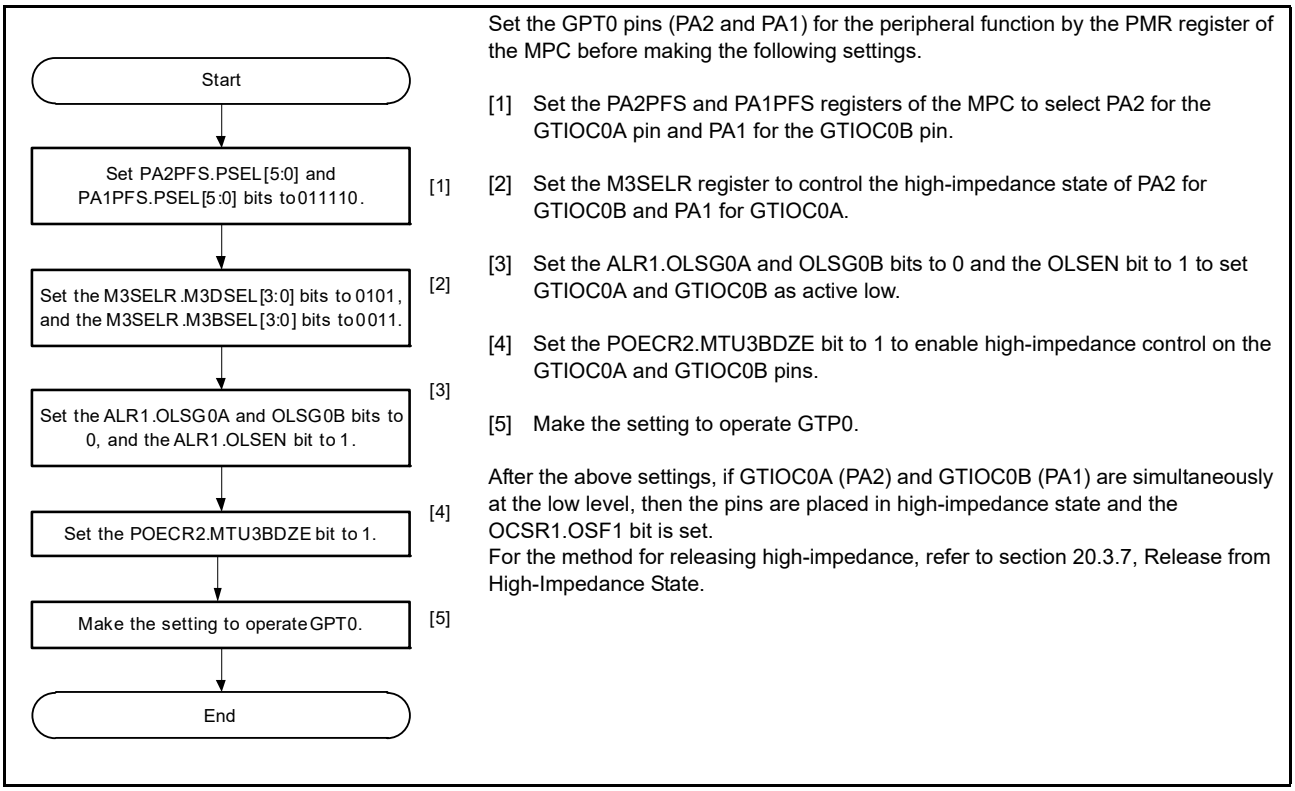

Figure 20.6 Procedure for Setting POE3

20.5 Interrupts

The POE3 issues a request to generate an interrupt when the specified condition is satisfied during input level detection or output level comparison. Table 20.6 shows the interrupt sources and their conditions.

Table 20.6 Interrupt Sources and Conditions

Name	Interrupt Source	Interrupt Flag	Condition
OEI1	Output enable interrupt 1	POE0F and OSF1	PIE1•POE0F+OIE1•OSF1
OEI2	Output enable interrupt 2	POE4F and OSF2	PIE2•POE4F+OIE2•OSF2
OEI3	Output enable interrupt 3	POE8F	PIE3•POE8F
OEI4	Output enable interrupt 4	ICSR4.POE10F and ICSR5.POE10F	PIE4•ICSR4.POE10F+PIE5•ICSR5.POE10F

20.6 Usage Notes

20.6.1 High-Impedance Control when the MTU and GPT Pins are Not Selected

If high-impedance control for a pin having a multiplexed MTU or GPT pin function on a register POECR1 to POECR3 is enabled and the high-impedance condition is satisfied, the pin is placed in the high-impedance state even if the MTU/GPT function is not selected for the pin on which it is multiplexed.
To avoid unintended high-impedance states, ensure that there are no differences between the settings for MTU and GPT pin selection in the PmnPFS registers of the MPC and for MTU and GPT pin selection in the pin selection register of the POE.

20.6.2 High-Impedance Control when MTU6 and MTU7 are Not Used

When MTU6 and MTU7 are not to be used, set the POECR2.MTU6BDZE, MTU7ACZE, and MTU7BDZE bits to 0 to disable high-impedance control.

21. General PWM Timer (GPTa)

The RZ/T1 has a general PWM timer (GPT) consisting of a four-channel 16-bit timer. The GPT can operate at up to 150 MHz.

21.1 Overview

Table 21.1 lists the specifications of the GPT, and Table 21.2 shows the functions of the GPT. Figure 21.1 shows a block diagram of the GPT.

Table 21.1 Specifications of GPT

Item	Description
Function	• 16 bits × 4 channels • Up-counting or down-counting (saw waves) or up/down-counting (triangle waves) for each counter. • Clock sources independently selectable for each channel • Two input/output pins per channel • Two output compare/input capture registers per channel • For the two output compare/input capture registers of each channel, four registers are provided as buffer registers and are capable of operating as comparison registers when buffering is not in use. • In output compare operation, buffer switching can be at crests or troughs, enabling the generation of laterally asymmetric PWM waveforms. • Registers for setting up frame cycles in each channel (with capability for generating interrupts at overflow or underflow) • Synchronizable operation of the several counters • Modes of synchronized operation (synchronized, or displaced by desired times for phase shifting) • Generation of dead times in PWM operation • Through combination of three counters, generation of three-phase PWM waveforms incorporating dead times • Starting, clearing, and stopping counters in response to external or internal triggers • Internal trigger sources: software, and compare match • Starting and stopping of the counter, event capture, and count clear are possible in response to events set in the event link controller. • Noise filtering is selectable for the input capture and external trigger inputs. • The module-stop state can be set.

21.2 Register Descriptions

21.2.1 General PWM Timer Software Start Register (GTSTR)

GTSTR starts or stops the GPTn.GTCNT counting operation (n = 0 to 3).

Address(es): GPT.GTSTR A006 C000h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Bit	Symbol	Bit Name	Description	R/W
b0	CST0	GPT0.GTCNT Count Start	0: Count operation is stopped 1: Count operation is performed	R/W
b1	CST1	GPT1.GTCNT Count Start		R/W
b2	CST2	GPT2.GTCNT Count Start		R/W
b3	CST3	GPT3.GTCNT Count Start		R/W
b15 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

CSTn Bit (GPTn.GTCNT Count Start) (n = 0 to 3)

This bit starts or stops GPTn.GTCNT operation.

If the SWPn bit in the general PWM timer start write-protection register (GTSWP) is set to disable writing to the CSTn bit, writing to the CSTn bit is ignored.

The counter operation can also be started or stopped by GTHSCR. When count operation is started by a hardware source, this bit is automatically set to 1, and when count operation is stopped by a hardware source, this bit is automatically cleared to 0.

21.2.2 Noise Filter Control Register (NFCR)

The NFCR register controls enabling and disabling of the noise filters and selects the sampling clocks for the noise filters.

Address(es): GPT.NFCR A006 C002h

NFAnEN Bit (Noise Filter nA Enable) (n = 0 to 3)

This bit disables or enables the noise filter for input from the GTIOCnA pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register (GTIOR) or set the GTCR.MD[2:0] bits to a value other than saw-wave PWM mode (000b) before doing so.

NFBnEN Bit (Noise Filter nB Enable) (n = 0 to 3)

This bit disables or enables the noise filter for input from the GTIOCnB pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register (GTIOR) or set the GTCR.MD[2:0] bits to a value other than saw-wave PWM mode (000b) before doing so.

NFCSn Bits (Noise Filter Sampling Clock Select) (n = 0 to 3)

These bits set the sampling interval for the noise filters. When setting these bits, wait for two cycles of the selected sampling interval before setting the input-capture function.

21.2.3 General PWM Timer Hardware Source Start/Stop Control Register (GTHSCR)

GTHSCR starts or stops the GPTn.GTCNT counting operation by a hardware source (n = 0 to 3).
When starting and stopping of the GPTn.GTCNT counter by a hardware source occur simultaneously, counter start is given priority.

Address(es): GPT.GTHSCR A006 C004h

b15, b14	CPHW3[1:0]	GPT3.GTCNT Hardware Source Count Stop		R/W

CSHWn[1:0] Bits (GPTn.GTCNT Hardware Source Count Start) (n = 0 to 3)

The GPTn.GTCNT counter is started by a hardware source.
When the count operation is started by a hardware source, the corresponding bit in GTSTR automatically becomes 1.
The hardware source can be selected by GTHSSR.

CPHWn[1:0] Bits (GPTn.GTCNT Hardware Source Count Stop) (n = 0 to 3)

The GPTn.GTCNT counter is stopped by a hardware source.
When the count operation is stopped by a hardware source, the corresponding bit in GTSTR automatically becomes 0.
The hardware source can be selected by GTHPSR.

21.2.4 General PWM Timer Hardware Source Clear Control Register (GTHCCR)

GTHCCR sets clearing of GPTn.GTCNT by a hardware source (n = 0 to 3).
Once the clearing of GPTn.GTCNT counter by a hardware source is set, counter clearing by the hardware source is executed whether the GPTn.GTCNT count operation is performed (GTSTR.CSTn = 1; n = 0 to 3) or stopped (GTSTR.CSTn = 0; n = 0 to 3).

b7, b6	CCHW3[1:0]	GPT3.GTCNT Hardware Source Counter Clear		R/W
b8	CCSW0	GPT0.GTCNT Counter Clear	When 1 is written to this bit, the counter is cleared. This bit automatically returns to 0 after the writing of 1. These bits are read as 0.	R/W
b9	CCSW1	GPT1.GTCNT Counter Clear		R/W
b10	CCSW2	GPT2.GTCNT Counter Clear		R/W
b11	CCSW3	GPT3.GTCNT Counter Clear		R/W
b15 to b12	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

CCHWn[1:0] Bits (GPTn.GTCNT Hardware Source Count Clear) (n = 0 to 3)

GPTn.GTCNT is cleared by a hardware source.
The hardware source can be selected by GTHPSR.
When CCHWn[1:0] is 01b, 10b, or 11b, the hardware source can be accepted repeatedly.
When CCHWn[1:0] is set to 01b, 10b, or 11b simultaneously with setting of GTHSCR.CPHWn[1:0] for the same channel to 01b, 10b, or 11b, set the GPTn.GTCR.TPCS bits to 00b in advance.

CCSWn Bit (GPTn.GTCNT Counter Clear) (n = 0 to 3)

When 1 is written to this bit, the GPTn.GTCNT counter is cleared. This bit automatically returns to 0 after the writing of 1. This bit is always read as 0.

21.2.5 General PWM Timer Hardware Start Source Select Register (GTHSSR)

GTHSSR sets the hardware source to start GPTn.GTCNT (n = 0 to 3).
To change the source, clear the GTHSCR.CSHWn[1:0] bits to 0 before changing the source.

Address(es): GPT.GTHSSR A006 C008h

CSHSLn[3:0] Bits (GPTn.GTCNT Hardware Counter Start Source Select) (n = 0 to 3)

These bits select the hardware source to start GPTn.GTCNT.

Note: When 1000b is selected as the hardware source, clear b5 of the GPT3.GTIOR.GTIOA[5:0] bits and the GPT3.GTONCR.OAE bit to 0. When 1001b is selected as the hardware source, clear b5 of the GPT3.GTIOR.GTIOB[5:0] bits and the GPT3.GTONCR.OBE bit to 0.

21.2.6 General PWM Timer Hardware Stop/Clear Source Select Register (GTHPSR)

GTHPSR sets the hardware source to stop or clear GPTn.GTCNT (n = 0 to 3).
To change the source, clear the GTHSCR.CPHWn[1:0] bits and GTHCCR.CCHWn[1:0] bits to 0 before changing the source.

Address(es): GPT.GTHPSR A006 C00Ah

CSHPLn[3:0] Bits (GPTn.GTCNT Hardware Counter Stop/Clear Source Select) (n = 0 to 3)

These bits select the hardware source to stop or clear GPTn.GTCNT.

Note: When 1000b is selected as the stop/clear source, clear b5 of the GPT3.GTIOR.GTIOA[5:0] bits and the GPT3.GTONCR.OAE bit to 0. When 1001b is selected as the stop/clear source, clear b5 of the GPT3.GTIOR.GTIOB[5:0] bits and the GPT3.GTONCR.OBE bit to 0.

21.2.7 General PWM Timer Write-Protection Register (GTWP)

GTWP enables or disables writing to registers to prevent accidental modification.
For registers to which writing is enabled or disabled by the setting of the GPWP register, see section 21.7.1, Write-Protection for Registers.

Address(es): GPT.GTWP A006 C00Ch

b15 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

WPn Bit (GPTn Register Write Disable) (n = 0 to 3)

This bit enables or disables writing to GPTn registers.

21.2.8 General PWM Timer Sync Register (GTSYNC)

GTSYNC sets the clearing source of the GPTn.GTCNT counter for synchronized clearing/synchronized operation. This register can be modified when count operation of GPTn.GTCNT is stopped (n = 0 to 3).

Address(es): GPT.GTSYNC A006 C00Eh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

b15, b14	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

SYNCn[1:0] Bits (GPTn.GTCNT Counter Synchronized-Clear Source Select) (n = 0 to 3)

These bits select which channel's counter clearing source is used to clear GPTn.GTCNT. When setting the SYNCn[1:0] bits, first set the GPTn.GTCR.CCLR[1:0] bits to 11b (cleared by counter clearing in another channel performing synchronized clearing/synchronized operation).

21.2.9 General PWM Timer External Trigger Input Interrupt Register (GTETINT)

GTETINT enables or disables interrupts by the external trigger input pin (GTETRG).

Address(es): GPT.GTETINT A006 C010h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Bit	Symbol	Bit Name	Description	R/W
b0	ETIPEN	External Trigger Rising Input Interrupt Request Enable	0: Interrupt request is disabled 1: Interrupt request is enabled	R/W
b1	ETINEN	External Trigger Falling Input Interrupt Request Enable	0: Interrupt request is disabled 1: Interrupt request is enabled	R/W
b7 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b9, b8	—	Reserved	The read value is undefined. The write value should be 1.	R/W
b12 to b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b14, b13	GTENFCS[1:0]	GTETRG Noise Filter Sampling Clock Select	b14 b13 0 0: PCLKC/1 0 1: PCLKC/2 1 0: PCLKC/4 1 1: PCLKC/32	R/W
b15	GTETRGEN	GTETRG Noise Filter Enable	0: The noise filter for the GTETRG pin is disabled. 1: The noise filter for the GTETRG pin is enabled.	R/W

ETIPEN Bit (External Trigger Rising Input Interrupt Request Enable)

This bit enables or disables an interrupt request generated at the rising edge of an external trigger input.

ETINEN Bit (External Trigger Falling Input Interrupt Request Enable)

This bit enables or disables an interrupt request generated at the falling edge of an external trigger input.

GTENFCS[1:0] Bits (GTETRG Noise Filter Sampling Clock Select)

These bits set the sampling interval for the noise filters.

For the following registers and bits, wait for two cycles of the selected sampling interval after setting these bits, and then select the source of GTETRG and enable interrupt requests.

(1) Hardware start source select register GTHSSR. CSHSLn[3:0] (n = 0 to 3)
(2) Hardware stop clear source select register GTHPSR. CSHPLn [3:0] (n = 0 to 3)
(3) Output negate control register GTONCR.NFS[3:0]
(4) Interrupt request enable bits ETIPEN and ETINEN of this register

GTETRGEN Bit (GTETRG Noise Filter Enable)

This bit disables or enables the noise filter for input from the GTETRG pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, set the registers and bits as follows before doing so while interrupt requests are disabled.

(1) Hardware start source select register GTHSSR. CSHSLn[3:0] ≠ 1100b (n = 0 to 3)
(2) Hardware stop clear source select register GTHPSR. CSHPLn [3:0] ≠ 1100b (n = 0 to 3)
(3) Output negate control register GTONCR.NFS[3:0] ≠ 0111b
(4) Interrupt request enable bits ETIPEN and ETINEN of this register = 0b

21.2.10 General PWM Timer Buffer Operation Disable Register (GTBDR)

GTBDR collectively enables or disables buffer operation of each channel. Even though a bit in GTBDR is set to 0 (buffer operation is enabled), buffer operation is not performed unless buffer operation is enabled by GTBER.

Address(es): GPT.GTBDR A006 C014h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

b14	BD32	GPT3.GTADTR Buffer Operation Disable		R/W
b15	BD33	GPT3.GTDV Buffer Operation Disable		R/W

BDn0 Bit (GPTn.GTCCR Buffer Operation Disable) (n = 0 to 3)

This bit disables buffer operation using GPTn.GTCCRA, GPTn.GTCCRC, and GPTn.GTCCRD registers together and buffer operation using GPTn.GTCCRB, GPTn.GTCCRE, and GPTn.GTCCRF registers together.

BDn1 Bit (GPTn.GTPR Buffer Operation Disable) (n = 0 to 3)

This bit disables buffer operation using GPTn.GTPR, GPTn.GTPBR, and GPTn.GTPDBR registers together.

BDn2 Bit (GPTn.GTADTR Counter Buffer Operation Disable) (n = 0 to 3)

This bit disables buffer operation using GPTn.GTADTRA, GPTn.GTADTBRA, and GPTn.GTADTDBRA registers together and buffer operation using GPTn.GTADTRB, GPTn.GTADTBRB, and GPTn.GTADTDBRB registers together.

BDn3 Bit (GPTn.GTDV Counter Buffer Operation Disable) (n = 0 to 3)

This bit disables buffer operation using the GPTn.GTDVU and GPTn.GTDBU registers together and buffer operation using GPTn.GTDVD and GPTn.GTDBD registers together.

21.2.11 General PWM Timer Start Write-Protection Register (GTSWP)

GTSWP enables or disables writing to the GTSTR register to prevent accidental modification.

Address(es): GPT.GTSWP A006 C018h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	SWP3	SWP2	SWP1	SWP0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	SWP0	GTSTR.CST0 Bit Write Disable	0: Writing to the register is enabled 1: Writing to the register is disabled	R/W
b1	SWP1	GTSTR.CST1 Bit Write Disable		R/W
b2	SWP2	GTSTR.CST2 Bit Write Disable		R/W
b3	SWP3	GTSTR.CST3 Bit Write Disable		R/W
b15 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

SWPn Bit (GTSTR.CSTn Bit Write Disable) (n = 0 to 3)

This bit enables or disables writing to the GTSTR.CSTn bit.

When this bit is set to disable writing, writing to the GTSTR.CSTn bit is ignored.

However, if the GTHSCR register is set to allow counter operation to be started or stopped by a hardware source, the status of counter operation (started or stopped by a hardware source) is written to the GTSTR.CSTn bit even if the SWPn bit is set to disable writing to GTSTR.CSTn bit.

21.2.12 General PWM Timer I/O Control Register (GTIOR)

GPTn.GTIOR sets the functions of the GTIOCnA and GTIOCnB pins (n = 0 to 3). Each channel has one GTIOCnA pin and one GTIOCnB pin. Values written to the GTIOR register are ignored when write-protection is set to the relevant channel by the GTWP.WPn bit.

Address(es): GPT0.GTIOR A006 C100h, GPT1.GTIOR A006 C180h, GPT2.GTIOR A006 C200h, GPT3.GTIOR A006 C280h

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b5 to b0	GTIOA[5:0]	GTIOCnA Pin Function Select	See Table 21.4.	R/W
b6	OADFLT	Output Value at GTIOCnA Pin Count Stop	0: The GTIOCnA pin outputs low when counting is stopped. 1: The GTIOCnA pin outputs high when counting is stopped.	R/W
b7	OAHLD	Output Retain at GTIOCnA Pin Count Start/ Stop	0: The GTIOCnA pin output level at start/stop of counting depends on the register setting. 1: The GTIOCnA pin output level is retained at start/ stop of counting.	R/W
b13 to b8	GTIOB[5:0]	GTIOCnB Pin Function Select	See Table 21.4.	R/W
b14	OBDFLT	Output Value at GTIOCnB Pin Count Stop	0: The GTIOCnB pin outputs low when counting is stopped. 1: The GTIOCnB pin outputs high when counting is stopped.	R/W
b15	OBHLD	Output Retain at GTIOCnB Pin Count Start/ Stop	0: The GTIOCnB pin output level at start/stop of counting depends on the register setting. 1: The GTIOCnB pin output level is retained at start/ stop of counting.	R/W

Note: n = 0 to 3

GTIOA[5:0] Bits (GTIOCnA Pin Function Select)

These bits select the GTIOCnA pin function. For details, see Table 21.4.

OADFLT Bit (Output Value at GTIOCnA Pin Count Stop)

This bit sets whether the GTIOCnA pin outputs high or low when counting is stopped.

OAHLD Bit (Output Retain at GTIOCnA Pin Count Start/Stop)

This bit specifies whether the GTIOCnA pin output level is retained or the level depends on the register setting when counting is started or stopped.

[When the OAHLD bit is set to 0]

- The initial output value specified by the GTIOA bit in GTIOR is output when counting starts.
- The value specified by the OADFLT bit is output when counting stops.
- If the OADFLT bit is modified while counting is stopped, it is immediately reflected in the output.

[When the OAHLD bit is set to 1]

- The output is retained when counting starts or stops.

GTIOB[5:0] Bits (GTIOCnB Pin Function Select)

These bits select the GTIOCnB pin function. For details, see Table 21.4.

OBDFLT Bit (Output Value at GTIOCnB Pin Count Stop)

This bit sets whether the GTIOCnB pin outputs high or low when counting is stopped.

OBHLD Bit (Output Retain at GTIOCnB Pin Count Start/Stop)

This bit specifies whether the GTIOCnB pin output level is retained or the level depends on the register setting when counting is started or stopped.

[When the OBHLD bit is set to 0]

- The initial output value specified by the GTIOB bit in GTIOR is output when counting starts.
- The value specified by the OBDFLT bit is output when counting stops.
- If the OBDFLT bit is modified while counting is stopped, it is immediately reflected in the output.

[When the OBHLD bit is set to 1]

- The output is retained when counting starts or stops.

Table 21.4 Settings of GTIOA[5:0] Bits (GTIOB[5:0] Bits) (1 / 2)

0	1	0	1	0	1				Low output at GTPn.GTCCRA/ GTCCRB compare match
0	1	0	1	1	0				High output at GPTn.GTCCRA/ GTCCRB compare match
0	1	0	1	1	1				Toggle output at GPTn.GTCCRA/ GTCCRB compare match
0	1	1	0	0	0			High output at cycle end	Output retained at GTPn.GTCCRA/ GTCCRB compare match
0	1	1	0	0	1				Low output at GPTn.GTCCRA/ GTCCRB compare match
0	1	1	0	1	0				High output at GPTn.GTCCRA/ GTCCRB compare match
0	1	1	0	1	1				Toggle output at GPTn.GTCCRA/ GTCCRB compare match
0	1	1	1	0	0			Toggle output at cycle end	Output retained at GTPn.GTCCRA/ GTCCRB compare match
0	1	1	1	0	1				Low output at GPTn.GTCCRA/ GTCCRB compare match
0	1	1	1	1	0				High output at GPTn.GTCCRA/ GTCCRB compare match
0	1	1	1	1	1				Toggle output at GPTn.GTCCRA/ GTCCRB compare match
1	x	x	x	0	0	Input capture	Don't care		Input capture at rising edge
1	x	x	x	0	1				Input capture at falling edge
1	x	x	x	1	0				Input capture at both edges
1	x	x	x	1	1				

x: Don't care

Note 1. The cycle end is an overflow (GTCNT = GTPR in up-count operation) or underflow (GTCNT = 0 in down-count operation) for saw waves, and the trough (GTCNT = 0) for triangle waves.

Note 2. When the timing of a cycle end and the timing of a GTCCRA/GTCCRB compare match are the same in a compare-match operation, the b3-b2 setting is given priority in saw-wave PWM mode, and the b1-b0 setting is given priority in any other mode.

Note 3. Even though a compare match is set in GTIOR, output will not be made to the pins. GTONCR needs to be set separately.

21.2.13 General PWM Timer Interrupt Output Setting Register (GTINTAD)

GTINTAD enables or disables interrupt requests and A/D converter start requests. Values written to the GTINTAD register are ignored when write-protection is set to the relevant channel by the GTWP.WPn bit.

Address(es): GPT0.GTINTAD A006 C102h, GPT1.GTINTAD A006 C182h, GPT2.GTINTAD A006 C202h, GPT3.GTINTAD A006 C282h

GTINTA Bit (GTCCRA Compare Match/Input Capture Interrupt Enable)

This bit enables or disables interrupt requests by GTCCRA compare match/input capture (GTCIA). Values written to the GTINTAD register are ignored when write-protection is set to the relevant channel by the GTWP.WPn bit.

GTINTB Bit (GTCCRB Compare Match/Input Capture Interrupt Enable)

This bit enables or disables interrupt requests by GTCCRB compare match/input capture (GTCIB).

GTINTC Bit (GTCCRC Compare Match Interrupt Enable)

This bit enables or disables interrupt requests by GTCCRC compare match (GTCIC).

GTINTD Bit (GTCCRD Compare Match Interrupt Enable)

This bit enables or disables interrupt requests by GTCCRD compare match (GTCIC). The interrupt request is generated as a GTCIC interrupt.

GTINTE Bit (GTCCRE Compare Match Interrupt Enable)

This bit enables or disables interrupt requests by GTCCRE compare match (GTCIE).

GTINTF Bit (GTCCRF Compare Match Interrupt Enable)

This bit enables or disables interrupt requests by GTCCRF compare match (GTCIE). The interrupt request is generated as a GTCIE interrupt.

GTINTPR[1:0] Bits (GTPR Compare Match Interrupt Request Setting)

These bits enable or disable interrupt requests by a GTPR compare match (GTCNT counter overflow) and those by a GTCNT counter underflow (GTCIV/GTCIU).

EINT Bit (Dead Time Error Interrupt Enable)

This bit enables or disables interrupt requests by a dead time error (GDTE). The interrupt request is generated as a GDTE interrupt.

ADTRAUEN Bit (GTADTRA Compare Match (Up-Count Operation) A/D Converter Start Request Enable)

This bit enables or disables A/D converter start requests generated by GTADTRA compare matches during GTCNT up-count operation.

ADTRADEN Bit (GTADTRA Compare Match (Down-Count Operation) A/D Converter Start Request Enable)

This bit enables or disables A/D converter start requests generated by GTADTRA compare matches during GTCNT down-count operation.

ADTRBUEN Bit (GTADTRB Compare Match (Up-Count Operation) A/D Converter Start Request Enable)

This bit enables or disables A/D converter start requests generated by GTADTRB compare matches during GTCNT up-count operation.

ADTRBDEN Bit (GTADTRB Compare Match (Down-Count Operation) A/D Converter Start Request Enable)

This bit enables or disables A/D converter start requests generated by GTADTRB compare matches during GTCNT down-count operation.

21.2.14 General PWM Timer Control Register (GTCR)

GTCR controls GTCNT. GTCR should be set while GTCNT operation is stopped. Values written to the GTCR register are ignored when write-protection is set to the relevant channel by the GTWP.WPn bit.

Address(es): GPT0.GTCR A006 C104h, GPT1.GTCR A006 C184h, GPT2.GTCR A006 C204h, GPT3.GTCR A006 C284h

b11, b10	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b13, b12	CCLR[1:0]	Counter Clear Source Select	b13 b12 0 0: None of the clearing sources is specified. 0 1: Cleared by GTCCRA input capture 1 0: Cleared by GTCCRB input capture 1 1: Cleared by counter clearing in another channel performing synchronous clearing/synchronous operation	R/W
b15, b14	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

MD[2:0] Bits (Mode Select)

These bits select the GPT operating mode.

TPCS[1:0] Bits (Timer Prescaler Select)

These bits select the clock for GTCNT. A clock source can be selected independently for each channel.

CCLR[1:0] Bits (Counter Clear Source Select)

These bits select the clearing source for GTCNT.

In saw-wave mode, when synchronous clearing is selected, synchronous clearing is handled equally to clearing by the counter's overflow or underflow and the pin output and buffer transfer are performed.

Even if the GTINTAD.GTINTPR[1:0] bits are set to 01b, 10b, or 11b at this time, the GTCIV interrupt is not requested.

In triangle-wave mode, when synchronous clearing is selected, only counter clearing is performed. Though the counter value becomes 0, it is not handled as a trough.

Once 01b, 10b, or 11b is selected as a counter clear source, counter clearing by the source is executed whether the GPTn.GTCNT count operation is performed (GTSTR.CSTn = 1; n = 0 to 3) or stopped (GTSTR.CSTn = 0, n = 0 to 3).

Do not set the CCLR[1:0] bits for a channel that is currently operating to 01b or 10b during synchronous clearing.

21.2.15 General PWM Timer Buffer Enable Register (GTBER)

GTBER makes settings for buffer operation.

GTBER should be set while GTCNT operation is stopped. Values written to the GTBER register are ignored when write-protection is set to the relevant channel by the GTWP.WPn bit.

Address(es): GPT0.GTBER A006 C106h, GPT1.GTBER A006 C186h, GPT2.GTBER A006 C206h, GPT3.GTBER A006 C286h

Bit	Symbol	Bit Name	Description	R/W
b15	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

CCRA[1:0] Bits (GTCCRA Buffer Operation)

These bits set buffer operation with GTCCRA, GTCCRC, and GTCCRD combined. When buffer operation is restricted by the operating mode set in GTCR, the GTCR setting is given priority.*1

CCRB[1:0] Bits (GTCCRB Buffer Operation)

These bits set buffer operation with GTCCRB, GTCCRE, and GTCCRF combined. When buffer operation is restricted by the operating mode set in GTCR, the GTCR setting is given priority.*1

PR[1:0] Bits (GTPR Buffer Operation)

These bits set buffer operation with GTPR, GTPBR, and GTPDBR combined.
For down-counting in saw-wave mode, set the PR[1:0] bits to 00b (buffered operation does not proceed).

CCRSWT Bit (GTCCRA and GTCCRB Forcible Buffer Operation)

Writing 1 to the CCRSWT bit forcibly performs buffer transfer of GTCCRA and GTCCRB. This bit automatically returns to 0 after the writing of 1. This bit is read as 0.
This bit is valid only when counting is stopped with compare match operation specified.

ADTTA[1:0] Bits (GTADTRA Buffer Transfer Timing Select)

These bits set the transfer timing for buffer operation of GTADTRA, GTADTBRA, and GTADTDBRA.

ADTDA Bit (GTADTRA Double Buffer Operation)

These bits set buffer operation with GTADTRA, GTADTBRA, and GTADTDBRA combined.

ADTTB[1:0] Bits (GTADTRB Buffer Transfer Timing Select)

These bits set the transfer timing for buffer operation of GTADTRB, GTADTBRB, and GTADTDBRB.

ADTDB Bit (GTADTRB Double Buffer Operation)

These bits set buffer operation with GTADTRB, GTADTBRB, and GTADTDBRB combined.

Note 1. The buffer operation mode is fixed in saw-wave one-shot pulse mode or triangle-wave PWM mode 3 (32-bit transfer at trough).

21.2.16 General PWM Timer Count Direction Register (GTUDC)

GTUDC sets the direction in which GTCNT counts (up-counting or down-counting).

- In saw-wave mode

When the UD value is set to 0 during up-counting, the count direction is changed at an overflow (GTCNT counter value = GTPR register value). When the UD value is set to 1 during up-counting, the count direction is changed at an underflow (GTCNT counter value = 0).
If the UD value is changed from 1 to 0 with the UDF bit being 0 and while counting is stopped, the counter starts up-count operation and the count direction is changed at an overflow (GTCNT counter value = GTPR register value).
If the UD value is changed from 0 to 1 with the UDF bit being 0 and while counting is stopped, the counter starts down-count operation and the count direction is changed at an underflow (GTCNT counter value = 0).
When the UDF bit is set to 1 while counting is stopped, the UD bit value at that time is reflected in the count direction when counting starts.

- In triangle-wave mode

Even if the UD value is changed during counting, the change will not be reflected in the count direction.
If the UD value is modified while the UDF bit is 0 and counting is stopped, the change will not be reflected in the count direction when counting starts. If the UDF bit is set to 1 while counting is stopped, the UD bit value at that time is reflected in the count direction when counting starts.

Address(es): GPT0.GTUDC A006 C108h, GPT1.GTUDC A006 C188h, GPT2.GTUDC A006 C208h, GPT3.GTUDC A006 C288h

b1	UDF	Forcible Count Direction Setting	0: Not forcibly set 1: Forcibly set	R/W
b15 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

UD Bit (Count Direction Setting)

This bit sets the count direction (up-counting or down-counting) for GTCNT.

UDF Bit (Forcible Count Direction Setting)

This bit forcibly sets the count direction when GTCNT starts operation as the UD value.
Only 0 should be written to this bit during counter operation.
When 1 has been written to this bit while counting is stopped, this bit should be returned to 0 before counting starts.

21.2.17 General PWM Timer Interrupt and A/D Converter Start Request Skipping Setting Register (GTITC)

GTITC sets the skipping function for GTCNT counter overflow (GTPR compare match) interrupt (GTCIV) or underflow interrupts (GTCIU) and also sets whether to link the other interrupts and A/D converter start requests with the GTCIV/GTCIU interrupt skipping function. Note that dead time error interrupts cannot be linked with the GTCIV/GTCIU interrupt skipping function.

Values written to the GTITC register are ignored when write-protection is set to the relevant channel by the GTWP.WPn bit.

Address(es): GPT0.GTITC A006 C10Ah, GPT1.GTITC A006 C18Ah, GPT2.GTITC A006 C20Ah, GPT3.GTITC A006 C28Ah

ITLA Bit (GTCCRA Compare Match/Input Capture Interrupt Link)

This bit specifies whether to link the GTCCRA compare match/input capture interrupt (GTCIA) with the GTCIV/GTCIU interrupt skipping function.

ITLB Bit (GTCCRB Compare Match/Input Capture Interrupt Link)

This bit specifies whether to link the GTCCRB compare match/input capture interrupt (GTCIB) with the GTCIV/GTCIU interrupt skipping function.

ITLC Bit (GTCCRC Compare Match Interrupt Link)

This bit specifies whether to link the GTCCRC compare match interrupt (GTCIC) with the GTCIV/GTCIU interrupt skipping function.

ITLD Bit (GTCCRD Compare Match Interrupt Link)

This bit specifies whether to link the GTCCRD compare match interrupt (GTCIC) with the GTCIV/GTCIU interrupt skipping function.

ITLE Bit (GTCCRE Compare Match Interrupt Link)

This bit specifies whether to link the GTCCRE compare match interrupt (GTCIE) with the GTCIV/GTCIU interrupt skipping function.

ITLF Bit (GTCCRF Compare Match Interrupt Link)

This bit specifies whether to link the GTCCRF compare match interrupt (GTCIE) with the GTCIV/GTCIU interrupt skipping function.

IVTC[1:0] Bits (GTCIV/GTCIU Interrupt Skipping Function Select)

These bits set the skipping function for the GTPR compare match (GTCNT overflow) interrupt (GTCIV) or GTCNT underflow interrupt (GTCIU).

IVTT[2:0] Bits (GTCIV Interrupt Skipping Count Select)

These bits set the skipping count for the GTPR compare match (GTCNT overflow) interrupt (GTCIV) or GTCNT underflow interrupt (GTCIU).
When modifying the IVTT[2:0] bits, first set the IVTC[1:0] bits to 00b.

ADTAL Bit (GTADTRA A/D Converter Start Request Link)

This bit specifies whether to link the GTADTRA A/D converter start request with GTCIVn/GTCIUn interrupt skipping function. (n = 0 to 3)

ADTBL Bit (GTADTRB A/D Converter Start Request Link)

This bit specifies whether to link the GTADTRB A/D converter start request with GTCIVn/GTCIUn interrupt skipping function. (n = 0 to 3)

21.2.18 General PWM Timer Status Register (GTST)

GTST indicates the status of the GPT. Values written to the GTST register are ignored when write-protection is set to the relevant channel by the GTWP.WPn bit.

Address(es): GPT0.GTST A006 C10Ch, GPT1.GTST A006 C18Ch, GPT2.GTST A006 C20Ch, GPT3.GTST A006 C28Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Value after reset:	1	0	0	0	0	0	0	0	x	x	x	x	x	x	x	x

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b7 to b0	—	Reserved	The read value is undefined.	R
b10 to b8	ITCNT[2:0]	GTCIV/GTCIU Interrupt Skipping Count Counter	Counter for counting the number of times a timer interrupt has been skipped.	R
b11	DTEF	Dead Time Error Flag	0: No dead time error has occurred. 1: A dead time error has occurred.	R
b14 to b12	—	Reserved	These bits are read as 0.	R
b15	TUCF	Count Direction Flag	0: The GPTn.GTCNT counter counts downward. 1: The GPTn.GTCNT counter counts upward.	R

ITCNT[2:0] Bits (GTCIV Interrupt Skipping Count Counter)

When the GTCIV/GTCIU interrupt skipping function is used (the GTITC.IVTC[1:0] bits are set to a value other than 00b), the counter is incremented by 1 every time the GTCIV/GTCIU interrupt source is generated.

[Clearing conditions]

- The GTCIV/GTCIU interrupt skipping function is not used (GTITC.IVTT[2:0] is 000b when GTITC.IVTC[1:0] is 00b).
- The GTCIV/GTCIU interrupt skipping count matches the specified count (ITCNT[2:0] matches the skipping count specified by GTITC.IVTT[2:0]).

DTEF Flag (Dead Time Error Flag)

This flag indicates that the timer output toggle point after the automatic addition of dead time has exceeded the timer cycle.

This flag returns to 0 when the timer output toggle point after the automatic addition of dead time is back within the cycle. This flag can only be read from. (Writing 0 to clear the flag is not allowed.)

When an interrupt by the DTEF flag is enabled (GTINTAD.EINT = 1), a GDTE interrupt is generated every time the DTEF flag changes from 0 to 1.

[Setting condition]

- The timer output toggle point after the automatic addition of dead time has exceeded the timer cycle.

[Clearing condition]

- The timer output toggle point after the automatic addition of dead time is within the timer cycle.

TUCF Flag (Count Direction Flag)

This flag indicates the count direction of GTCNT.

21.2.19 General PWM Timer Counter (GTCNT)

GTCNT is a 16-bit readable/writable counter. There is a total of four GTCNT counters, one counter for each channel. GTCNT can be written to only when counting is stopped; GTCNT cannot be written to during counting operation. GTCNT should always be accessed in 16-bits. Access in 8-bit units is prohibited. Values written to the GTCNT counter are ignored when write-protection is set to the relevant channel by the GTWP.WPn bit.

Address(es): GPT0.GTCNT A006 C10Eh, GPT1.GTCNT A006 C18Eh, GPT2.GTCNT A006 C20Eh, GPT3.GTCNT A006 C28Eh

21.2.20 General PWM Timer Compare Capture Register m (GTCCRm) (m = A to F)

GTCCRm registers are 16-bit readable/writable registers. There is a total of 24 GTCCRm registers, six registers for each channel.
GTCCRA and GTCCRB are registers used for both output compare and input capture.
GTCCRC and GTCCRE are compare match registers that can also function as buffer registers for GTCCRA and GTCCRB.
GTCCRD and GTCCRF are compare match registers that can also function as buffer registers for GTCCRC and GTCCRE (double-buffer registers for GTCCRA and GTCCRB). Values written to GTCCRm registers are ignored when write-protection is set to the relevant channel by the GTWP.WPn bit.

Address(es): GPT0.GTCCRA A006 C110h, GPT0.GTCCRB A006 C112h, GPT0.GTCCRC A006 C114h, GPT0.GTCCRD A006 C116h, GPT0.GTCCRE A006 C118h, GPT0.GTCCRF A006 C11Ah, GPT1.GTCCRA A006 C190h, GPT1.GTCCRB A006 C192h, GPT1.GTCCRC A006 C194h, GPT1.GTCCRD A006 C196h, GPT1.GTCCRE A006 C198h, GPT1.GTCCRF A006 C19Ah, GPT2.GTCCRA A006 C210h, GPT2.GTCCRB A006 C212h, GPT2.GTCCRC A006 C214h, GPT2.GTCCRD A006 C216h, GPT2.GTCCRE A006 C218h, GPT2.GTCCRF A006 C21Ah, GPT3.GTCCRA A006 C290h, GPT3.GTCCRB A006 C292h, GPT3.GTCCRC A006 C294h, GPT3.GTCCRD A006 C296h, GPT3.GTCCRE A006 C298h, GPT3.GTCCRF A006 C29Ah

Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

21.2.21 General PWM Timer Cycle Setting Register (GTPR)

GTPR is a 16-bit readable/writable register that sets the maximum count value of GTCNT. There is a total of four GTPR registers, one register for each channel.
For saw waves, the value of (GTPR × 1) is the cycle. For triangle waves, the value of (GTPR value × 2) is the cycle.
Values written to the GTPR register are ignored when write-protection is set to the relevant channel by the GTWP.WPn bit. Do not modify the GTPR register during down-counting in saw-wave mode.

Address(es): GPT0.GTPR A006 C11Ch, GPT1.GTPR A006 C19Ch, GPT2.GTPR A006 C21Ch, GPT3.GTPR A006 C29Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

21.2.22 General PWM Timer Cycle Setting Buffer Register (GTPBR)

GTPBR is a 16-bit readable/writable register that functions as a buffer register for GTPR. There is a total of four GTPPR registers, one register for each channel. Values written to the GTPBR register are ignored when write-protection is set to the relevant channel by the GTWP.WPn bit.

Address(es): GPT0.GTPBR A006 C11Eh, GPT1.GTPBR A006 C19Eh, GPT2.GTPBR A006 C21Eh, GPT3.GTPBR A006 C29Eh

Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

21.2.23 General PWM Timer Cycle Setting Double-Buffer Register (GTPDBR)

GTPDBR is a 16-bit readable/writable register that functions as a buffer register for GTPBR (double-buffer register for GTPR). There is a total of four GTPDBR registers, one register for each channel. Values written to the GTPDBR register are ignored when write-protection is set to the relevant channel by the GTWP.WPn bit.

Address(es): GPT0.GTPDBR A006 C120h, GPT1.GTPDBR A006 C1A0h, GPT2.GTPDBR A006 C220h, GPT3.GTPDBR A006 C2A0h

Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

21.2.24 A/D Converter Start Request Timing Register m (GTADTRm) (m = A, B)

GTADTRm registers are 16-bit readable/writable registers that set the timing of A/D converter start request generation. When the GTADTRm value matches the GTCNT counter value, an A/D converter start request is generated. There is a total of eight GTPPRm registers, two register for each channel.

GTADTRm should always be accessed in 16-bit units. Access in 8-bit units is prohibited. Values written to GTADTRm registers are ignored when write-protection is set to the relevant channel by the GTWP.WPn bit.

Address(es): GPT0.GTADTRA A006 C124h, GPT1.GTADTRA A006 C1A4h, GPT2.GTADTRA A006 C224h, GPT3.GTADTRA A006 C2A4h, GPT0.GTADTRB A006 C12Ch, GPT1.GTADTRB A006 C1ACh, GPT2.GTADTRB A006 C22Ch, GPT3.GTADTRB A006 C2ACh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

21.2.25 A/D Converter Start Request Timing Buffer Register m (GTADTBRm) (m = A, B)

GTADTBRm registers are 16-bit readable/writable registers that function as buffer registers for GTADTRm. There is a total of eight GTPPBRm registers, two register for each channel.
GTADTBRm should always be accessed in 16-bit units. Access in 8-bit units is prohibited. Values written to GTADTBRm registers are ignored when write-protection is set to the relevant channel by the GTWP.WPn bit.

Address(es): GPT0.GTADTBRA A006 C126h, GPT1.GTADTBRA A006 C1A6h, GPT2.GTADTBRA A006 C226h, GPT3.GTADTBRA A006 C2A6h, GPT0.GTADTBRB A006 C12Eh, GPT1.GTADTBRB A006 C1AEh, GPT2.GTADTBRB A006 C22Eh, GPT3.GTADTBRB A006 C2AEh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

21.2.26 A/D Converter Start Request Timing Double-Buffer Register m (GTADTDBRm) (m = A, B)

GTADTDBRm registers are 16-bit readable/writable registers that function as buffer registers for GTADTBRm (double-buffer registers for GTADTR). There is a total of eight GTPPDBRm registers, two register for each channel.
GTADTDBRm should always be accessed in 16-bit units. Access in 8-bit units is prohibited. Values written to GTADTDBRm registers are ignored when write-protection is set to the relevant channel by the GTWP.WPn bit.

Address(es): GPT0.GTADTDBRA A006 C128h, GPT1.GTADTDBRA A006 C1A8h, GPT2.GTADTDBRA A006 C228h, GPT3.GTADTDBRA A006 C2A8h,
GPT0.GTADTDBRB A006 C130h, GPT1.GTADTDBRB A006 C1B0h, GPT2.GTADTDBRB A006 C230h, GPT3.GTADTDBRB A006 C2B0h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

21.2.27 General PWM Timer Output Negate Control Register (GTONCR)

GTONCR controls negate of the GTIOCnA pin output and GTIOCnB pin output. Values written to the GTONCR register are ignored when write-protection is set to the relevant channel by the GTWP.WPn bit.

Address(es): GPT0.GTONCR A006 C134h, GPT1.GTONCR A006 C1B4h, GPT2.GTONCR A006 C234h, GPT3.GTONCR A006 C2B4h

Note: n = 0 to 3

NEA Bit (GTIOCnA Pin Negate Control Enable)

This bit enables negate control of the GTIOCnA pin output.

NEB Bit (GTIOCnB Pin Negate Control Enable)

This bit enables negate control of the GTIOCnB pin output.

NVA Bit (GTIOCnA Pin Negate Value Setting)

This bit sets the output value of the GTIOCnA pin at negate control.

NVB Bit (GTIOCnB Pin Negate Value Setting)

This bit sets the output value of the GTIOCnB pin at negate control.

NFS[3:0] Bits (GTIOC Output Negate Source Select)

These bits select the negate source for the GTIOCnA pin output and GTIOCnB pin output.

NFV Bit (Negate Source Polarity Select)

This bit selects the negate source polarity for the GTIOCnA pin output and GTIOCnB pin output.

SWN Bit (Software Negate Control)

This bit specifies whether to provide negate control for the GTIOCnA pin output and GTIOCnB pin output.
This bit setting is valid when software control is selected as the negate source (NFS[3] bit is set to 1).

OAE Bit (GTIOCnA Pin Output Enable)

This bit selects whether to output the GTIOCnA pin output. This bit setting is valid only when compare match has been set (the GTIOR.GTIOA[5] bit is 0).

OBE Bit (GTIOCnB Pin Output Enable)

This bit selects whether to output the GTIOCnB pin output. This bit setting is valid only when compare match has been set (the GTIOR.GTIOB[13] bit is 0).

21.2.28 General PWM Timer Dead Time Control Register (GTDTCR)

GTDTCR enables automatic setting of a compare match value for negative-phase waveform with dead time. Values written to the GTDTCR register are ignored when write-protection is set to the relevant channel by the GTWP.WPn bit.

Address(es): GPT0.GTDTCR A006 C136h, GPT1.GTDTCR A006 C1B6h, GPT2.GTDTCR A006 C236h, GPT3.GTDTCR A006 C2B6h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	TDFER	—	—	TDBDE	TDBUE	—	—	—	TDE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	TDE	Negative-Phase Waveform Setting	0: GTCCRB is set without using GTDVU and GTDVD. 1: GTDVU and GTDVD are used to set the compare match value for negative-phase waveform with dead time automatically in GTCCRB.	R/W
b3 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b4	TDBUE	GTDVU Buffer Operation Enable	0: GTDVU buffer operation is disabled 1: GTDVU buffer operation is enabled	R/W
b5	TDBDE	GTDVD Buffer Operation Enable	0: GTDVD buffer operation is disabled 1: GTDVD buffer operation is enabled	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W
b8	TDFER	GTDVD Setting	0: GTDVU and GTDVD are set separately. 1: The value written to GTDVU is automatically set to GTDVD.	R/W
b15 to b9	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

TDE Bit (Negative-Phase Waveform Setting)

This bit sets whether to use GTDVU and GTDVD. When GTDVU and GTDVD are used, the compare match value for a negative-phase waveform with dead time that was obtained by the compare match value of a positive-phase waveform (GTCCRA) and the dead time value (GTDVU and GTDVD) is automatically set in GTCCRB.
The TDE bit setting is ignored in saw-wave PWM mode, and automatic setting does not take place.

The automatically set GTCCRB value has the following upper and lower limit values. If the obtained GTCCRB value is not within the upper or lower limit, the following limit value is set in GTCCRB and the GPTn.GTST.DTEF flag is set to 1.

- Triangle waves
  Upper limit value: GTPR register value - 1
  Lower limit value: 1 in up-counting, 0 in down-counting
- Saw-wave one-shot pulse mode
  Upper limit value: GTPR register value
  Lower limit value: 0

TDBUE Bit (GTDVU Buffer Operation Enable)

This bit enables buffer operation with GTDVU and GTDBU combined.
The buffer transfer timing is the trough for triangle waves, and an overflow or underflow for saw waves.

TDBDE Bit (GTDVD Buffer Operation Enable)

This bit enables buffer operation with GTDVD and GTDBD combined.
The buffer transfer timing is the trough for triangle waves, and an overflow or underflow for saw waves.
When this bit and the TDFER bit are set to 1 simultaneously, the TDFER bit setting is given priority.

TDFER Bit (GTDVD Setting)

This bits sets whether or not the value written to GTDVU is also set to GTDVD automatically.

21.2.29 General PWM Timer Dead Time Value Register m (GTDVm) (m = U, D)

GTDVm is a 16-bit readable/writable register that sets the dead time for generating PWM waveforms with dead time.
There is a total of eight GTDVm registers, two registers for each channel: GTDVU used for up-counting and GTDVD used for down-counting.
Setting a dead time value that exceeds the cycle is prohibited. The set value can be confirmed by reading from GTCCRB.
When GTDVm is used, writing to GTCCRB is prohibited.
When this register is set to 0, waveforms without dead time are output.
GTDVm should always be accessed in 16-bit units. Access in 8-bit units is prohibited. Values written to GTDVm registers are ignored when write-protection is set to the relevant channel by the GTWP.WPn bit.

Address(es): GPT0.GTDVU A006 C138h, GPT1.GTDVU A006 C1B8h, GPT2.GTDVU A006 C238h, GPT3.GTDVU A006 C2B8h, GPT0.GTDVD A006 C13Ah, GPT1.GTDVD A006 C1BAh, GPT2.GTDVD A006 C23Ah, GPT3.GTDVD A006 C2BAh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

21.2.30 General PWM Timer Dead Time Buffer Register m (GTDBm) (m = U, D)

GTDBm is a 16-bit readable/writable register that functions as a buffer register for GTDVm.
There is a total of eight GTDBm registers, two registers for each channel: GTDBU used for up-counting and GTDBD used for down-counting. Values written to GTDBm registers are ignored when write-protection is set to the relevant channel by the GTWP.WPn bit.

Address(es): GPT0.GTDBU A006 C13Ch, GPT1.GTDBU A006 C1BCh, GPT2.GTDBU A006 C23Ch, GPT3.GTDBU A006 C2BCh, GPT0.GTDBD A006 C13Eh, GPT1.GTDBD A006 C1BEh, GPT2.GTDBD A006 C23Eh, GPT3.GTDBD A006 C2BEh

Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

21.2.31 General PWM Timer Output Protection Function Status Register (GTSOS)

GTSOS is a status register that indicates the status of the output protection function. The output protection function is enabled only when the dead time is automatically set (GTDTCR.TDE bit = 1) in triangle-wave mode. Values written to the GTSOTR register are ignored when write-protection is set to the relevant channel by the GTWP.WPn bit.

Address(es): GPT0.GTSOS A006 C140h, GPT1.GTSOS A006 C1C0h, GPT2.GTSOS A006 C240h, GPT3.GTSOS A006 C2C0h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Value after reset:	0	0	0	0	0	0	x	x	0	0	0	0	0	0	0	0

x: Undefined

Bit	Symbol	Bit Name	Description	R/W
b1, b0	SOS[1:0]	Output Protection Function Status	b1 b0 0 0: Normal operation 0 1: Protected state (GTCCRA = 0 is set during transfer at trough or crest) 1 0: Protected state (GTCCRA ≥ GTPR is set during transfer at trough) 1 1: Protected state (GTCCRA ≥ GTPR is set during transfer at crest)	R
b7 to b2	—	Reserved	These bits are read as 0 and cannot be modified.	R
b9, b8	—	Reserved	The read value is undefined. These bits cannot be modified.	R
b15 to b10	—	Reserved	These bits are read as 0 and cannot be modified.	R

SOS Bit (Output Protection Function Status)

This bit indicates the status of the output protection function in triangle-wave PWM mode. For details of the output protection function, see section 21.7.4, Output Protection Function for GTIOC Pin Output.

21.2.32 General PWM Timer Output Protection Function Temporary Release Register (GTSOTR)

GTSOTR temporarily releases the protected state of GTIOCnB pin output when output protection has been set. The protected state can be released only for the case of GTSOS.SOS[1:0] bits = 10b (protected state in which GTCCRA ≥ GTPR has occurred during transfer at trough). The protected state cannot be released for any other case. Values written to the GTSOTR register are ignored when write-protection is set to the relevant channel by the GTWP.WPn bit.

Address(es): GPT0.GTSOTR A006 C142h, GPT1.GTSOTR A006 C1C2h, GPT2.GTSOTR A006 C242h, GPT3.GTSOTR A006 C2C2h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SOTR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	SOTR	Output Protection Function Temporary Release	0: Protected state is not released 1: Protected state is released	R/W
b15 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

SOTR Bit (Output Protection Function Temporary Release)

This bit sets whether to temporarily release the protected state of the GTIOCnB pin output in an output protected state. After the SOTR bit has been set to 1, the output protection function is canceled from the first trough. After the SOTR bit has been set to 0, output protection is resumed from the first trough.

21.3 Operation

21.3.1 Basic Operation

Each channel has a 16-bit timer which performs up-counting, down-counting, and up-/down-counting.
The cycle is controlled by compare register GTPR.
When the counter value matches the value in GTCCRA or GTCCRB, the output from the corresponding pin GTIOCnA or GTIOCnB can be changed (n = 0 to 3). GTCCRA or GTCCRB can be used as an input capture register with the GTIOCnA or GTIOCnB pin as the input.
GTCCRC and GTCCRD can function as buffer registers of GTCCRA, and GTCCRE and GTCCRF can function as buffer registers of GTCCRB.

21.3.1.1 Counter Operation

(1) Periodic Count Operation (in Up-Count Operation)

The counter in each channel starts up-count operation when the corresponding GTSTS.CSTn bit is set to 1. When the GTCNT value matches the GTPR value (overflow), the GTST.TCFPO flag is set to 1. If the GTINTAD.GTINTPR[0] bit is 1 at this time, a GTCIV interrupt is requested. After GTCNT overflows, up-count operation is resumed from 0000h.
Figure 21.2 shows an example of periodic count operation in up-count operation.

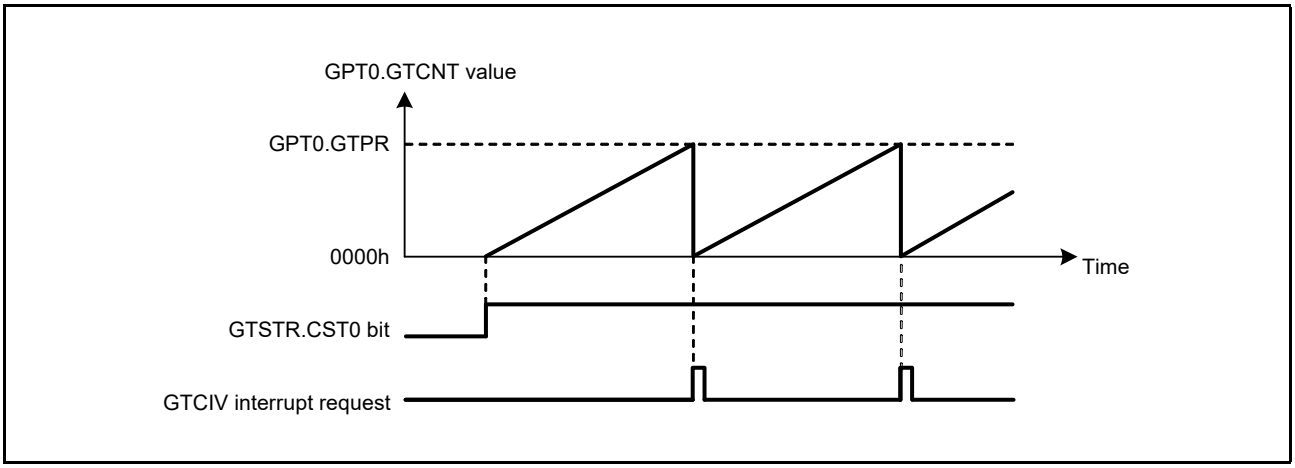

Figure 21.2 Example of Periodic Count Operation (in Up-Count Operation)

Figure 21.3 shows an example for setting periodic count operation in up-count operation.

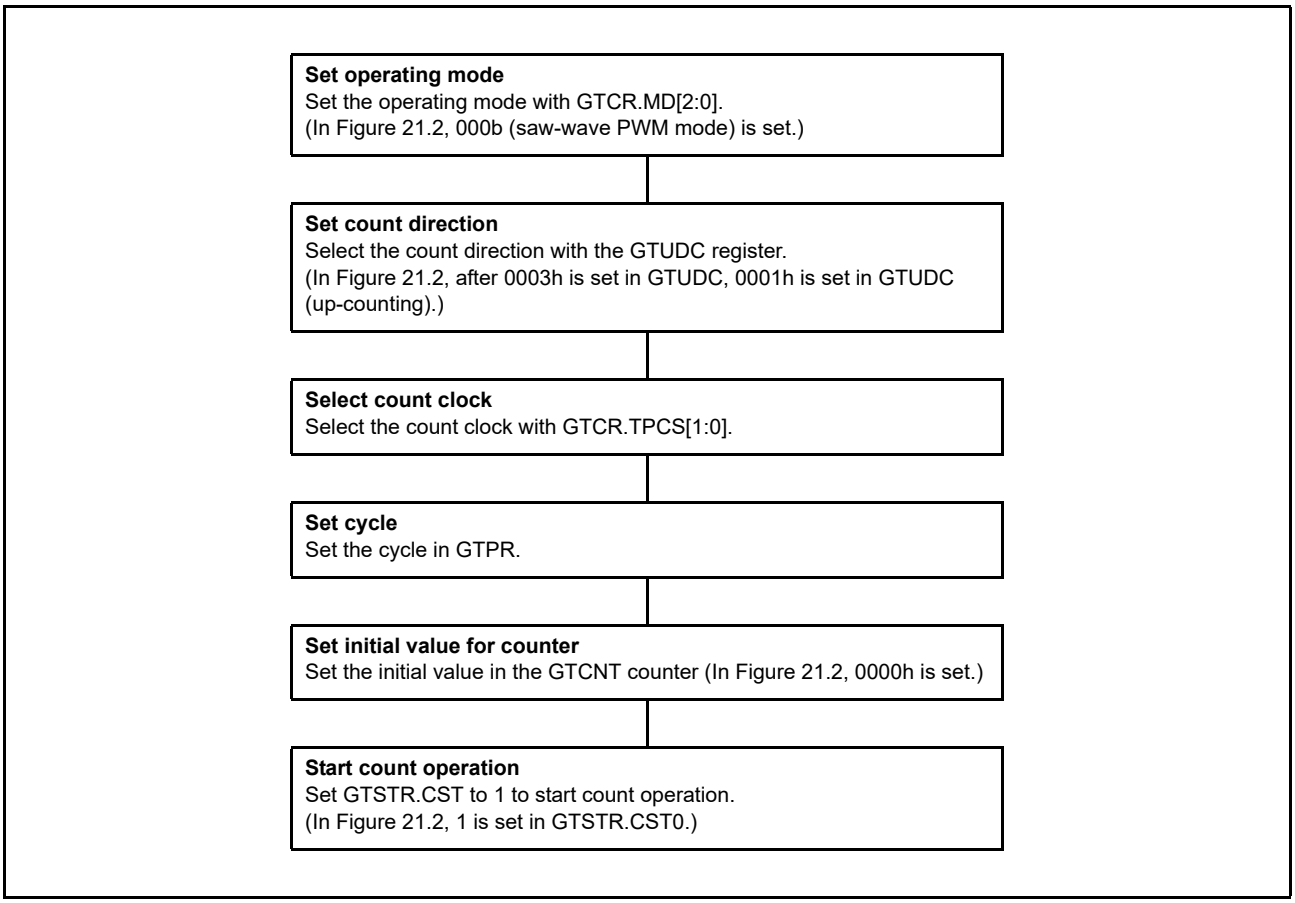

Figure 21.3 Example for Setting Periodic Count Operation (in Up-Count Operation)

(2) Periodic Count Operation (in Down-Count Operation)

The counter in each channel can perform down-count operation by setting GTUDC.
When GTCNT reaches 0 (underflow), the GTST.TCFPU flag is set to 1. If the GTINTAD.GTINTPR[1] bit is 1 at this time, a GTCIU interrupt is requested. After the GTCNT counter underflows, down-count operation is resumed from the GTPR value.
Figure 21.4 shows an example of periodic count operation in down-count operation.

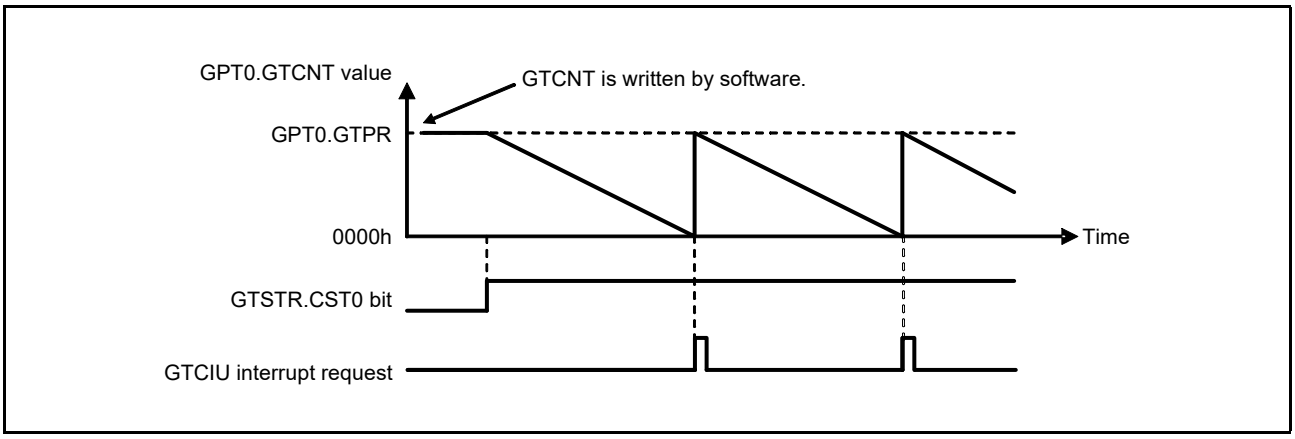

Figure 21.4 Example of Periodic Count Operation (in Down-Count Operation)

Figure 21.5 shows an example for setting periodic count operation in down-count operation.

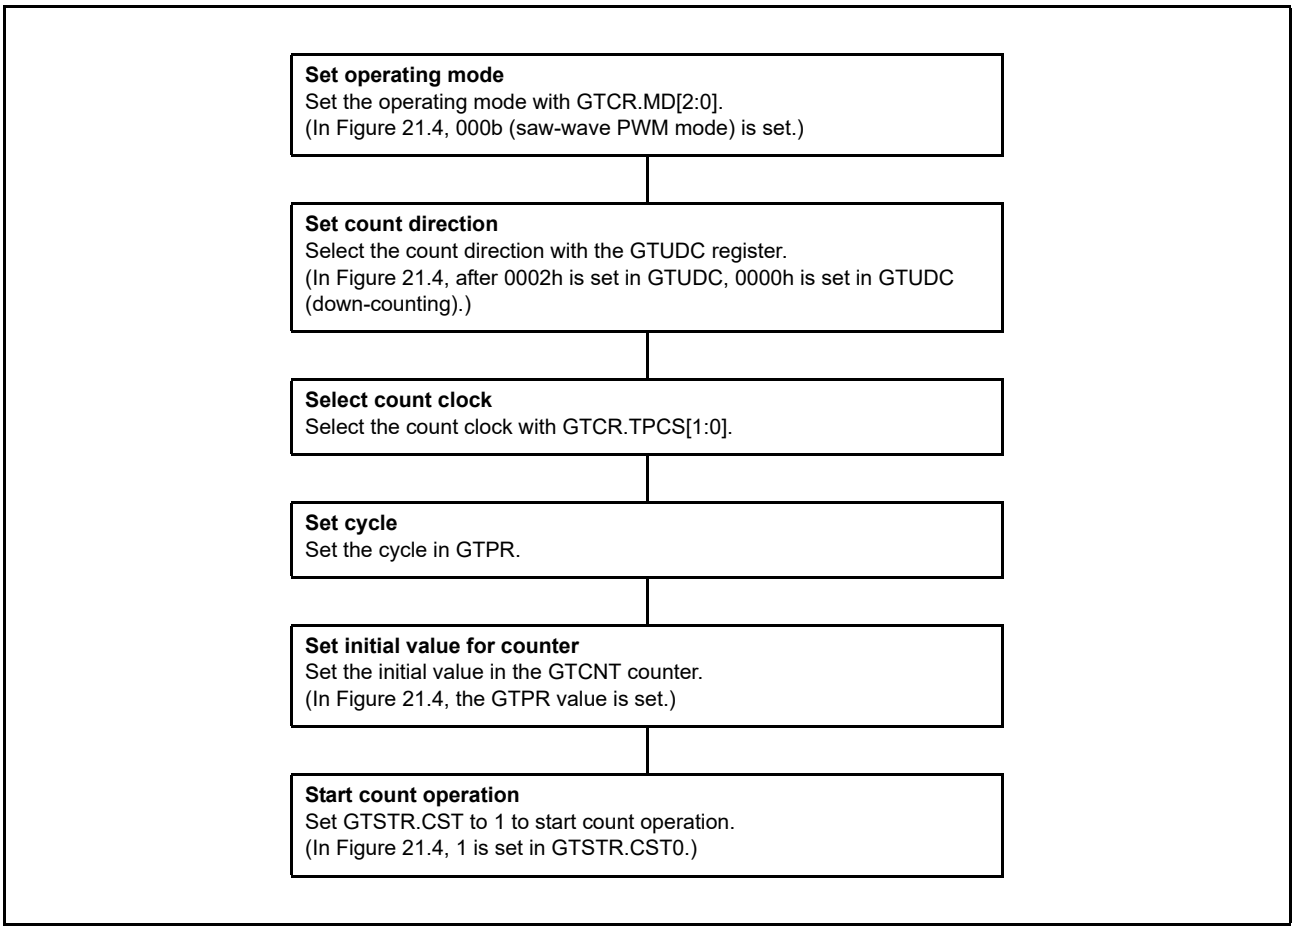

Figure 21.5 Example for Setting Periodic Count Operation (in Down-Count Operation)

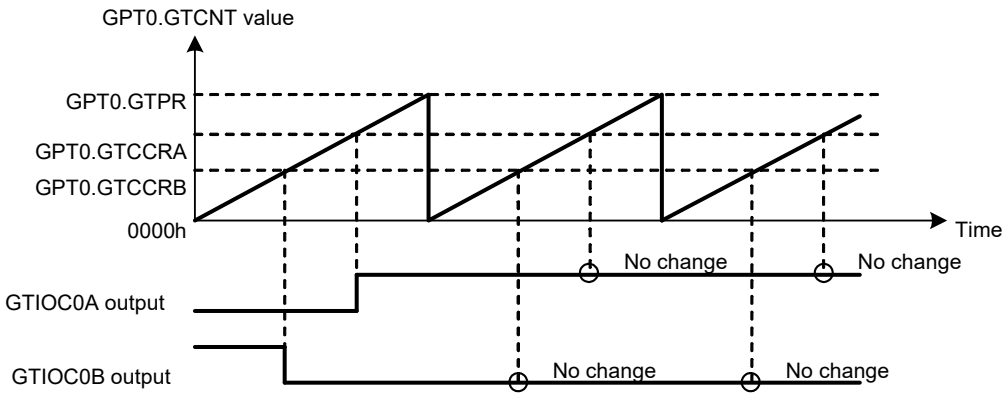
21.3.1.2 Waveform Output by Compare Match

When the GPTn.GTCNT counter value matches GTPn.GTCCRA or GTPn.GTCCRB, the GPT can output low or high or toggles output from the corresponding GTIOCnA or GTIOCnB output pin (n = 0 to 3).
In addition, the GTIOCnA or GTIOCnB pin output can be low, high, or toggled at the “cycle end” which is determined by GPTn.GTPR.
The cycle end is:

- For saw waves in up-count operation: When the GPTn.GTCNT counter value equals the GPTn.GTPR register value (overflow)
- For saw waves in down-count operation: When the GPTn.GTCNT counter value equals 0 (underflow)
- For triangle waves: When the GPTn.GTCNT counter value equals 0 (trough)

(1) Low Output and High Output

Figure 21.6 shows an example of low output and high output operation by a compare match of GTCCRA and GTCCRB.
In this example, up-count operation is performed in channel 0, and settings have been made so that high is output from the GTIOC0A pin by a GPT0.GTCCRA compare match, and low is output from the GTIOC0B pin by a GPT0n.GTCCRB compare match. The pin level does not change when the specified level and pin level match.



[Setting examples]
GPT0.GTIOR.GTIOA[5:0]: Initial output of 0, 1 output at compare match, output retained at cycle end
GPT0.GTIOR.GTIOB[5:0]: Initial output of 1, 0 output at compare match, output retained at cycle end

Figure 21.6 Example of Low Output and High Output Operation

Figure 21.7 shows an example for setting low output and high output operation.

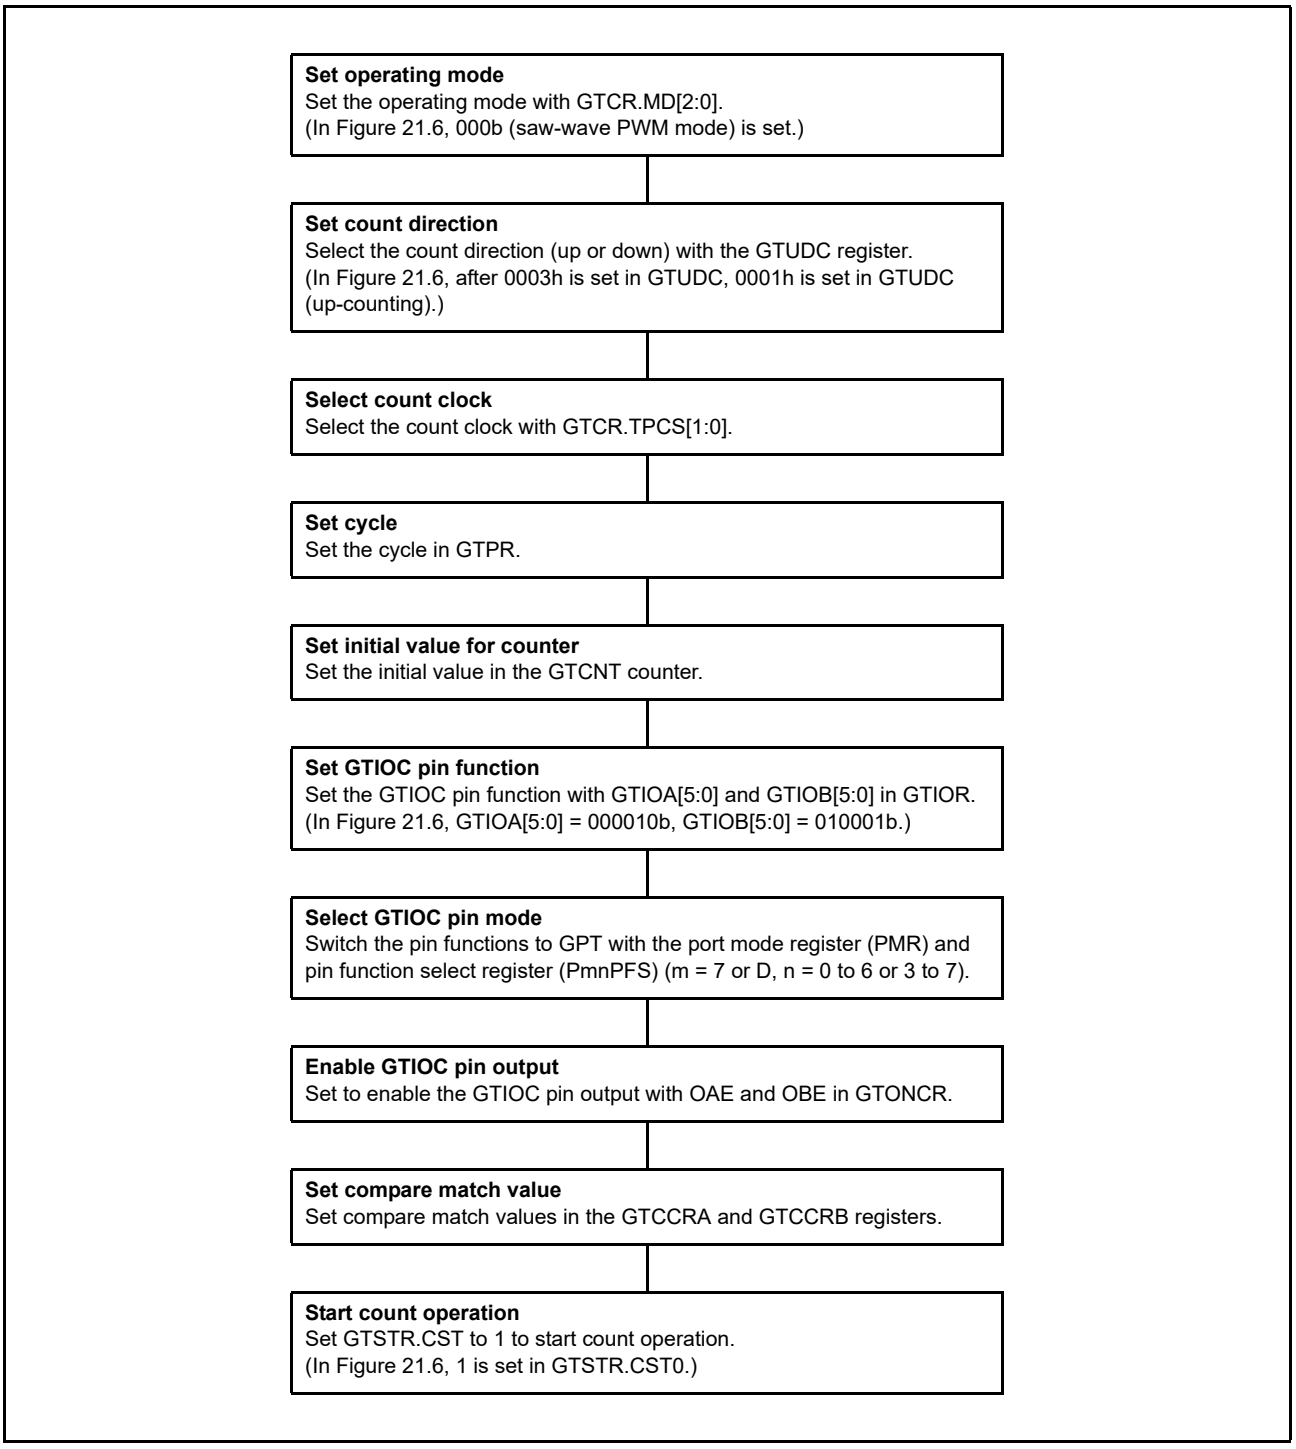


Figure 21.7 Example for Setting Low Output and High Output Operation

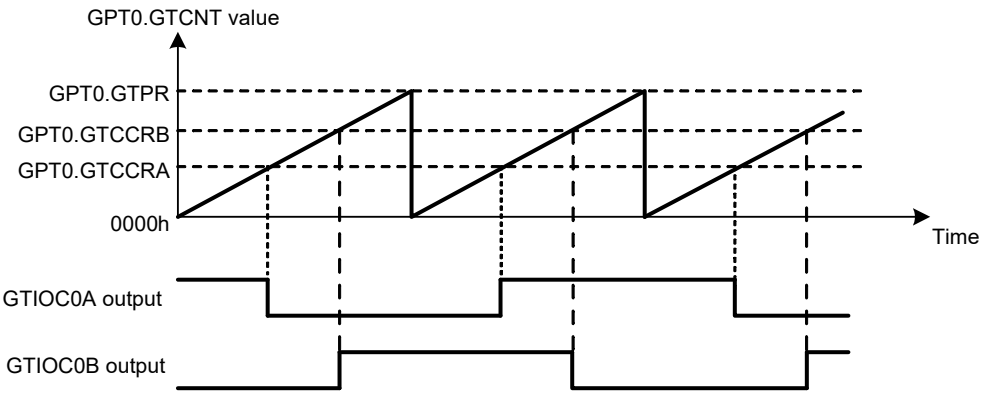
(2) Toggled Output

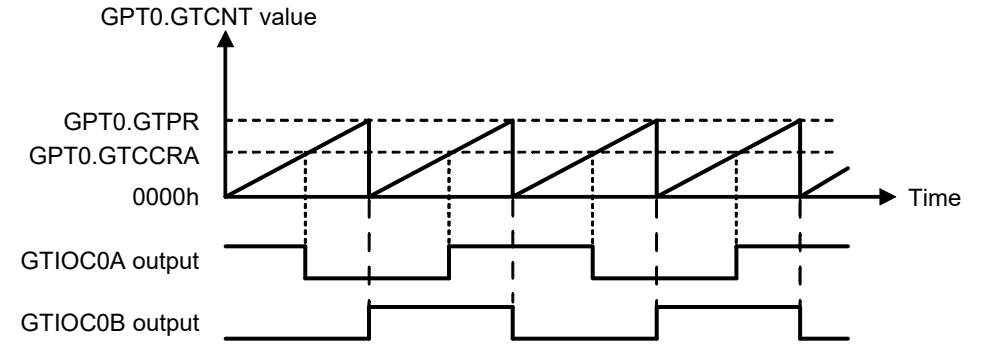
Figure 21.8 and Figure 21.9 show examples of toggled output operation by compare matches of GTCCRA and GTCCRB. In Figure 21.8, up-count operation is performed in channel 0, and settings have been made so that the GTIOC0A pin output by a GPT0.GTCCRA compare match and GTIOC0B pin output by a GPT0n.GTCCRB compare match are toggled.

In Figure 21.9, up-count operation is performed in channel 0, and settings have been made so that the GTIOC0A output is toggled by a compare match of GPT0.GTCCRA and the GTIOC0B output is toggled at the cycle end.



[Setting examples]
GPT0.GTIOR.GTIOA[5:0]: Initial output of 1, toggle output at compare match, output retained at cycle end
GPT0.GTIOR.GTIOB[5:0]: Initial output of 0, toggle output at compare match, output retained at cycle end

Figure 21.8 Example of Toggled Output Operation (1)



[Setting examples]
GPT0.GTIOR.GTIOA[5:0]: Initial output of 1, toggle output at compare match, output retained at cycle end
GPT0.GTIOR.GTIOB[5:0]: Initial output of 0, output retained at compare match, toggle output at cycle end

Figure 21.9 Example of Toggled Output Operation (2)

Figure 21.10 shows an example for setting toggled output operation.

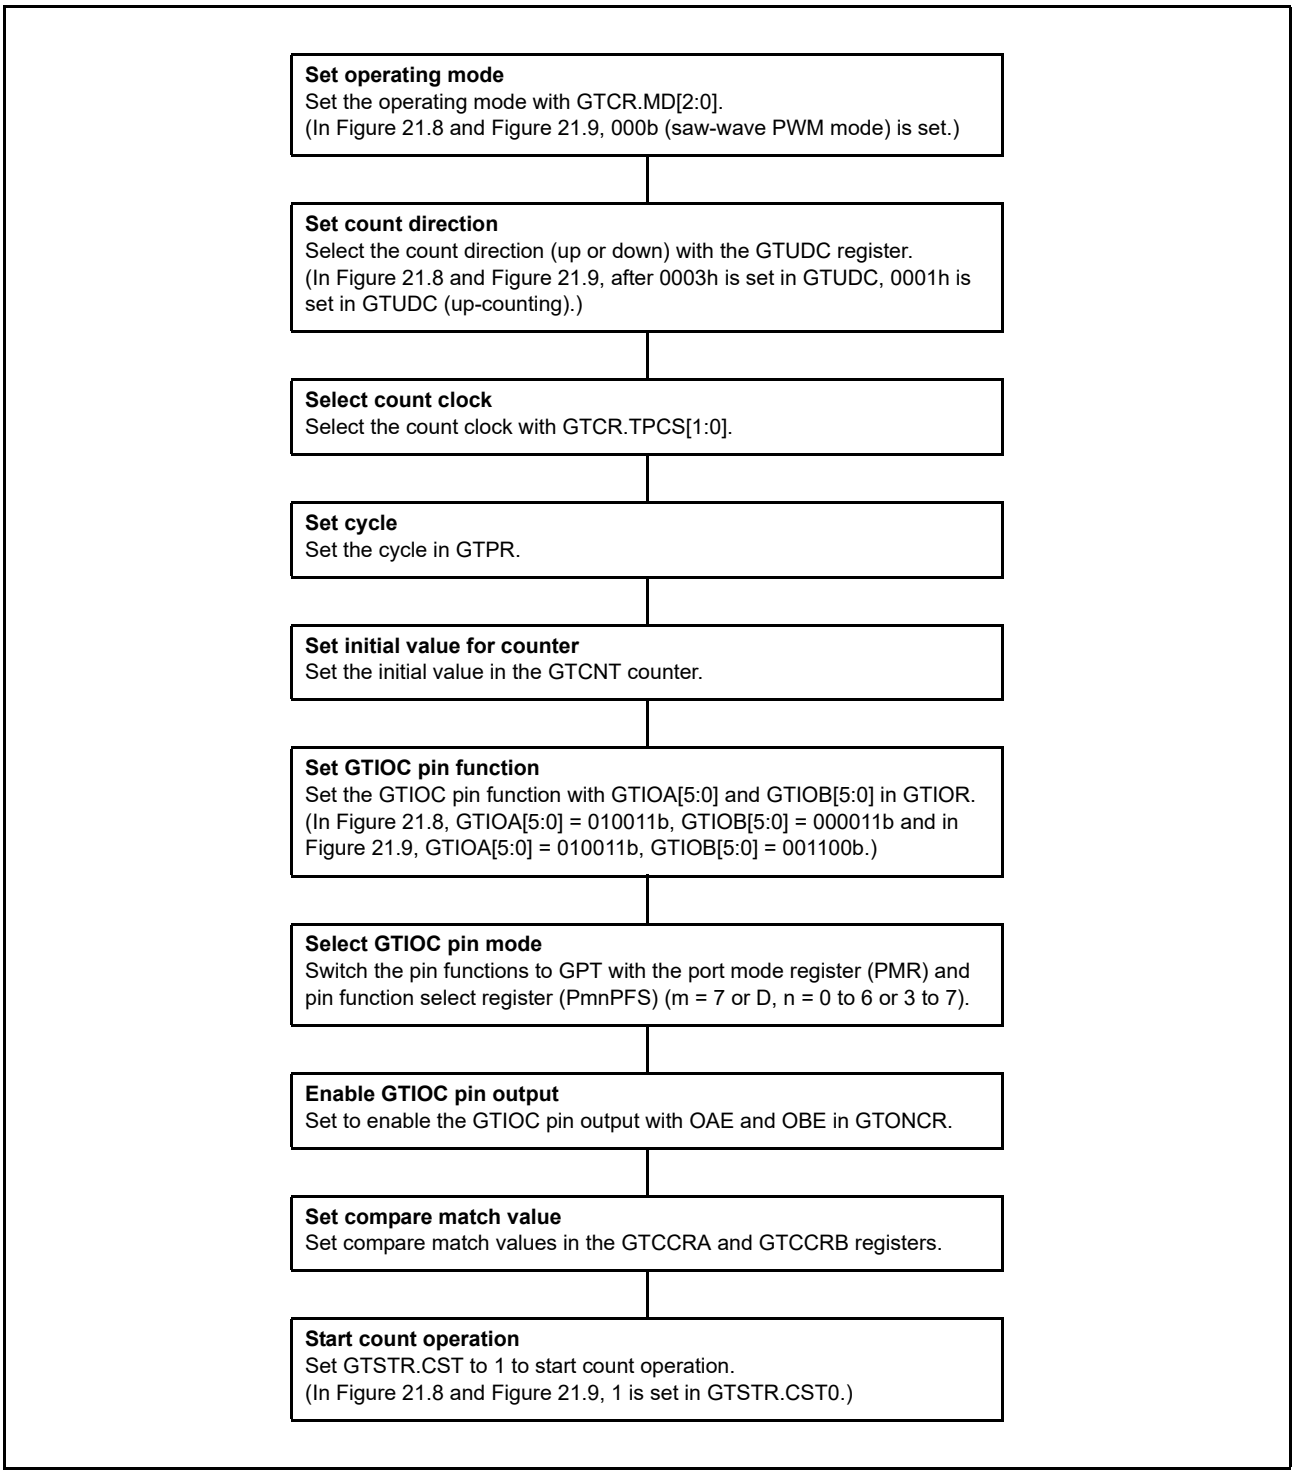


Figure 21.10 Example for Setting Toggled Output Operation

21.3.1.3 Input Capture Function

The GPTn.GTCNT counter value can be transferred to either GPTn.GTCCRA or GPTn.GTCCRB on detection of the input edge of the GTIOCnA input pin or GTIOCnB input pin, respectively (n = 0 to 3). The rising edge, falling edge, or both edges can be selected as the detection edge.

Figure 21.11 shows an example of the input capture function. In this example, up-count operation is performed on channel 0, and settings have been made so that an input capture is performed at both edges of the GTIOC0A input pin and at the rising edge of the GTIOC0B input pin.

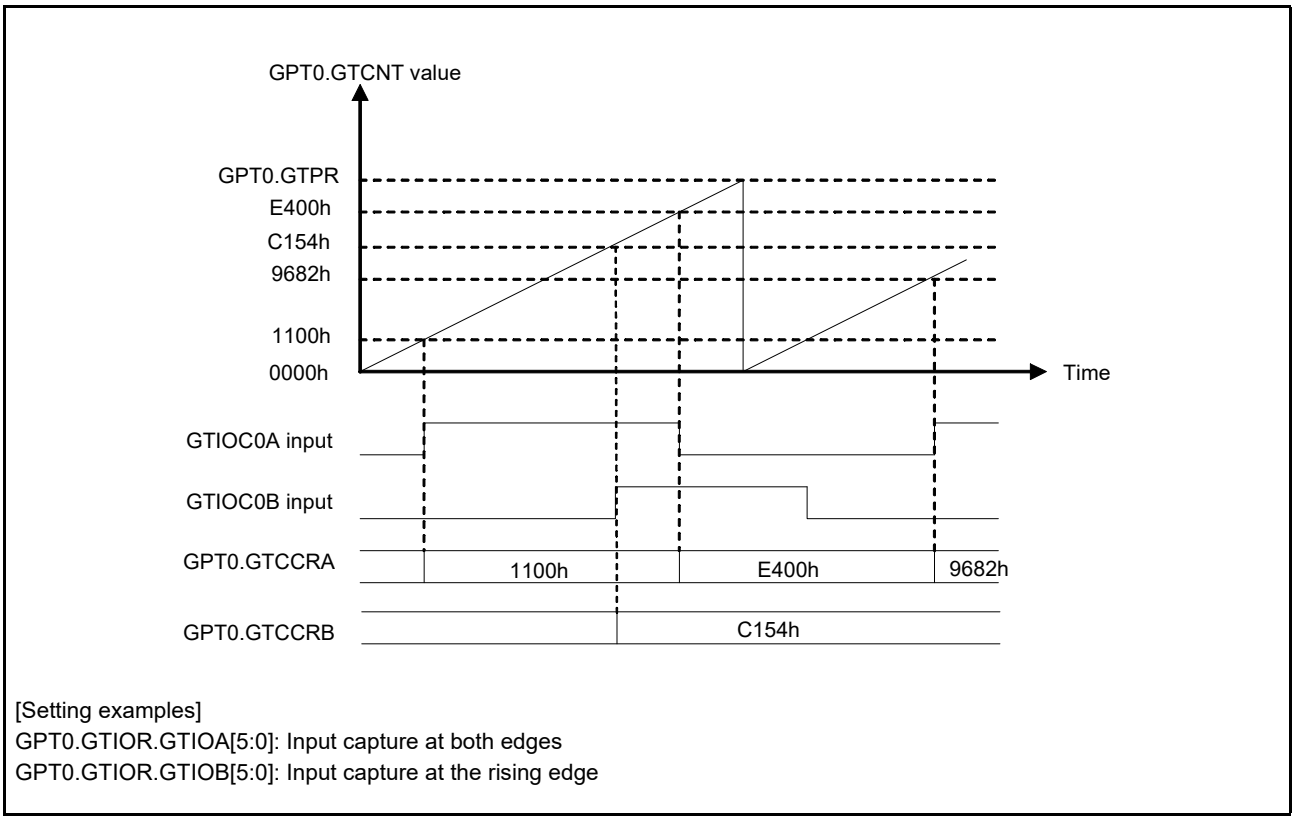

Figure 21.11 Example of Input Capture Operation

Figure 21.12 shows an example for setting input capture operation.

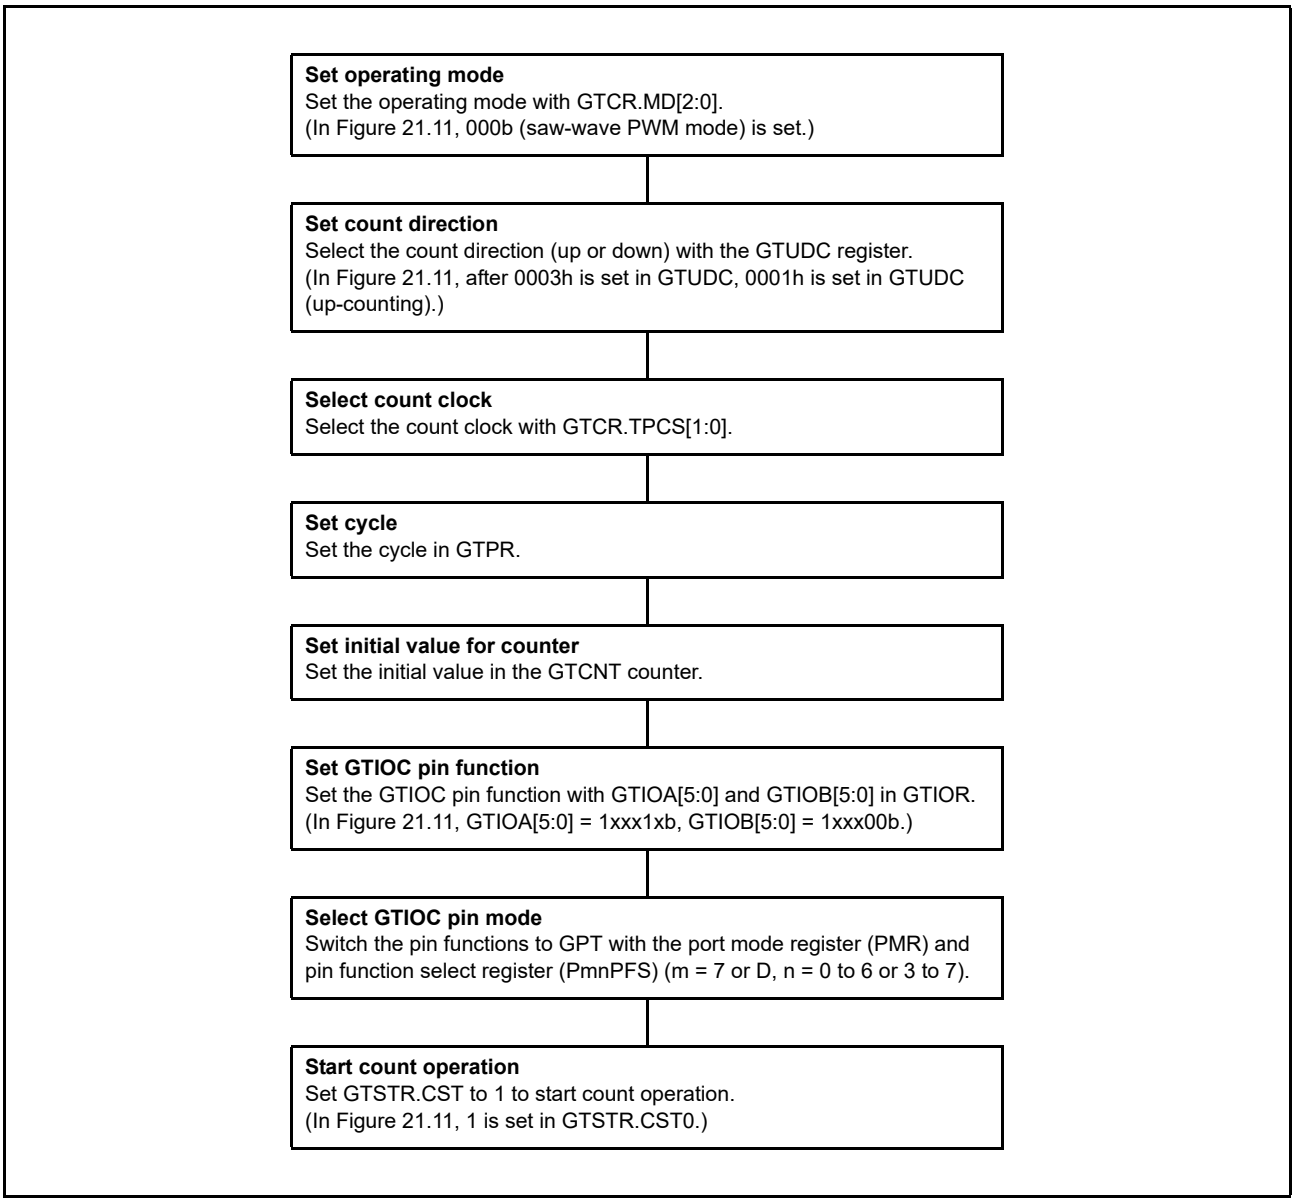

Figure 21.12 Example for Setting Input Capture Operation

21.3.2 Buffer Operation

The following buffer operation can be set with GTBER.

- Buffer operation with GTCCRA, GTCCRC, and GTCCRD used together
- Buffer operation with GTCCRB, GTCCRE, and GTCCRF used together
- Buffer operation with GTPR, GTPBR, and GTPDBR used together
- Buffer operation with GTADTRA, GTADTBRA, and GTADTDBRA used together
- Buffer operation with GTADTRB, GTADTBRB, and GTADTDBRB used together

The following buffer operation can be set with GTDTCR.

- Buffer operation with GTDVU and GTDBU used together
- Buffer operation with GTDVU and GTDBD used together

21.3.2.1 GTPR Register Buffer Operation

GTPBR can function as a buffer register for GTPR, and GTPCBR can function as a buffer register for GTPBR (double-buffer register for GTPR).
The buffer transfer is performed at an overflow (during up-count operation) or an underflow (during down-count operation) in saw-wave mode, and at a trough in triangle-wave mode.
To set GTPR to function as double buffer, set GTBER.PR[1:0] to 10b or 11b. For single buffer operation, set 01b. Not to function as buffer, set 00b.
When the direction of counting is down in saw-wave mode, the setting to select buffered operation is prohibited. Transfer from the buffer proceeds on overflow and clearing of the counter in saw-wave mode, and at troughs in triangle-wave mode.
Figure 21.13 and Figure 21.14 show examples of GTPR buffer operation and Figure 21.15 shows an example for setting GTPR buffer operation.

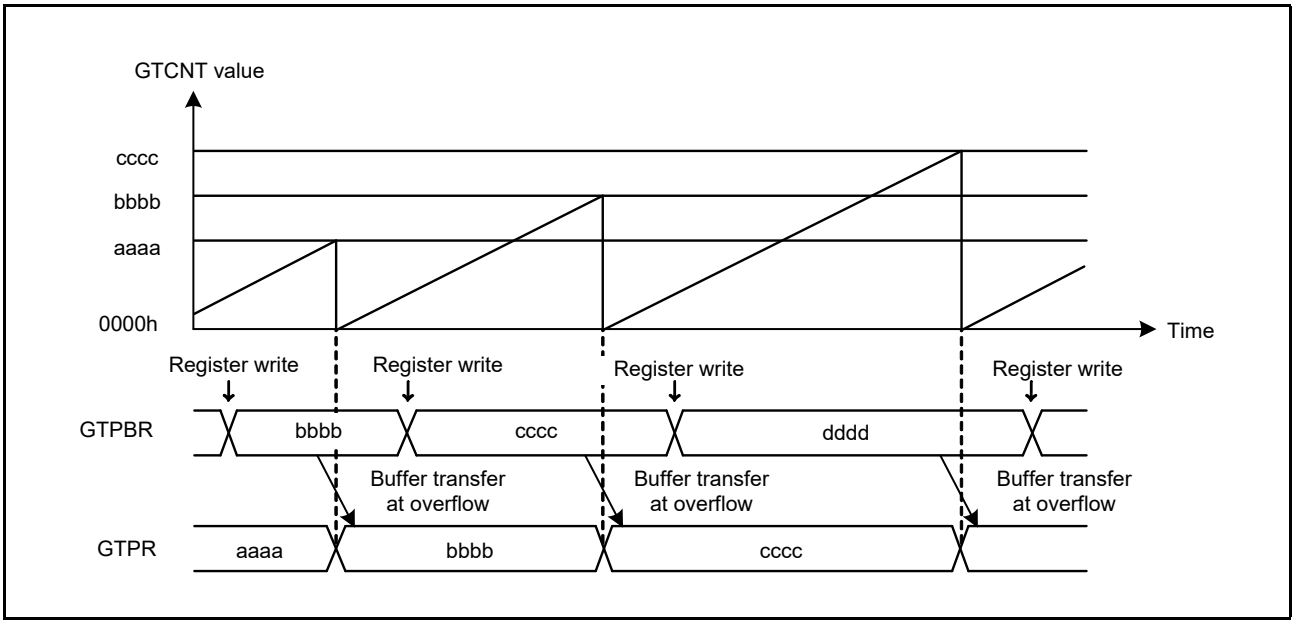

Figure 21.13 Example of GTPR Buffer Operation (Saw Waves in Up-Count Operation)

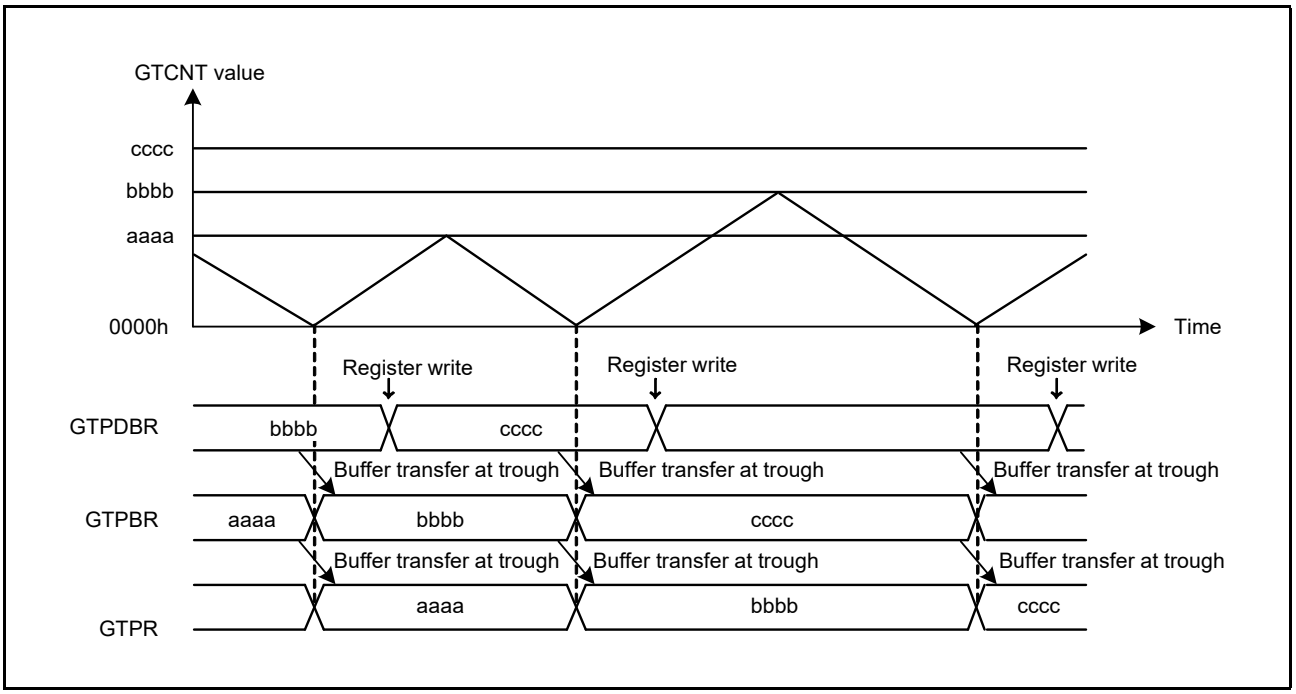

Figure 21.14 Example of GTPR Double Buffer Operation (Triangle Waves)

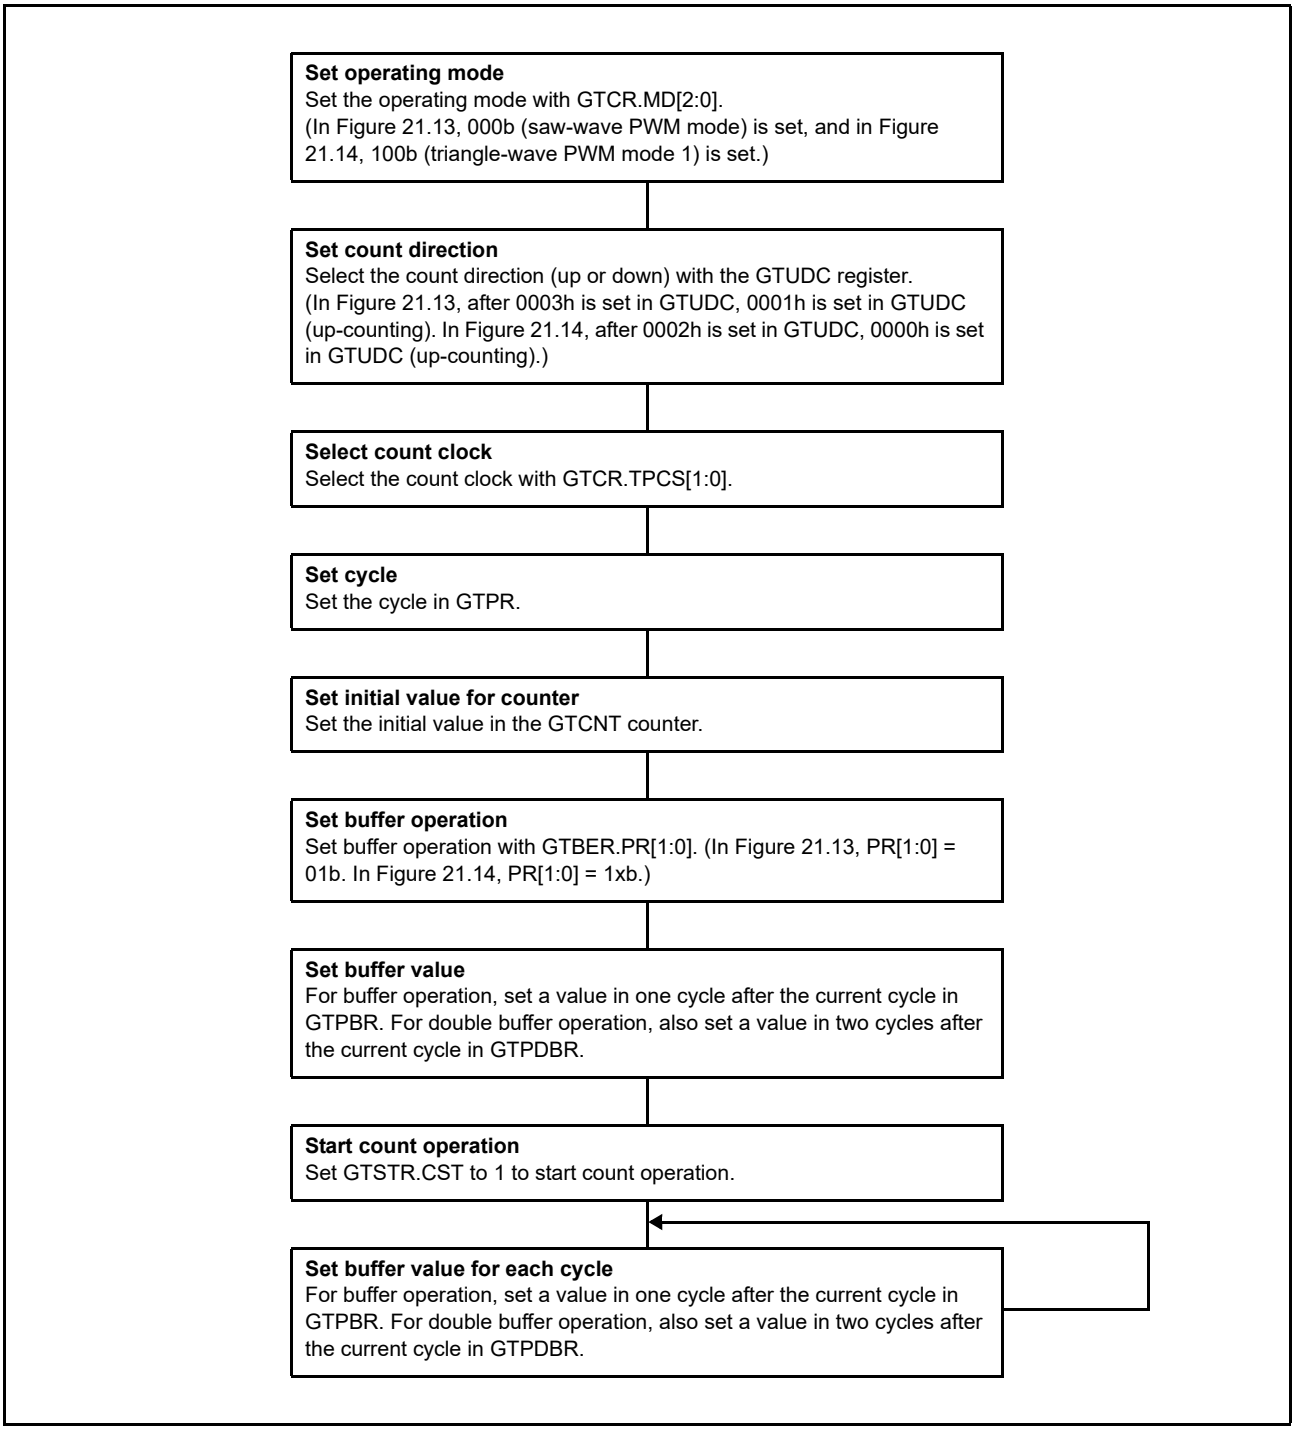

Figure 21.15 Example for Setting GTPR Buffer Operation

21.3.2.2 Buffer Operation for GTCCRA and GTCCRB

GTCCRC can function as the GTCCRA buffer register and GTCCRD can function as the GTCCRC buffer register (double-buffer register for GTCCRA). Similarly, GTCCRE can function as the GTCCRB buffer register and GTCCRF can function as the GTCCRE buffer register (double-buffer register for GTCCRB).
To set GTCCRA or GTCCRB to function as a double buffer, set GTBER.CCRA[1:0] or GTBER.CCRB[1:0] to 10b or 11b. For single buffer operation, set 01b. Not to function as buffer, set 00b.

(1) When GTCCRA or GTCCRB Functions as Output Compare Register

Buffer transfer is performed at an overflow (during up-count operation) or an underflow (during down-count operation) in saw-wave mode, and at a trough in triangle-wave mode.
Figure 21.16 to Figure 21.18 show examples of GTCCRA and GTCCRB buffer operation and Figure 21.19 shows an example for setting GTCCRA and GTCCRB buffer operation.

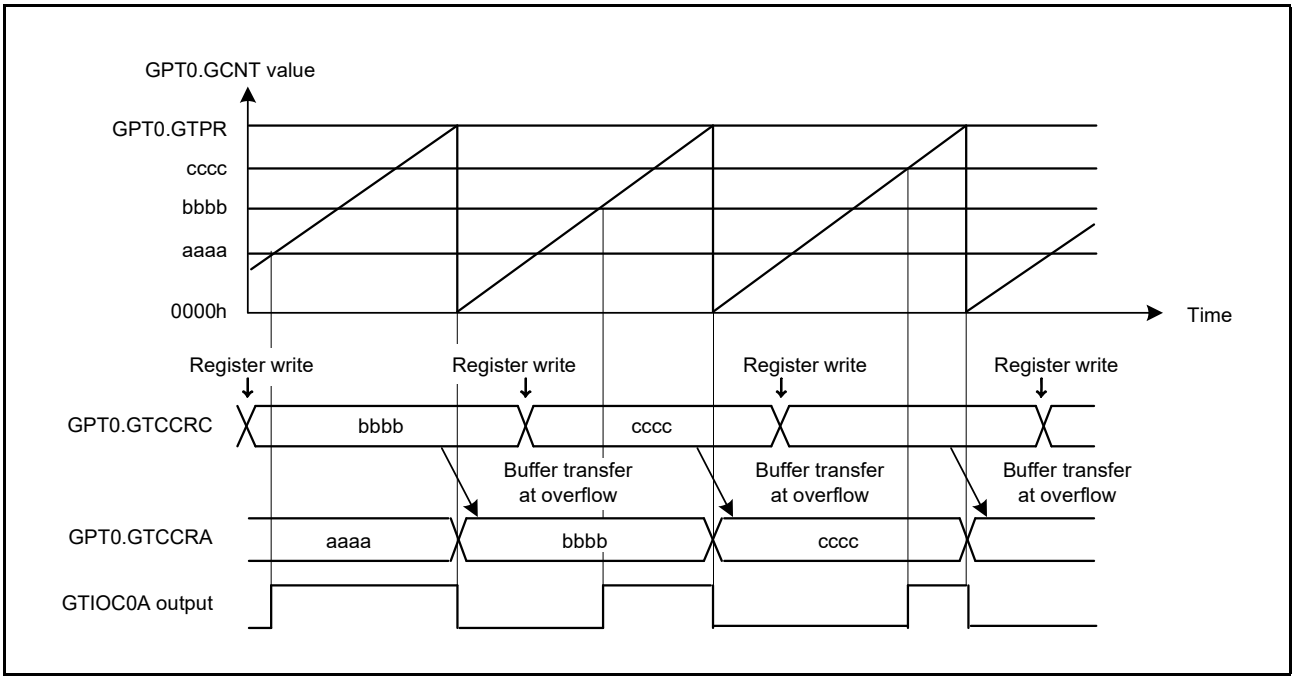

Figure 21.16 Example of GTCCRA and GTCCRB Buffer Operation (Output Compare, Saw Waves in Up-Count Operation, High Output at GTCCRA Compare Match, Low Output at Cycle End)

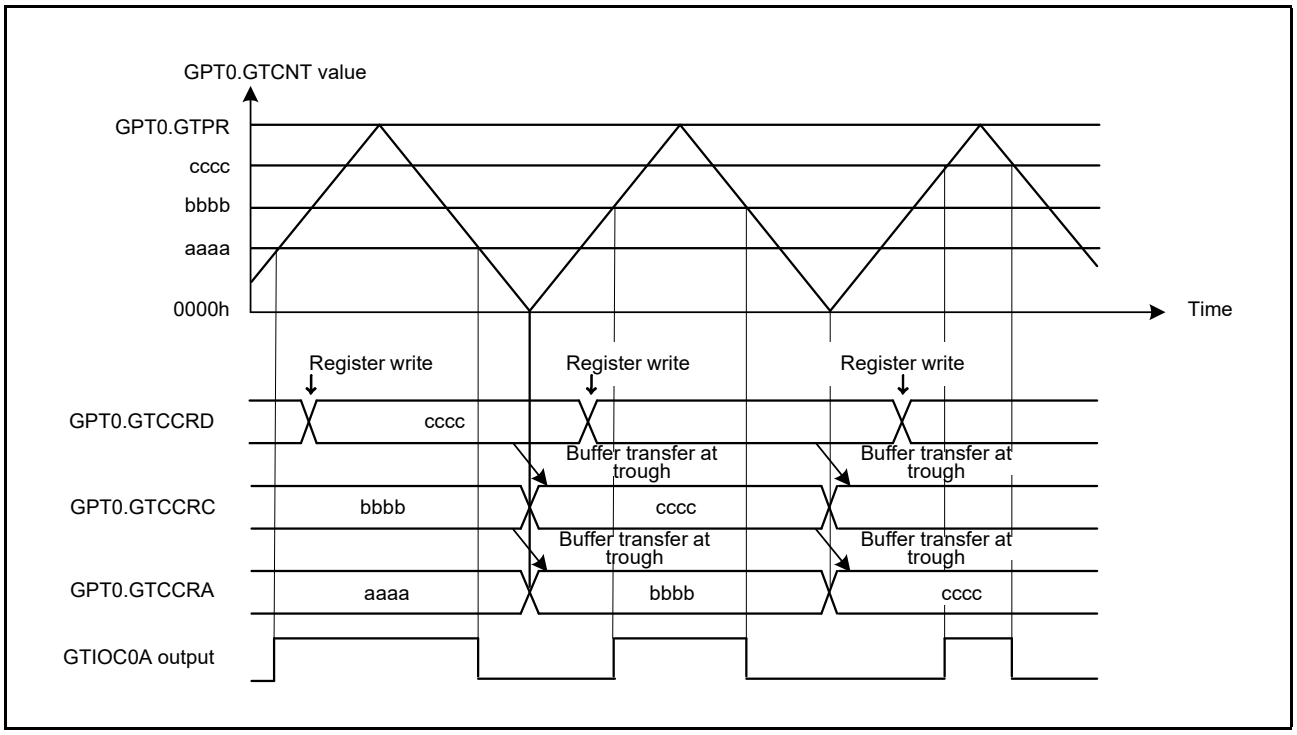

Figure 21.17 Example of GTCCRA and GTCCRB Double Buffer Operation (Output Compare, Triangle Waves, Buffer Operation at Trough, Toggle Output at GTCCRA Compare Match, Output Retained at Cycle End)

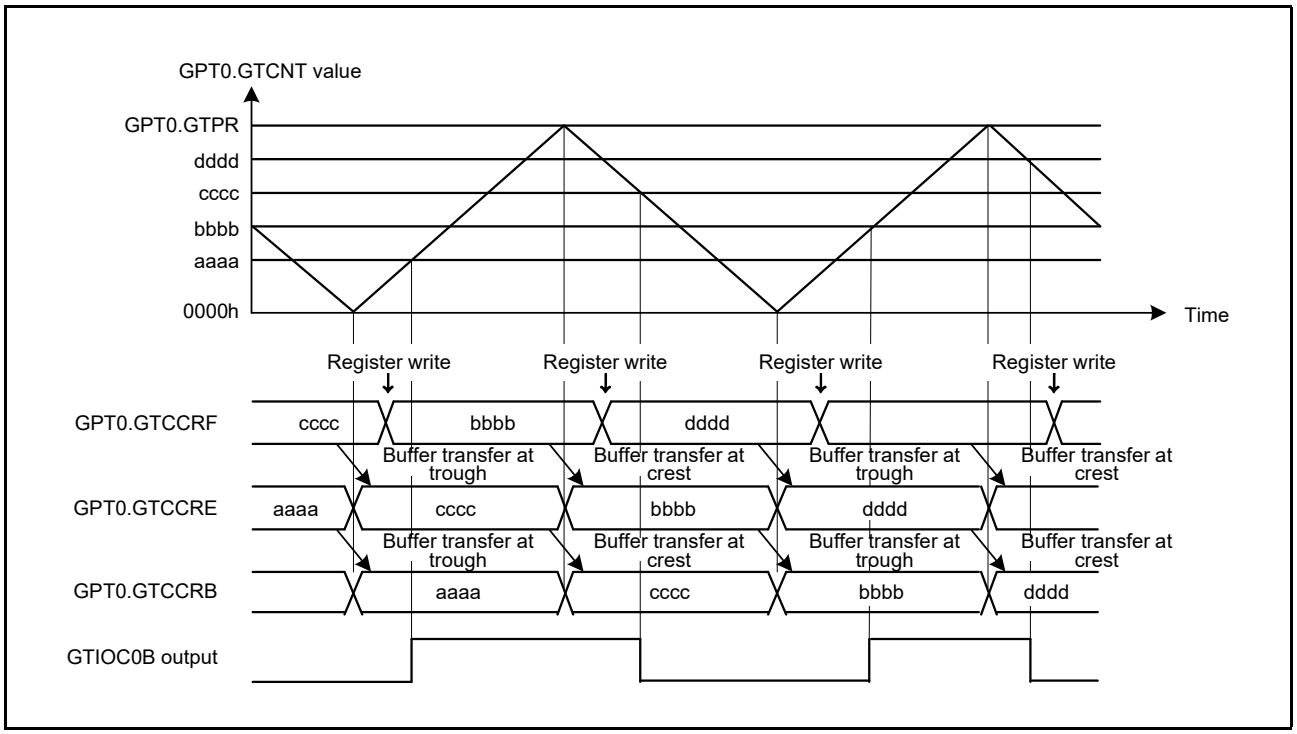

Figure 21.18 Example of GTCCRA and GTCCRB Double Buffer Operation (Output Compare, Triangle Waves, Buffer Operation at Both Troughs and Crests, Toggle Output at GTCCRB Compare Match, Output Retained at Cycle End)

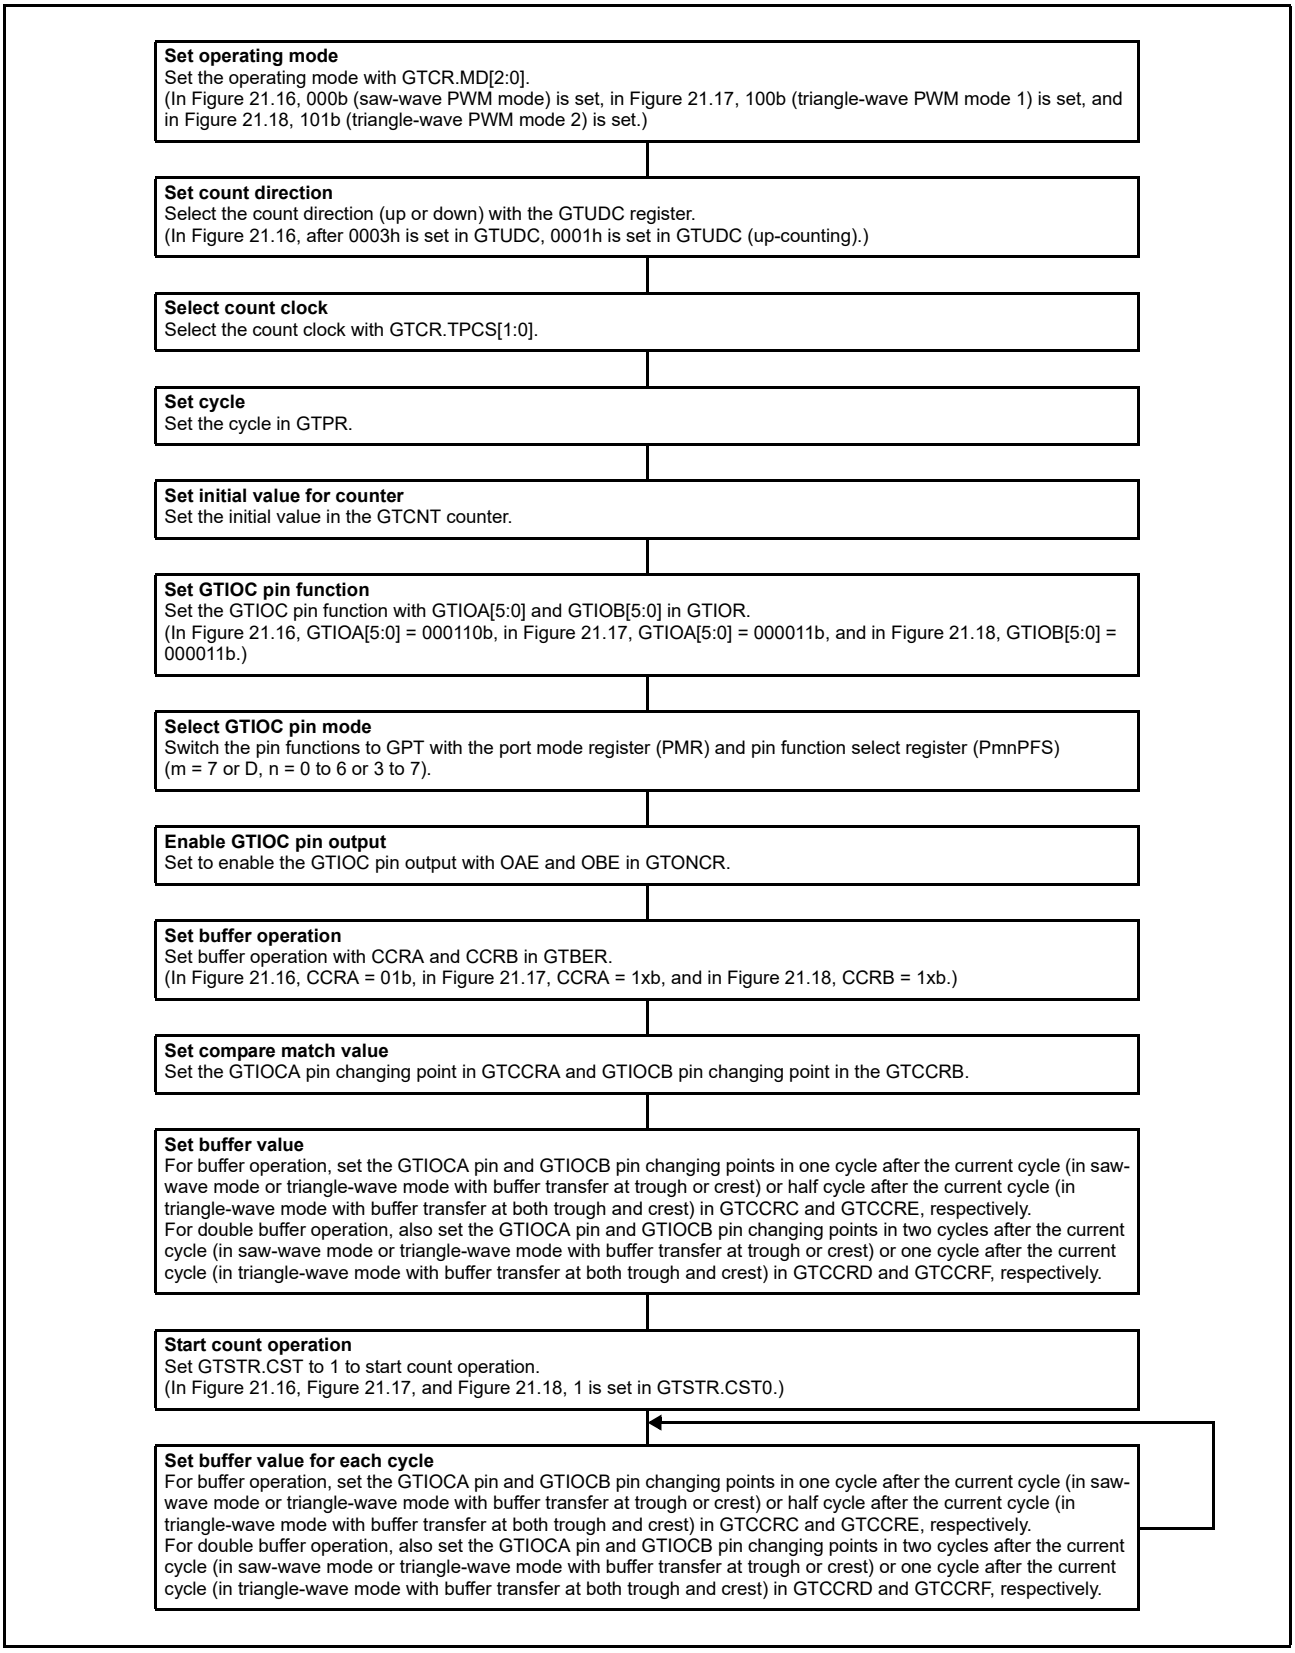

Figure 21.19 Example for Setting GTCCRA and GTCCRB Buffer Operation (for Output Compare)

(2) When GTCCRA or GTCCRB Functions as Input Capture Register

Buffer transfer is performed at a point when an input capture is generated. When an input capture is generated, the GTCNT counter value is transferred to GTCCRA and GTCCRB and the stored GTCCRA and GTCCRB register values are transferred to buffer registers.

Figure 21.20 and Figure 21.21 show examples of GTCCRA and GTCCRB buffer operation and Figure 21.22 shows an example for setting GTCCRB buffer operation.

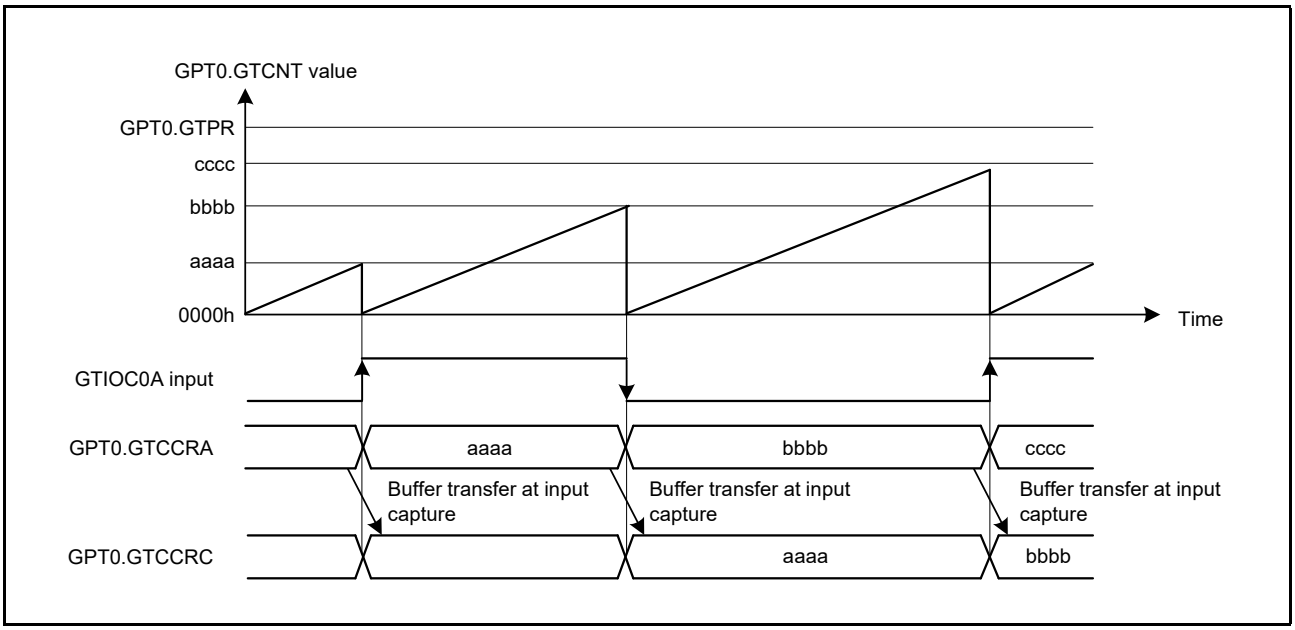

Figure 21.20 Example of GTCCRA and GTCCRB Buffer Operation (Input Capture at Both Edges of GTIOC0A Input, Saw Waves in Up-Count Operation, GTCNT Counter Cleared at GTCCRA Input Capture)

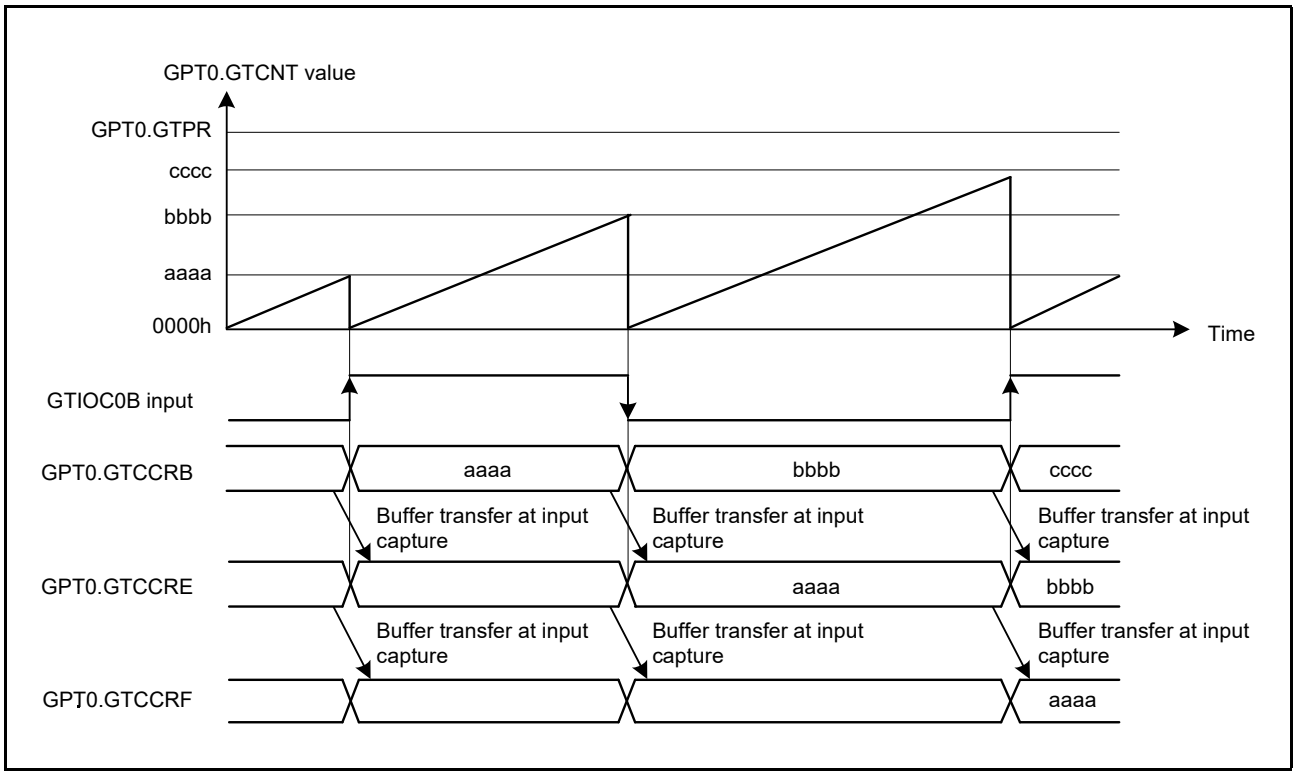

Figure 21.21 Example of GTCCRA and GTCCRB Double Buffer Operation (Input Capture at Both Edges of GTIOC0B Input, Saw Waves in Up-Count Operation, GTCNT Counter Cleared at GTCCRB Input Capture)

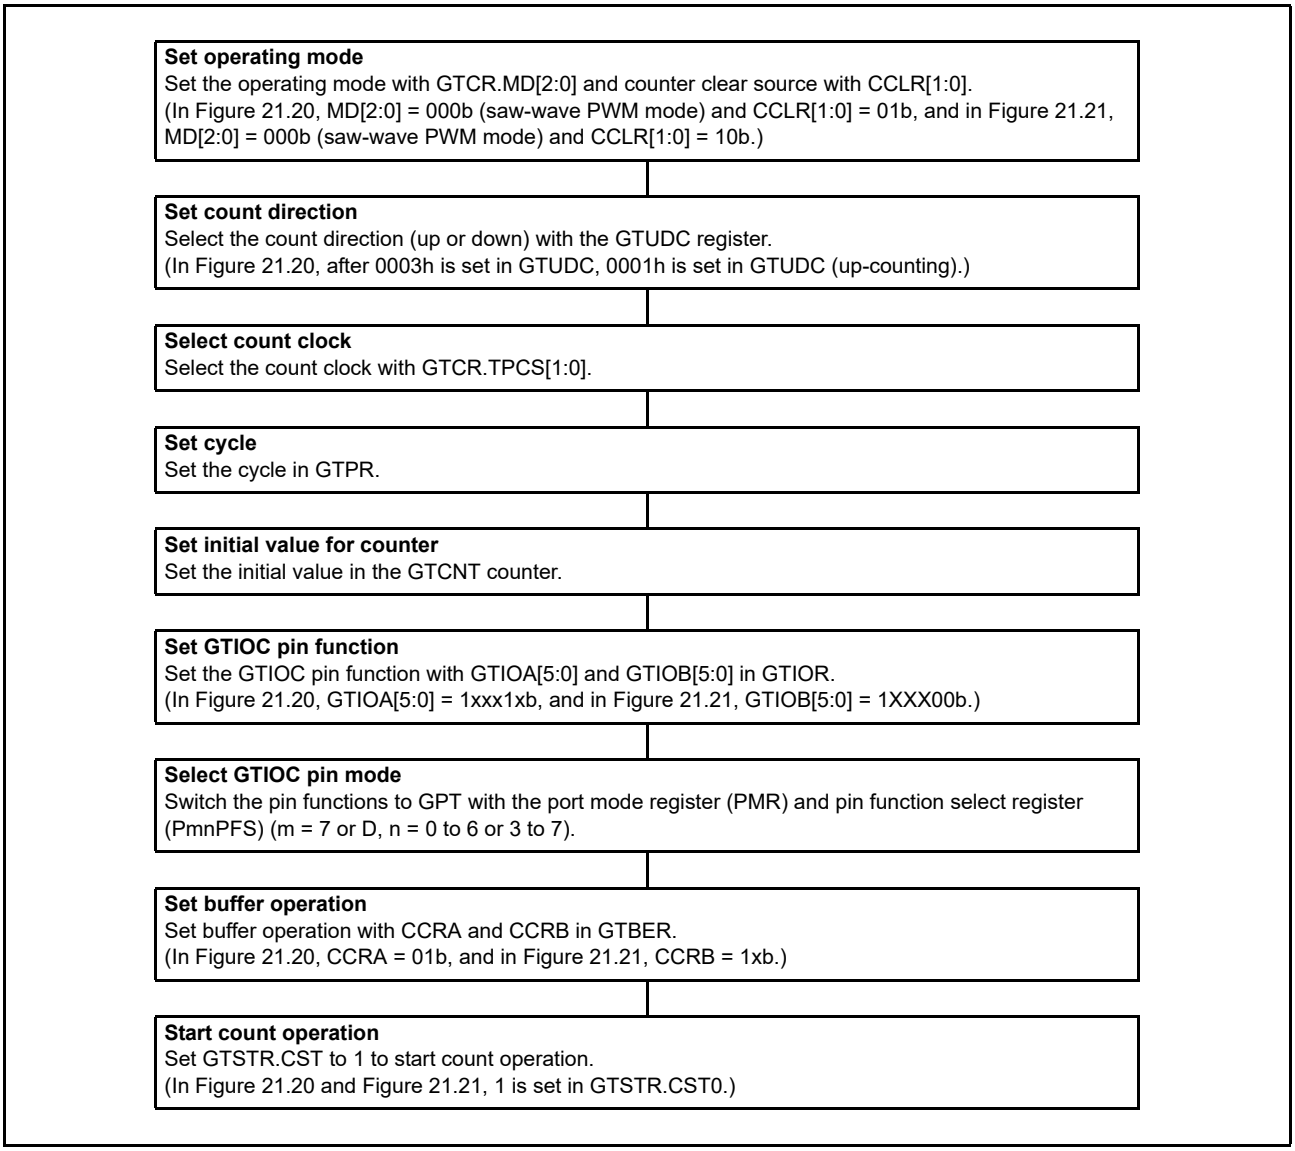

Figure 21.22 Example for Setting GTCCRA and GTCCRB Buffer Operation (for Input Capture)

21.3.2.3 Buffer Operation for GTADTRA and GTADTRB

GTADTBRA can function as the GTADTRA buffer register and GTADTDBRA can function as the GTADTBRA buffer register (double-buffer register for GTADTRA). Similarly, GTADTBRB can function as the GTADTRB buffer register and GTADTDBRB can function as the GTADTBRB buffer register (double-buffer register for GTADTRB).
To set GTADTRA or GTADTRB to function as a double buffer, set GTBER.ADTDA or GTBER.ADTDB to 1. For single buffer operation, set 0. Not to function as buffer, set GTBER.ADTTA[1:0] or GTBER.ADTTB[1:0] to 00b.
The buffer transfer timing can be set with the GTBER.ADTTA[1:0] bits. For saw waves, overflows (during up-count operation) or underflows (during down-count operation) can be selected. For triangle waves, crests are selected when GTBER.ADTTA[1:0] = 01b, troughs are selected when GTBER.ADTTA[1:0] = 10b, and both crests and troughs are selected when GTBER.ADTTA[1:0] = 11b.
Figure 21.23 to Figure 21.25 show examples of GTADTRA and GTADTRB buffer operation and Figure 21.26 shows an example for setting GTDTRA and GTADTRB buffer operation.

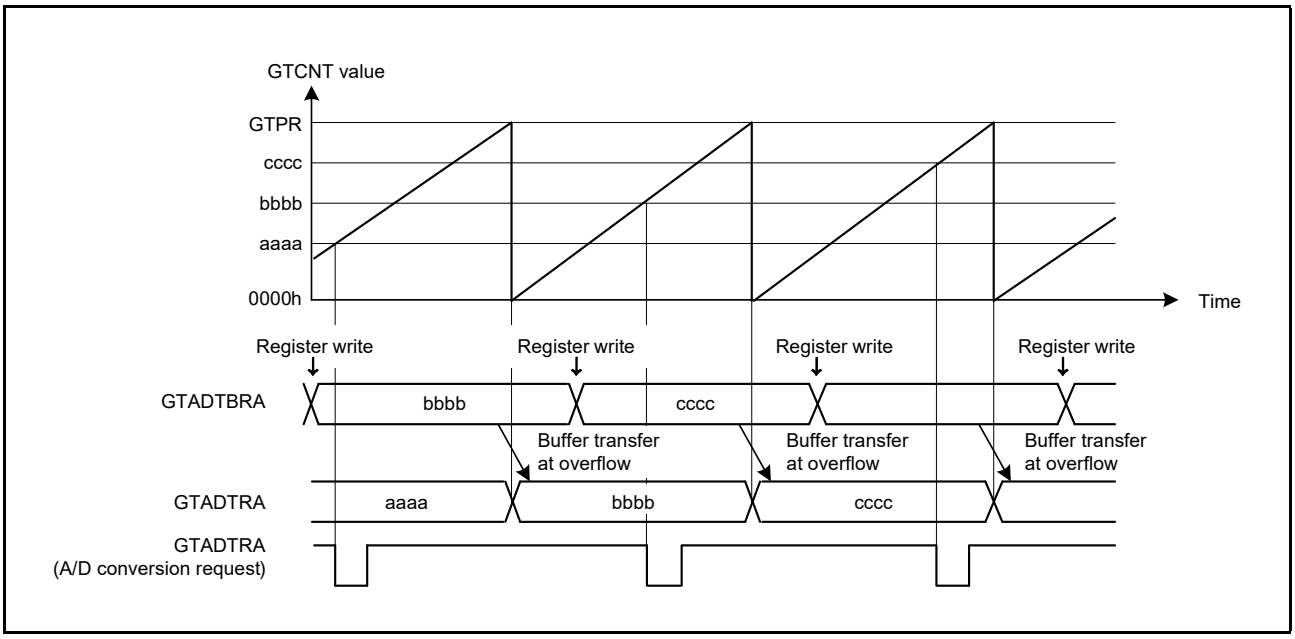

Figure 21.23 Example of GTADTRA and GTADTRB Buffer Operation (Saw Waves in Up-Count Operation, A/D Converter Start Request Generated by Up-Counting)

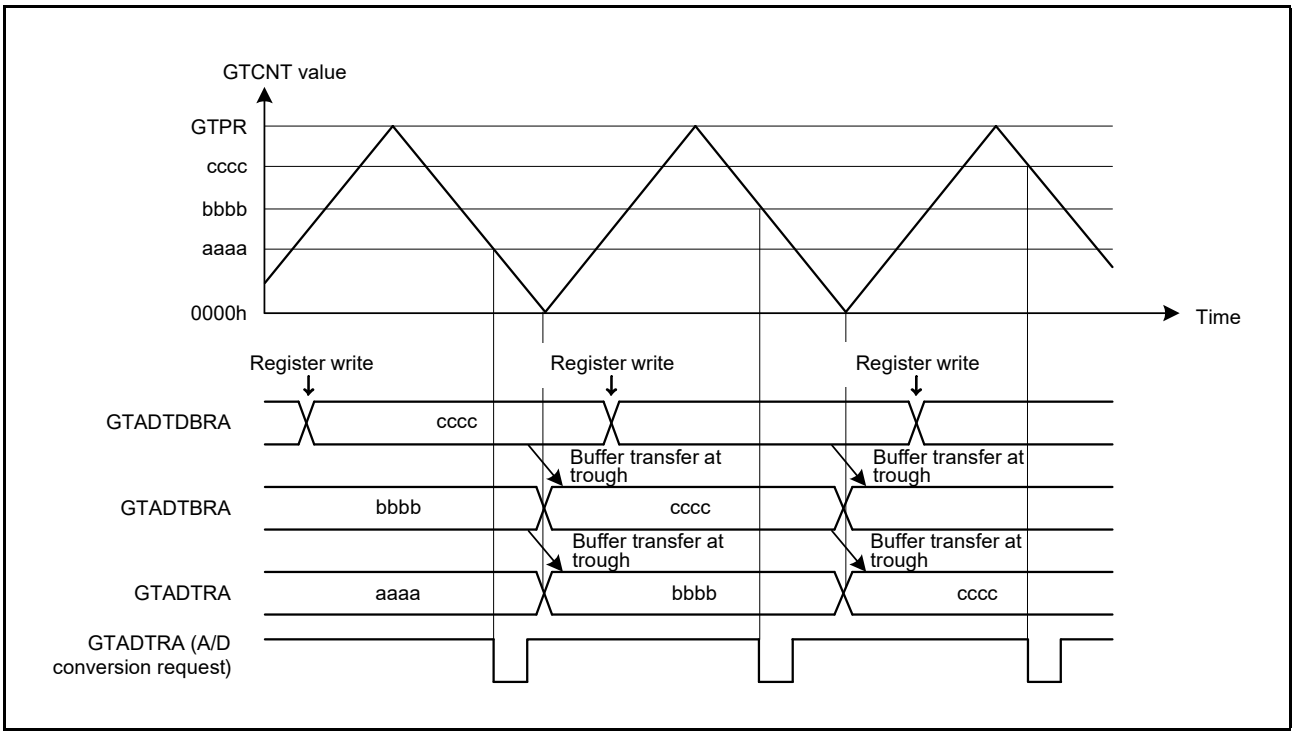

Figure 21.24 Example of GTADTRA and GTADTRB Double Buffer Operation (Triangle Waves, Buffer Transfer at Troughs, A/D Converter Start Request Generated by Down-Counting)

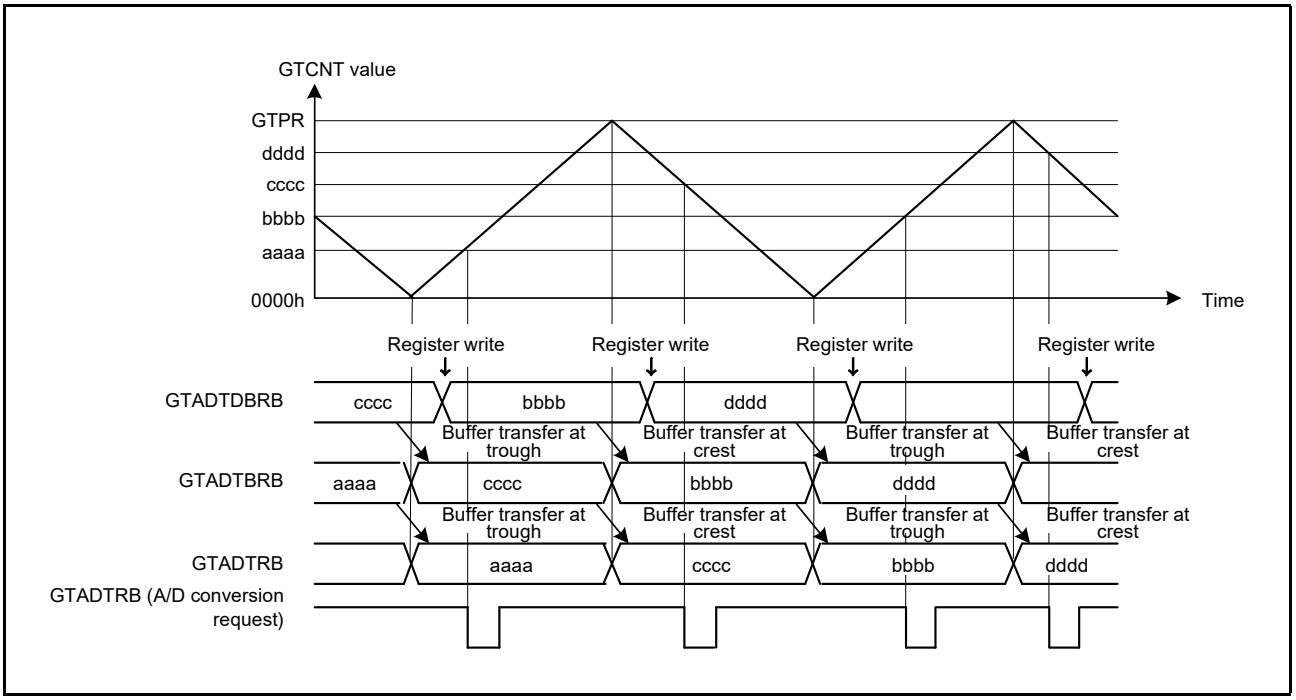

Figure 21.25 Example of GTADTRA and GTADTRB Double Buffer Operation (Triangle Waves, Buffer Transfer at Both Troughs and Crests, A/D Converter Start Request Generated by Both Up- and Down-Counting)

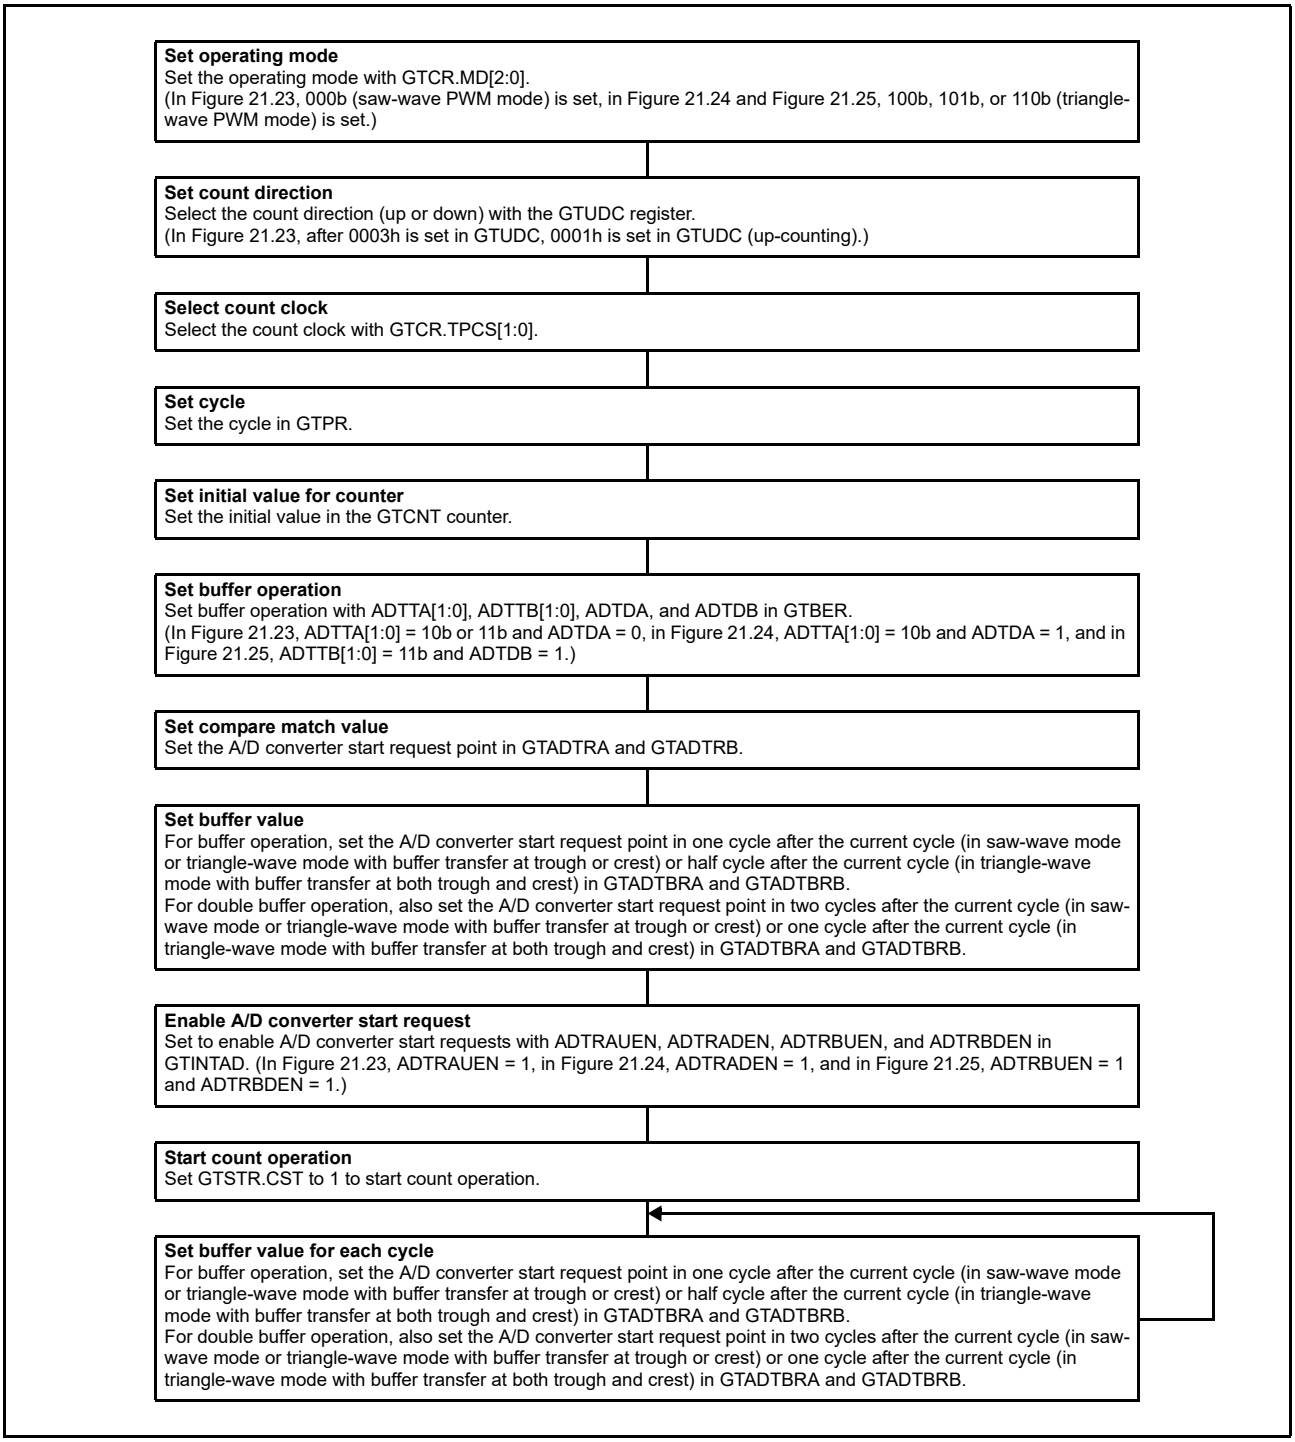

Figure 21.26 Example for Setting GTADTRA and GTADTRB Buffer Operation

21.3.3 PWM Output Operating Mode

The GPT can output PWM waveforms to the GTIOCnA pin or GTIOCnB pin by a compare match between the GPTn.CTCNT counter and GPTn.GTCCRA or GPTn.GTCCRB (n = 0 to 3). An operating mode can be set independently for each channel, and synchronized operation on channels is also possible.
By setting GTDTCR, GTDVU, and GTDVD, the compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

(1) Saw-Wave PWM Mode (GTCR.MD = 000b)

In saw-wave PWM mode, GPTn.GTCNT performs saw-wave (half-wave) operation by setting the cycle in GTPR and a PWM waveform is output to the GTIOCnA or GTIOCnB pin when a GPTn.GTCCRA or GPTn.GTCCRB compare match occurs (n = 0 to 3). The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end according to the GTIOR setting
Figure 21.27 shows an example of saw-wave PWM mode operation, and Figure 21.28 shows an example for setting saw-wave PWM mode.

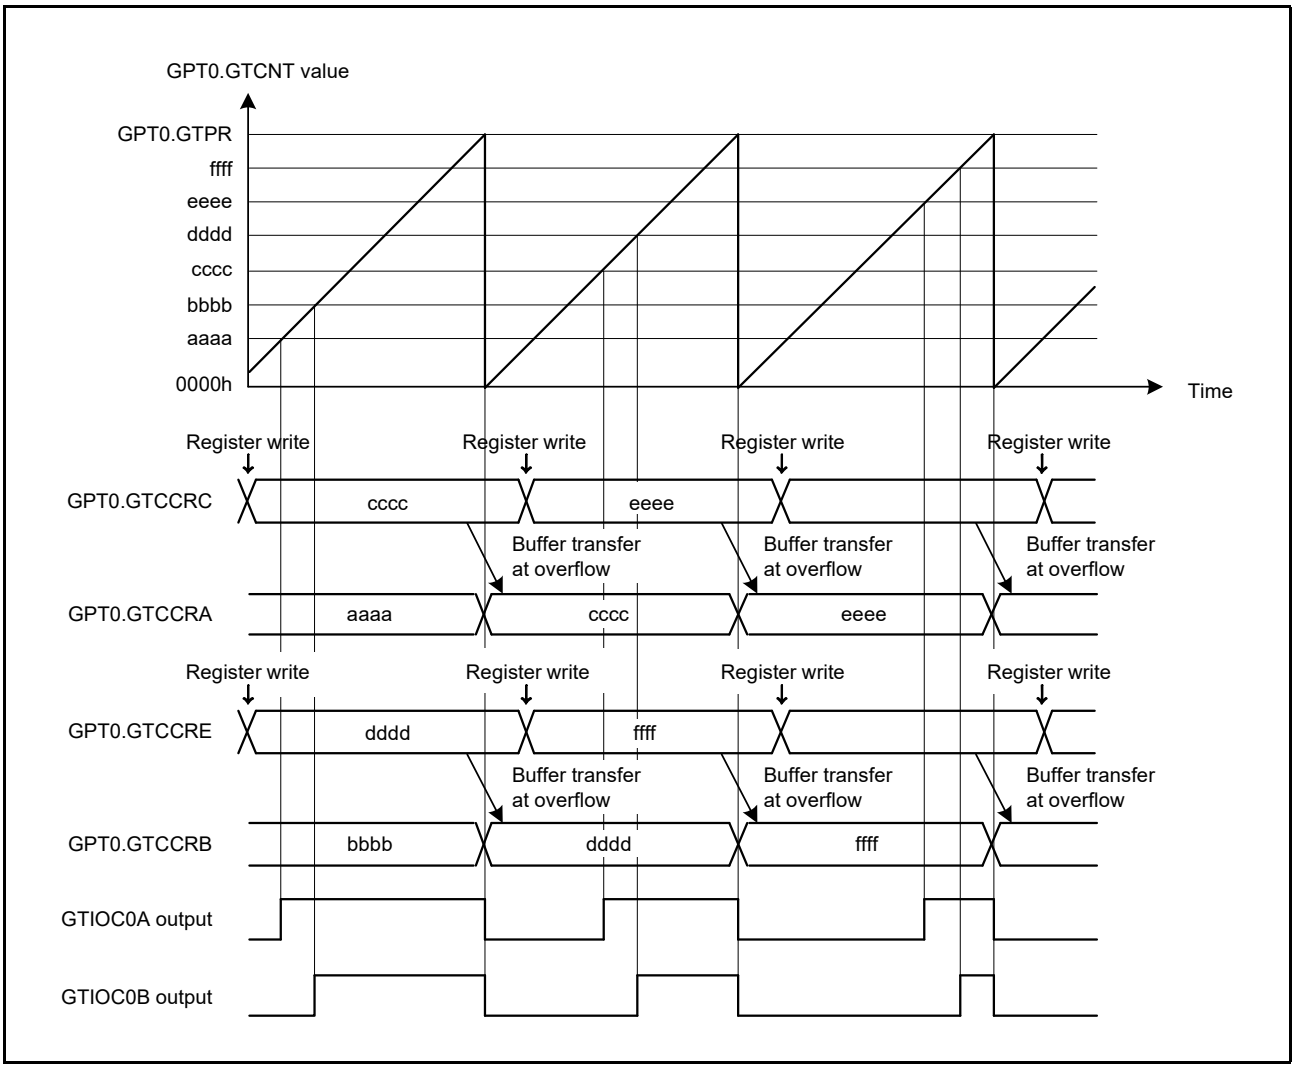

Figure 21.27 Example of Saw-Wave PWM Mode Operation (Up-Count Operation, Buffer Operation, High Output at GTCCRA/GTCCRB Compare Match, Low Output at Cycle End)

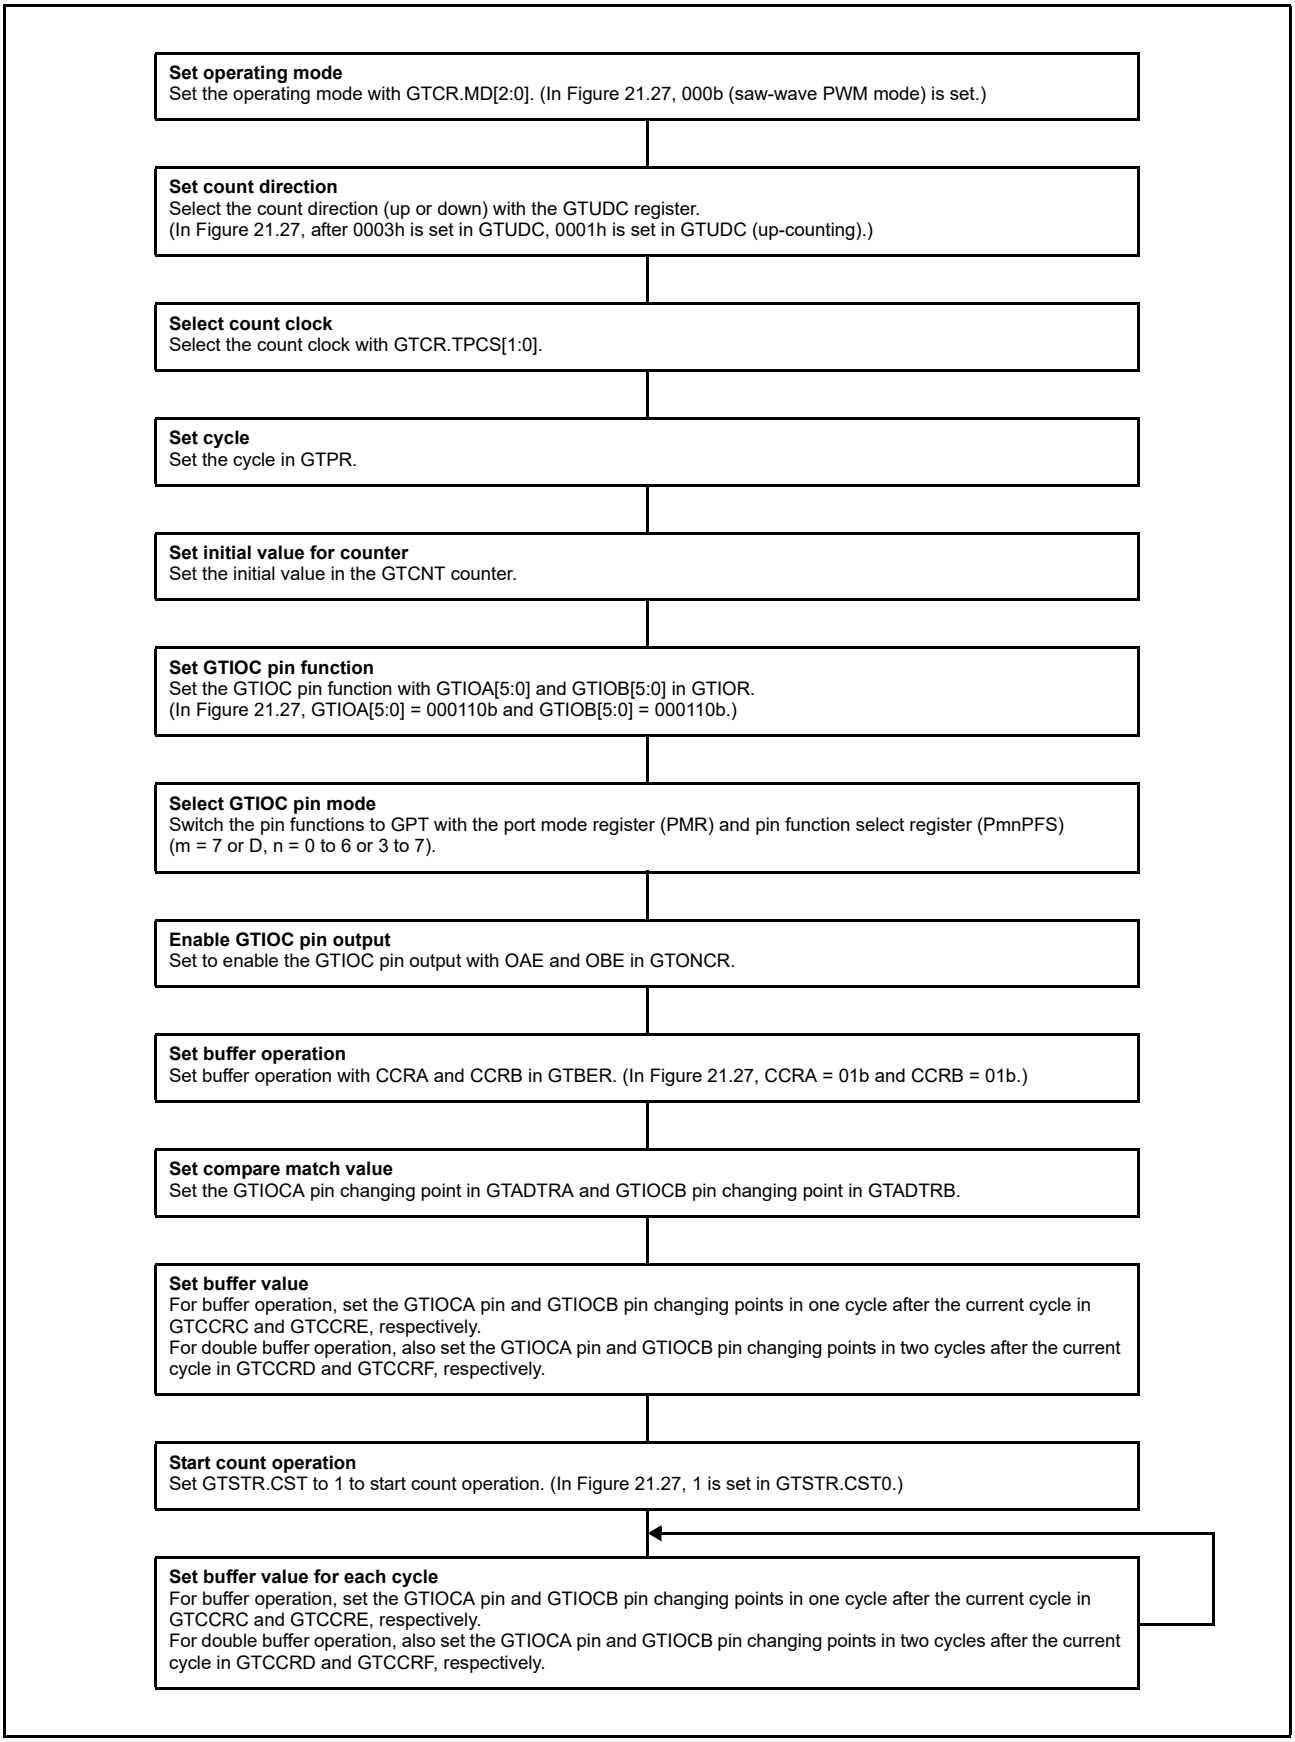

Figure 21.28 Example for Setting Saw-Wave PWM Mode

(2) Saw-Wave One-Shot Pulse Mode

The saw-wave one-shot pulse mode is a mode in which the cycle is set in GPTn.GTPR, the GPTn.GTCNT counter performs saw-wave (half-wave) operation and a PWM waveform is output to the GTIOCnA or GTIOCnB pin at a compare match of GPTn.GTCCRA or GPTn.GTCCRB with buffer operation fixed (n = 0 to 3).

Buffer operation in saw-wave one-shot pulse mode is different from the usual buffer operation. Buffer transfer is performed from GTCCRC to GTCCRA, from GTCCRE to GTCCRB, from GTCCRD to temporary register A, and from GTCCRF to temporary register B at the cycle end, and from temporary register A to GTCCRA at a GTCCRA compare match and from temporary register B to GTCCRB at a GTCCRB compare match. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and the cycle end according to the GTIOR setting.

By setting GTDTCR, GTCVU, and GTDVD, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 21.29 shows an example of saw-wave one-shot pulse mode operation, and Figure 21.30 shows an example for setting saw-wave one-shot pulse mode.

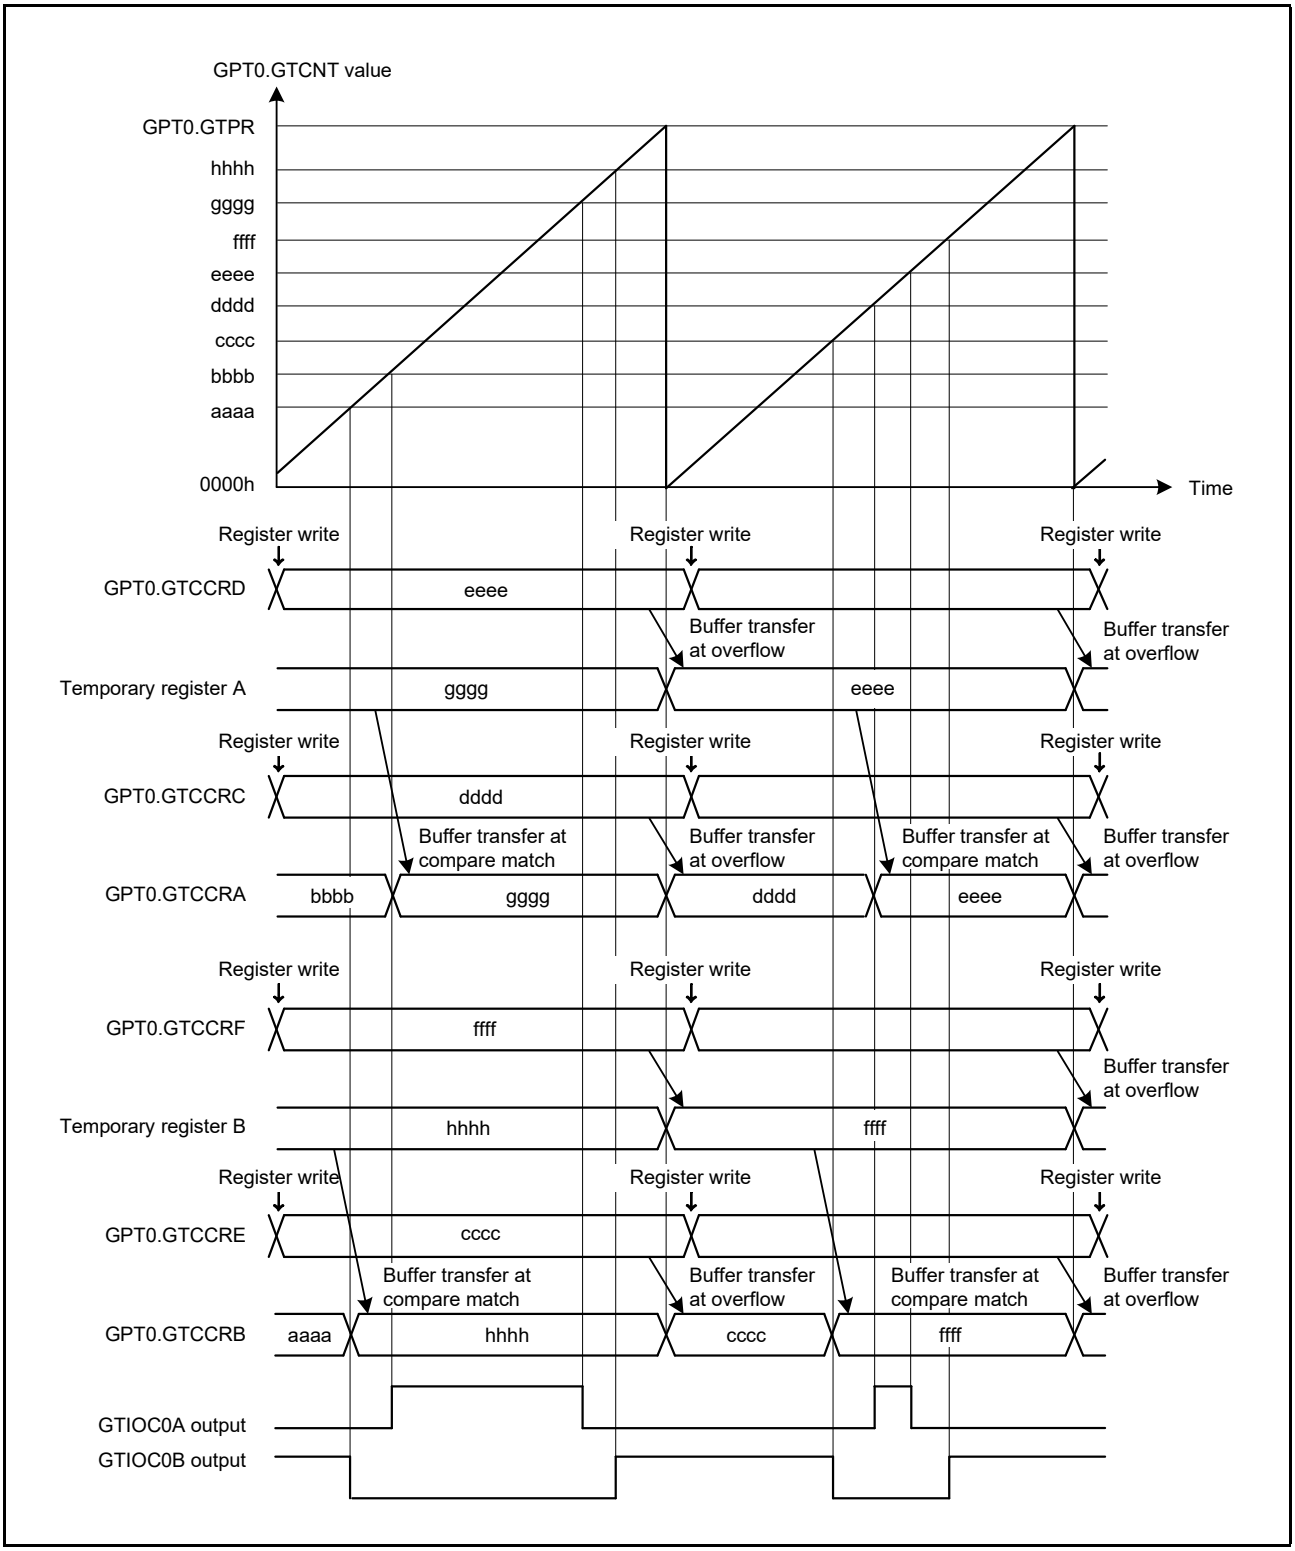

Figure 21.29 Example of Saw-Wave One-Shot Pulse Mode Operation (Up-Count Operation, Low Output from GTIOC0A and High Output from GTIOC0B at Count Start, Toggle Output at GTCCRA/GTCCRB Compare Match, Output Retained at Cycle End)

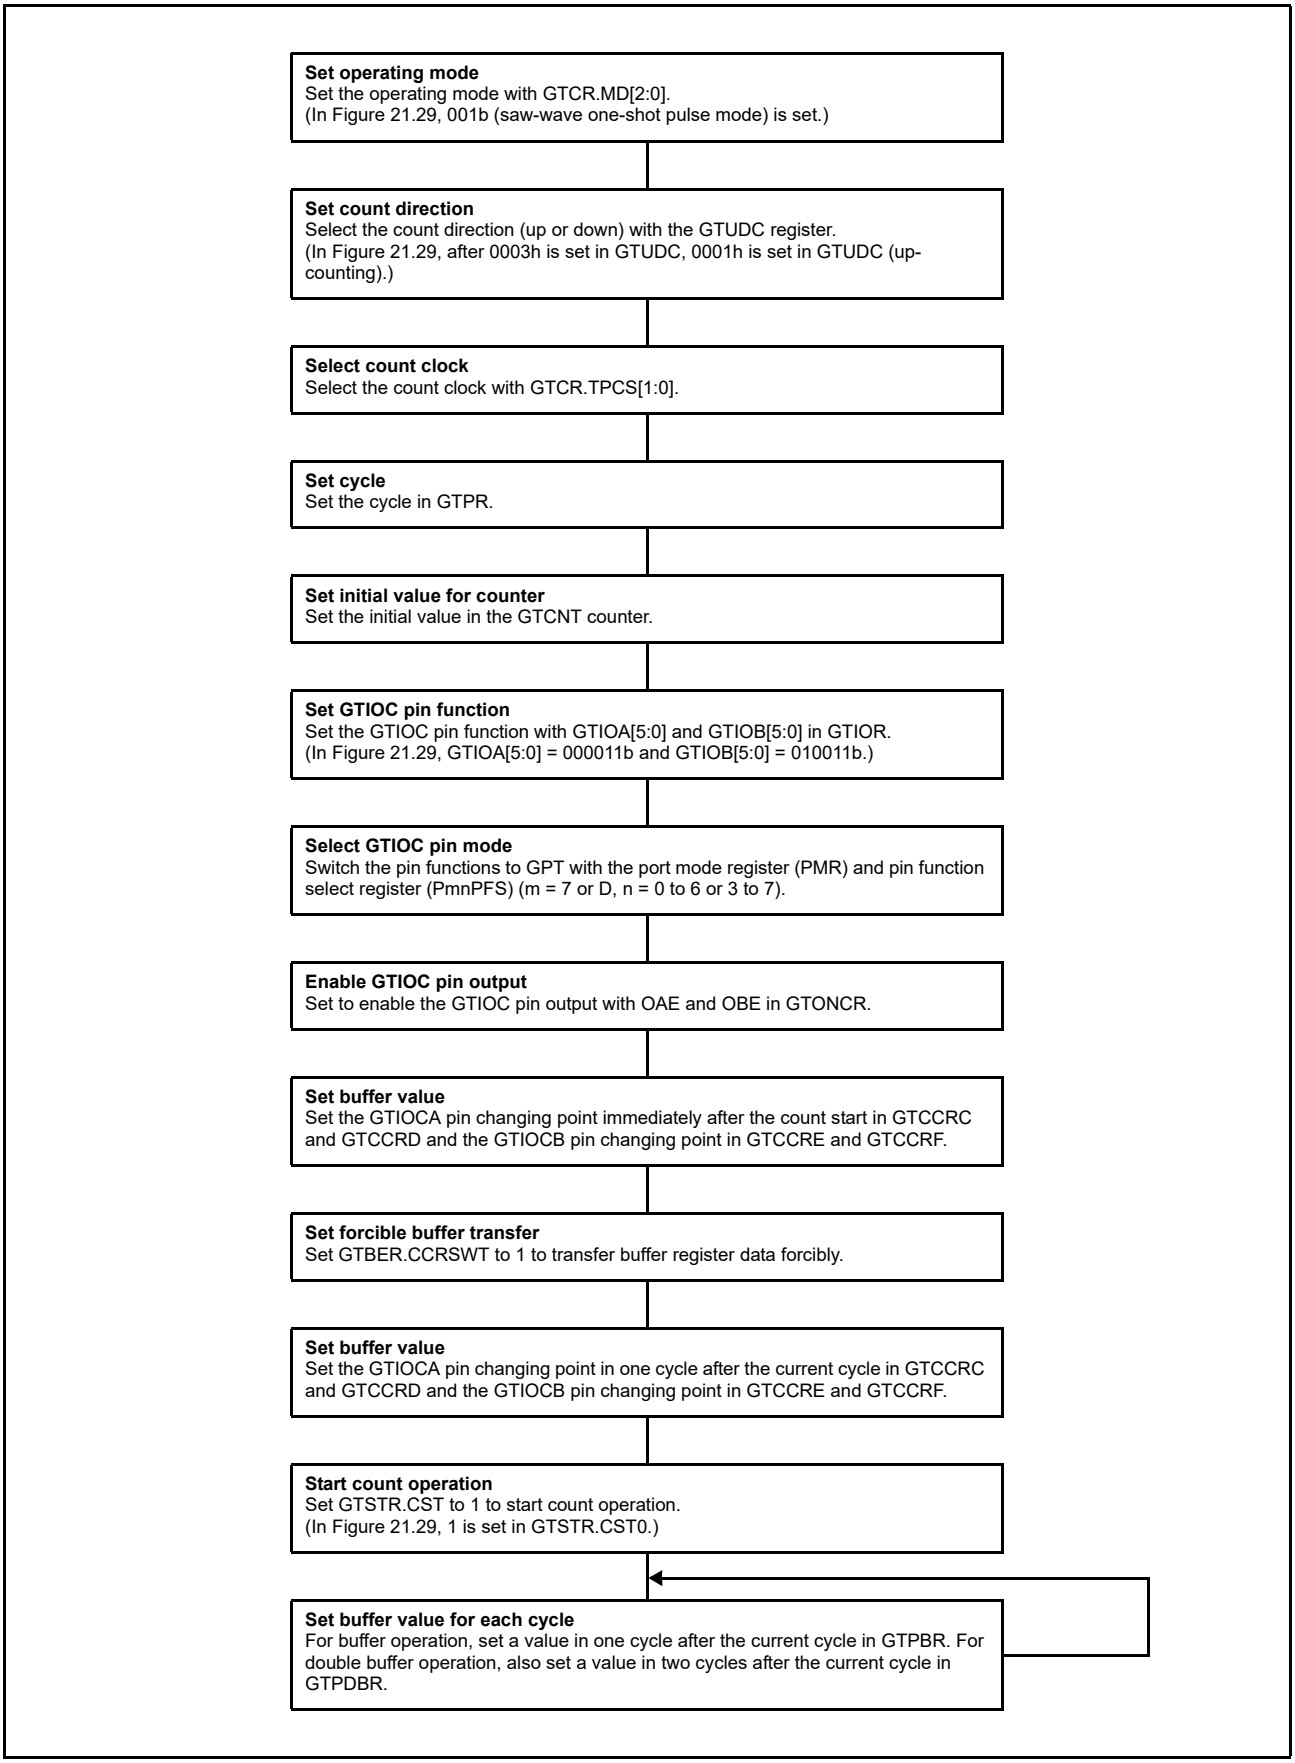

Figure 21.30 Example for Setting Saw-Wave One-Shot Pulse Mode

(3) Triangle-Wave PWM Mode 1 (16-Bit Transfer at Trough)

The triangle-wave PWM mode 1 is a mode in which the cycle is set in GPTn.GTPR, the GPTn.GTCNT counter performs triangle-wave (full-wave) operation, and a PWM waveform is output to the GTIOCnA or GTIOCnB pin when a GPTn.GTCCRA or GPTn.GTCCRB compare match occurs (n = 0 to 3). Buffer transfer is performed at the trough. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end according to the GTIOR setting.

By setting GTDTCR, GTCVU, and GTDVD, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 21.31 shows an example of triangle-wave PWM mode 1 operation, and Figure 21.32 shows an example for setting triangle-wave PWM mode 1.

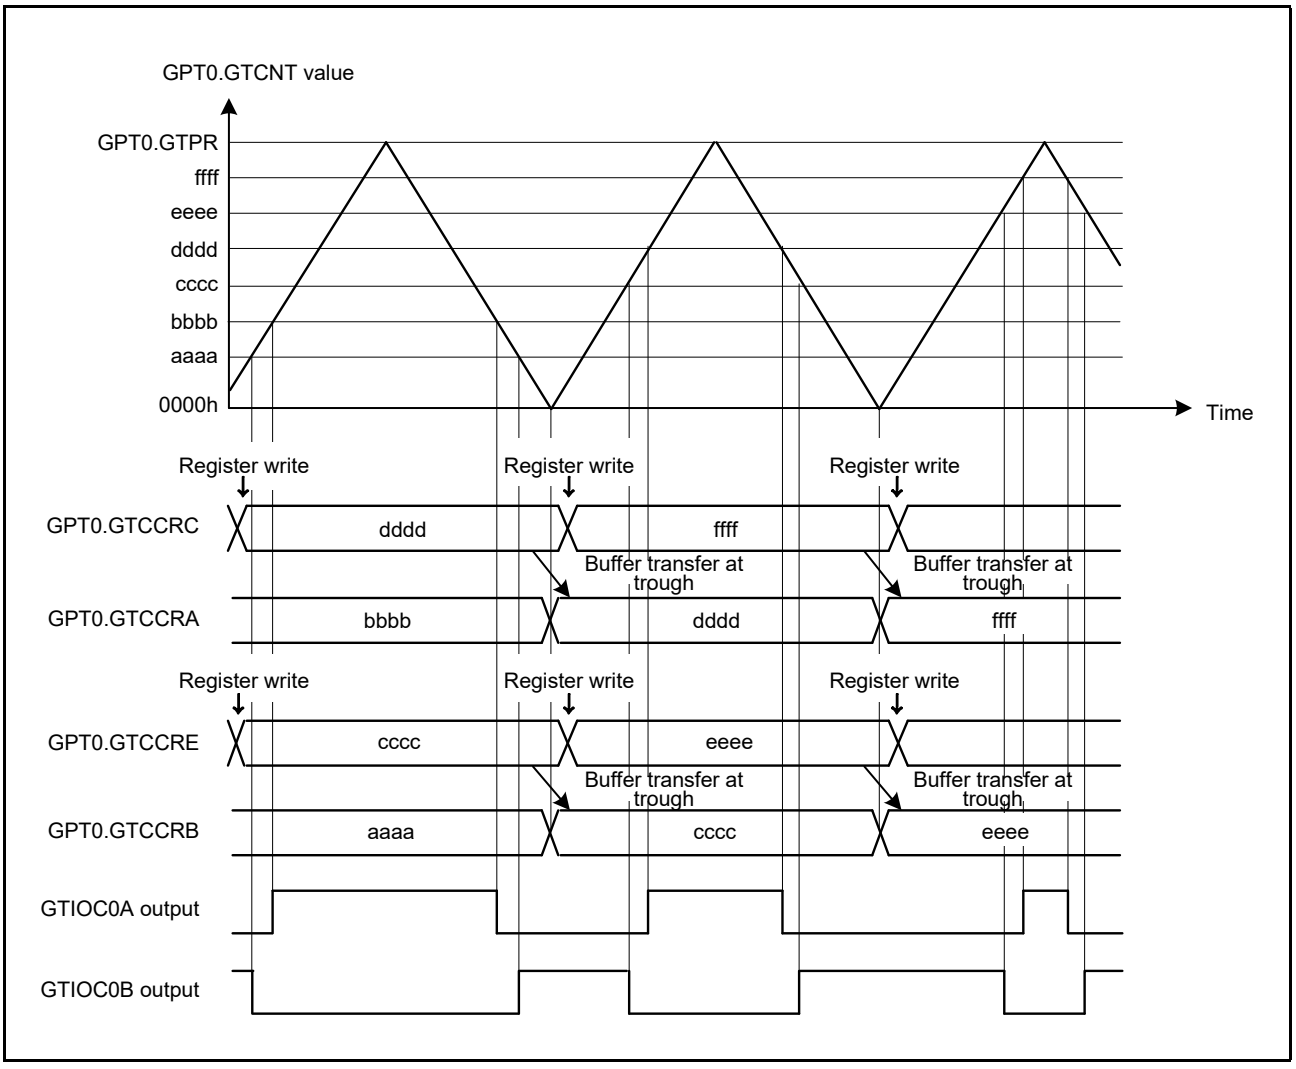

Figure 21.31 Example of Triangle-Wave PWM Mode 1 Operation (Buffer Operation, Low Output from GTIOC0A and High Output from GTIOC0B at Count Start, Toggle Output at GTCCRA/GTCCRB Compare Match, Output Retained at Cycle End)

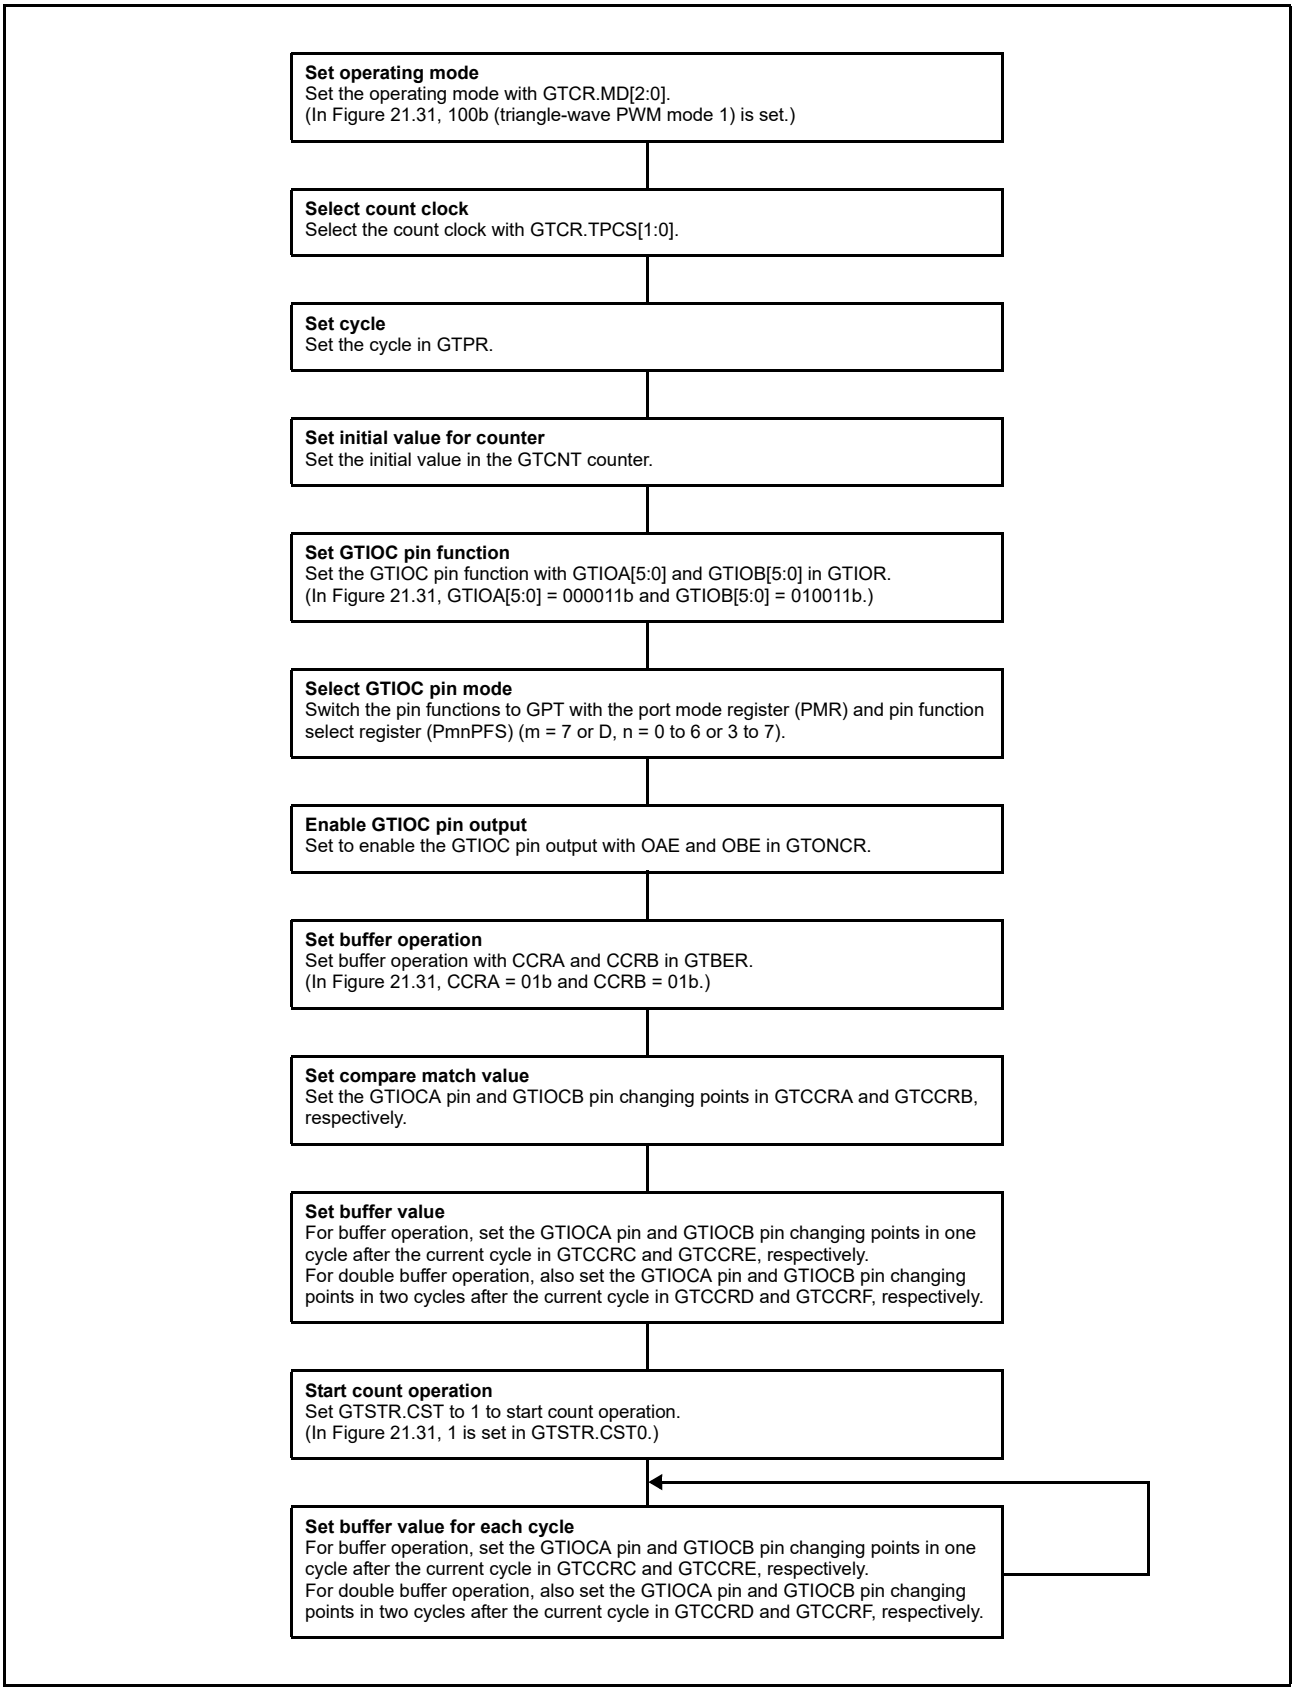

Figure 21.32 Example for Setting Triangle-Wave PWM Mode 1

(4) Triangle-Wave PWM Mode 2 (16-Bit Transfer at Crest and Trough)

Similarly to triangle-wave PWM mode 1, in triangle-wave PWM mode 2 the cycle is set in GPTn.GTPR, the GPTn.GTCNT counter performs triangle-wave (full-wave) operation, and a PWM waveform is output to the GTIOCnA or GTIOCnB pin when a GPTn.GTCCRA or GPTn.GTCCRB compare match occurs (n = 0 to 3). The buffer transfer is performed at both crests and troughs. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end according to the GTIOR setting.
By setting GTDTCR, GTCVU, and GTDVD, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.
Figure 21.33 shows an example of triangle-wave PWM mode 2 operation, and Figure 21.34 shows an example for setting triangle-wave PWM mode 2.

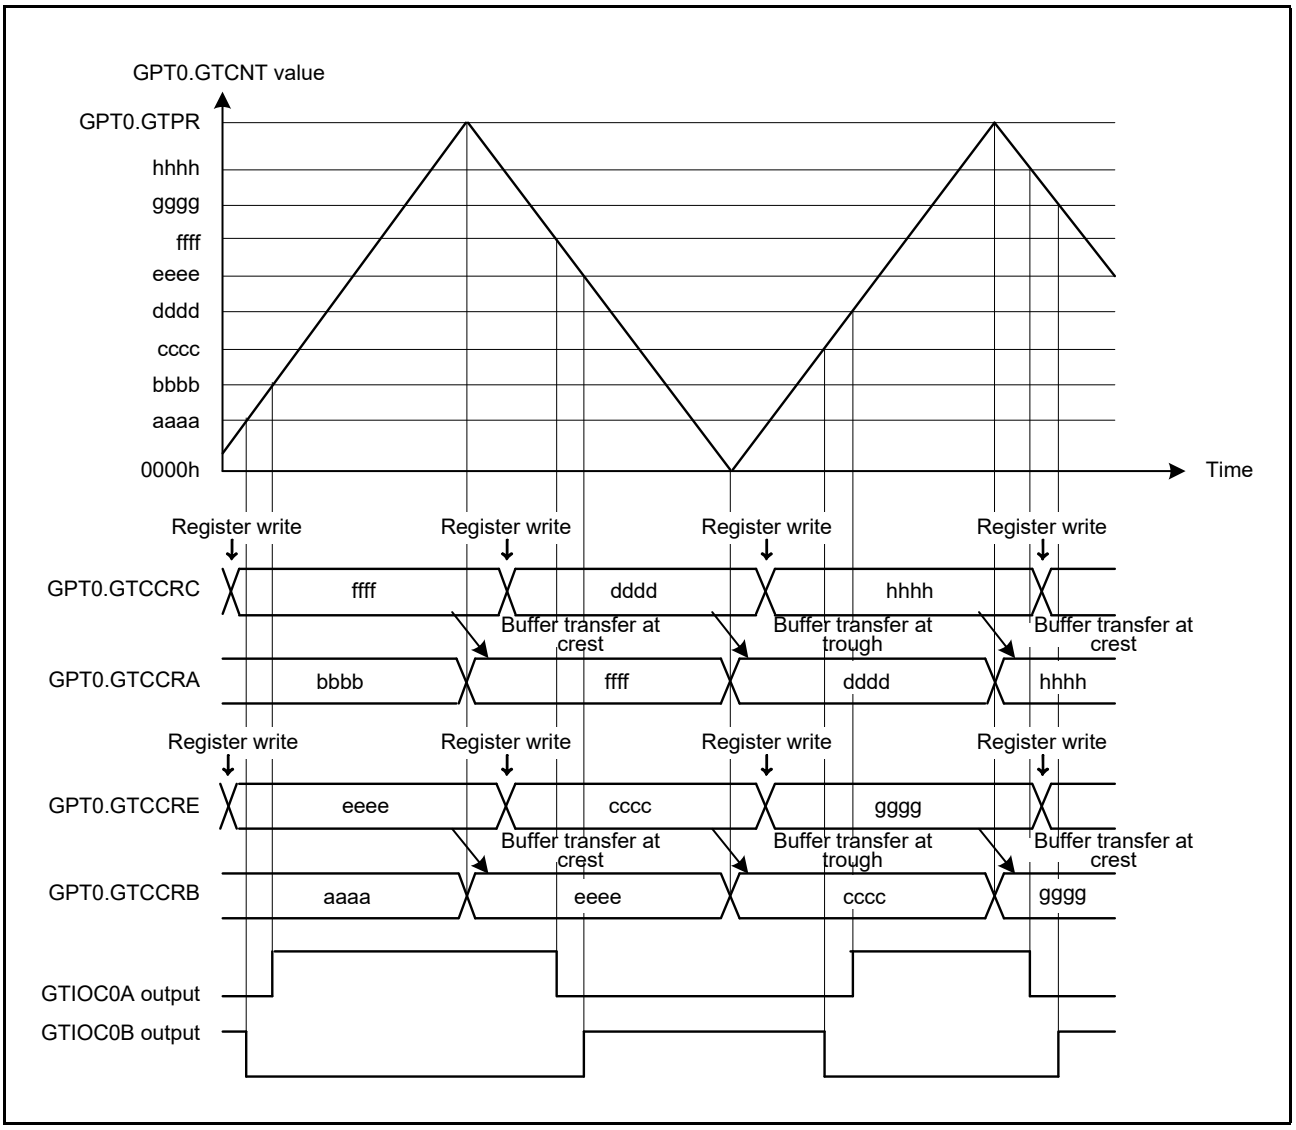

Figure 21.33 Example of Triangle-Wave PWM Mode 2 Operation (Buffer Operation, Low Output from GTIOC0A and High Output from GTIOC0B at Count Start, Toggle Output at GTCCRA/GTCCRB Compare Match, Output Retained at Cycle End)

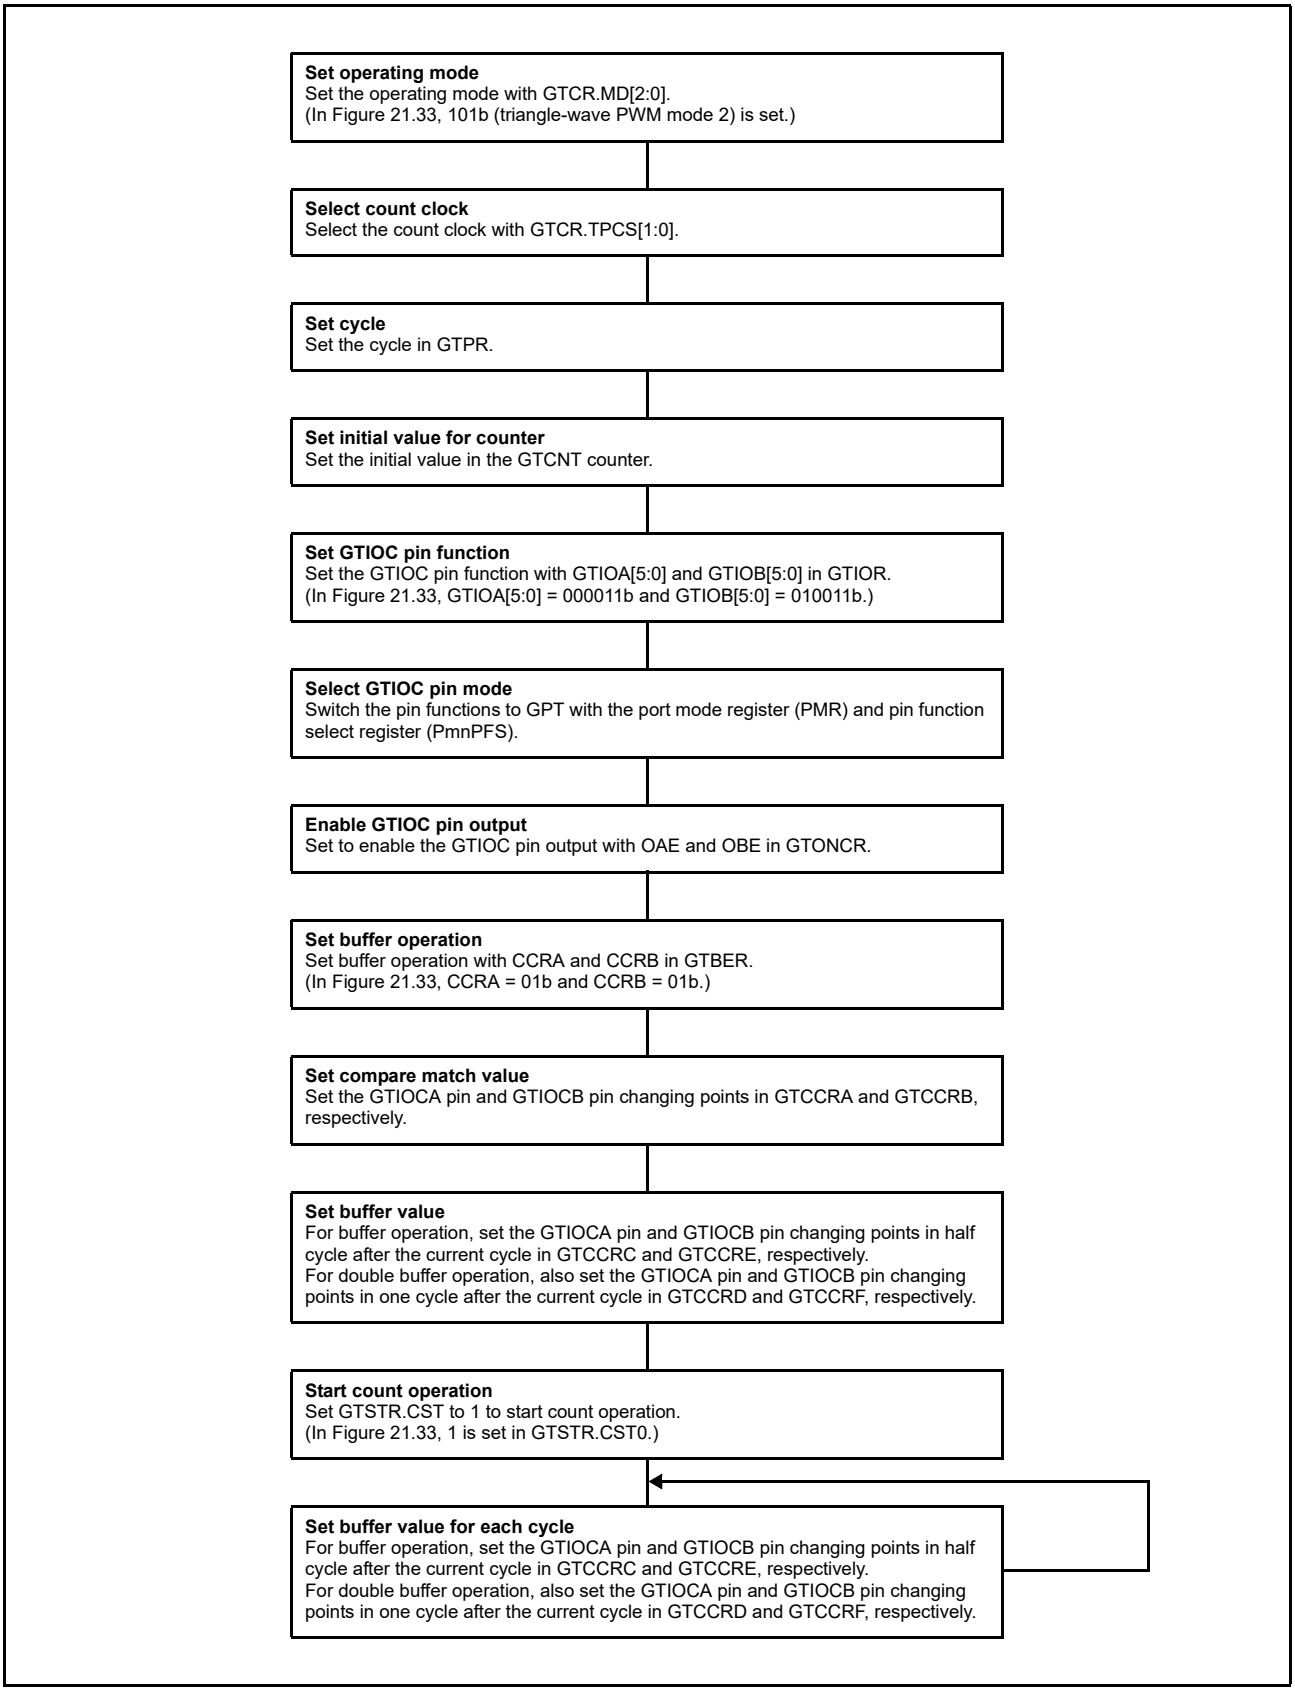

Figure 21.34 Example for Setting Triangle-Wave PWM Mode 2

(5) Triangle-Wave PWM Mode 3 (32-Bit Transfer at Trough)

The triangle-wave PWM mode 3 is a mode in which the cycle is set in GPTn.GTPR, the GPTn.GTCNT counter performs triangle-wave (full-wave) operation and a PWM waveform is output to the GTIOCnA or GTIOCnB pin at a compare match of GPTn.GTCCRA or GPTn.GTCCRB with buffer operation fixed (n = 0 to 3). Buffer operation in triangle-wave PWM mode 3 is different from the usual buffer operation. Buffer transfer is performed from GTCCRC to GTCCRA, from GTCCRE to GTCCRB, from GTCCRD to temporary register A, and from GTCCRF to temporary register B at the trough, and from temporary register A to GTCCRA and from temporary register B to GTCCRB at the crest. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end according to the GTIOR setting.

By setting GTDTCR, GTCVU, and GTDVD, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 21.35 shows an example of triangle-wave PWM mode 3 operation, and Figure 21.36 shows an example for setting triangle-wave PWM mode 3.

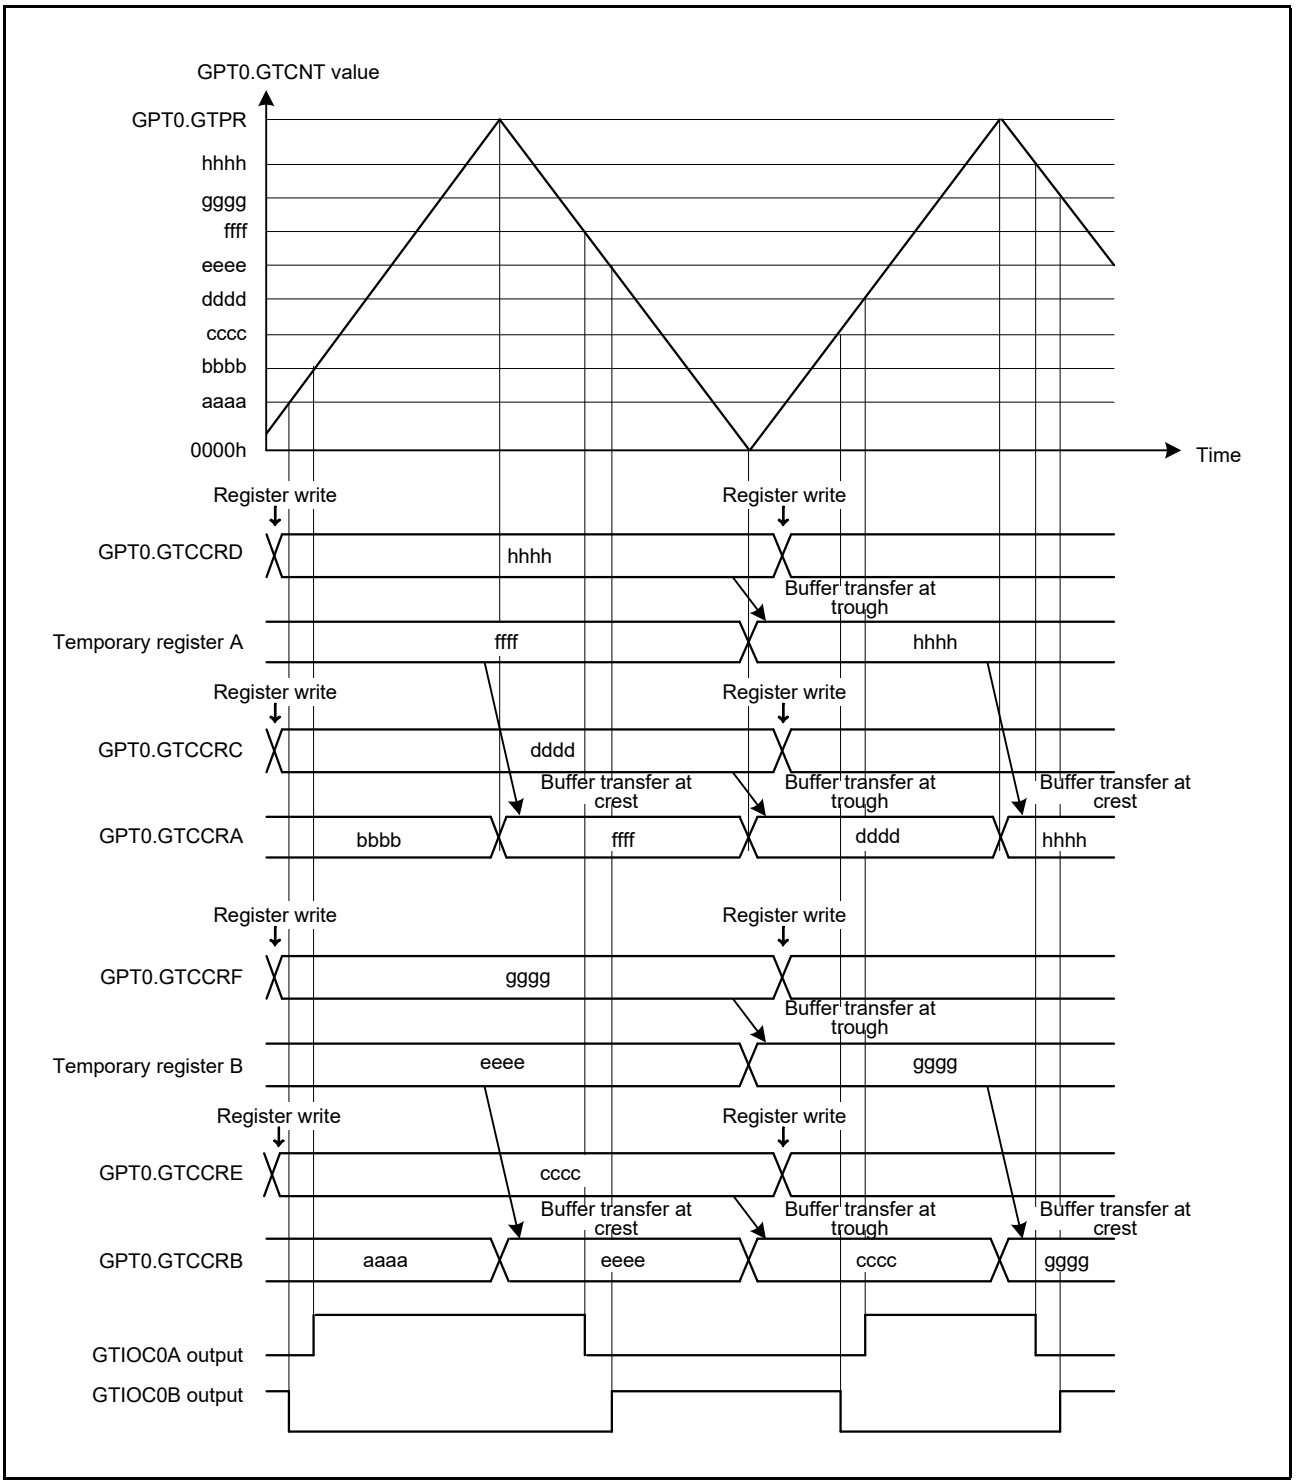

Figure 21.35 Example of Triangle-Wave PWM Mode 3 Operation (Low Output from GTIOC0A and High Output from GTIOC0B at Count Start, Toggle Output at GTCCRA/GTCCRB Compare Match, Output Retained at Cycle End)

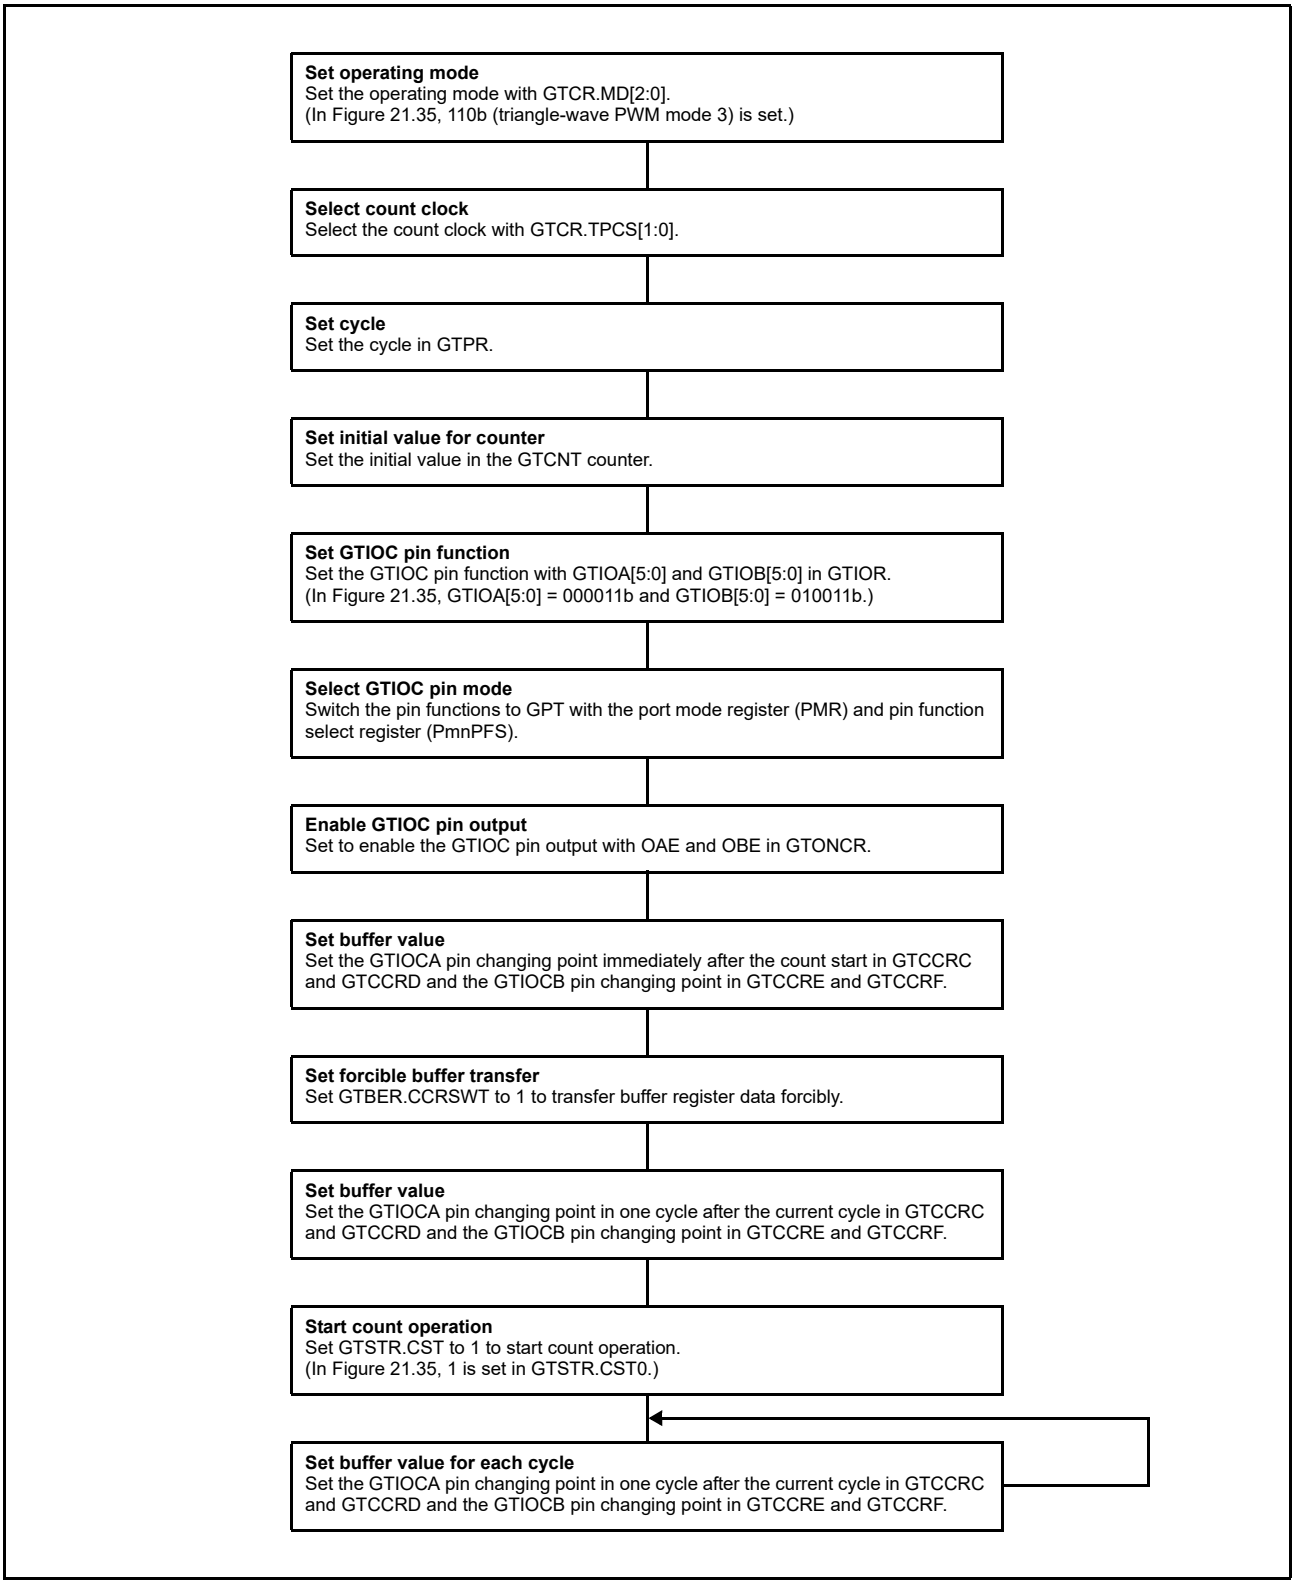

Figure 21.36 Example for Setting Triangle-Wave PWM Mode 3

21.3.4 Automatic Dead Time Setting Function

By setting GTDTCR, a compare match value for a negative waveform with dead time obtained by a compare match value for a positive waveform (GTCCRA value) and specified dead time values (GTDVU and GTDVD values) can automatically be set to GTCCRB.

The automatic dead time setting function can be used in saw-wave one-shot pulse mode and all the triangle PWM modes. Dead time can be separately set for the first half and second half of a waveform. Dead time for the changing point in the first half of a negative waveform is set in GTDVU and that in the second half is set in GTDVD. The same dead time can also be set for the first and second halves.

GTDBU can be used as a buffer register of GTDVU, and GTDBD can be used as a buffer register of GTDVD. Buffer transfer is performed at the cycle end (at a GTCNT overflow (during up-count operation) or an underflow (during down-count operation) for saw waves and at the trough for triangle waves).

Writing to GTCCRB is prohibited when the automatic dead time setting function is used. Dead time setting beyond the cycle is also prohibited. Values for automatic dead time setting can be read from GTCCRB.

Figure 21.37 to Figure 21.39 show examples of automatic dead time setting function operation. Figure 21.40 and Figure 21.41 show the setting examples.

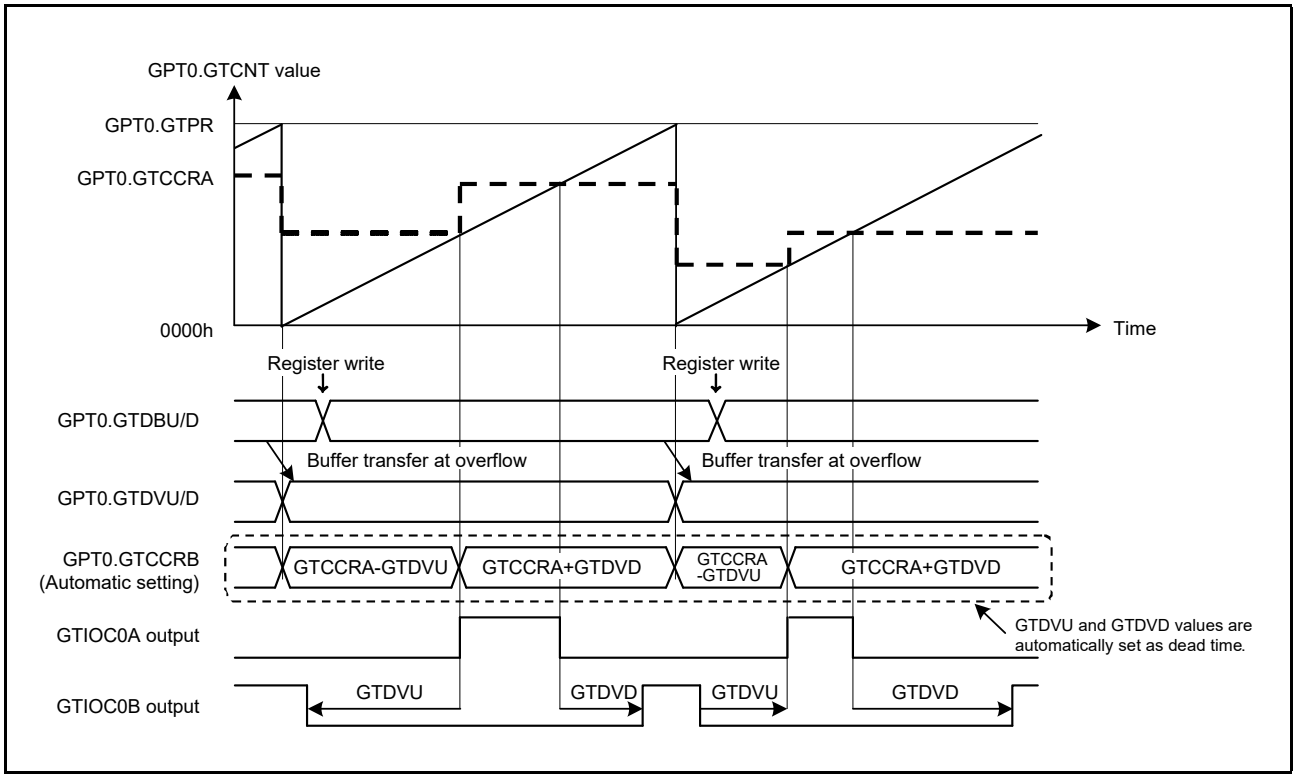

Figure 21.37 Example of Automatic Dead Time Setting Function Operation (Saw-Wave One-Shot Pulse Mode, GTDVU and GTDVD Set to Buffer Operation, Active Level: High)

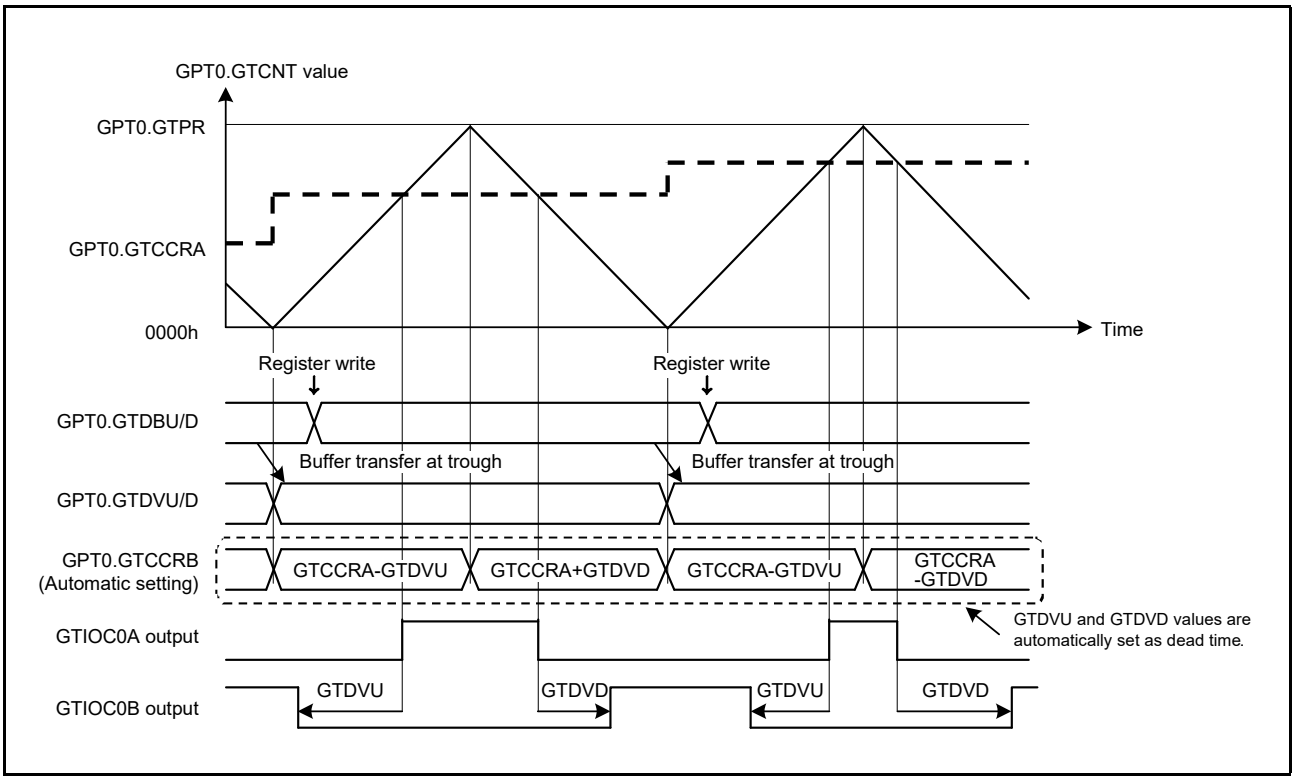

Figure 21.38 Example of Automatic Compare-Match Value Setting Function with Dead Time (Triangle-Wave PWM Mode 1, GTDVU and GTDVD Set to Buffer Operation, Active Level: High)

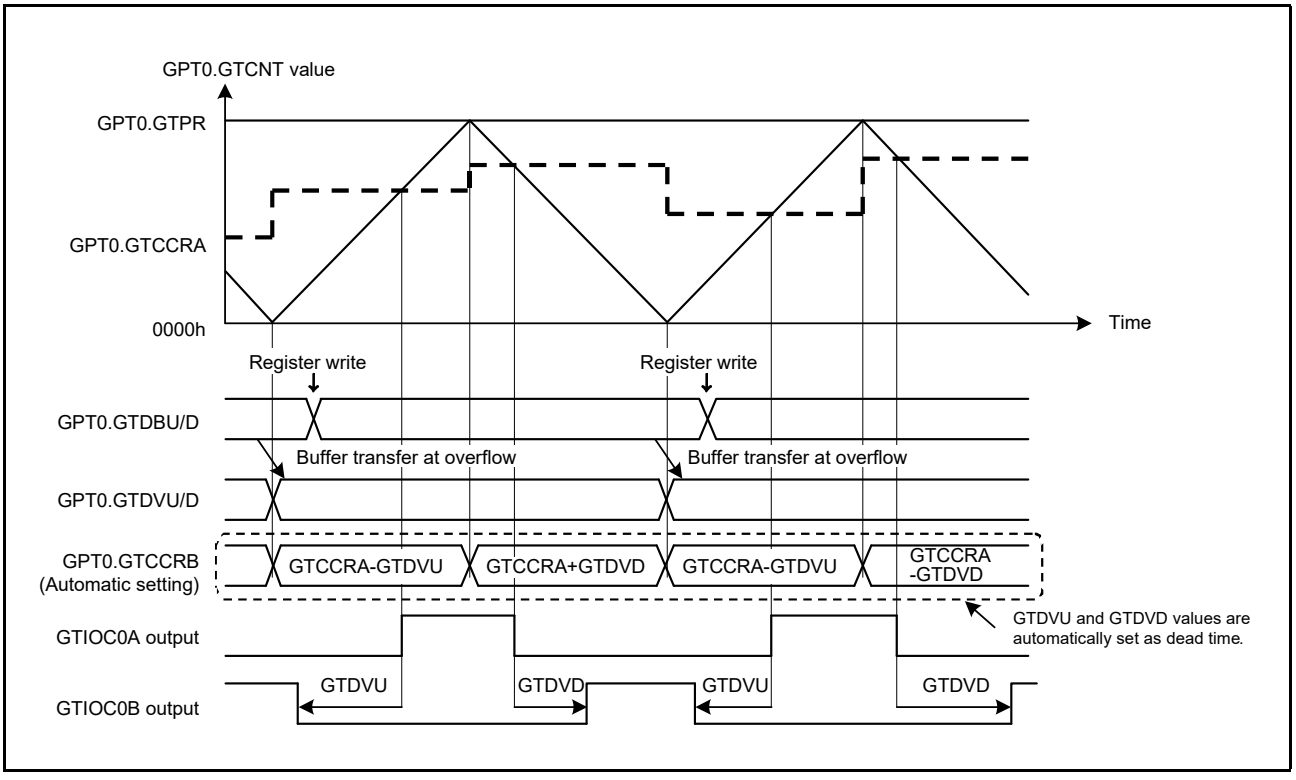

Figure 21.39 Example of Automatic Compare-Match Value Setting Function with Dead Time (Triangle-Wave PWM Mode 2 or 3, GTDVU and GTDVD Set to Buffer Operation, Active Level: High)

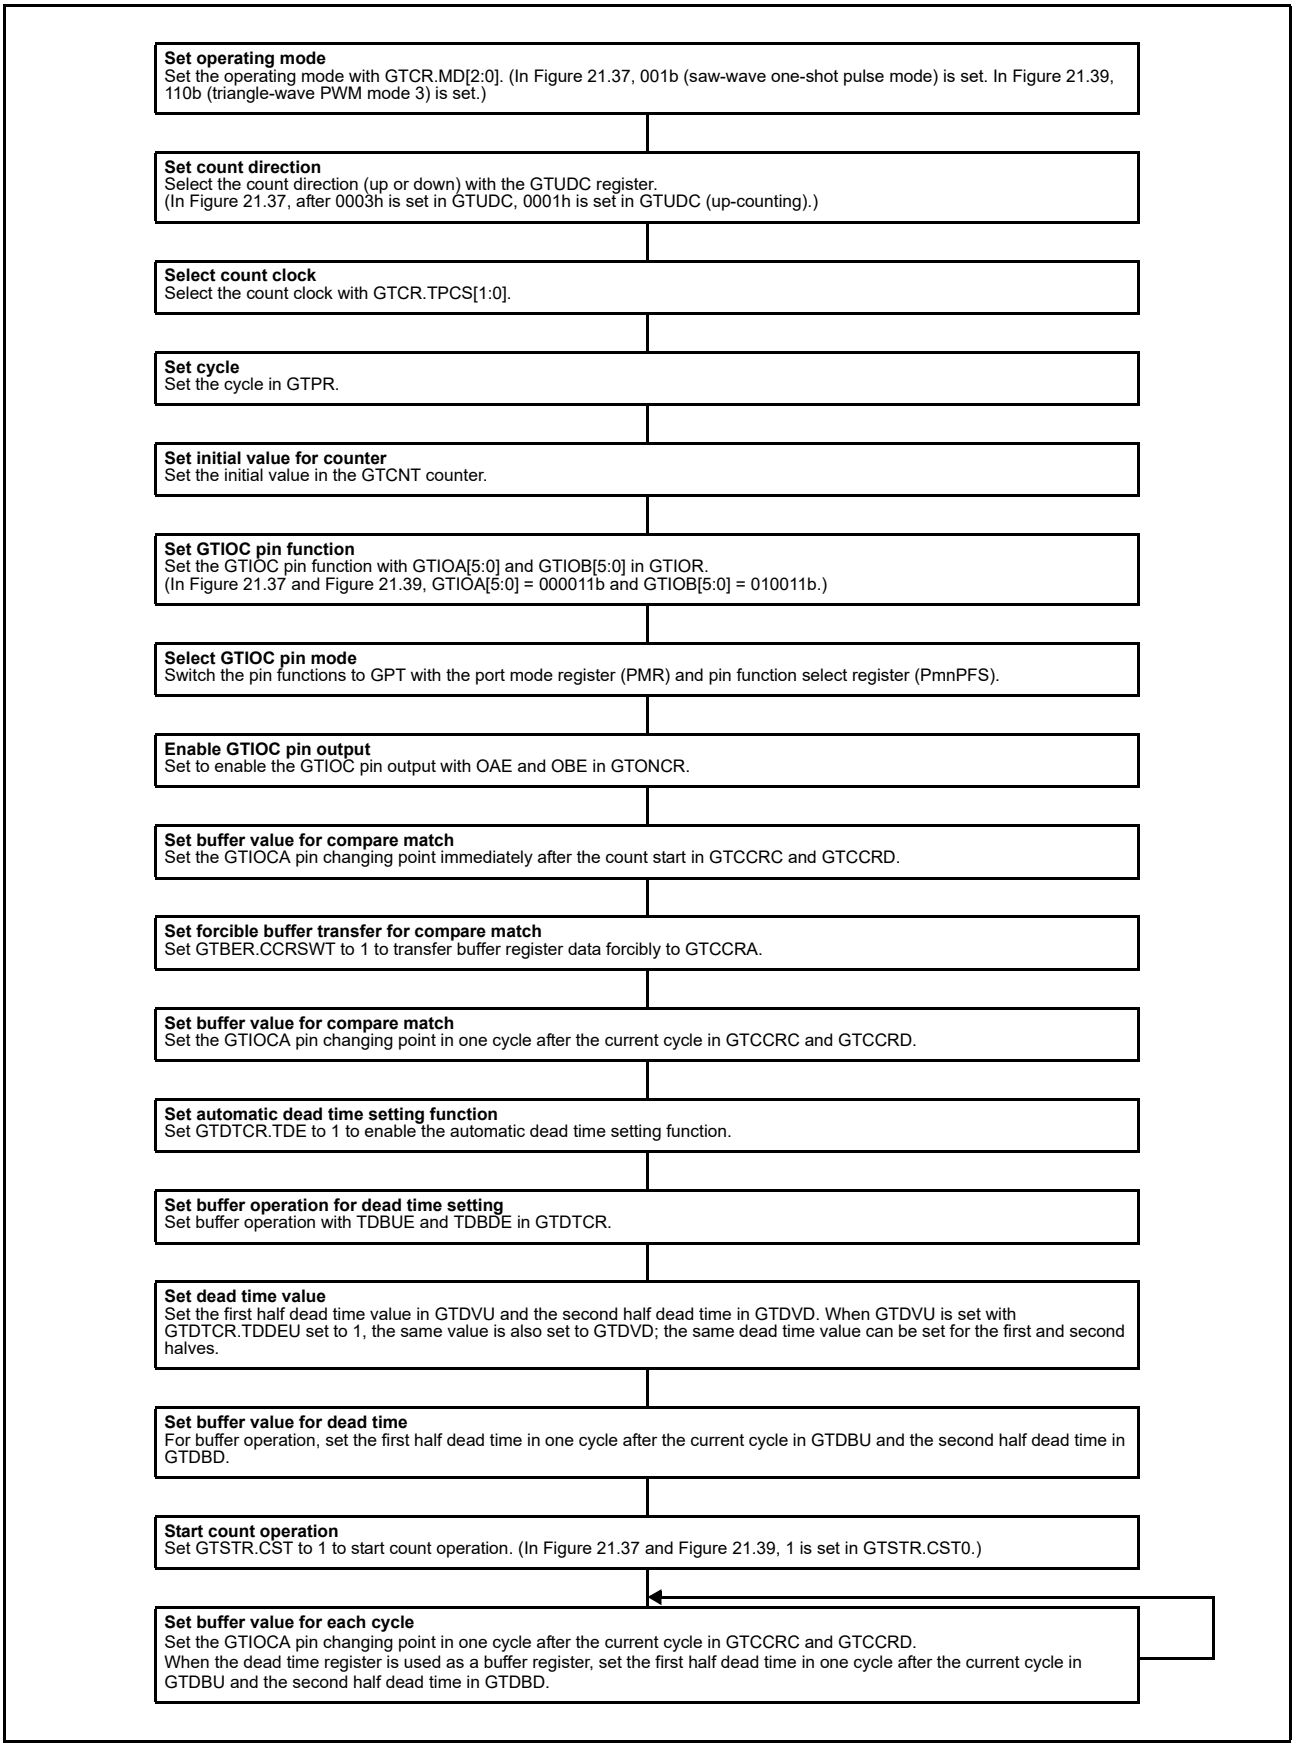

Figure 21.40 Example for Setting Automatic Dead Time Setting Function (Saw-Wave One-Shot Pulse Mode, Triangle-Wave PWM Mode 3)

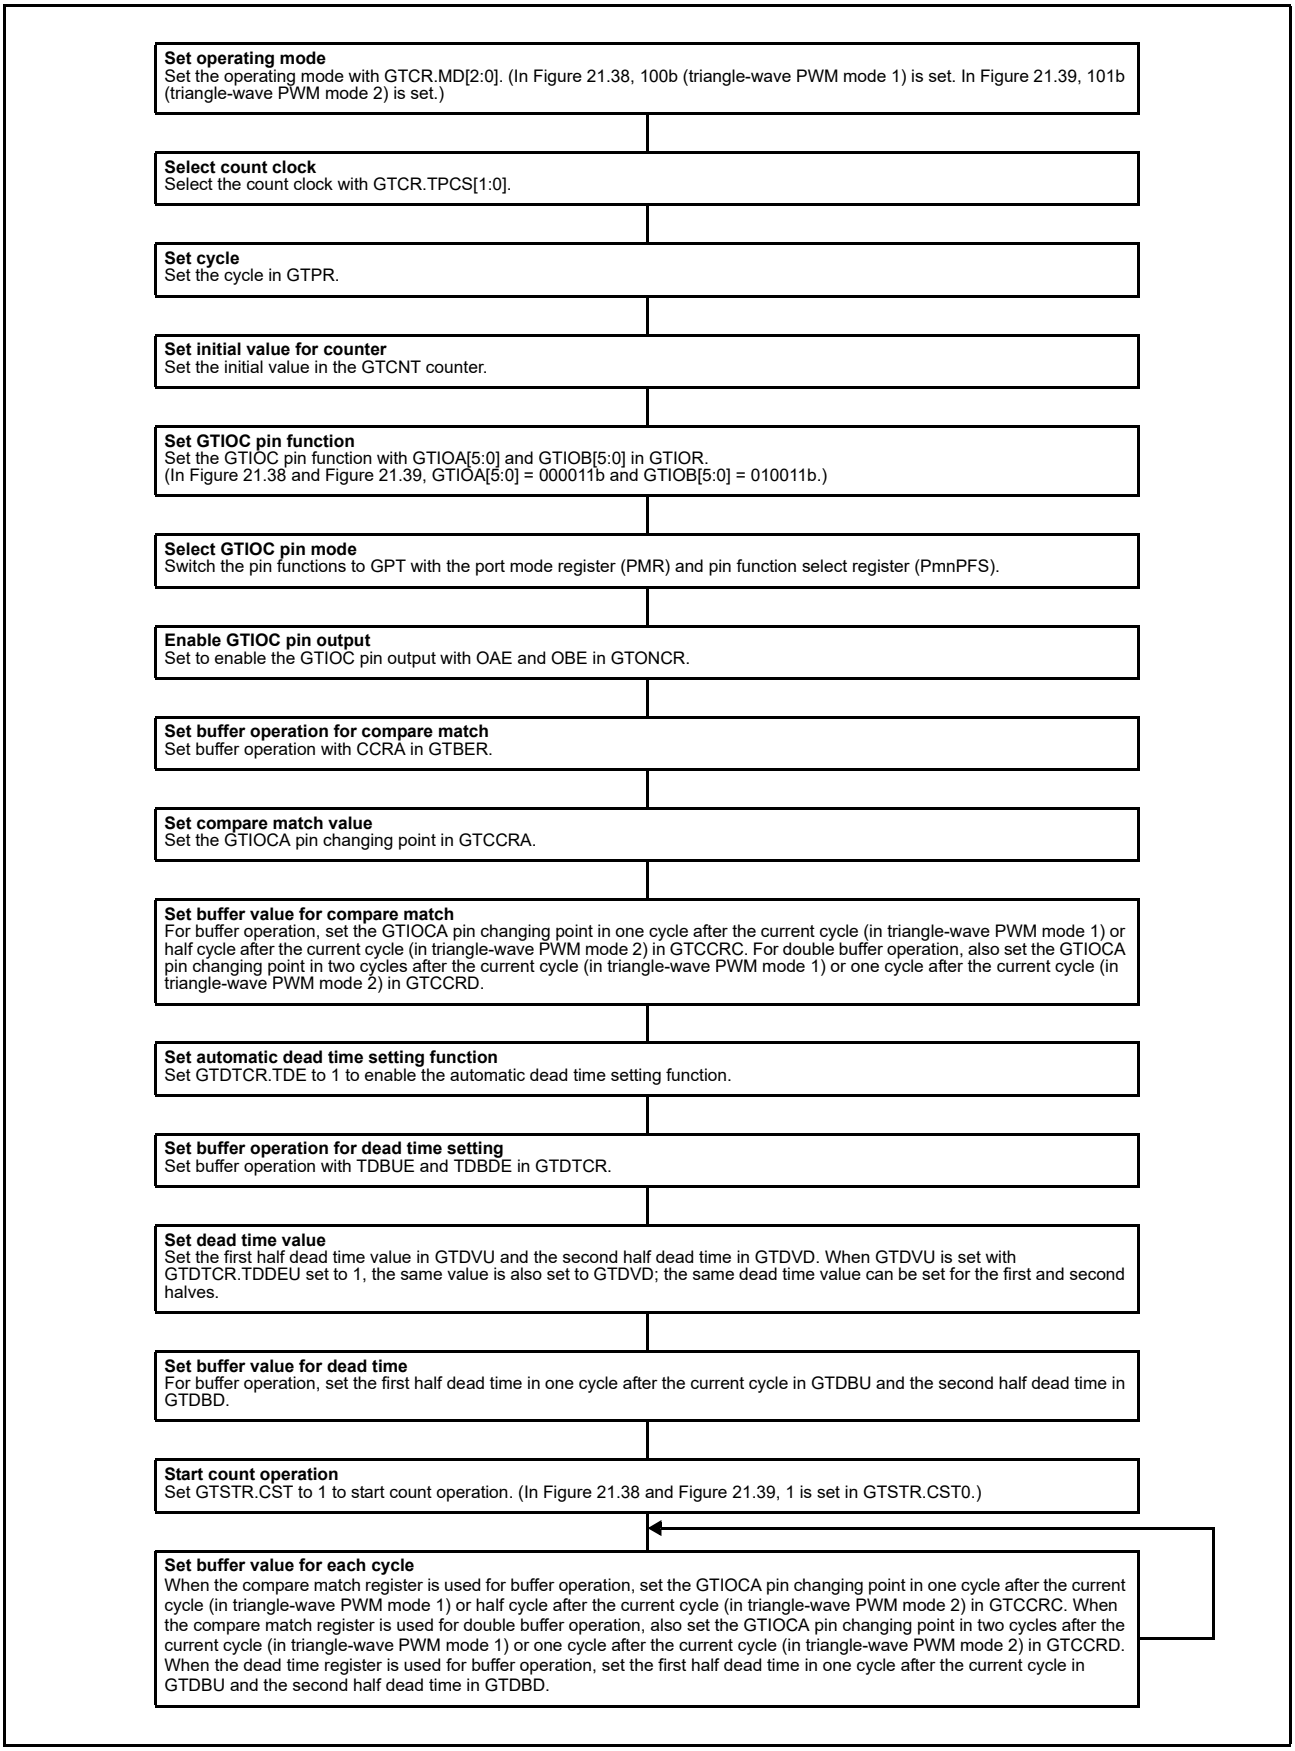

Figure 21.41 Example for Setting Automatic Dead Time Setting Function (Triangle-Wave PWM Mode 1 or 2)

21.3.5 Count Direction Changing Function

The count direction of the GTCNT counter can be changed by modifying the UD bit in GTUDC.
In saw-wave mode, if the UD bit in GTUDC is modified during count operation, the count direction is changed at an overflow (when modified during up-count operation) or an underflow (when modified during down-count operation). If the UD bit is modified while count operation is stopped and the UDF bit is 0, the UD bit modification is not reflected at the start of counting and the count direction is changed at an overflow or an underflow. If the UDF bit is set to 1 while count operation is stopped, the UD bit value at that time is reflected at the start of counting.
In triangle-wave mode, the count direction is not changed even though the UD bit in GTUDC is modified during count operation. Similarly, even though the UD bit is modified while count operation is stopped and UDF bit is 0, the UD bit value is not reflected to the count operation. If the UDF bit is set to 1 while count operation is stopped, the UD bit value at that time is reflected at the start of counting.
If the count direction is changed during saw-wave count operation, the GTPR value after the start of up-counting is reflected to the count cycle during up-count operation and the GTPR value before the start of down-counting is reflected during down-count operation.

Figure 21.42 shows an example of count direction changing function operation.

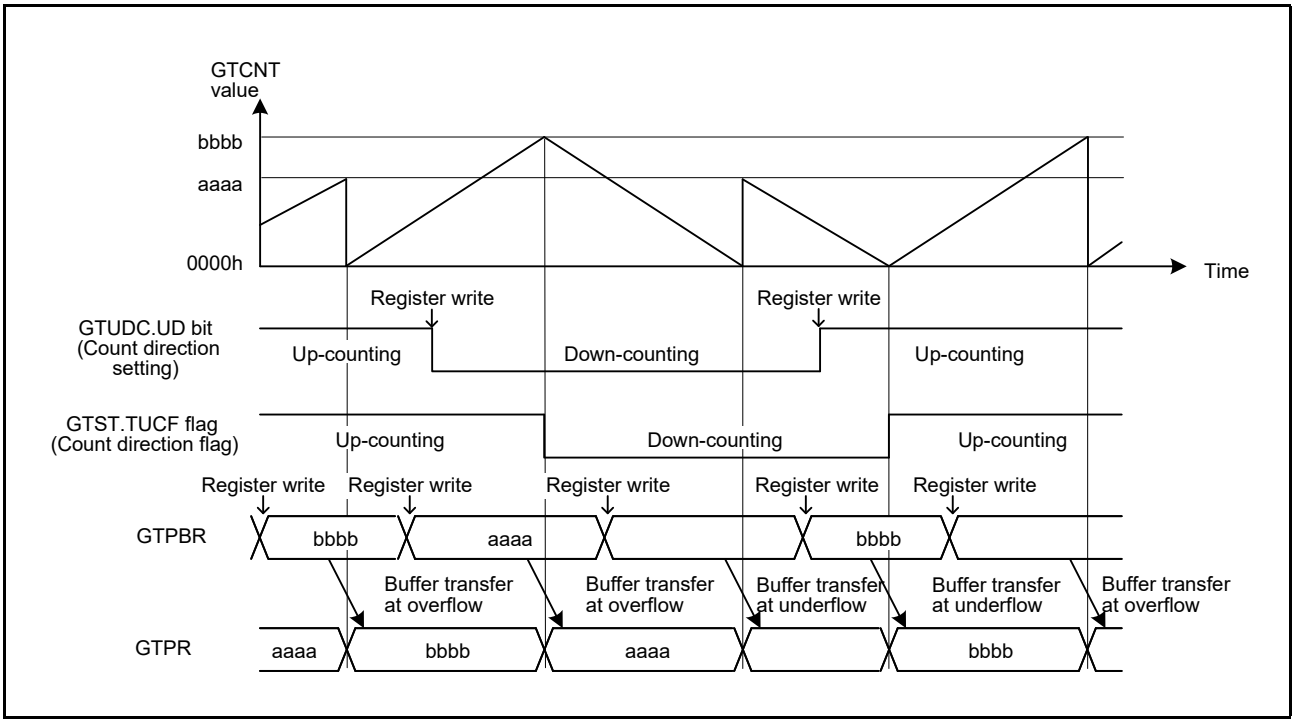

Figure 21.42 Example of Count Direction Changing Function Operation (during Buffer Operation)

21.3.6 Hardware Start/Stop and Clear Operation

The GTCNT counter can be started, stopped, or cleared by following hardware sources: GTETRG pin input, GTIOC3A/GTIOC3B pin input, and GTIOC3A/GTIOC3B internal output (output compare).
The counter can also be cleared by the GTCCRA or GTCCRB input capture.

21.3.6.1 Hardware Start Operation

The GTCNT counter can be started by a hardware source. Select a hardware source to start counting using GTHSSR.CSHSL, set the changing edge for the hardware source with GTHSCR.CSHW, and then enable to start counting.
Figure 21.43 shows an example of count start operation by a hardware source. Figure 21.44 shows the setting example.

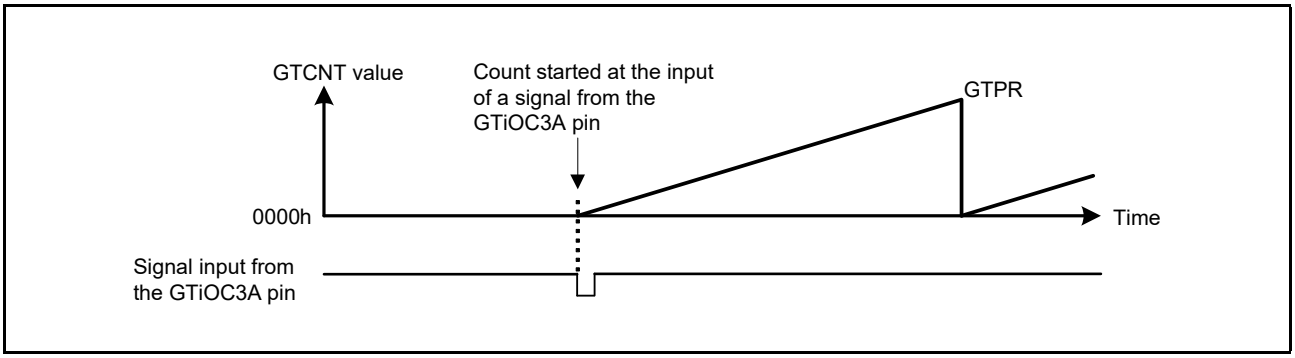

Figure 21.43 Example of Count Start Operation by Hardware Source (Started at Input of Signal from the GTiOC3A Pin)

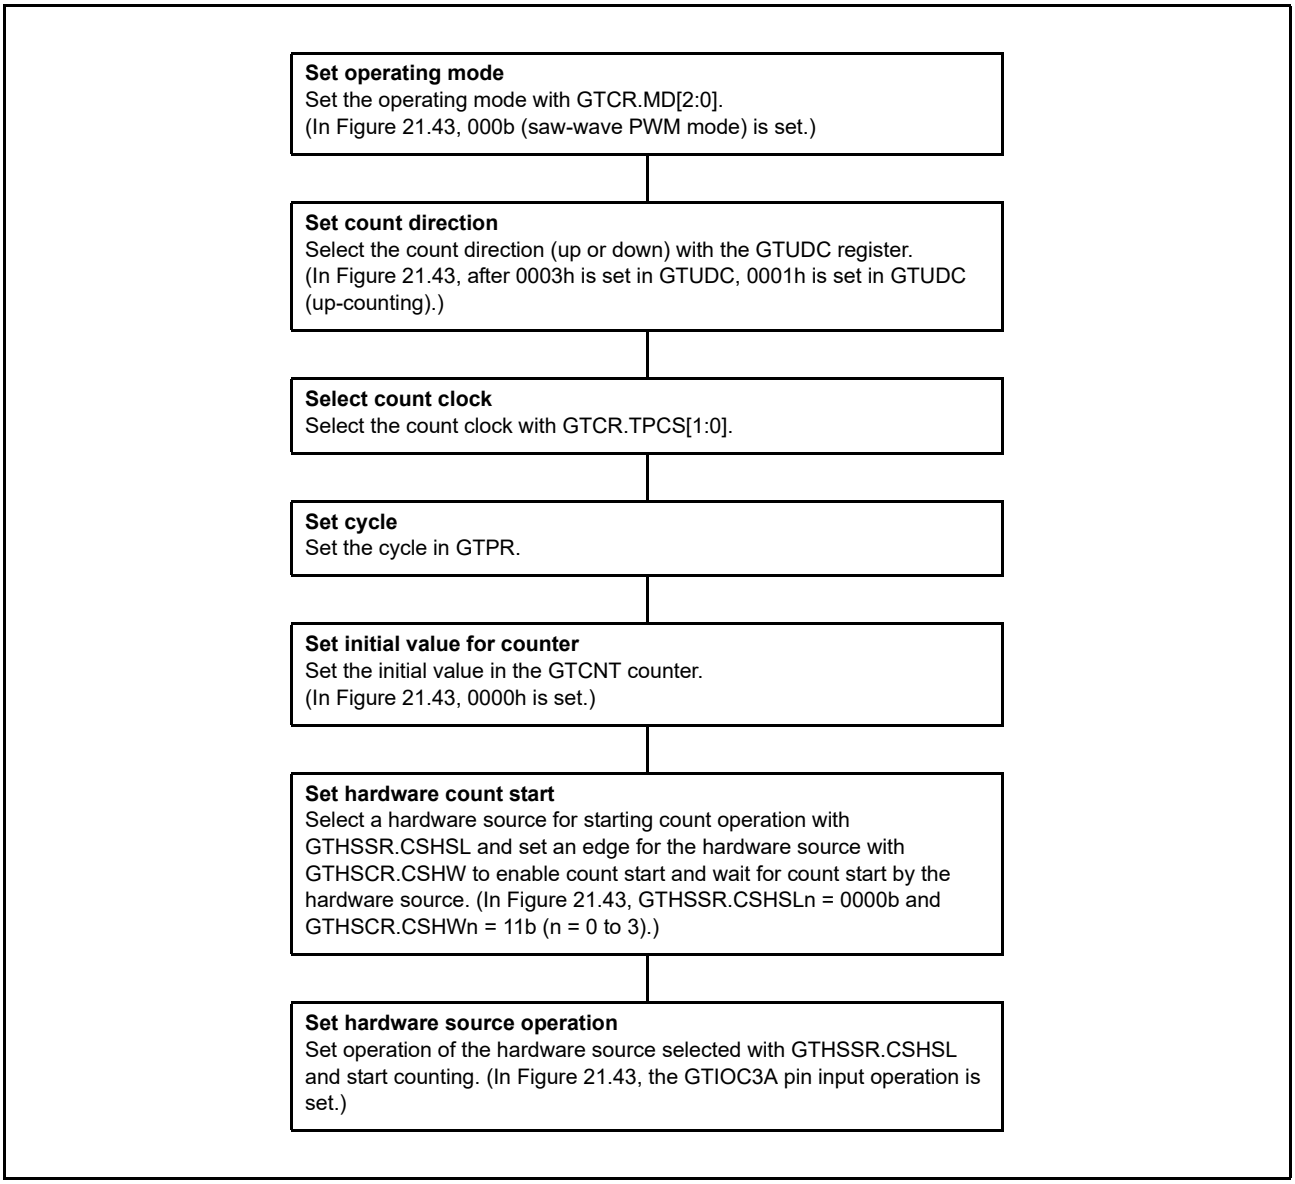

Figure 21.44 Example for Setting Count Start Operation by Hardware Source

21.3.6.2 Hardware Stop Operation

The GTCNT counter can be stopped by a hardware source. Select a hardware source to stop counting using GTHPSR.CSHPL, set the changing edge for the hardware source with GTHSCR.CPHW, and then enable to stop counting.

Figure 21.45 shows an example of count stop operation by a hardware source. Figure 21.46 shows the setting example. In this example, the count operation is stopped at both edges of the GTIOC3A internal output (output compare) and is restarted at both edges of the GTIOC3B internal output (output compare).

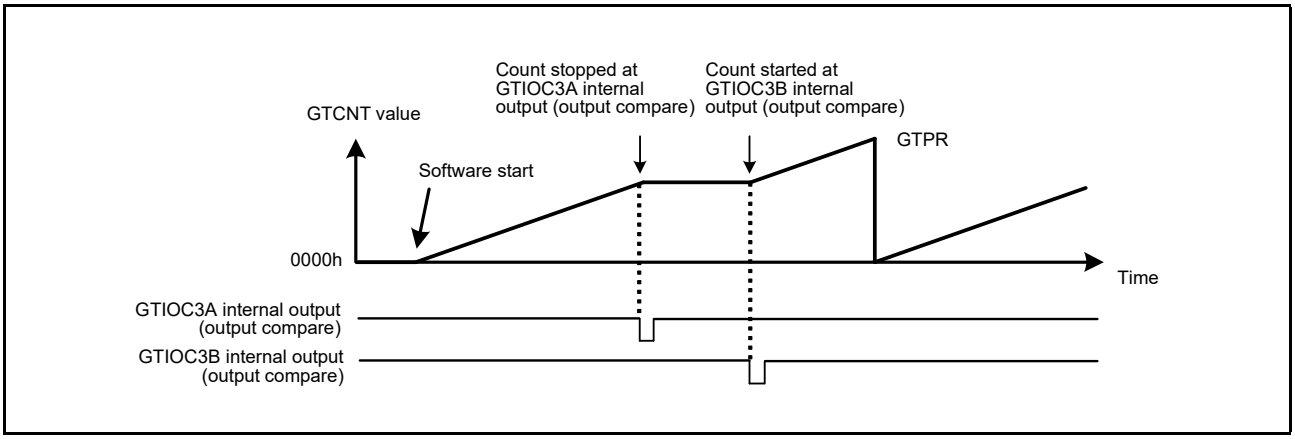

Figure 21.45 Example of Count Stop Operation by Hardware Source (Started by Software, Stopped at GTIOC3A Internal Output (Output Compare), Restarted at GTIOC3B Internal Output (Output Compare))

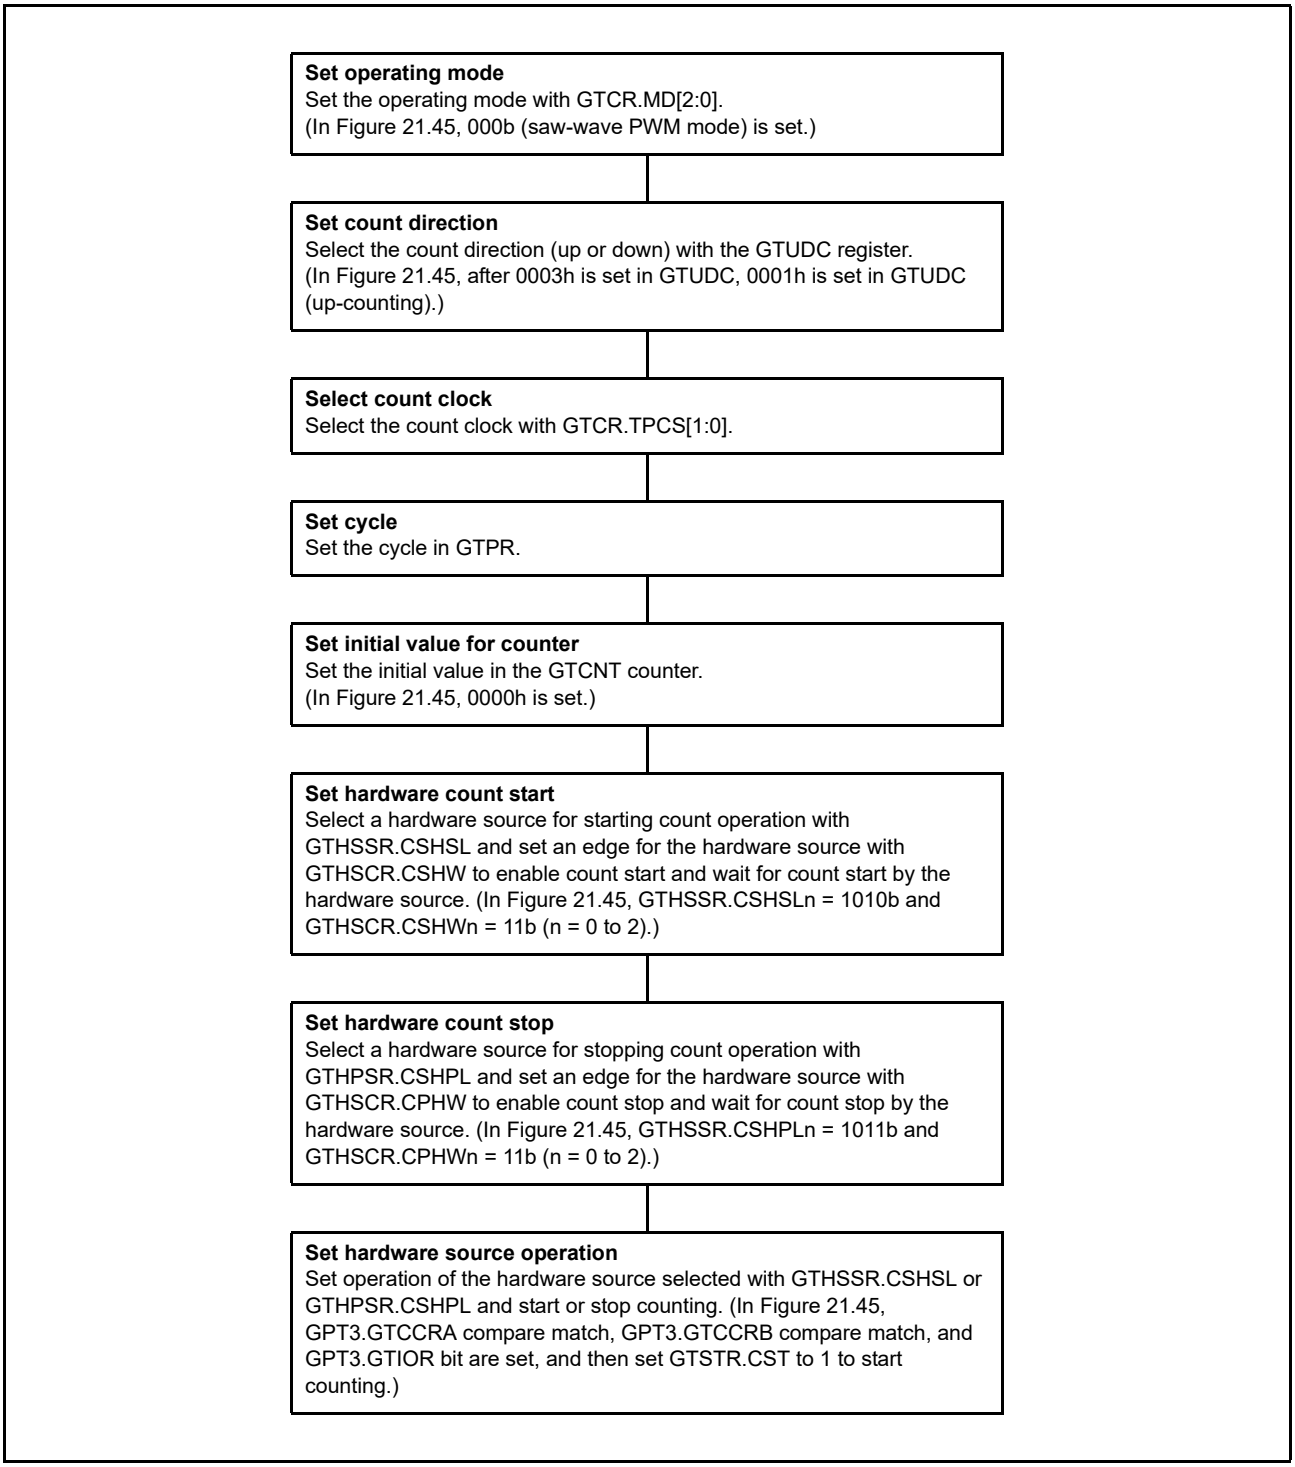

Figure 21.46 Example for Setting Count Stop Operation by Hardware Source

Figure 21.47 shows an example of count start/stop operation by a hardware source. Figure 21.48 shows the setting example. In this example, the counter operates during the high-level periods of the external trigger input GTETRG.

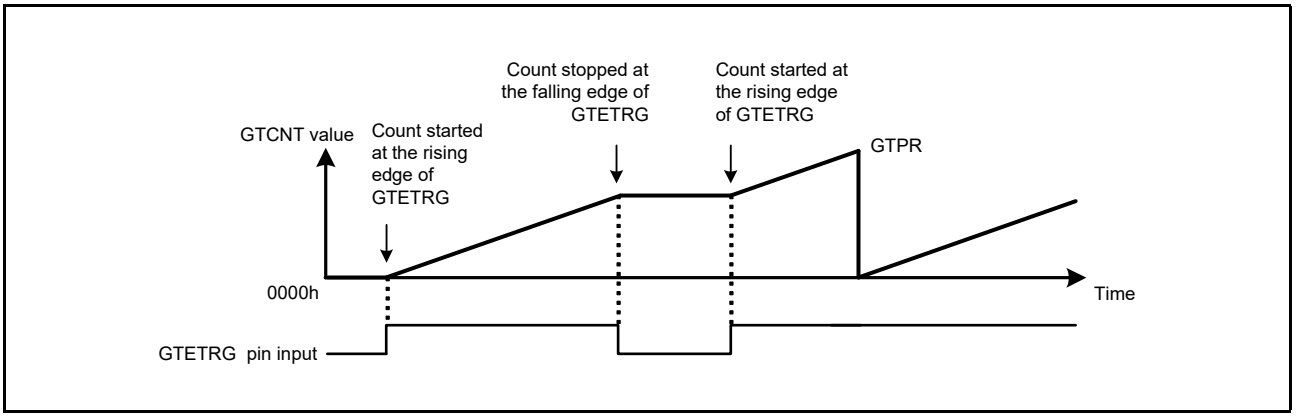

Figure 21.47 Example of Count Start/Stop Operation by Hardware Source (Started at Rising Edge of GTETRG Pin Input, Stopped at Falling Edge of GTETRG Pin Input)

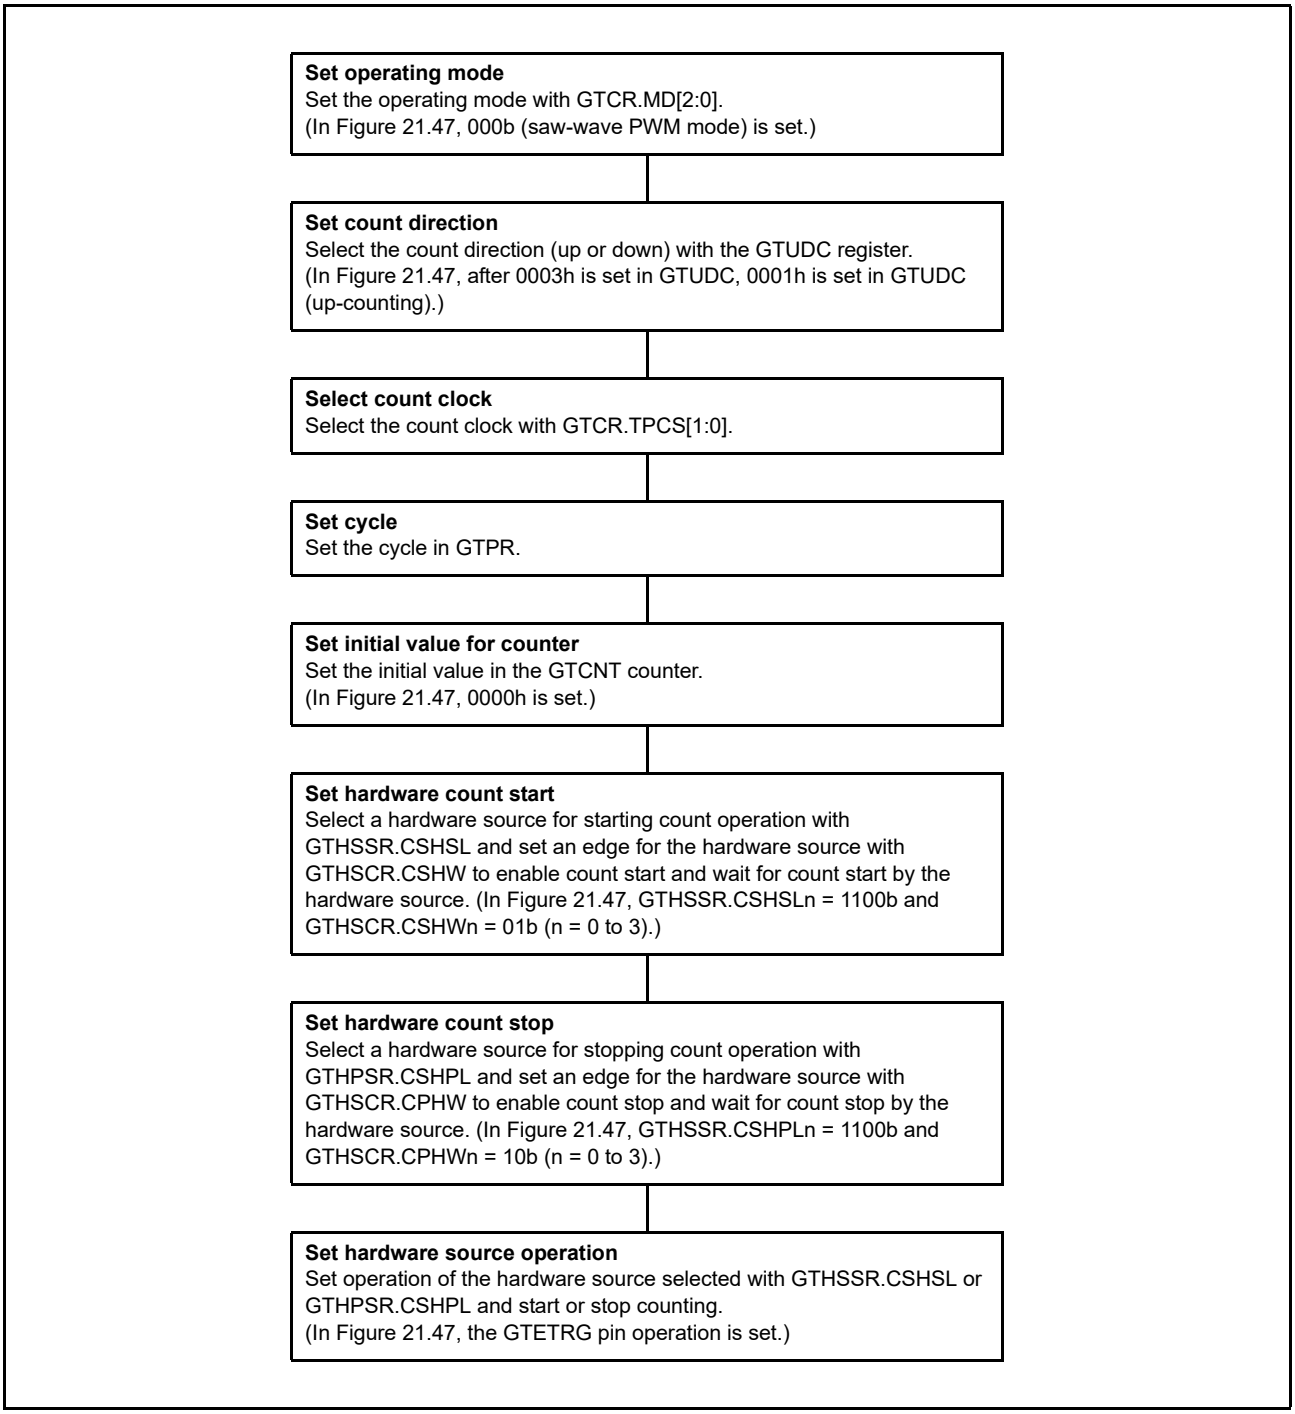

Figure 21.48 Example for Setting Count Start/Stop Operation by Hardware Source

21.3.6.3 Hardware Clear Operation

The GTCNT counter can be cleared by a hardware source. Select a hardware source to clear the counter using GTHPSR.CSHPL, set the changing edge for the hardware source with GTHCCR.CCHW, and then enable to clear the counter.

The counter can also be cleared by a GTCCRA or GTCCRB input capture by setting GTCR.CCLR[1:0].

Note that the GTCIV/GTCIU interrupt (overflow/underflow interrupt) is not generated when the counter is cleared by a hardware source or by software.

Figure 21.49 and Figure 21.50 show examples of counter clearing operation by a hardware source. Figure 21.51 shows the setting example. In this example, the counter is started at both edges of the GTIOC3A pin, and the counter is stopped/cleared at both edges of the GTOC3B pin input.

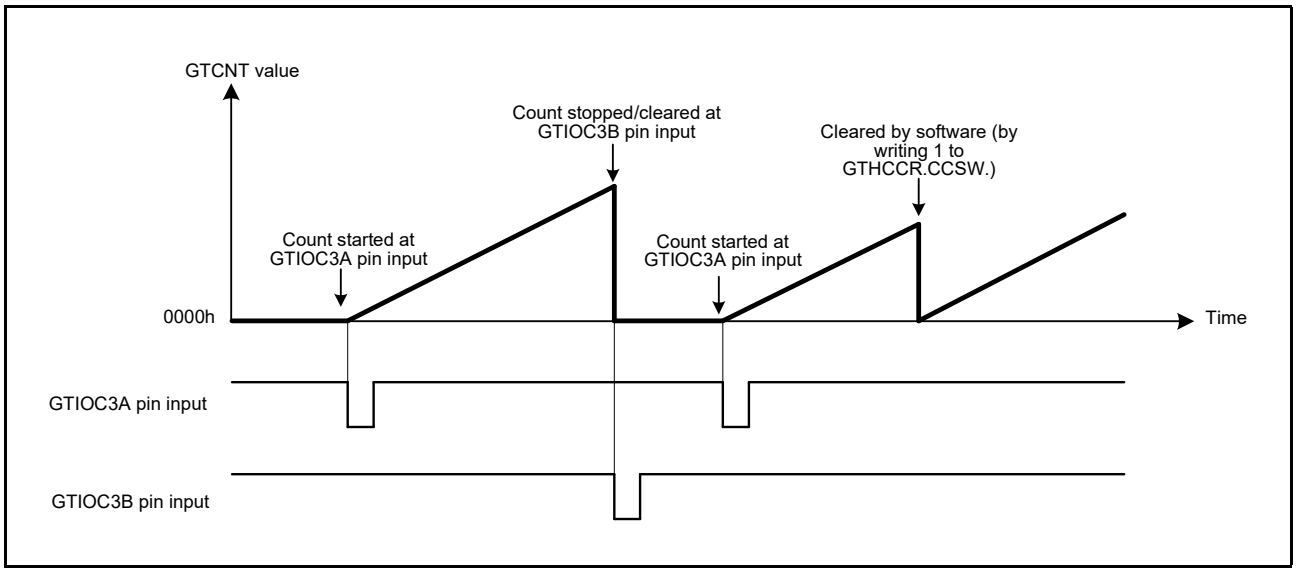

Figure 21.49 Examples of Count Clearing Operation by Hardware Source (Saw-Wave Up-Counting, Started at GTIOC3A Pin Input, Stopped/Cleared at GTIOC3B Pin Input)

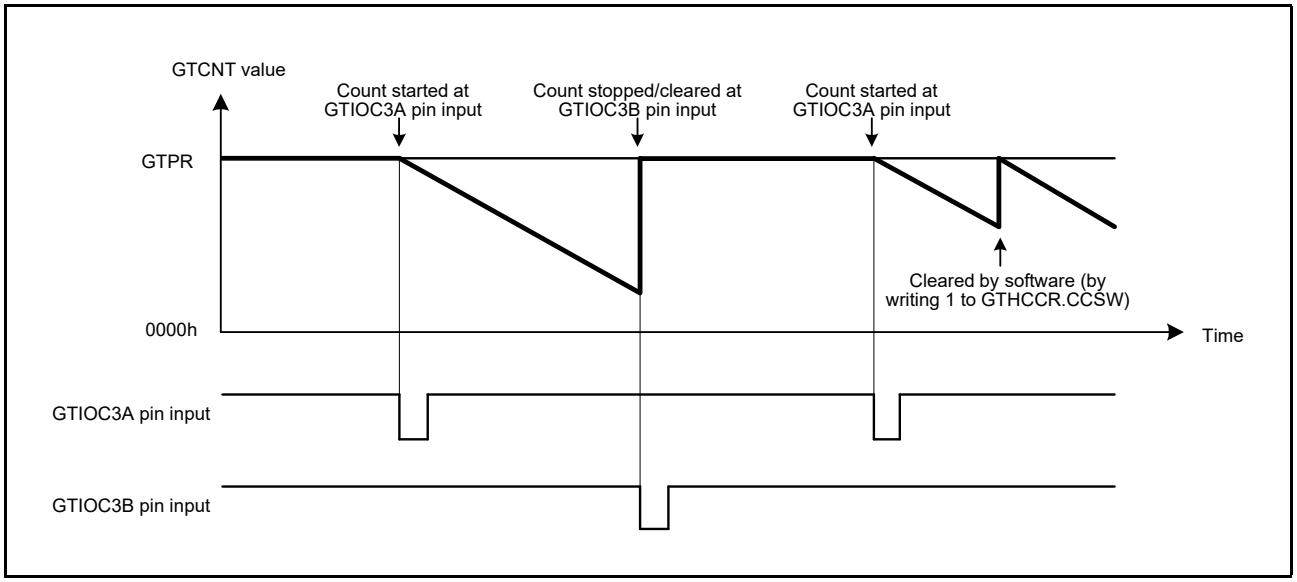

Figure 21.50 Examples of Count Clearing Operation by Hardware Source (Saw-Wave Down-Counting, Started at GTIOC3A Pin Input, Stopped/Cleared at GTIOC3B Pin Input)

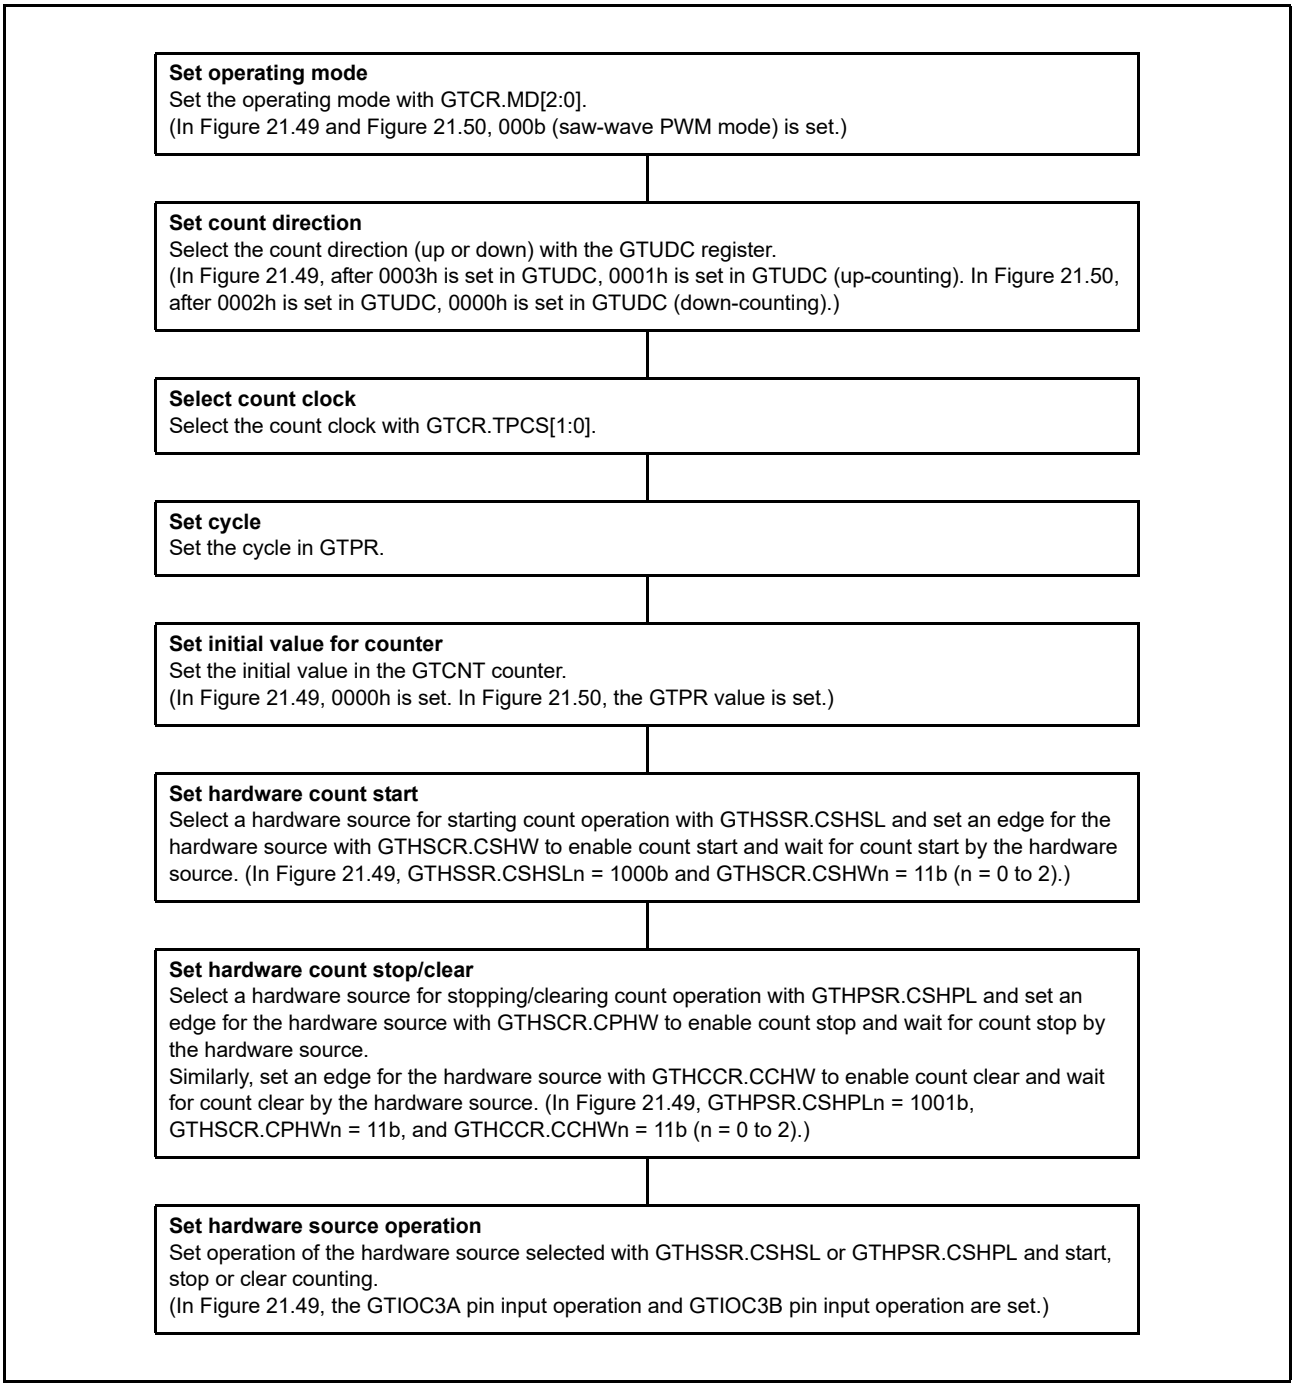

Figure 21.51 Example for Setting Count Clearing Operation by Hardware Source

The GTCIV/GTCIU interrupt (overflow/underflow interrupt) is not generated when the counter is cleared by a hardware source or by software.

Figure 21.52 shows the relationship between the counter clearing by a hardware source and the GTCIV interrupt.

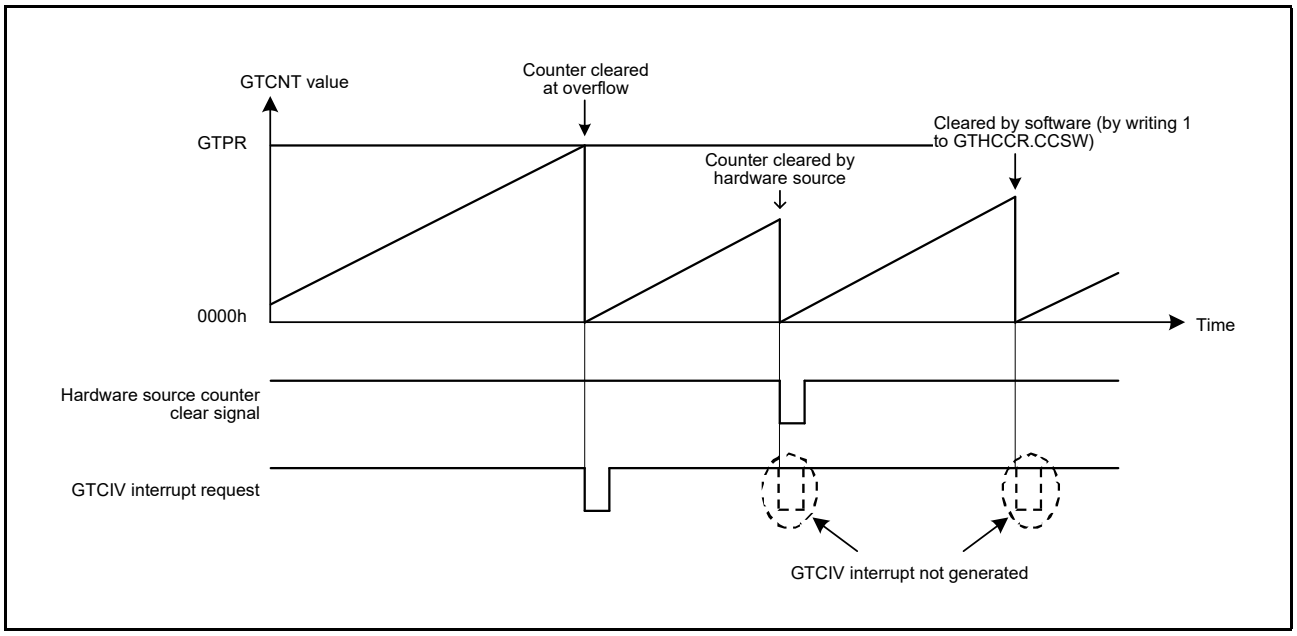

Figure 21.52 Relationship between Counter Clearing by Hardware Source and GTCIV Interrupt

21.3.7 Synchronized Operation

Synchronized operation on channels (synchronized clear operation, synchronized start operation) can be performed.

21.3.7.1 Synchronized Clear Operation

Synchronized clearing on channels can be controlled. Select which channels to be synchronously cleared by setting GTCR.CCLR[1:0] of the pertinent channels to 11b and which channel clearing source to be used for synchronized clearing by setting GTSYNC.SYNCn[1:0] (n = 0 to 3).

Figure 21.53 shows an example of synchronized clear operation, and Figure 21.55 shows the setting example. In this example, GPT1.GTCNT and GPT2.GTCNT are synchronously cleared by the GPT0.GTCNT clearing source (overflow).

Synchronized clearing of channels by a clear source does not cause synchronized clearing of another channel by the same clear source. (Synchronized clearing is not transmitted.)

Figure 21.54 shows an operation example in which two channels are synchronously cleared by the clear source of one of the channels and another channel is synchronously cleared by the clear source of the other one of the two channels.

Figure 21.55 shows the setting example. In this example, GPT1.GTCNT is synchronously cleared by GPT0.GTCNT clearing source (overflow), and GPT2.GTCNT is synchronously cleared by GPT1.GTCNT clearing source (overflow).

Although GPT1.GTCNT is synchronously cleared by the GPT0.GTCNT clearing source (overflow), GPT2.GTCNT is not synchronously cleared when GPT1.GTCNT is cleared by the GPT0.GTCNT clearing source.

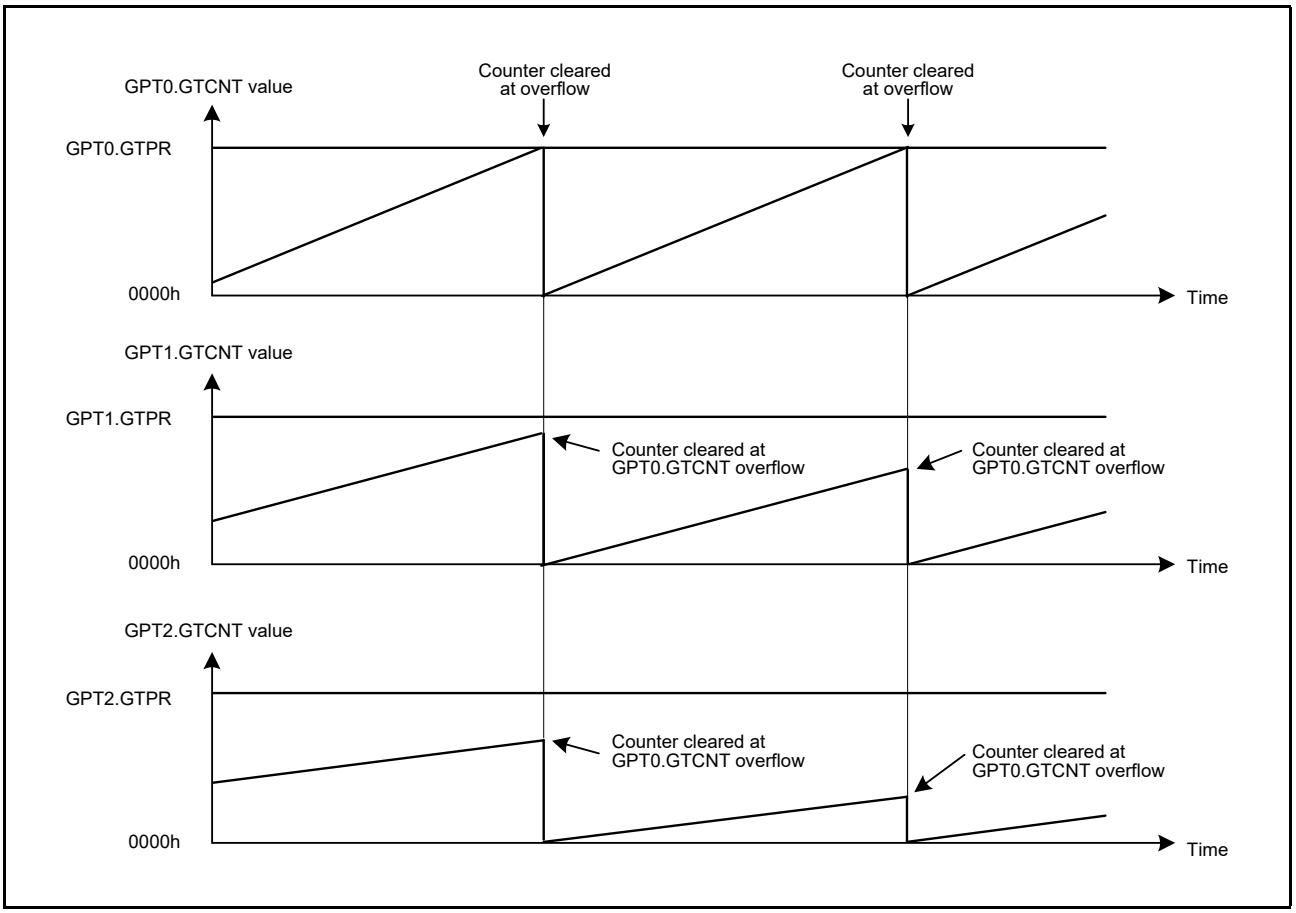

Figure 21.53 Example of Synchronized Clear Operation (GPT1.GTCNT and GPT2.GTCNT are Synchronously Cleared by GPT0.GTCNT Clearing Source)

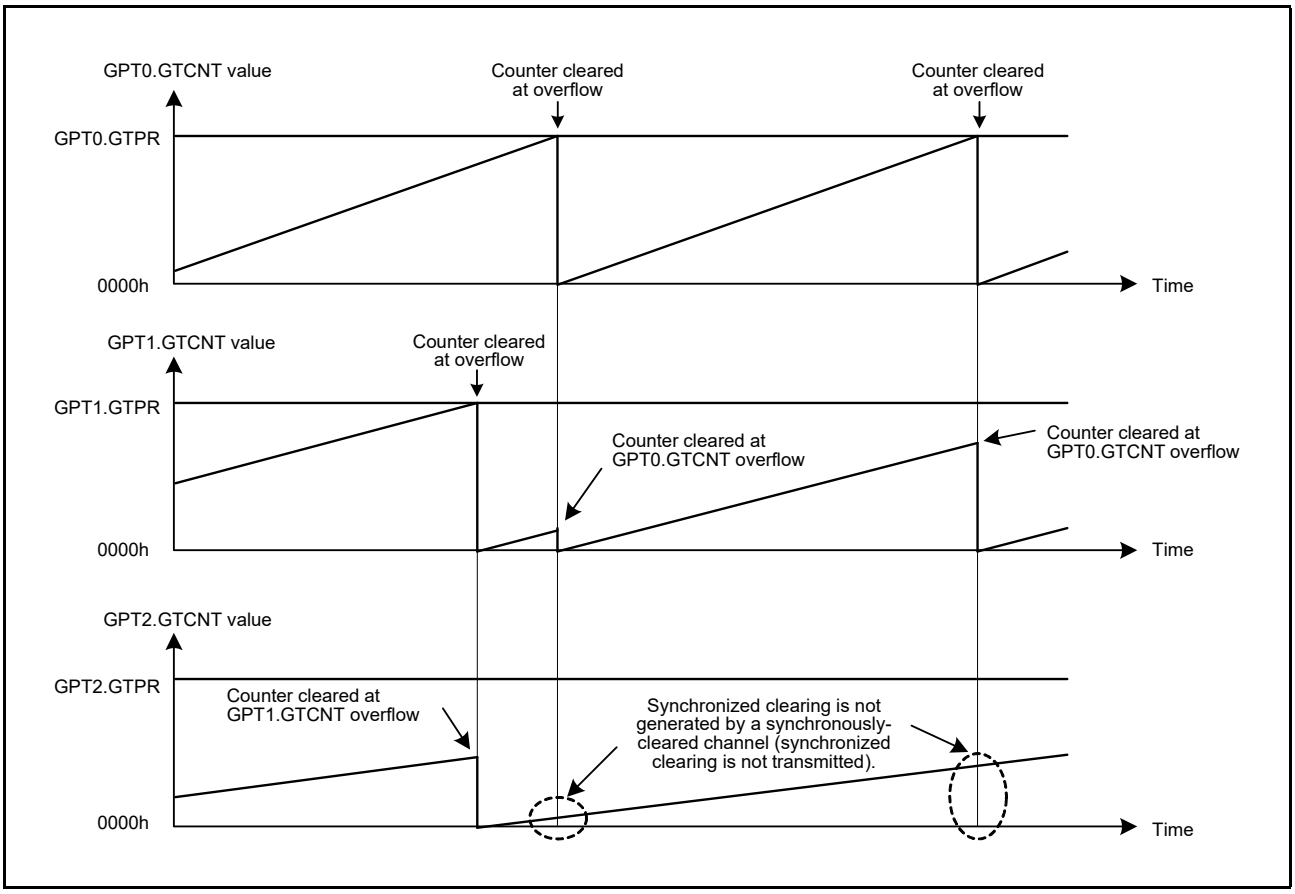

Figure 21.54 Example of Synchronized Clear Operation (GPT1.GTCNT is Synchronously Cleared by GPT0.GTCNT Clearing Source and GPT2.GTCNT is Synchronously Cleared by GPT1.GTCNT Clearing Source)

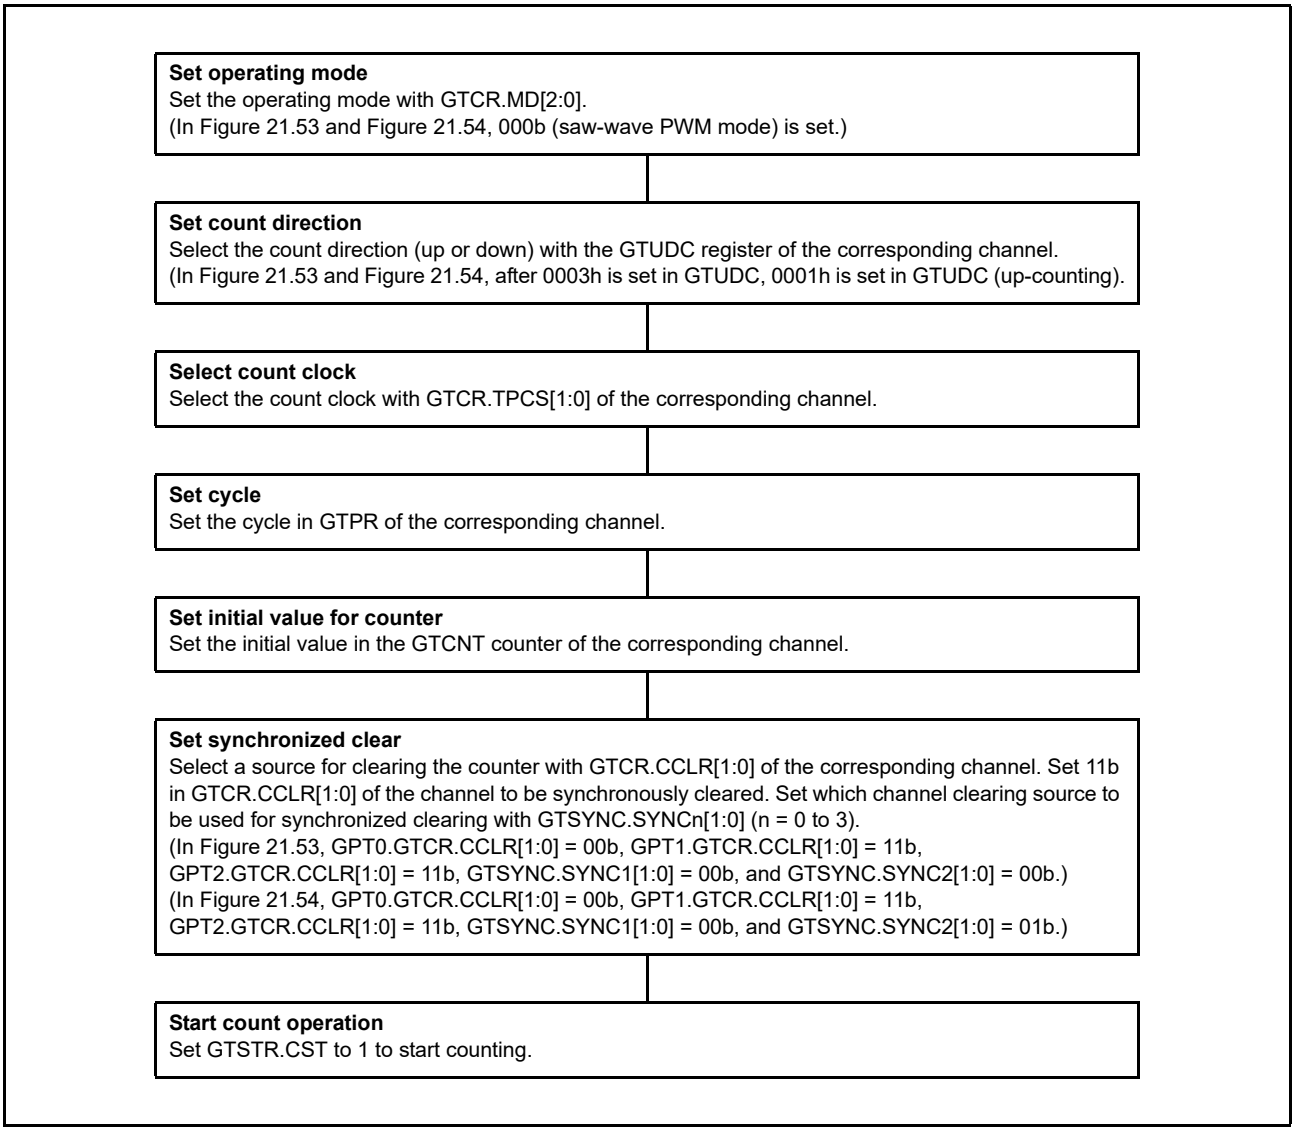

Figure 21.55 Example for Setting Synchronized Clear Operation

21.3.7.2 Synchronized Start Operation

(1) Simultaneous Start by Software

Count operation can be started simultaneously on channels by simultaneously setting the GTSTR.CST bits which correspond to the channels to be started simultaneously to 1 (n = 0 to 3).

Figure 21.56 shows an example of simultaneous start by software.

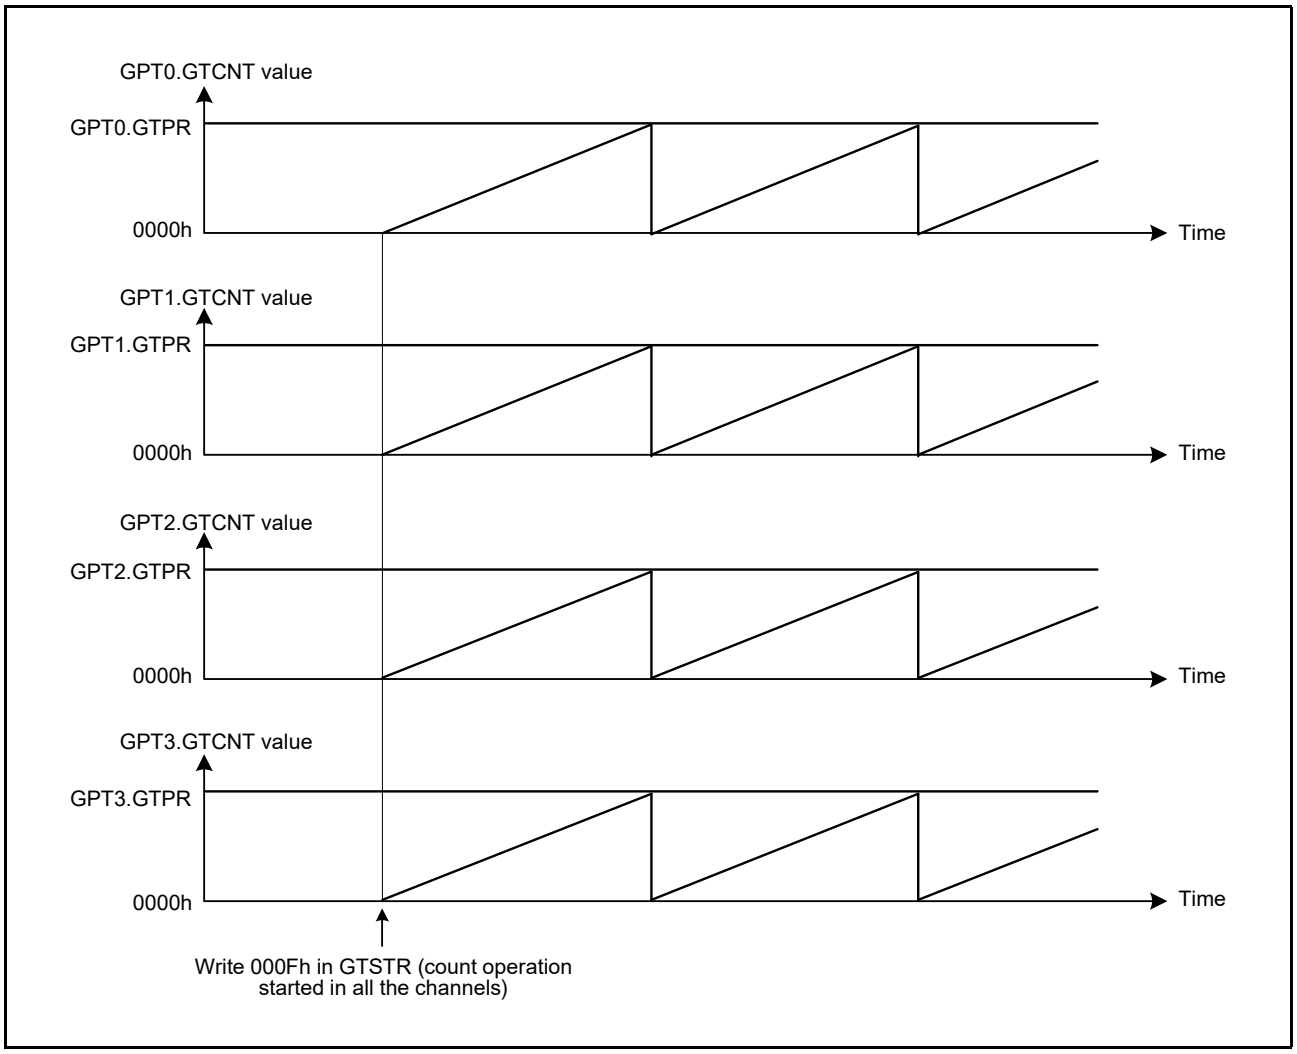

Figure 21.56 Example of Simultaneous Start by Software (with Same Count Cycle (GTPR Value))

(2) Phase Start by Software

Count start with a phase difference is possible by setting the initial value in GCNT before counting starts and then simultaneously setting the CST bits in GTSTR which correspond to the channels to be started simultaneously to 1 (n = 0 to 3).

Figure 21.57 shows an example of phase start operation by software.

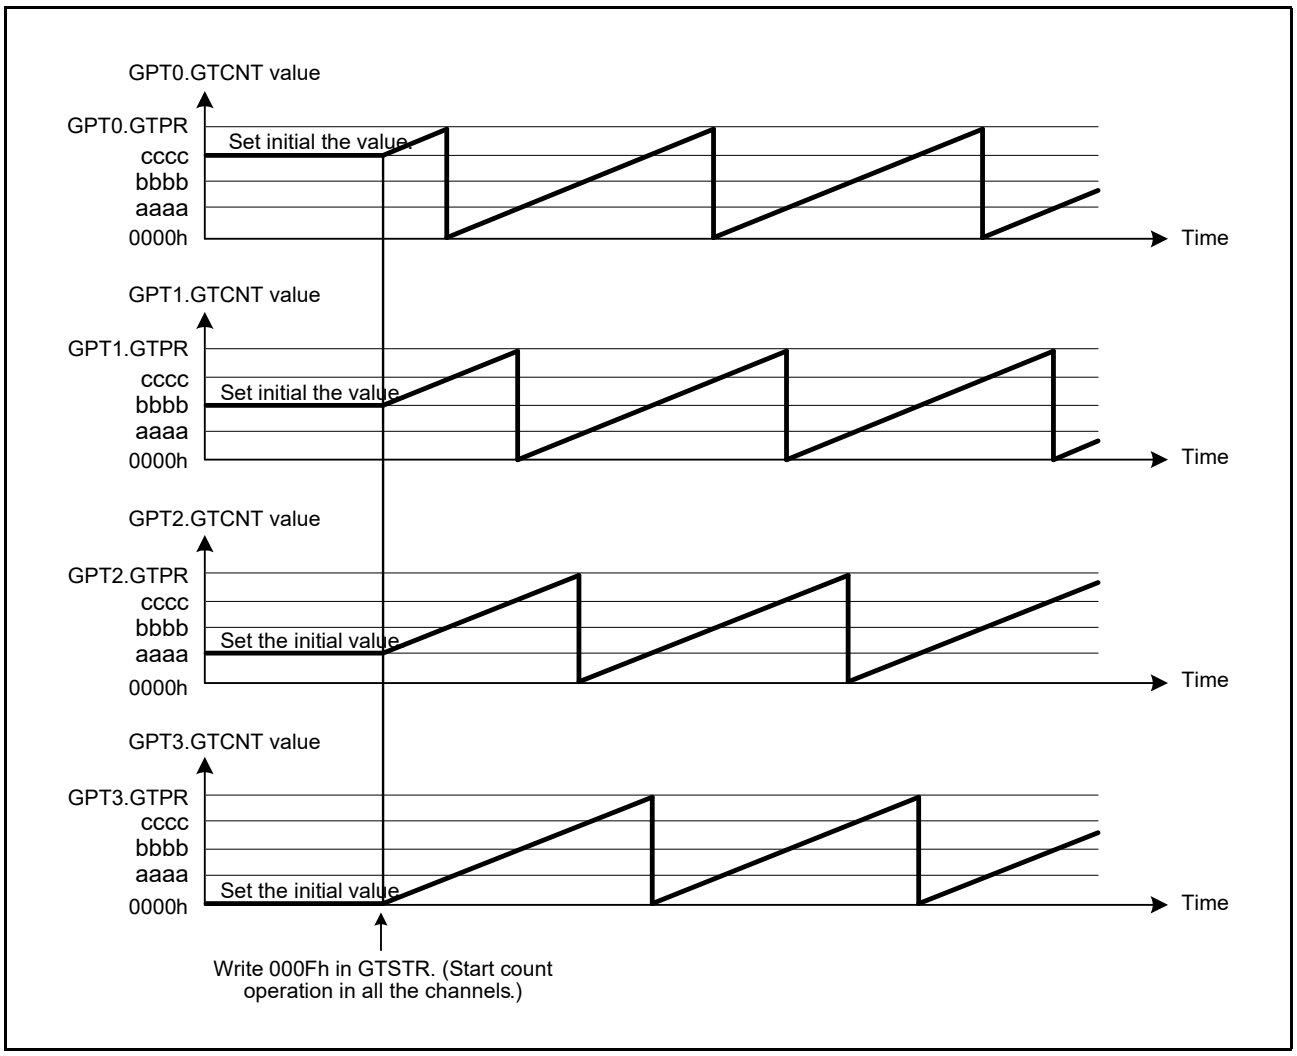

Figure 21.57 Example of Software Phase Start (with Same Count Cycle (GTPR Value))

(3) Simultaneous Start by Hardware Source

Count operation can be started simultaneously on channels by following hardware sources: GTETRG pin input, GTIOC3A/GTIOC3B pin input, and GTIOC3A/GTIOC3B internal output (output compare).
Figure 21.58 shows an example of simultaneous start operation by a hardware source and Figure 21.59 shows the setting example. In this example, count operation is started in all the channels by the input of a signal from the GTiOC3A pin.

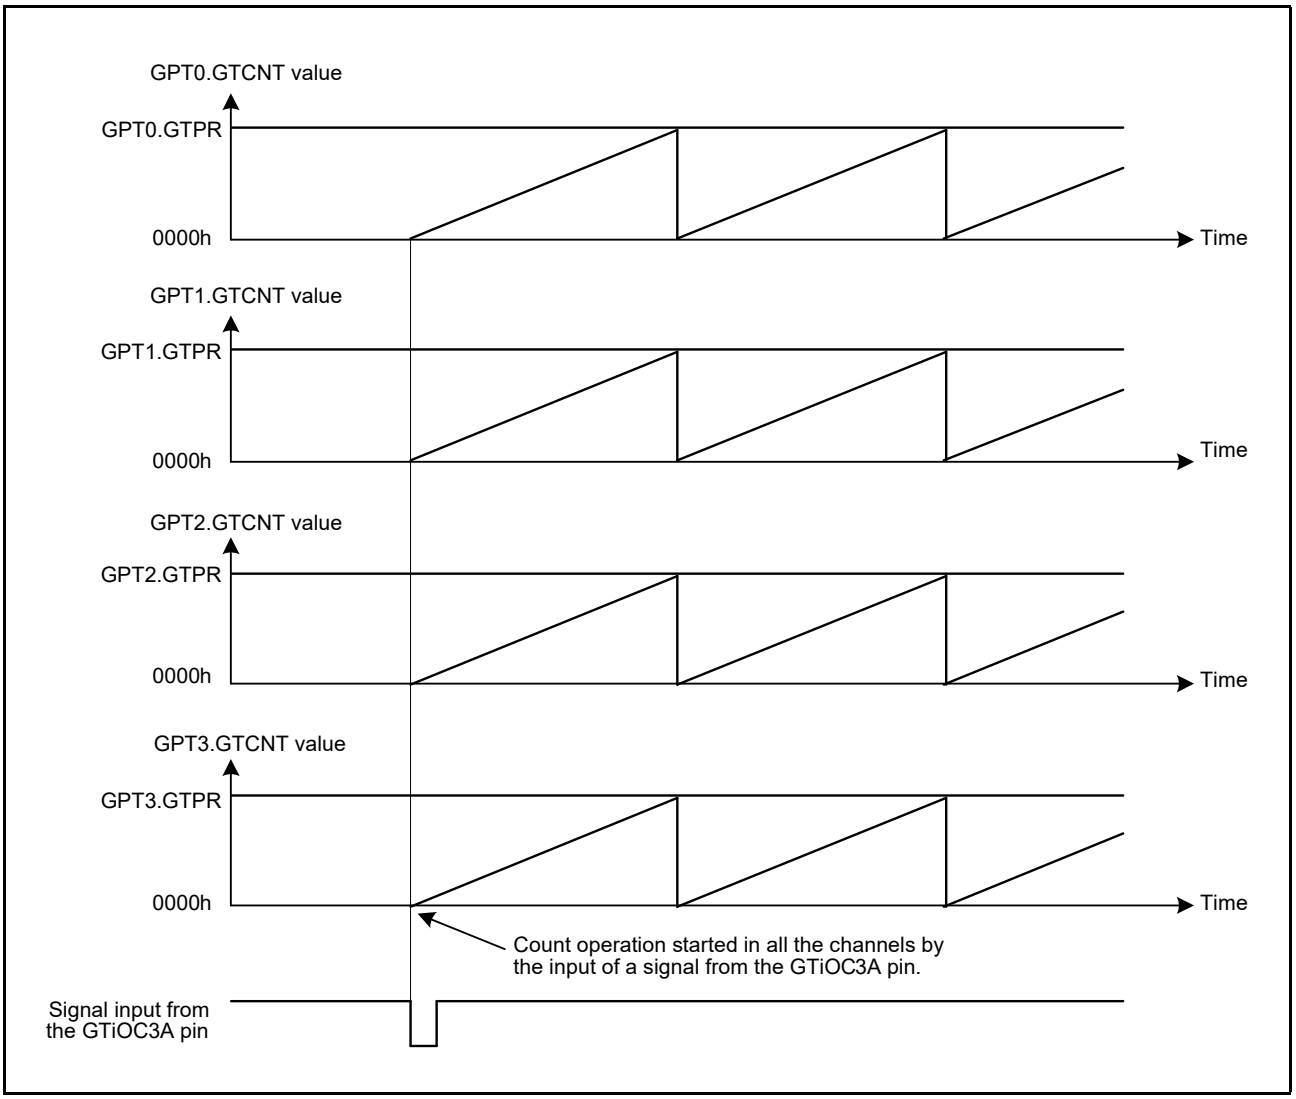

Figure 21.58 Example of Simultaneous Start Operation by Hardware Source (with Same Count Cycle (GTPR Value))

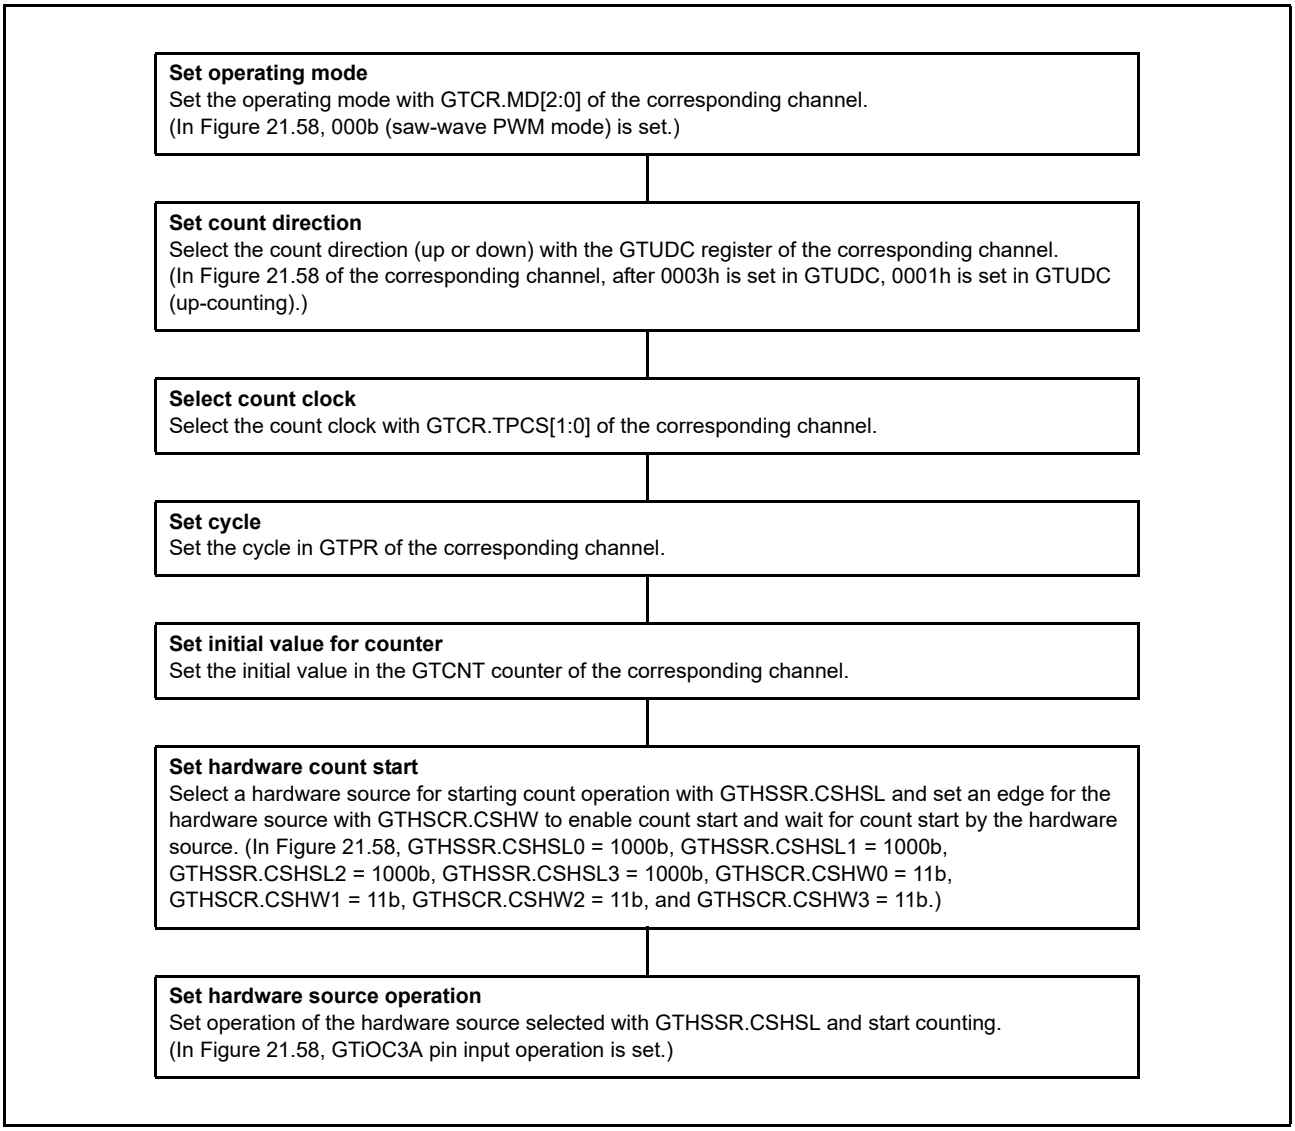

Figure 21.59 Example for Setting Simultaneous Start by Hardware Source

(4) Phase Start by Hardware Source

Count start with a phase difference is possible by following hardware sources: GTETRG pin input, GTIOC3A/GTIOC3B pin input, and GTIOC3A/GTIOC3B internal output (output compare).

Figure 21.60 shows an example of phase start operation by a hardware source and Figure 21.61 shows the setting example. In this example, GPT3.GTCNT and GPT0.GTCNT simultaneously start counting and GPT1.GTCNT and GPT2.GTCNT start counting by the GTIOC3A and GTIOC3B internal outputs (output compare).

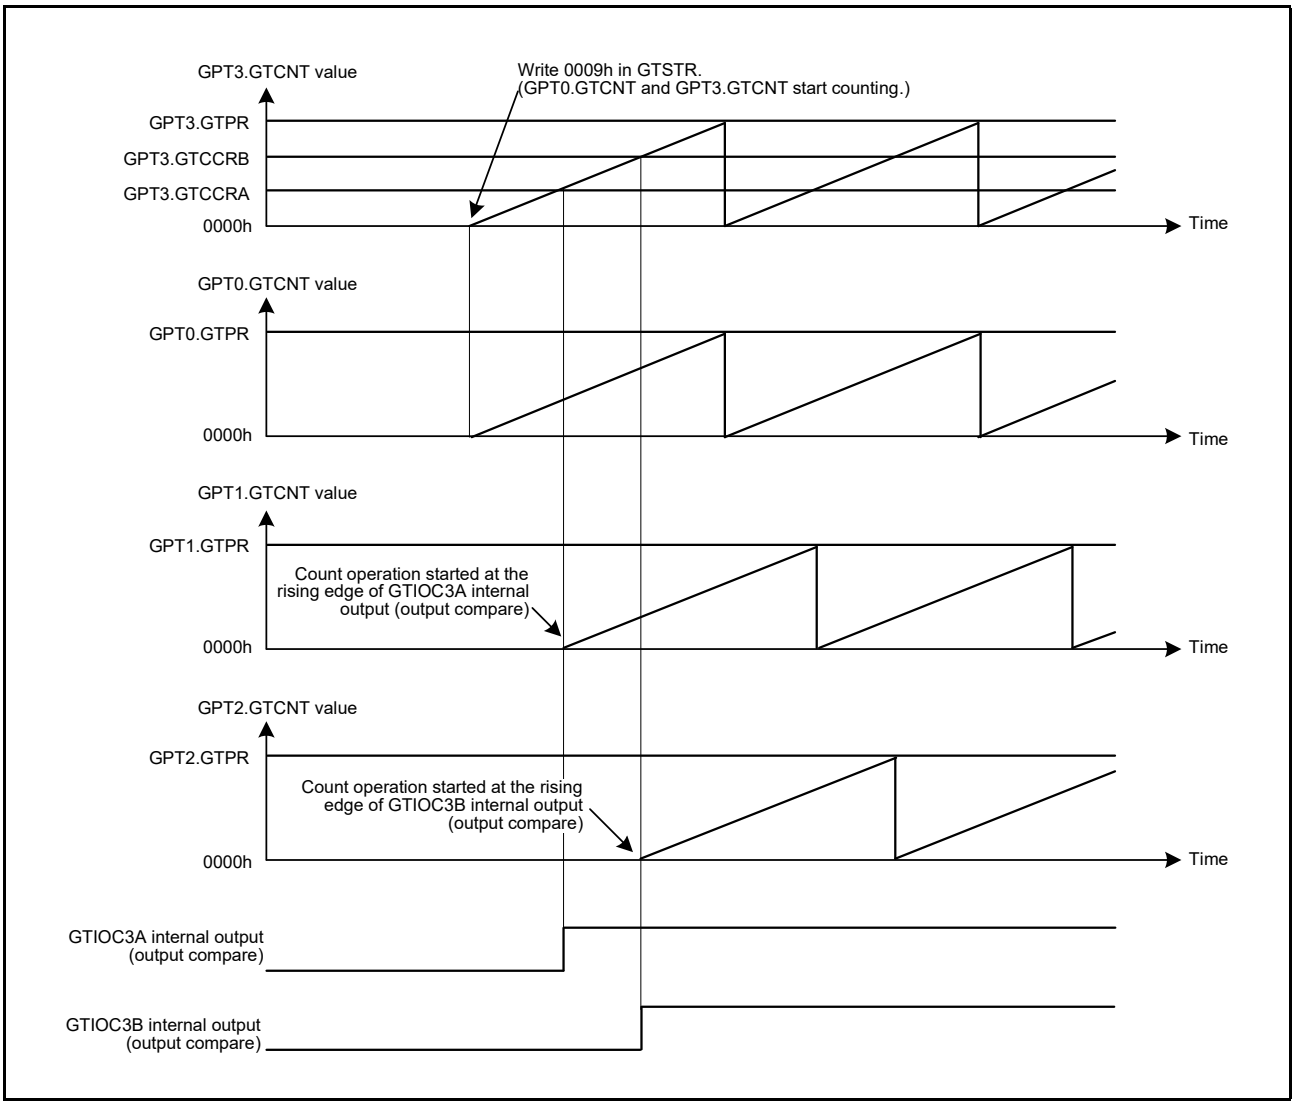

Figure 21.60 Example of Phase Start Operation by Hardware Source (with Same Count Cycle (GTPR Value))

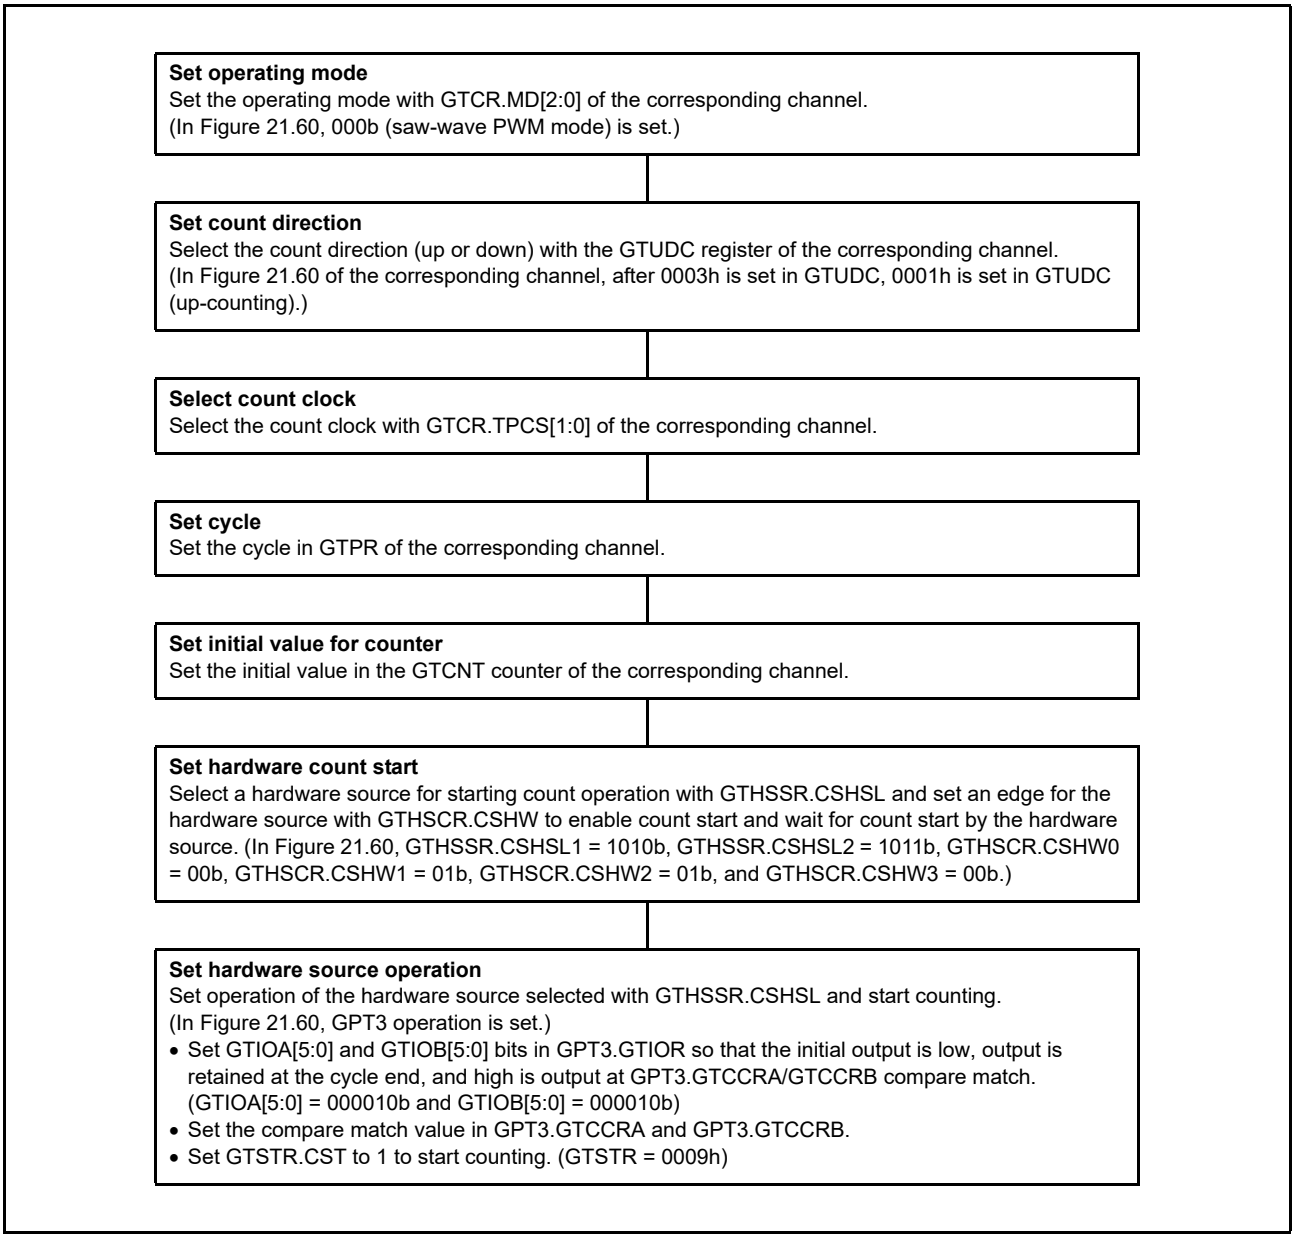

Figure 21.61 Example for Setting Phase Start by Hardware Source

21.3.8 PWM Output Operation Examples

(1) Synchronized PWM Output

The GPT can output eight phases of linked PWM waveforms for a maximum of four channels by synchronizing operation of the channels.

Figure 21.62 shows an example in which all the channels perform synchronized operation in saw-wave PWM mode and eight phases of PWM waveforms are output. The GTIOCnA is set so that it will output low as the initial value, high at a GTCCRA compare match, and low at the cycle end. The GTIOCnB is set so that it will output low as the initial value, high at a GTCCRB compare match, and low at the cycle end (n = 0 to 3).

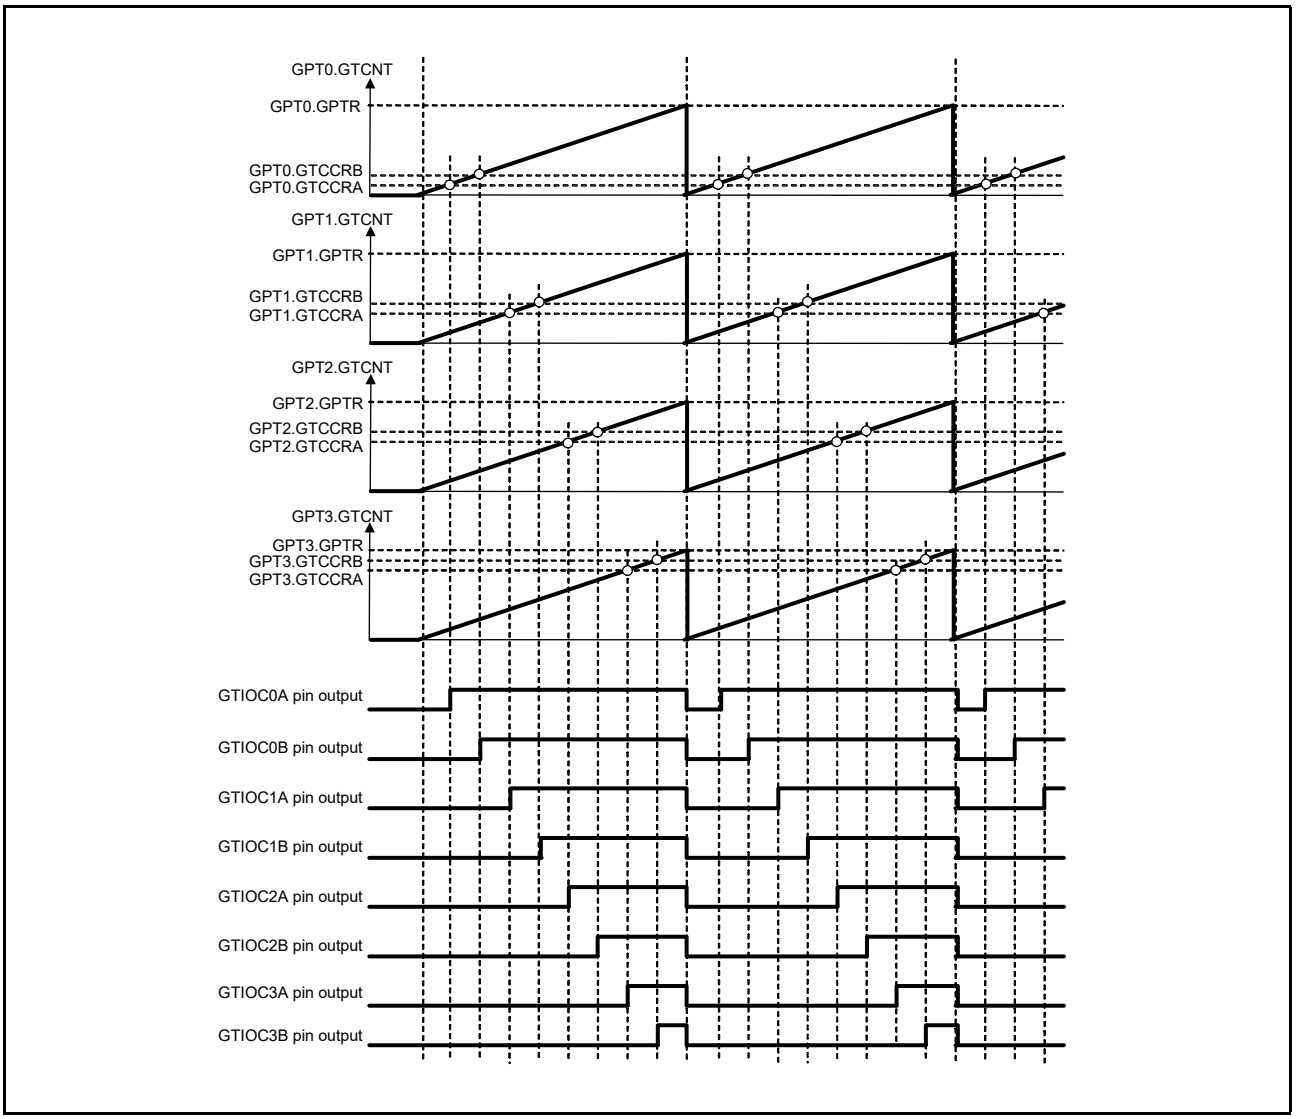

Figure 21.62 Example of Synchronized PWM Output

(2) Three-Phase Saw-Wave Complementary PWM Output

Figure 21.63 shows an example in which three channels perform synchronized operation in saw-wave PWM mode and three-phase complementary PWM waveforms are output. The GTIOCnA is set so that it will output low as the initial value, high at a GTCCRA compare match, and low at the cycle end. The GTIOCnB is set so that it will output high as the initial value, low at a GTCCRB compare match, and high at the cycle end.

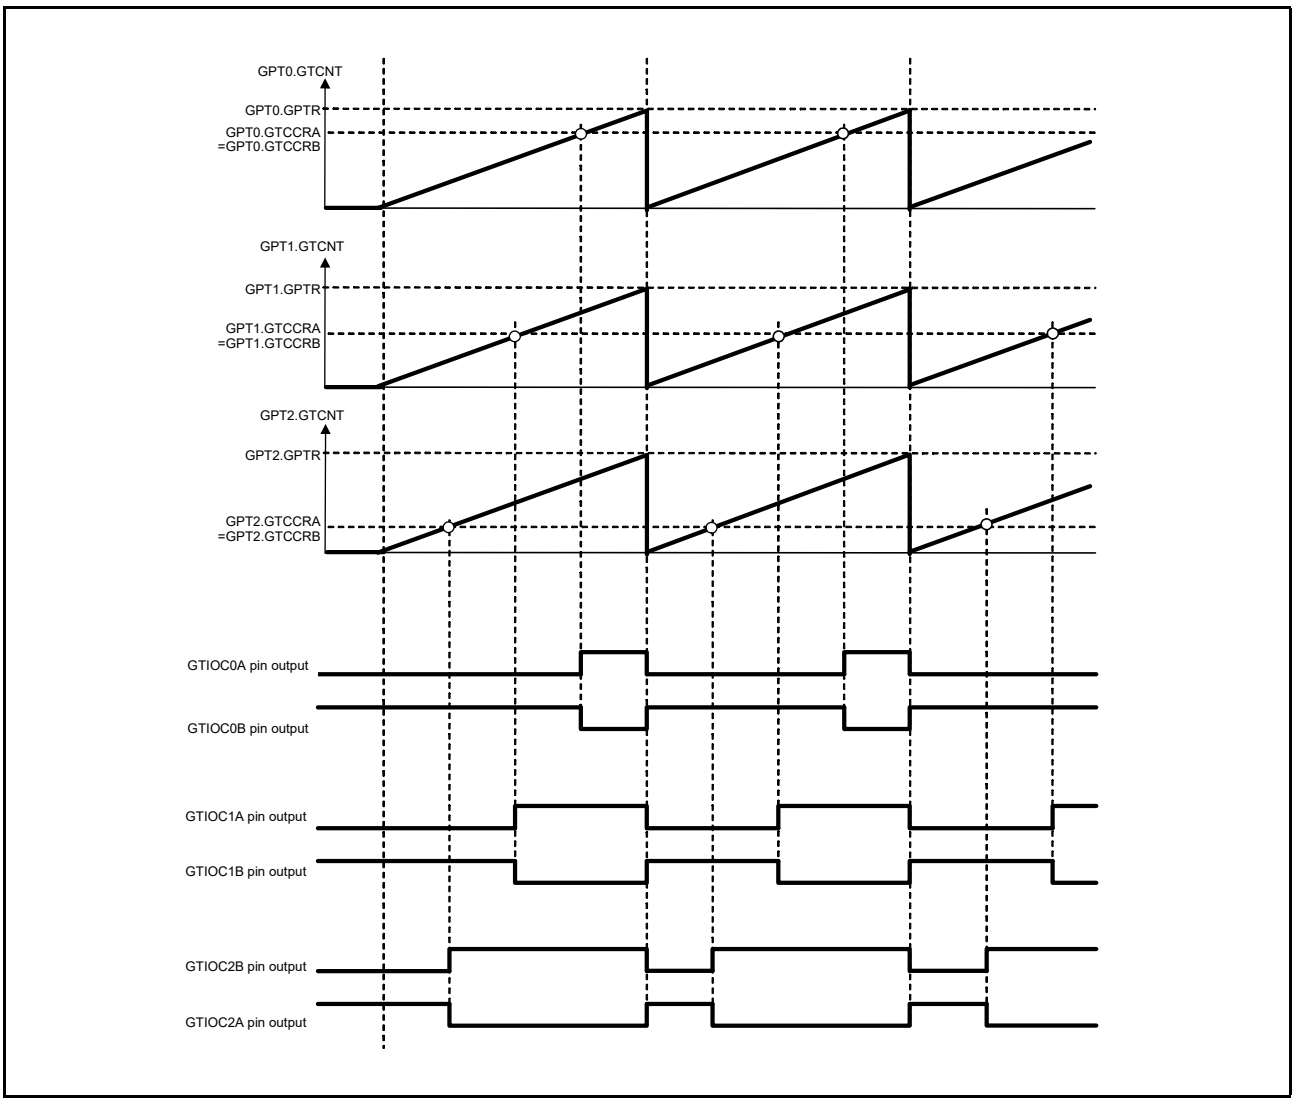

Figure 21.63 Example of Three-Phase Saw-Wave Complementary PWM Output

(3) Three-Phase Saw-Wave Complementary PWM Output with Automatic Dead Time Setting

Figure 21.64 shows an example in which three channels perform synchronized operation in saw-wave one-shot pulse mode with automatic dead time setting and three-phase complementary PWM waveforms are output. The GTIOCnA is set so that it will output low as the initial value, toggle the output at a GTCCRA compare match, and retain the output at the cycle end. The GTIOCnB is set so that it will output high as the initial value, toggle the output at a GTCCRB compare match, and retain the output at the cycle end.

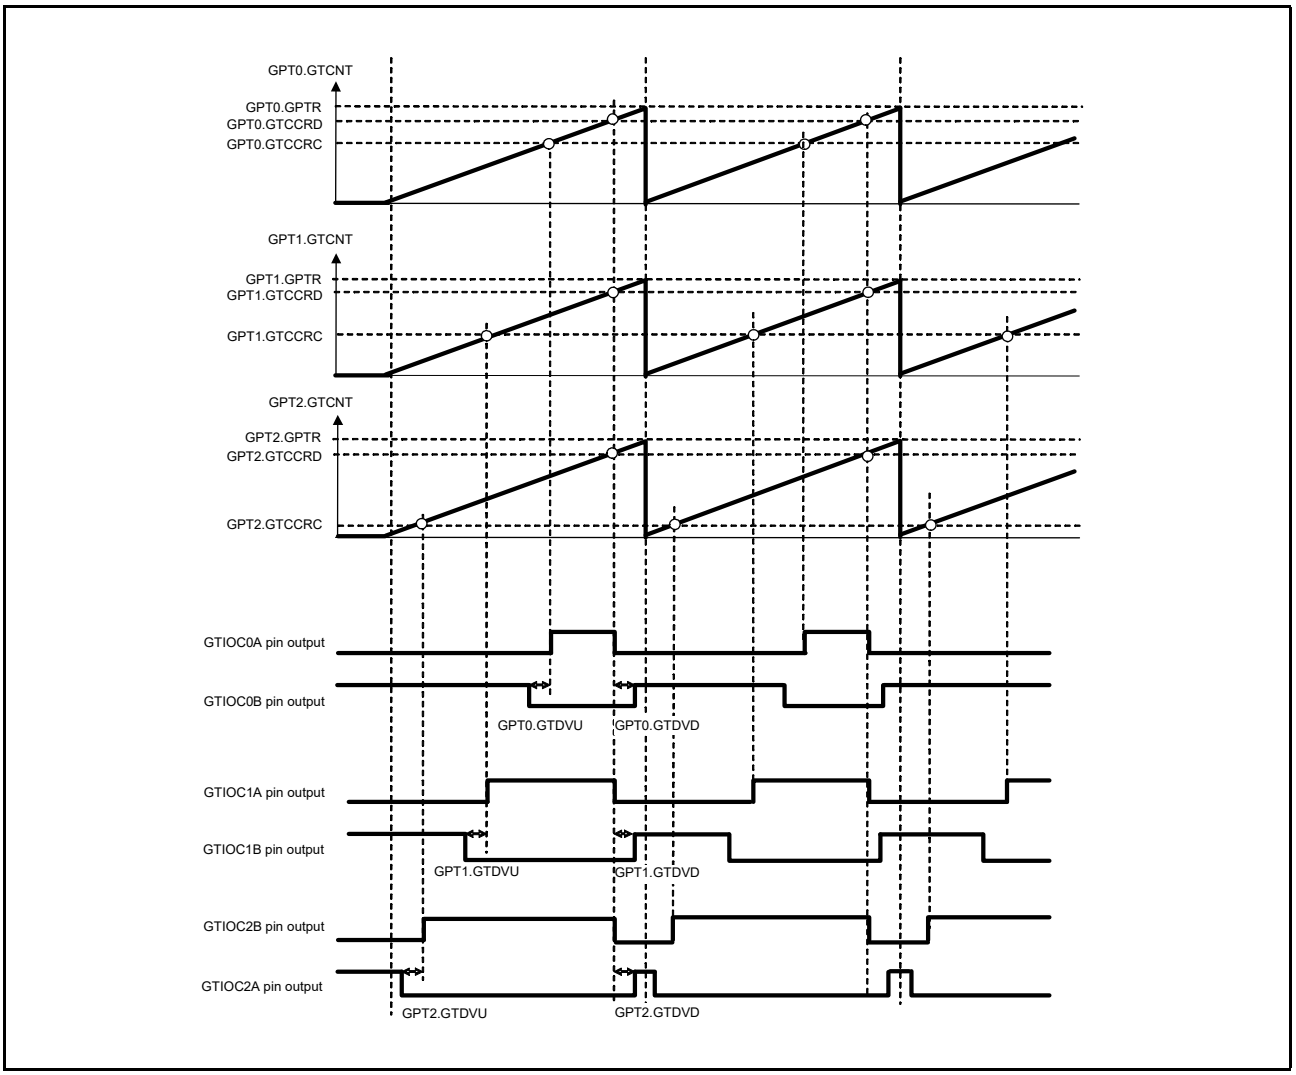

Figure 21.64 Example of Three-Phase Saw-Wave Complementary PWM Output with Automatic Dead Time Setting

(4) Three-Phase Triangle-Wave Complementary PWM Output

Figure 21.65 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 1 and three-phase complementary PWM waveforms are output. The GTIOCnA is set so that it will output low as the initial value, toggle the output at a GTCCRA compare match, and retain the output at the cycle end. The GTIOCnB is set so that it will output high as the initial value, toggle the output at a GTCCRB compare match, and retain the output at the cycle end.

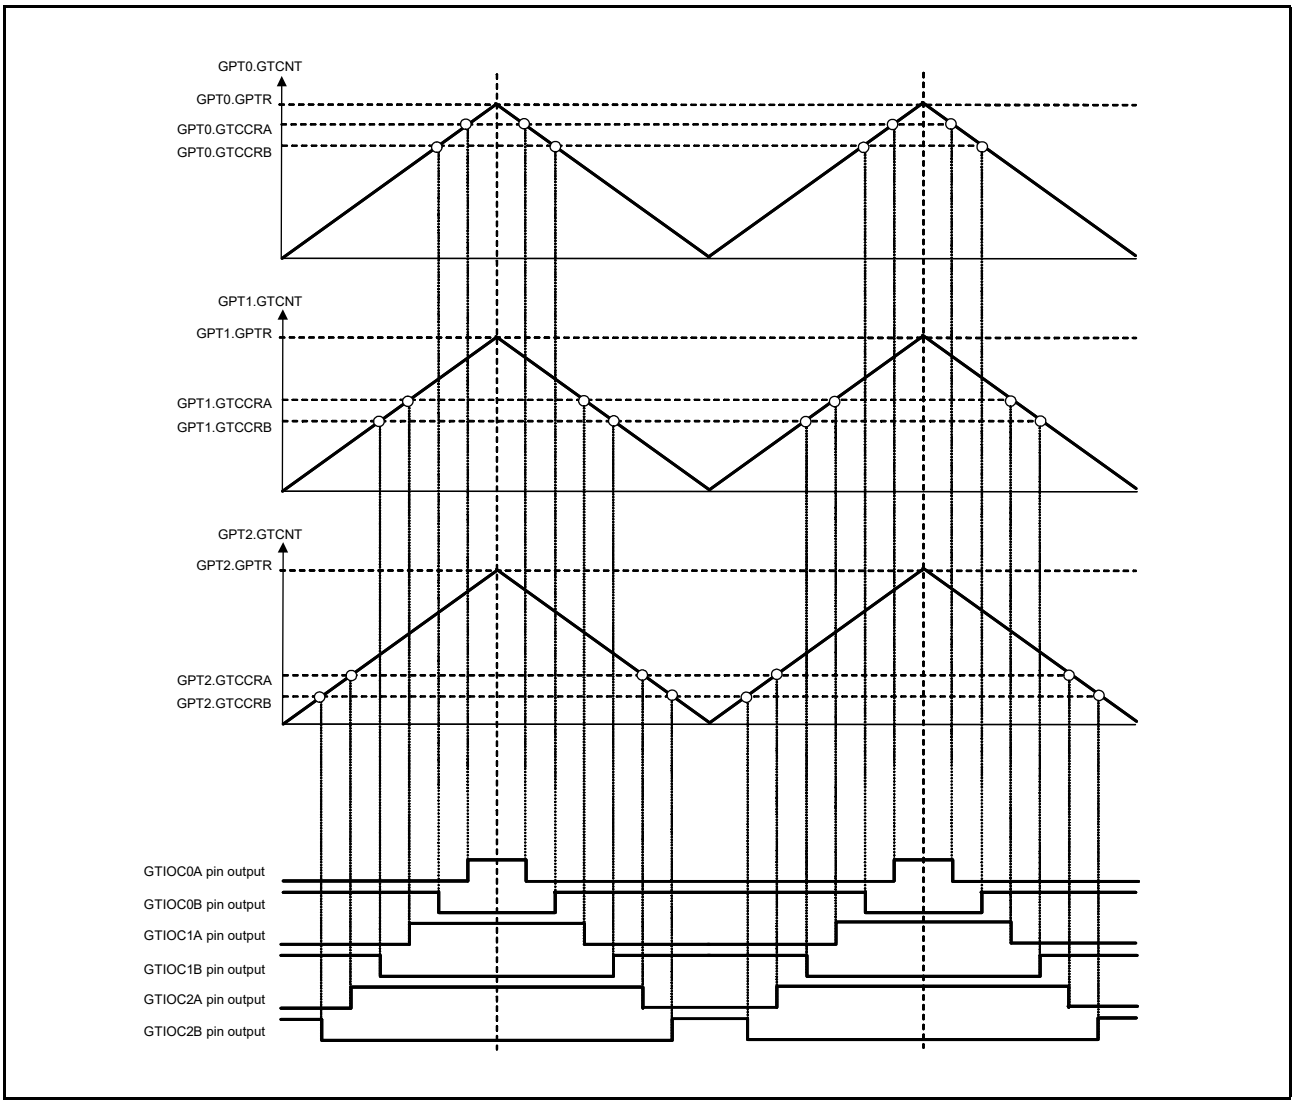

Figure 21.65 Example of Three-Phase Triangle-Wave Complementary PWM Output

(5) Three-Phase Triangle-Wave Complementary PWM Output with Automatic Dead Time Setting

Figure 21.66 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 1 with automatic dead time setting and three-phase complementary PWM waveforms are output. The GTIOCnA is set so that it will output low as the initial value, toggle the output at a GTCCRA compare match, and retain the output at the cycle end. The GTIOCnB is set so that it will output high as the initial value, toggle the output at a GTCCRB compare match, and retain the output at the cycle end.

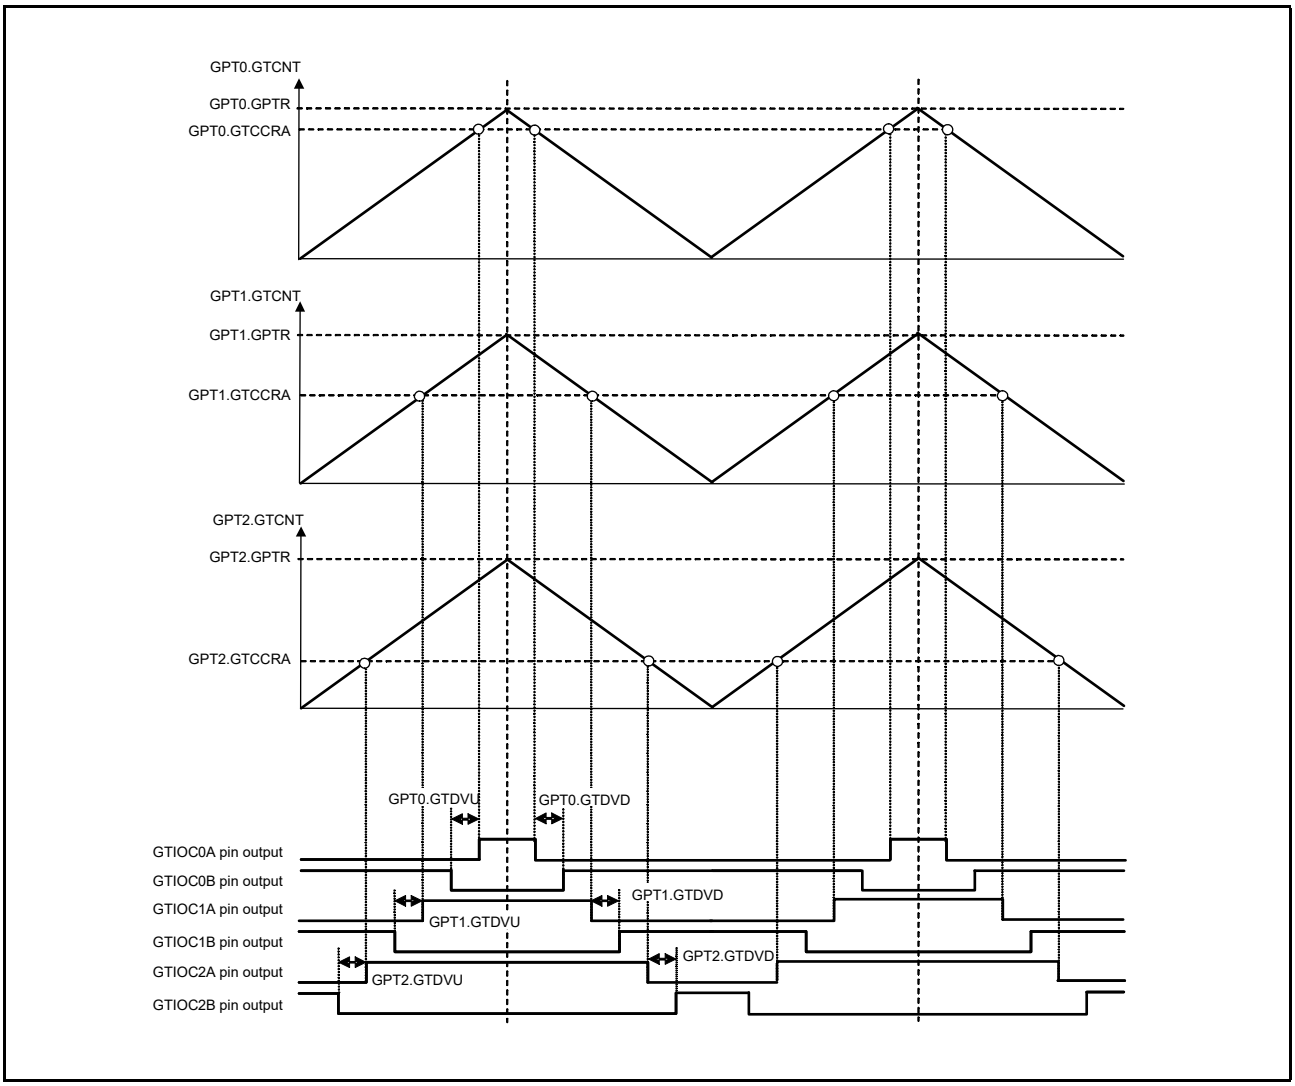

Figure 21.66 Example of Three-Phase Triangle-Wave Complementary PWM Output with Automatic Dead Time Setting

(6) Three-Phase Asymmetric Triangle-Wave Complementary PWM Output with Automatic Dead Time Setting

Figure 21.67 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 3 with automatic dead time setting and three-phase complementary PWM waveforms are output. The GTIOCnA is set so that it will output low as the initial value, toggle the output at a GTCCRA compare match, and retain the output at the cycle end. The GTIOCnB is set so that it will output high as the initial value, toggle the output at a GTCCRB compare match, and retain the output at the cycle end.

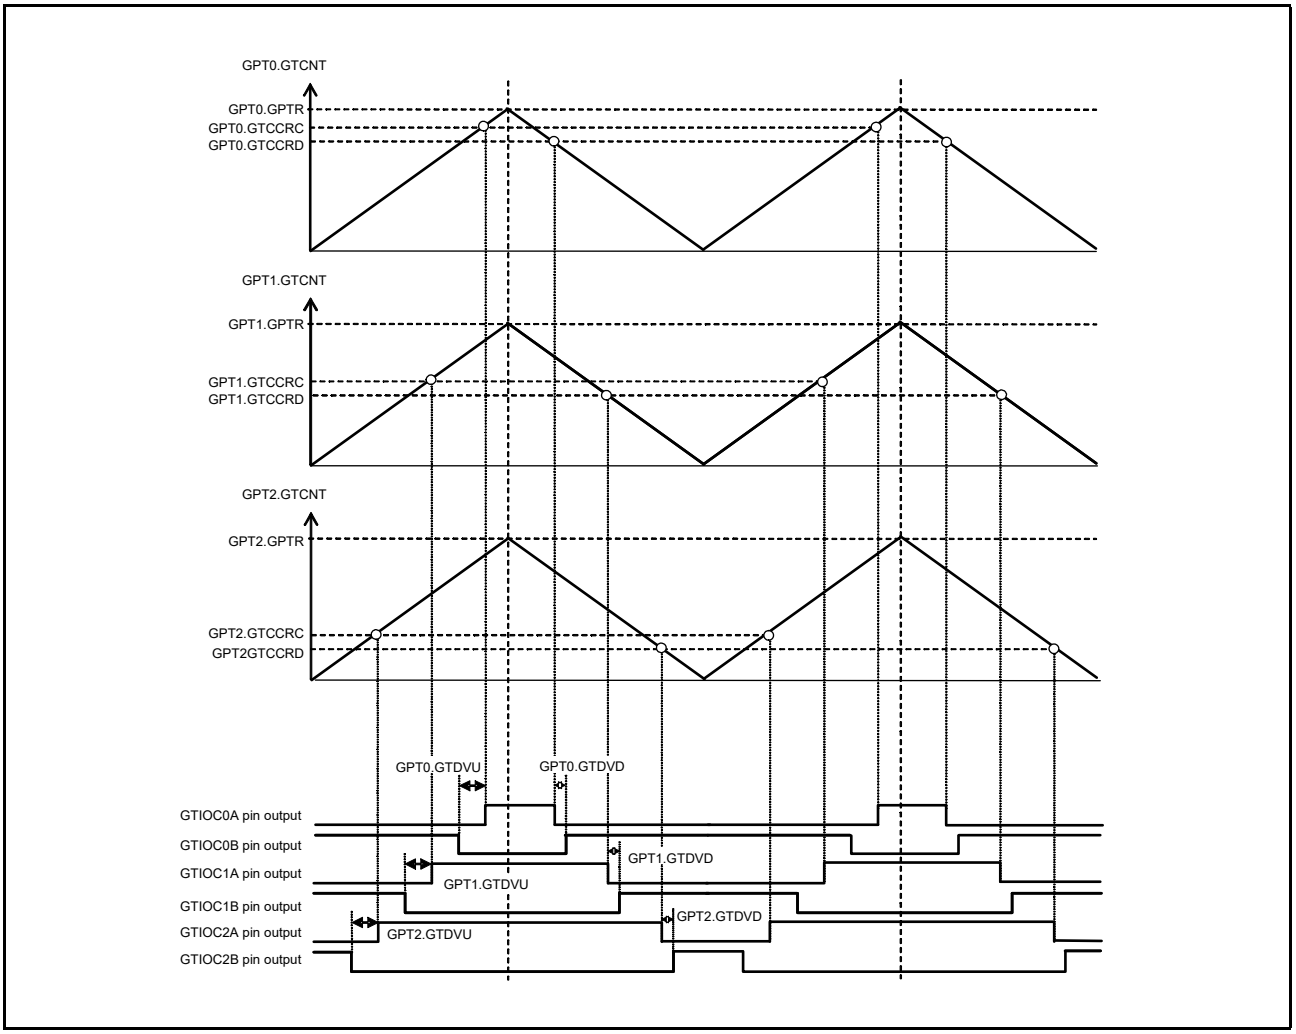

Figure 21.67 Example of Three-Phase Asymmetric Triangle-Wave Complementary PWM Output with Automatic Dead Time Setting

21.3.9 Noise Filter Function

Each pin for use in input capture and external trigger input to the GPT is equipped with a noise filter. The noise filter samples input signals at the sampling clock and removes the pulses of which length is less than three sampling cycles. The noise filter functionality includes enabling and disabling of the noise filter for each pin and setting of the sampling clock for each channel.

Figure 21.68 shows the timing of noise filtering.

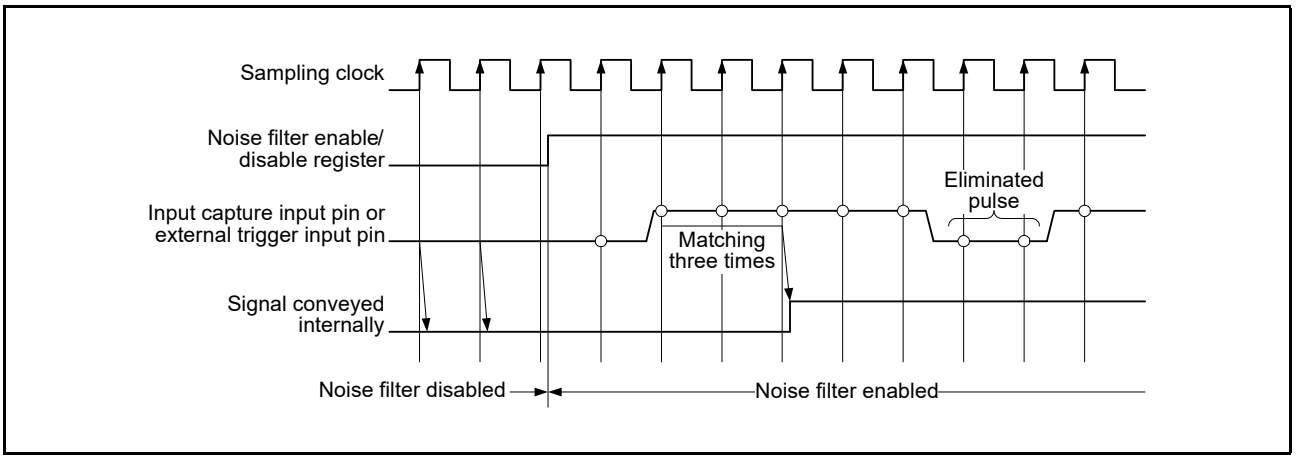

Figure 21.68 Timing of Noise Filtering

If noise filtering is enabled, input capture operation or external trigger operation is performed on the edges of noise-filtered signal after a delay of (minimum sampling interval × 2 + PCLKC) due to noise filtering for the input capture input or external trigger operation.

21.4 Interrupt Sources

21.4.1 Interrupt Sources and Priorities

Table 21.5 lists the GPTa interrupt sources.
Each interrupt source has a control bit for the respective dedicated interrupt request generation and enables or disables the generation of interrupt request independently.
The priority of channels can be changed by the interrupt controller settings. For details, see section 12, Interrupt Controller (ICUA).

Table 21.5 GPT Interrupt Sources (1 / 2)

Channel	Name	Interrupt Source	DMAC Activation
Common	ETGIN	External trigger falling input	Possible
	ETGIP	External trigger rising input	Possible
0	GTCIA0	GPT0.GTCCRA input capture/compare match	Possible

	GTCIF3	GPT3.GTCCRF compare match	Possible
	GTCIV3	GPT3.GTCNT overflow (GPT3.GTPR compare match)	Possible
	GTCIU3	GPT3.GTCNT underflow	Possible

Note: This table shows the initial state immediately after a reset. The relative channel priorities can be changed by the interrupt controller.

(1) GTCIAn interrupt (n = 0 to 3)

When the interrupt enable bit (GTINTA) in the GTINTAD register is 1, an interrupt request is generated under the following conditions.

- When the GTCCRA register functions as a compare match register, the GTCNT counter value matches with the GTCCRA register.
- When the GTCCRA register functions as an input capture register, the input-capture signal has caused transfer of the GTCNT counter value to the GTCCRA register.

(2) GTCIBn interrupt (n = 0 to 3)

When the interrupt enable bit (GTINTB) in the GTINTAD register is 1, an interrupt request is generated under the following conditions.

- When the GTCCRB register functions as a compare match register, the GTCNT counter value matches with the GTCCRB register.
- When the GTCCRB register functions as an input capture register, the input-capture signal has caused transfer of the GTCNT counter value to the GTCCRB register.

(3) GTCICn interrupt (n = 0 to 3)

When the interrupt enable bit (GTINTC) in the GTINTAD register is 1, an interrupt request is generated under the following condition.

- When the GTCCRC register functions as a compare match register, the GTCNT counter value matches with the GTCCRC register.

A compare match is not performed and thus interrupt is not requested under the following conditions.

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 01b, 10b, 11b (buffer operation with the GTCCRC register)

(4) GTCIDn interrupt (n = 0 to 3)

When the interrupt enable bit (GTINTD) in the GTINTAD register is 1, an interrupt request is generated under the following condition.

- When the GTCCRD register functions as a compare match register, the GTCNT counter value matches with the GTCCRD register.

A compare match is not performed and thus interrupt is not requested under the following conditions.

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 10b, 11b (buffer operation with the GTCCRD register)

(5) GTCIEn interrupt (n = 0 to 3)

When the interrupt enable bit (GTINTE) in the GTINTAD register is 1, an interrupt request is generated under the following condition.

- When the GTCCRE register functions as a compare match register, the GTCNT counter value matches with the GTCCRE register.

A compare match is not performed and thus interrupt is not requested under the following conditions.

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 01b, 10b, 11b (buffer operation with the GTCCRE register)

(6) GTCIFn interrupt (n = 0 to 3)

When the interrupt enable bit (GTINTF) in the GTINTAD register is 1, an interrupt request is generated under the following condition.

- When the GTCCRF register functions as a compare match register, the GTCNT counter value matches with the GTCCRF register.

A compare match is not performed and thus interrupt is not requested under the following conditions.

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 10b, 11b (buffer operation with the GTCCRF register)

(7) GTCIVn interrupt (n = 0 to 3)

When the interrupt enable bit (GTINTPR[0]) in the GTINTAD register is 1, an interrupt request is generated under the following conditions.

- In saw-wave mode, interrupt requests are enabled at overflows (when the GTCNT counter value matches with the GTPR register during up-counting).
- In triangle-wave mode, interrupt requests are enabled at crests (GTCNT = GTPR).

(8) GTCIUn interrupt (n = 0 to 3)

When the interrupt enable bit (GTINTPR[1]) in the GTINTAD register is 1, an interrupt request is generated under the following conditions.

- In saw-wave mode, interrupt requests are enabled at underflows (when the GTCNT counter value reaches 0 during down-counting).
- In triangle-wave mode, interrupt requests are enabled at troughs (GTCNT = 0).

(9) ETGIP interrupt

When the interrupt enable bit (ETIPEN) in the GTETINT register is 1, an interrupt request is generated under the following condition.

- When the rising edge of an external trigger input is detected

(10) ETGIN interrupt

When the interrupt enable bit (ETINEN) in the GTETINT register is 1, an interrupt request is generated under the following condition.

- When the falling edge of an external trigger input is detected

(11) GDTEn interrupt (n = 0 to 3)

When automatic dead time setting has been made, the GTST.DTEF flag becomes 1 when the timer output toggle point with dead time added exceeds the timer cycle. If GTINTAD.EINT is 1 at this time, a dead time error interrupt request (GDTE) is generated.
In addition, when the timer output toggle point with dead time added is back within the timer cycle, the GTST.DTEF flag changes from 1 to 0.

21.4.2 DMAC Activation

The DMAC can be activated by the interrupt in each channel. For details, see section 12, Interrupt Controller (ICUA) and section 15, DMA Controller (DMACAa).

21.4.3 Interrupt and A/D Conversion Request Skipping Function

By setting the GTITC register, the GTCNT counter overflows (GTPR compare matches) (GTCIV) or underflow interrupts (GTCIU) can be skipped. Other interrupts and A/D converter start request signals can be skipped in coordination with the GTCIV/GTCIU skipping function. However, the dead time error interrupts cannot be linked with the GTCIV/GTCIU skipping function.

When both troughs and crests are counted and skipped in triangle-wave mode, if the number of times of skipping is odd, GTCIV/GTCIU interrupt requests cannot be generated at troughs only or at crests only depending on the skipping counter start timing. Therefore, in order to count both troughs and crests and generate the GTCIV/GTCIU interrupts at troughs only or crests only in triangle-wave mode, the number of times of skipping should be even.

Similarly, in saw-wave mode, when both overflows and underflows are counted and skipped with the count direction changed, GTCIV interrupt requests cannot be generated at overflows only or at underflows only. Therefore, in order to count both overflows and underflows with the count direction changed and generate the GTCIV/GTCIU interrupts at overflows only or underflows only in saw wave mode, the skipping state should be carefully checked before using.

When changing the skipping count, be sure to release the skipping count setting (GTITC.IVTC[1:0] = 00b).

Figure 21.69 to Figure 21.74 show examples of skipping function operation.

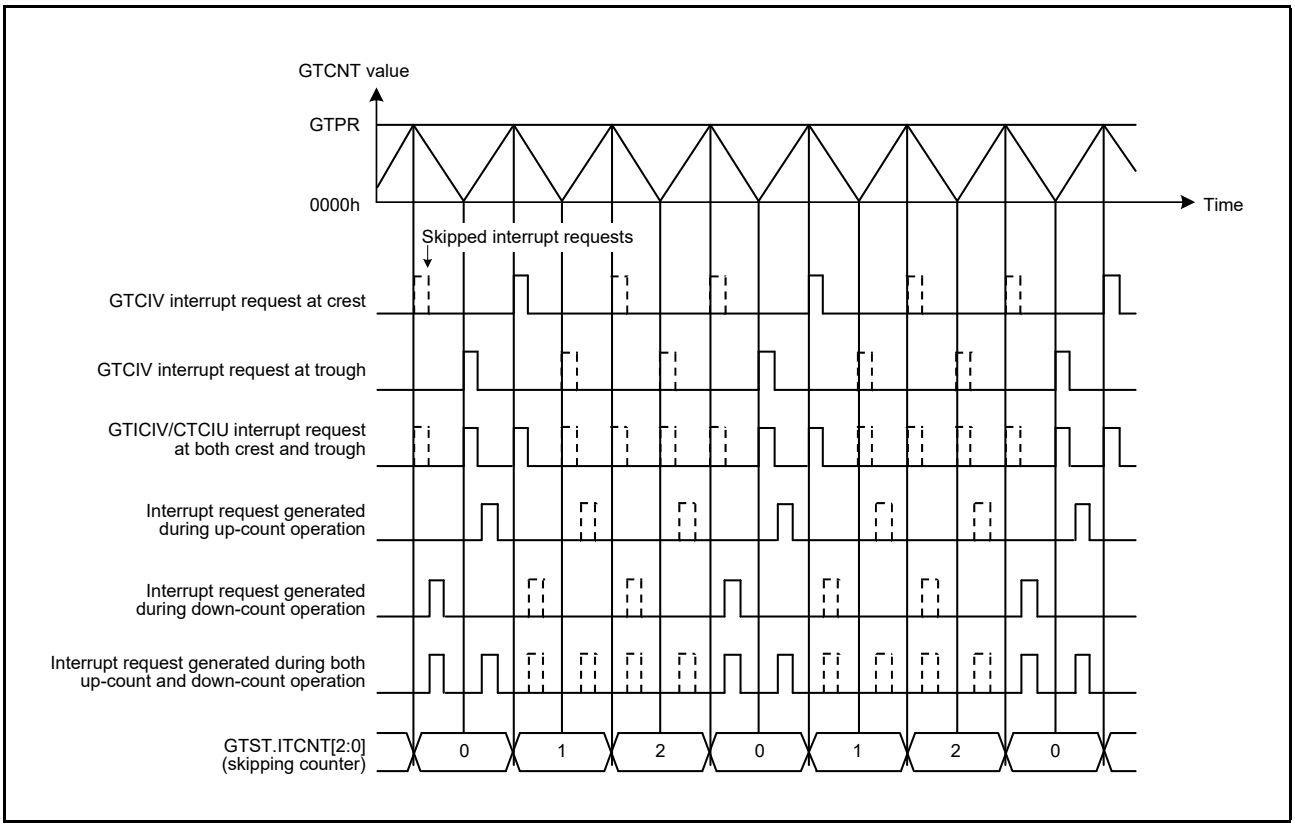

Figure 21.69 Example of Interrupt Skipping Function Operation (Triangle Waves, Counting and Skipping Crests, Skipping Count: 2)

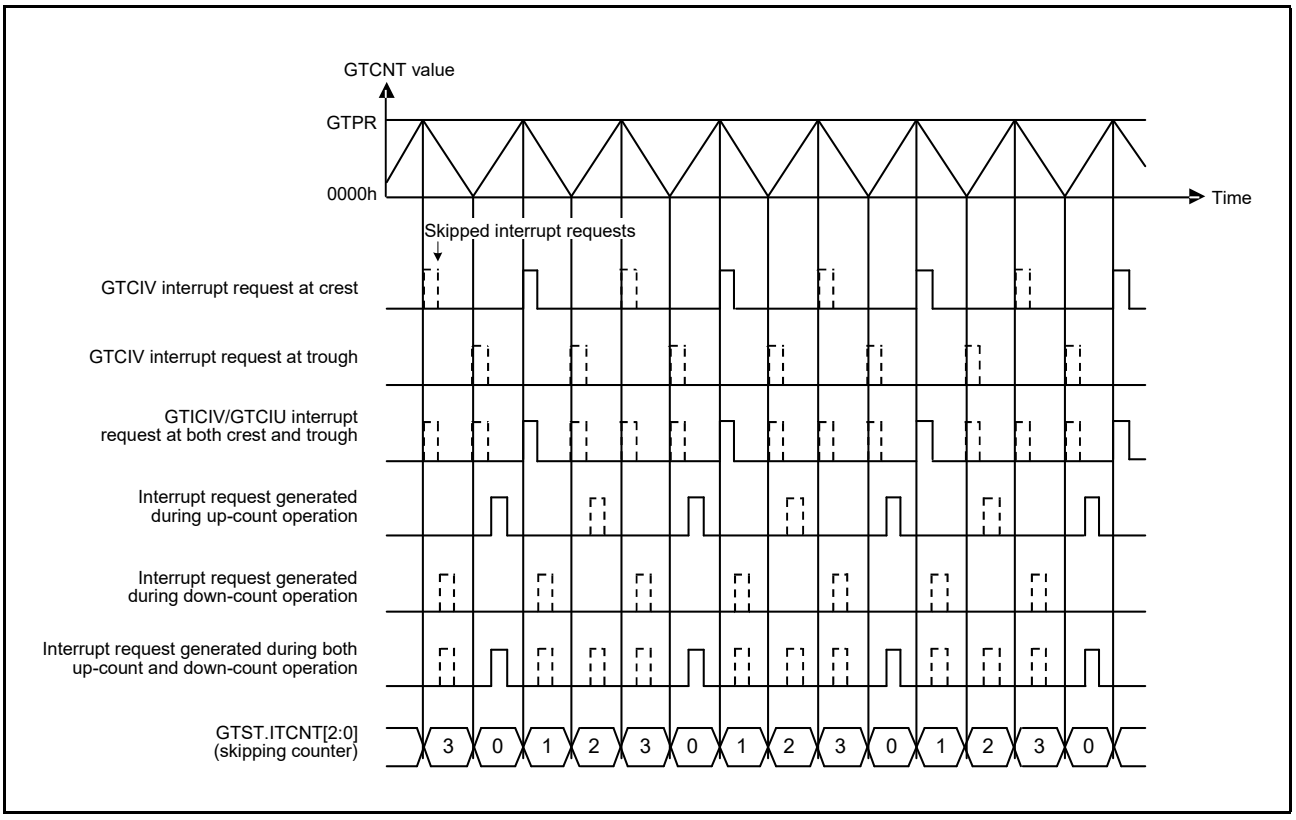

Figure 21.73 Example of Interrupt Skipping Function Operation (Triangle Waves, Counting and Skipping Both Troughs and Crests, Skipping Count: 3, Skipping Started at Down-Counting)

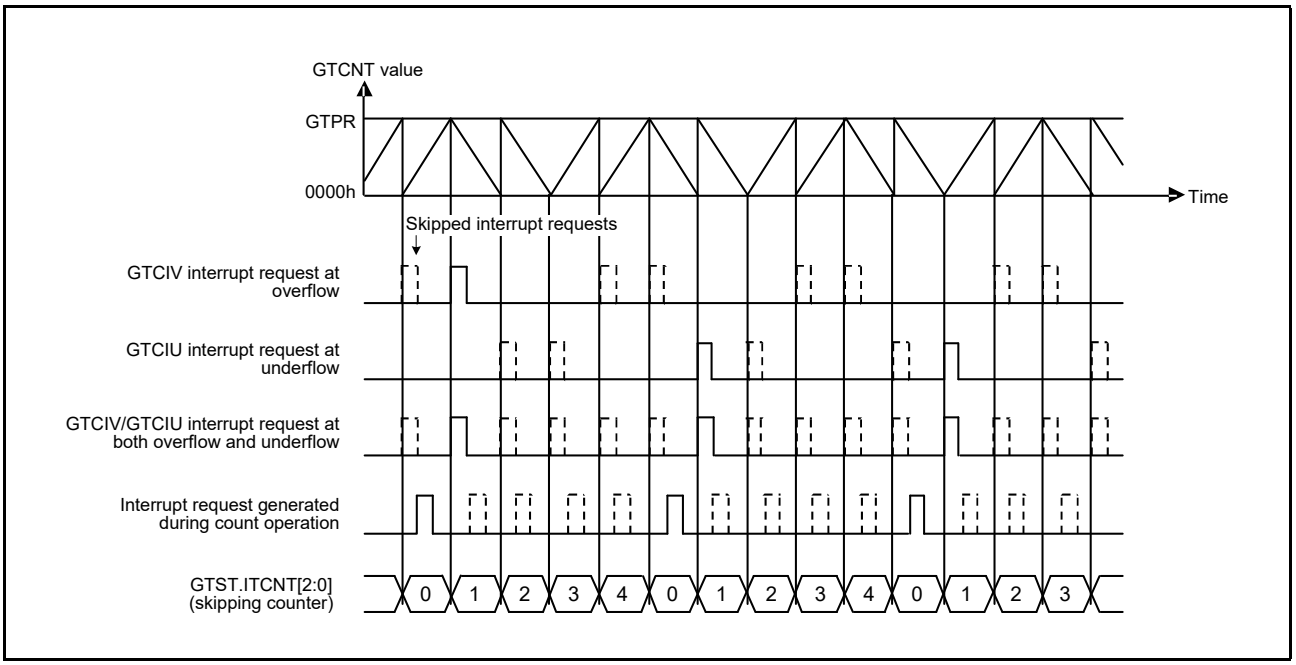

Figure 21.74 Example of Interrupt Skipping Function Operation (Saw Waves, Operation with Count Direction Changed, Counting and Skipping Both Overflows and Underflows, Skipping Count: 4)

21.5 A/D Converter Start Request

An A/D converter start request can be issued at a compare match between the GTCNT counter and GTADTRA or GTADTRB, and up-counting only, down-counting only, or both up-counting and down-counting can be specified. GTADTRA and GTADTRB each has two buffer registers. Buffer operation with GTADTRA used together with GTADTBRA and GTADTDBRA, and buffer operation with GTADTRB used together with GTADTBRB and GTADTDBRB can be performed.

Figure 21.75 shows an example of A/D converter start request operation, and Figure 21.76 shows an example for setting A/D converter start request operation.

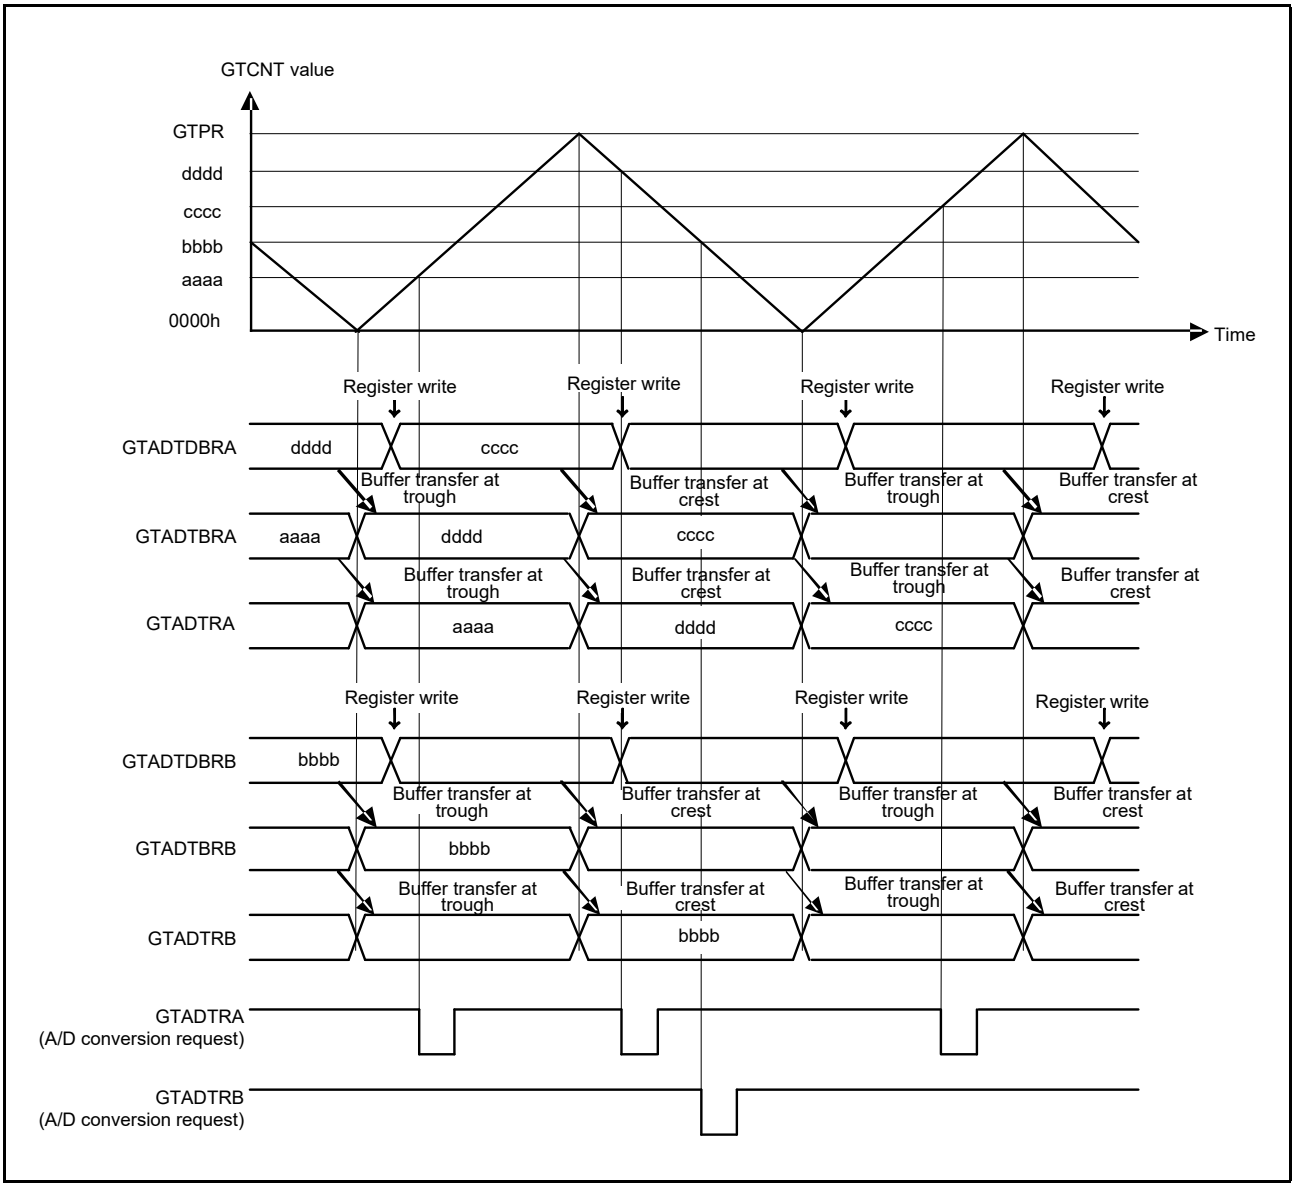

Figure 21.75 Example of A/D Converter Start Request Timing Operation (Triangle Waves, Double Buffer Operation, Buffer Transfer at Both Troughs and Crests, A/D Converter Start Requested by GTADTRA0 at Both Up-Counting and Down-Counting, A/D Converter Start Requested by GTADTRB0 at Down-Counting)

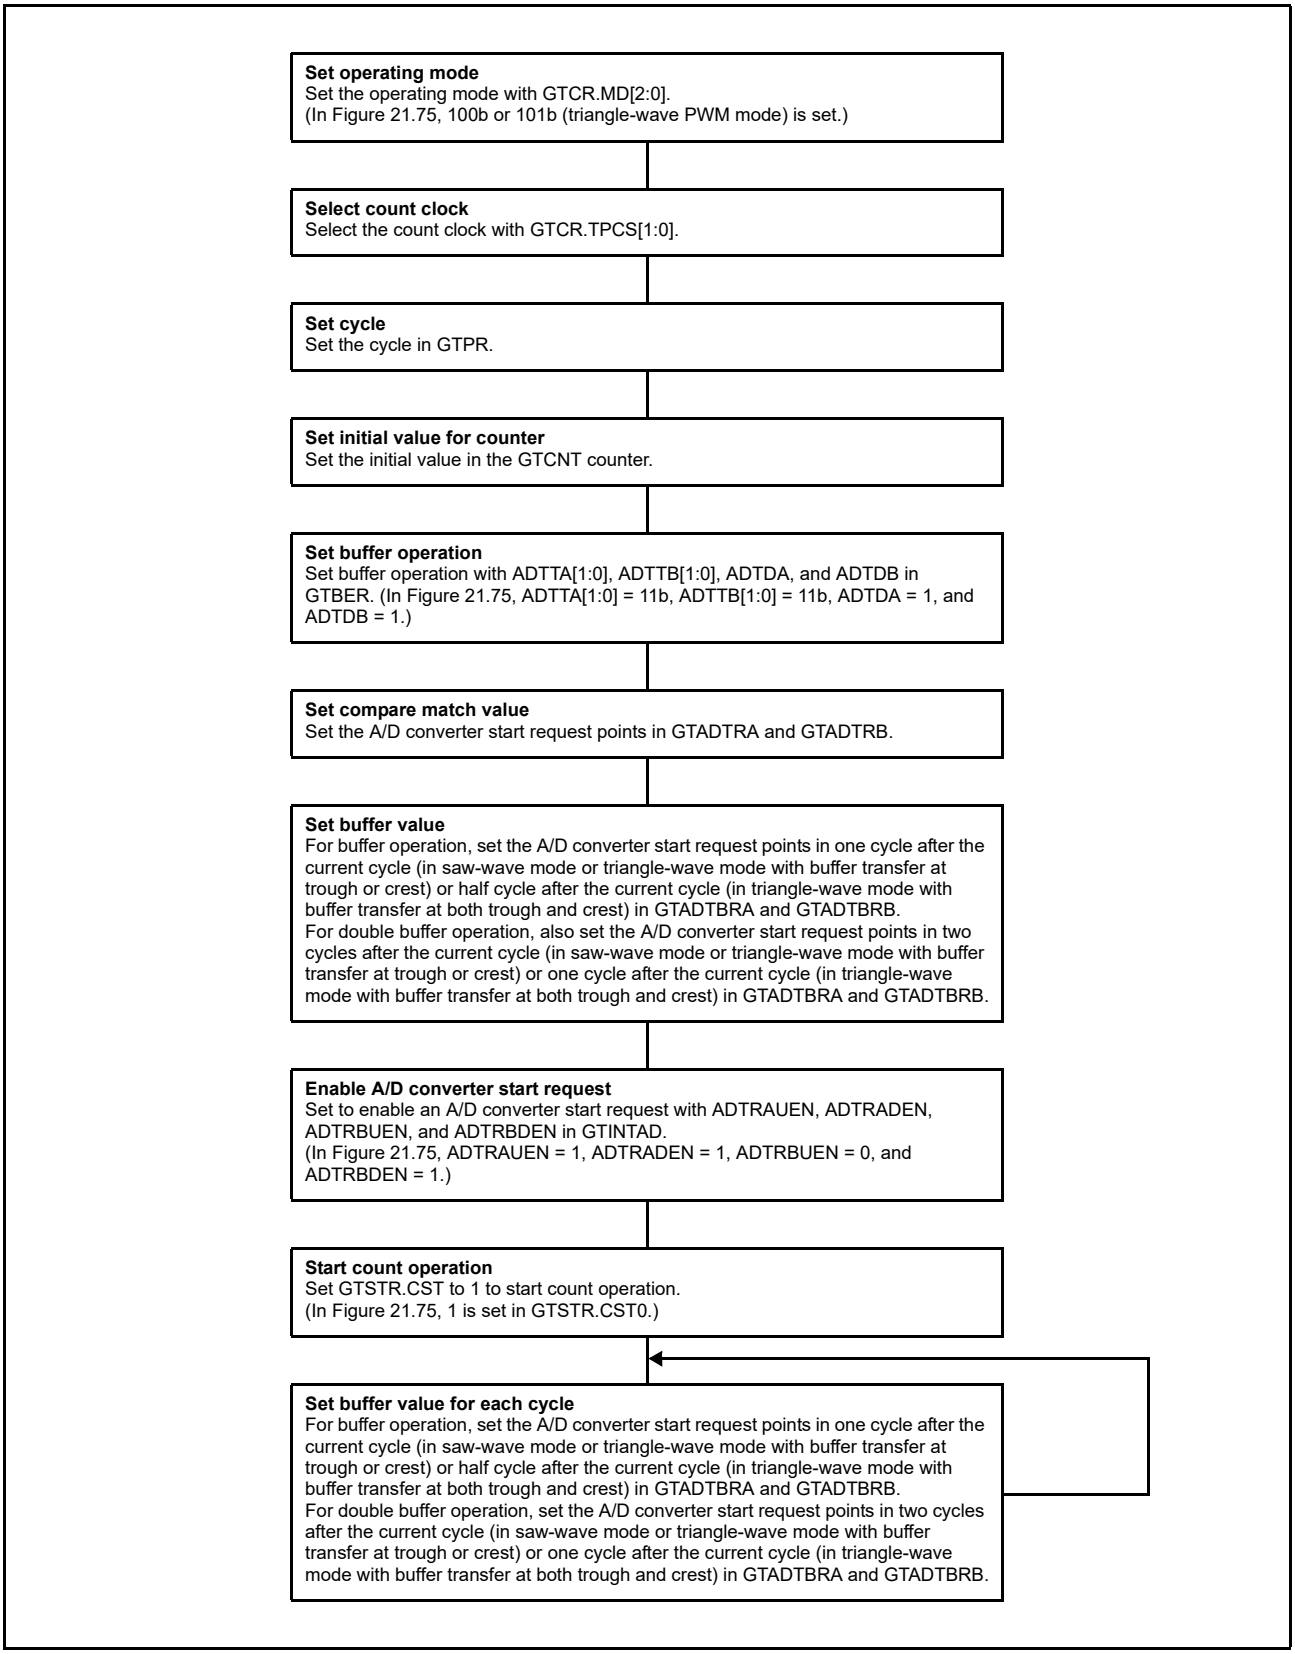

Figure 21.76 Example for Setting A/D Converter Start Request Timing Operation

21.6 Operations Linked by the ELC

21.6.1 Event Signal Output to the ELC

GPT is capable of operation linked with another module set in advance when its interrupt request signal is used as an event signal by the event link controller (ELC).
GPT outputs the event signal regardless of the setting of the corresponding interrupt request enable bit.
For details, see section 16, Event Link Controller (ELC).

21.6.2 GPT Operations in Response to Receiving Event Signals from the ELC

The GPT can perform the following operations in response to the event set in advance in the ELSRn register of the event link controller (ELC).

(1) Start Counting

Counting by the GPT starts in response to the event when this is selected by the setting of the ELOPI or ELOPJ register of the ELC. The ELOPI register handles control for GPT0 to 2 and the ELOPJ register handles control for GPT2 and 3.
When the start event specified in the ELSRn register occurs, the CSTn bit in the GTSTR register (timer start register) shown in Table 21.6 is set to 1, and the GPT counter starts.
However, when the specified count start event is generated while the CSTn bit in the GTSTR register (timer start register) has already been set to 1, the event has no effect. Table 21.6 lists the GTSTR register bits used for each channel.

Table 21.6 Operation of the GTSTR register (timer start register) in response to the ELC

Channel No.	GTSTR Register (Timer Start Register)
Channel 0	GTSTR.CST0 bit
Channel 1	GTSTR.CST1 bit
Channel 2	GTSTR.CST2 bit
Channel 3	GTSTR.CST3 bit

(2) Input Capture Operation

Input capture by the GPT proceeds when this is selected by the setting of the ELOPI or ELOPJ register of the ELC. The ELOPI register handles control for GPT0 and 1 and the ELOPJ register handles control for GPT2 and 3. When the event specified in the ELSRn register occurs, the GTCCR register (general PWM timer compare capture register) captures the value of the GTCNT register (general PWM timer counter). When using input capture in response to an event, the corresponding bit of the GTIOR register (general PWM timer I/O control register) in the GPT should be set for input capture and the CSTn bit of GTSTR register (timer start register) should be set to 1 to start counting by the counter.
In this case, the GTIOCnA pin (input capture pin) input has no effect.
Table 21.7 lists the GTCCR and GTIOR registers used for each channel in input capture operation in response to the ELC.

Table 21.7 Registers Used in the Input Capture Operation by ELC

Channel No.	Timer General Register Name	Timer I/O Control Register
Channel 0	GPT0.GTCCRA bit	GPT0.GTIOR.GTIOA[5:0] bit
Channel 1	GPT1.GTCCRA bit	GPT1.GTIOR.GTIOA[5:0] bit
Channel 2	GPT2.GTCCRA bit	GPT2.GTIOR.GTIOA[5:0] bit
Channel 3	GPT3.GTCCRA bit	GPT3.GTIOR.GTIOA[5:0] bit

(3) Clear Counting

Counting by GPTa is cleared when this is selected by the setting of the ELOPI or ELOPJ register of the ELC. The ELOPI register handles control for GPT0 and 1 and the ELOPJ register handles control for GPT2 and 3. When the event specified in the ELSRn register occurs while count clearing is set by the associated bit, the GTCNT counter (timer counter) is returned to its initial value. If the corresponding CSTn bit in the GTSTR register (timer start register) is set to 1 (count operation is performed), counting continues, i.e. counting is restarted. For the CSTn bits in the GTSTR register, see Table 21.6.

(4) Stop Counting

Counting by GPTa stops when this is selected by the setting of the ELOPI or ELOPJ register of the ELC. The ELOPI register handles control for GPT0 and 1 and the ELOPJ register handles control for GPT2 and 3. When the event specified in the ELSRn register occurs, the corresponding CSTn bit in the GTSTR register (timer start register) shown in Table 21.6 is cleared to 0 and the GPTa counter stops.
If an event occurs while the CSTn bit in the GTSTR register (timer start register) is 0, the event is ignored.

21.6.3 Usage Notes on GPT Operation by Event Signal Reception from ELC

The following notes on usage apply when the GPT is used in event link operation.

(1) Start Counting

If the event specified in the ELSRn register occurs during a cycle of writing to a CSTn bit in the GTSTR counter (timer start), writing to the CSTn bit in the GTSTR register takes priority.

(2) Stop Counting

If the event specified in the ELSRn register occurs during a cycle of writing to the GTCNT register (timer counter register), writing to the GTCNT register takes priority.

21.6.4 Noise Filtering

Each input pin for use in input capture and external trigger is equipped with a noise filter. The noise filter functionality includes enabling and disabling of the noise filter for each pin.
The sampling clock of the noise filter can be set for each channel and even clock signals with frequencies differing from that of the counter source setting (except in cases where the counter source itself is selected) can be set. Figure 21.77 shows the timing of noise filtering.

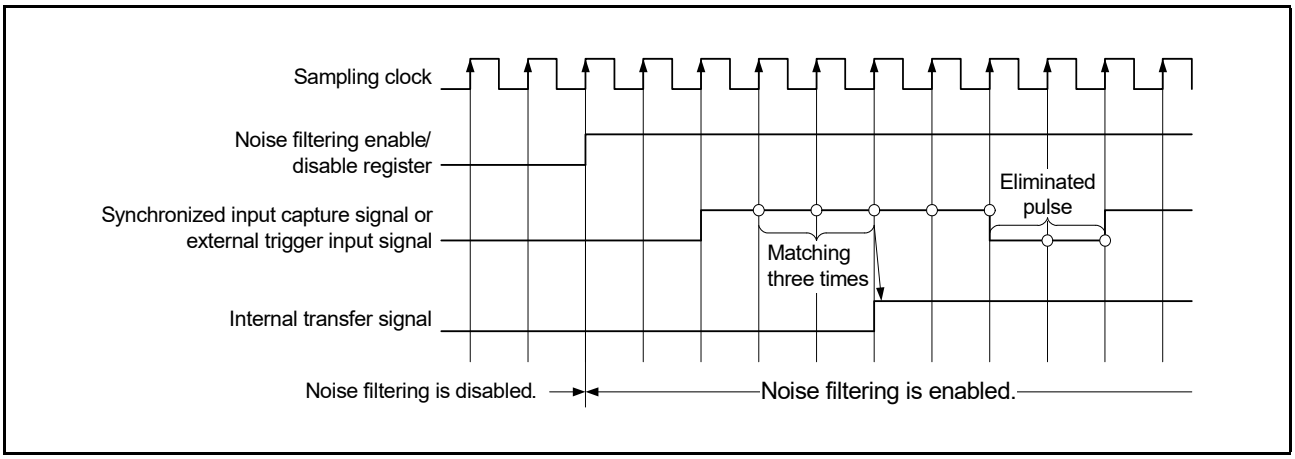

Figure 21.77 Timing of Noise Filtering

Table 21.8 lists the types of noise that can be removed when noise filtering is enabled. When the level of the synchronized input capture signal or external trigger input signal changes and then remains at the new level for at least three cycles of the sampling clock, the new level is conveyed by the filter. It is not conveyed if it only stays at the new level for two cycles of the sampling clock.

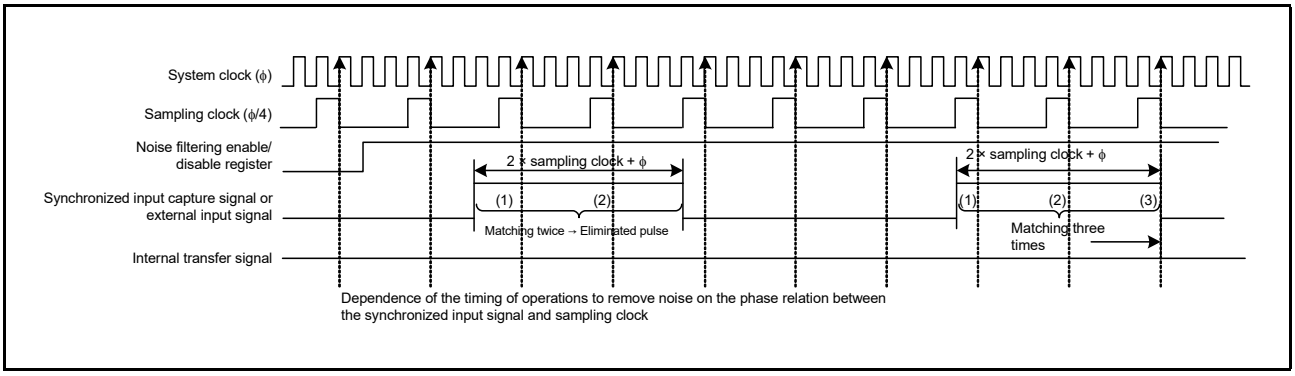

Figure 21.78 Dependence of the Timing of Operations to Remove Noise on the Phase Relation between the Synchronized Input Signal and Sampling Clock

Table 21.8 Relationship between Noise and Sampling Clock

Synchronized Input Capture Signal or External Trigger Input Signal	Number of Times Samples Match	Removed or Not Removed
At least as long as three cycles of the sampling clock	At least three times	Not removed
From two cycles of the sampling clock to three cycles of the sampling clock (but not exactly twice or three times the cycle)	Three times or twice (both are possible since this depends on the phase relation between the synchronized signal and the sampling clock)	The signal is not eliminated after matching three times The signal is eliminated after matching twice
Shorter than or lasting for only two cycles of the sampling clock	Twice, once, or not at all	Removed

21.7 Protection Function

21.7.1 Write-Protection for Registers

In order to prevent registers from being accidentally modified, registers can be write-protected in channel units by setting GTWP.WPn (n = 0 to 3).
The write-protection can be set for the following registers:

Table 21.9 List of Write-Protected Registers

Register Symbol	Register Name
GTIOR	General PWM timer I/O control register
GTINTAD	General PWM timer interrupt output register
GTCR	General PWM timer control register
GTBER	General PWM timer buffer enable register
GTUDC	General PWM timer count direction register
GTITC	General PWM timer interrupt and A/D converter start request skipping setting register
GTST	General PWM timer status register
GTCNT	General PWM timer counter
GTCCRA to GTCCRF	General PWM timer compare capture registers A to F
GTPR	General PWM timer period cycle setting register
GTPBR	General PWM timer cycle setting buffer register
GTPDBR	General PWM timer cycle setting double-buffer register
GTADTRA, GTADTRB	A/D converter start request timing registers A and B
GTADTBRA, GTADTBRB	A/D converter start request timing buffer registers A and B
GTADTDBRA, GTADTDBRB	A/D converter start request timing double-buffer registers A and B
GTONCR	General PWM timer output negate control register
GTDTCR	General PWM timer dead time control register
GTDVU, GTDVD	General PWM timer dead time value registers U and D
GTDBU, GTDBD	General PWM timer dead time buffer registers U and D
GTSOS	General PWM timer output protection function status register
GTSOTR	General PWM timer output protection function temporary release register

21.7.2 Disabling of Buffer Operation

If the timing of buffer register write is too late for the buffer transfer timing, buffer operation can be suspended with the GTBDR setting. Specifically, buffer transfer can be temporarily disabled, even though a buffer transfer condition is generated during buffer register write, by setting the corresponding GTBDR bit to 1 (buffer operation disabled) before buffer register write and clearing the bit to 0 (buffer operation enabled) after completion of writing to all the buffer registers.

Figure 21.79 shows an example of operation for disabling buffer operation

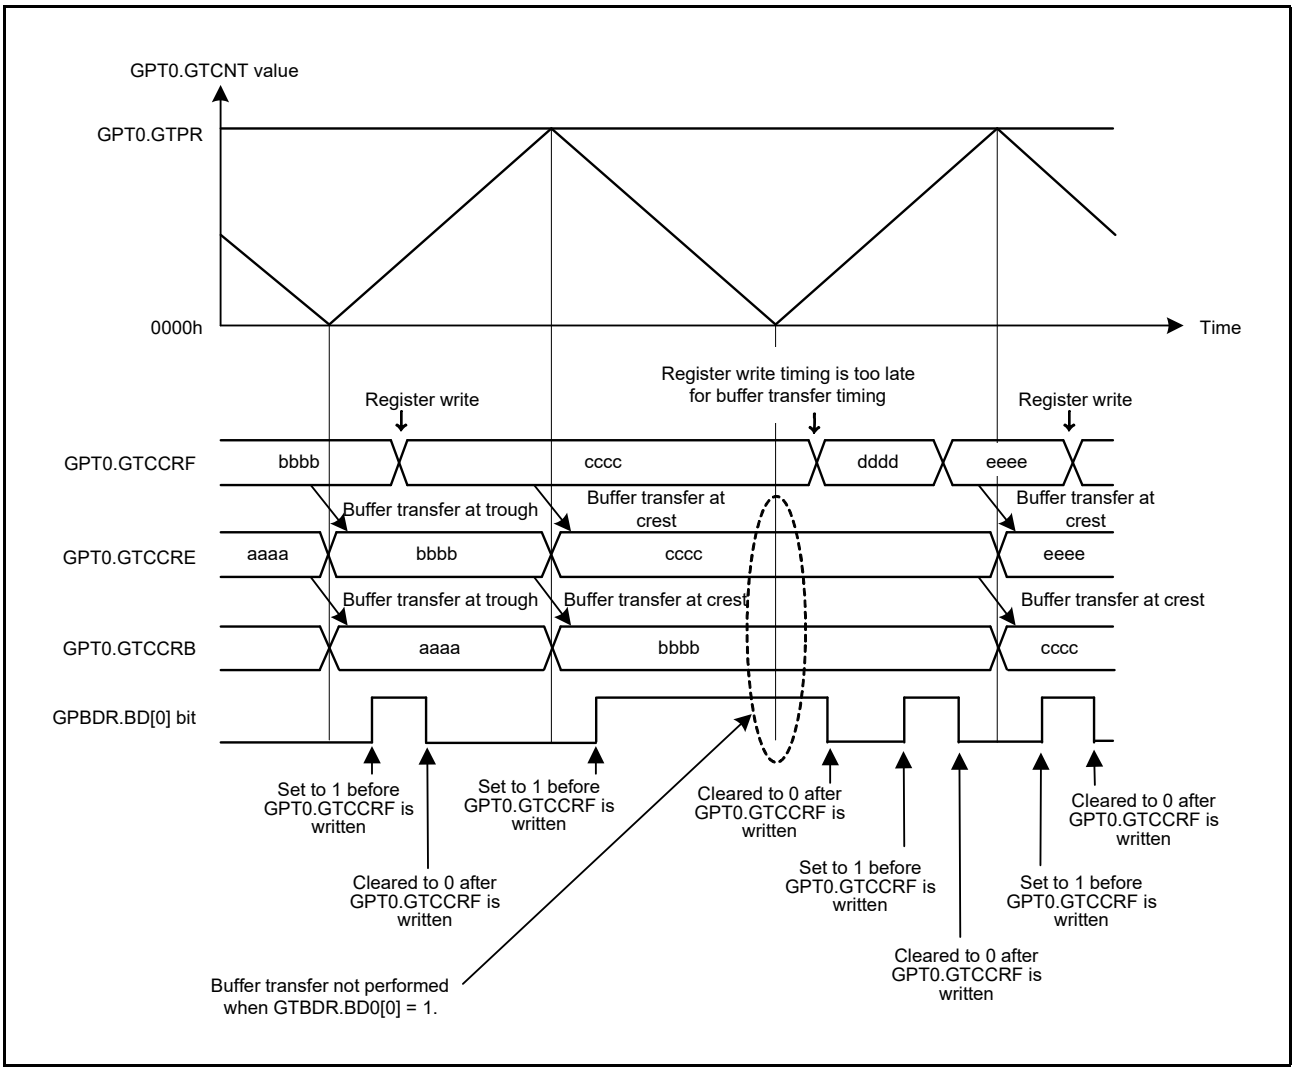

Figure 21.79 Example of Operation for Disabling Buffer Operation (Triangle Waves, Double Buffer Operation, Buffer Transfer at Both Troughs and Crests)

21.7.3 GTIOC Pin Output Negate Control

For protection from system failure, the negate control (deactivating the output level) is provided for GTIOC pin output with the GTONCR setting. There are three negate control sources: GTETRG pin input, and writing to GTONCR.SWN. Figure 21.80 shows an example of the GTIOC pin output negate control operation.

Note that once the negate control is performed, the negate control will not be released in the same cycle if the negate condition is no longer satisfied. The negate control is released in the next cycle.

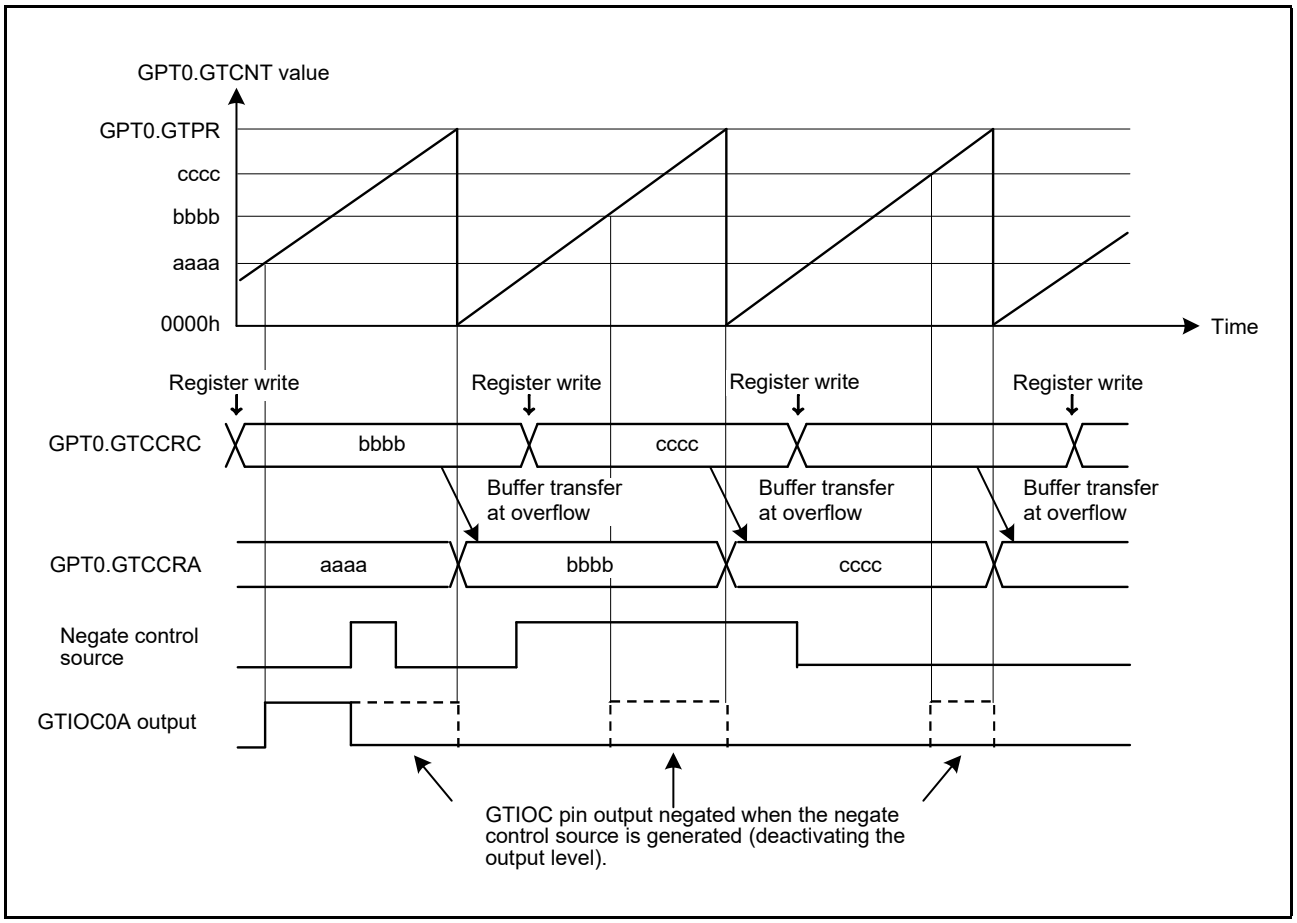

Figure 21.80 Example of GTIOC Pin Output Negate Control Operation (Saw-Wave Up-Counting, Buffer Operation, Active Level: 1, High Output at GTCCRA Compare Match, Low Output at Cycle End)

21.7.4 Output Protection Function for GTIOC Pin Output

In preparation for incorrect GTCCRA settings (settings outside the range of 0 < GTCCRA < GTPR), the output protection function for the GTIOC pin output (disabling function) is activated when the automatic dead time setting (GTDTCR.TDE = 1) is made in triangle-wave mode.

The status of the output protection function can be read from GTSOS.SOS[1:0].

Figure 21.81 shows the output protection function state transition.

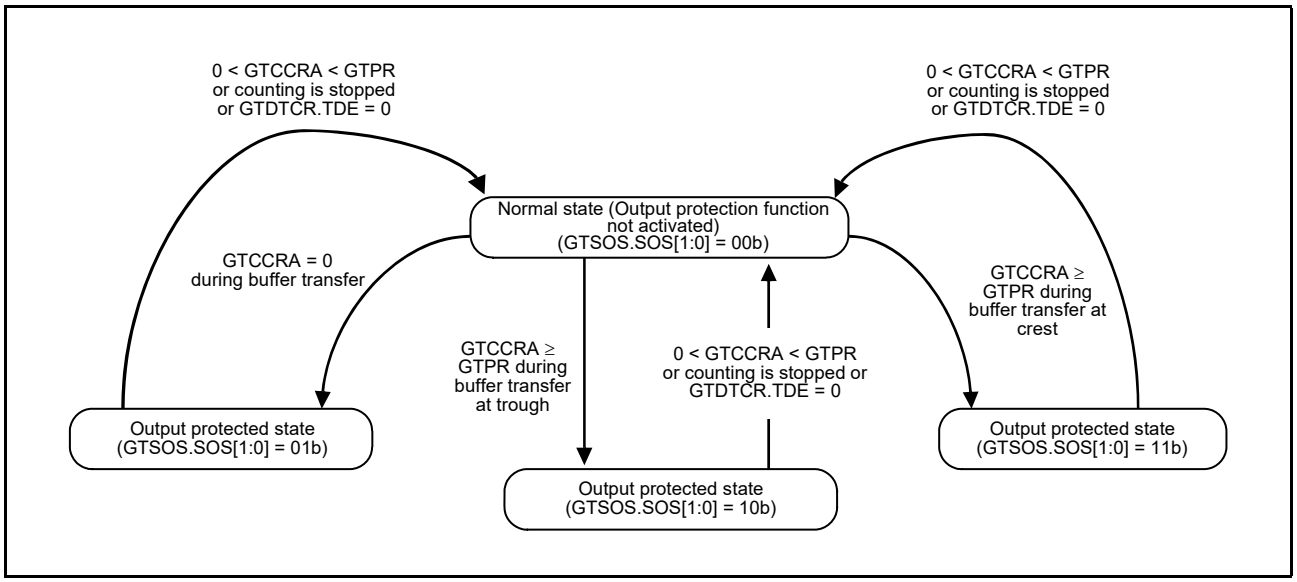

Figure 21.81 Output Protection Function

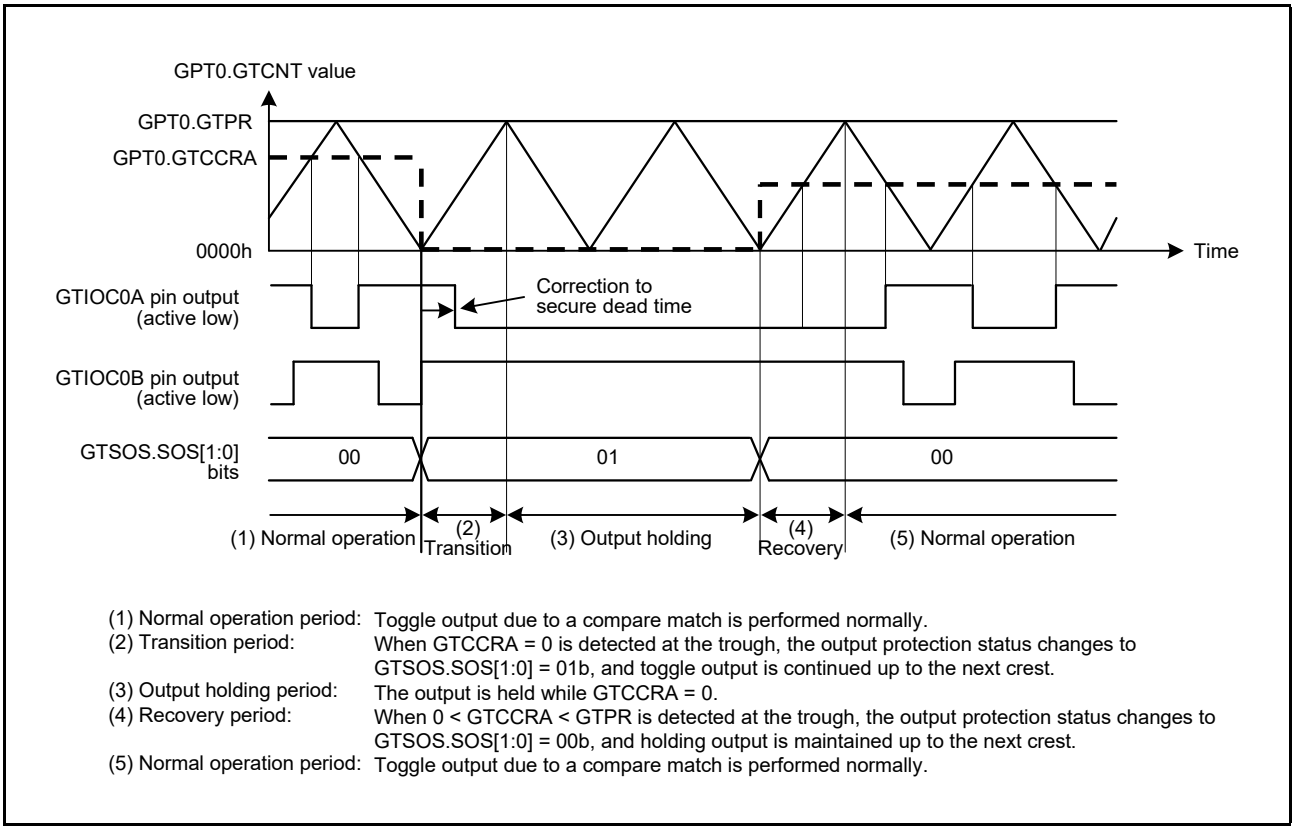
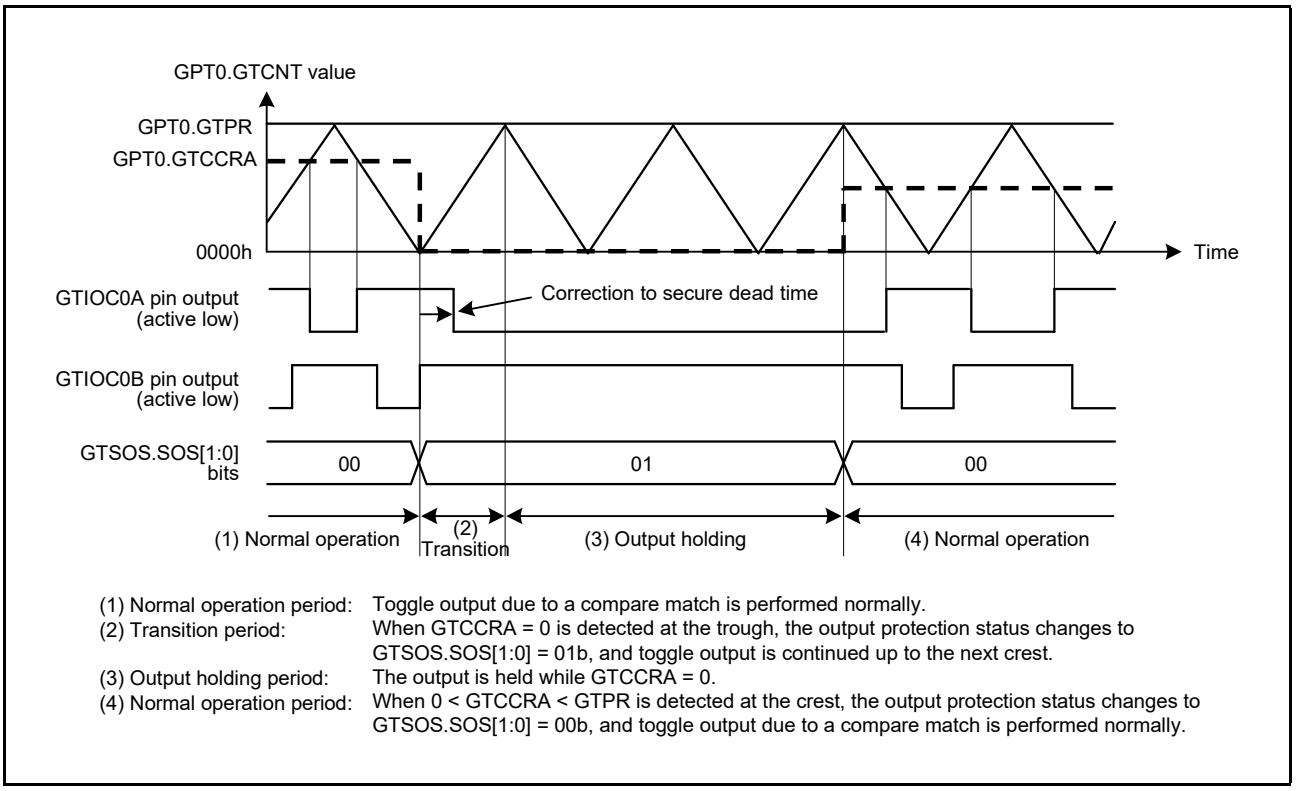
(1) Output Protection Function When GTCCRA is Set to 0 during Buffer Transfer

Figure 21.82 and Figure 21.83 show examples of output protection function operation when GTCCRA is set to 0 during buffer transfer at troughs, and Figure 21.84 and Figure 21.85 show examples when GTCCRA is set to 0 during buffer transfer at crests.



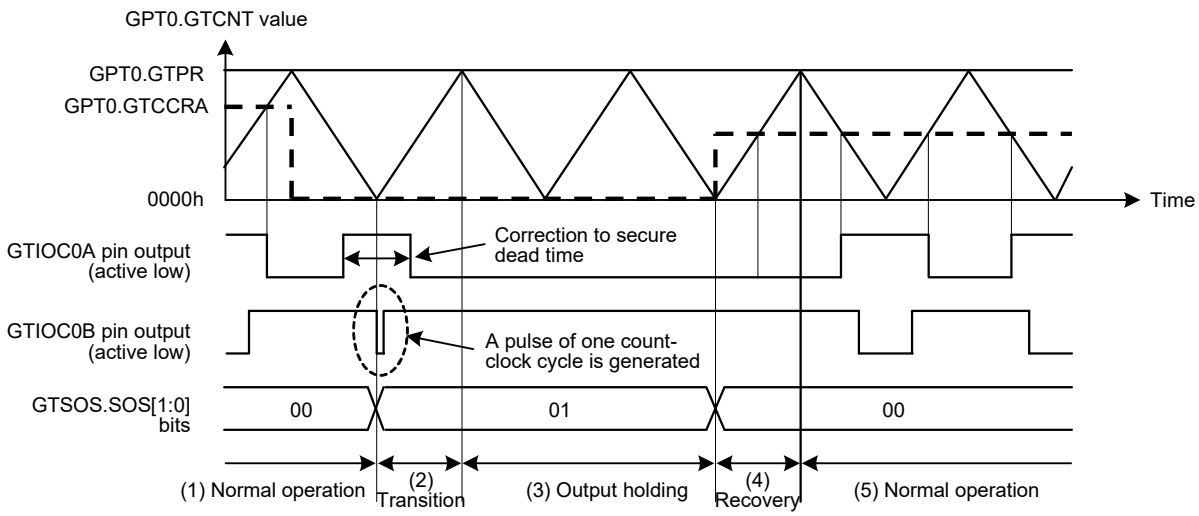
(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Transition period: When GTCCRA = 0 is detected at the trough, the output protection status changes to GTSOS.SOS[1:0] = 01b, and toggle output is continued up to the next crest.
(3) Output holding period: The output is held while GTCCRA = 0.
(4) Recovery period: When 0 < GTCCRA < GTPR is detected at the trough, the output protection status changes to GTSOS.SOS[1:0] = 00b, and holding output is maintained up to the next crest.
(5) Normal operation period: Toggle output due to a compare match is performed normally.

Figure 21.82 Example of Output Protection Function Operation When GTCCRA is Set to 0 during Buffer Transfer at Troughs (Restored to 0 < GTCCRA < GTPR during Buffer Transfer at Troughs, Active Level: Low)



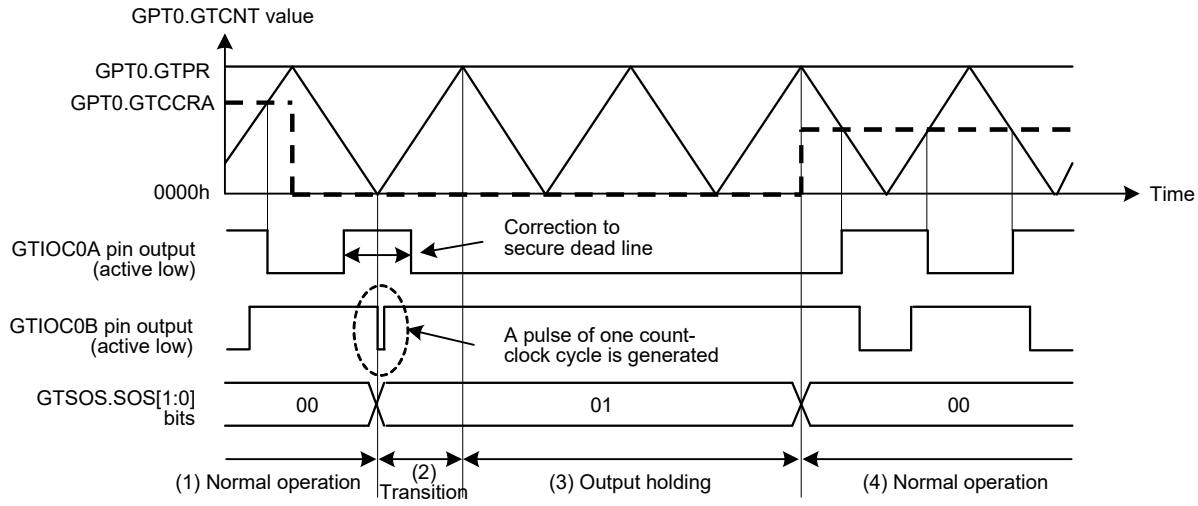
(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Transition period: When GTCCRA = 0 is detected at the trough, the output protection status changes to GTSOS.SOS[1:0] = 01b, and toggle output is continued up to the next crest.
(3) Output holding period: The output is held while GTCCRA = 0.
(4) Normal operation period: When 0 < GTCCRA < GTPR is detected at the crest, the output protection status changes to GTSOS.SOS[1:0] = 00b, and toggle output due to a compare match is performed normally.

Figure 21.83 Example of Output Protection Function Operation When GTCCRA is Set to 0 during Buffer Transfer at Troughs (Restored to 0 < GTCCRA < GTPR during Buffer Transfer at Crests, Active Level: Low)



(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Transition period: When GTCCRA = 0 is detected at the trough, the output protection status changes to GTSOS.SOS[1:0] = 01b, and toggle output is continued up to the next crest.
(3) Output holding period: The output is held while GTCCRA = 0.
(4) Recovery period: When 0 < GTCCRA < GTPR is detected at the trough, the output protection status changes to GTSOS.SOS[1:0] = 00b, and holding output is maintained up to the next crest.
(5) Normal operation period: Toggle output due to a compare match is performed normally.

Figure 21.84 Example of Output Protection Function Operation When GTCCRA is Set to 0 during Buffer Transfer at Crests (Restored to 0 < GTCCRA < GTPR during Buffer Transfer at Troughs, Active Level: Low)



(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Transition period: When GTCCRA = 0 is detected at the trough, the output protection status changes to GTSOS.SOS[1:0] = 01b, and toggle output is continued up to the next crest.
(3) Output holding period: The output is held while GTCCRA = 0.
(4) Recovery period: When 0 < GTCCRA < GTPR is detected at the crest, the output protection status changes to GTSOS.SOS[1:0] = 00b, and toggle output due to a compare match is performed normally.

Figure 21.85 Example of Output Protection Function Operation When GTCCRA is Set to 0 during Buffer Transfer at Crests (Restored to 0 < GTCCRA < GTPR during Buffer Transfer at Crests, Active Level: Low)

(2) Output Protection Function When GTCCRA ≥ GTPR is Set during Buffer Transfer at Troughs

Figure 21.86 and Figure 21.87 show examples of output protection function operation when GTCCRA ≥ GTPR is set during buffer transfer at troughs.

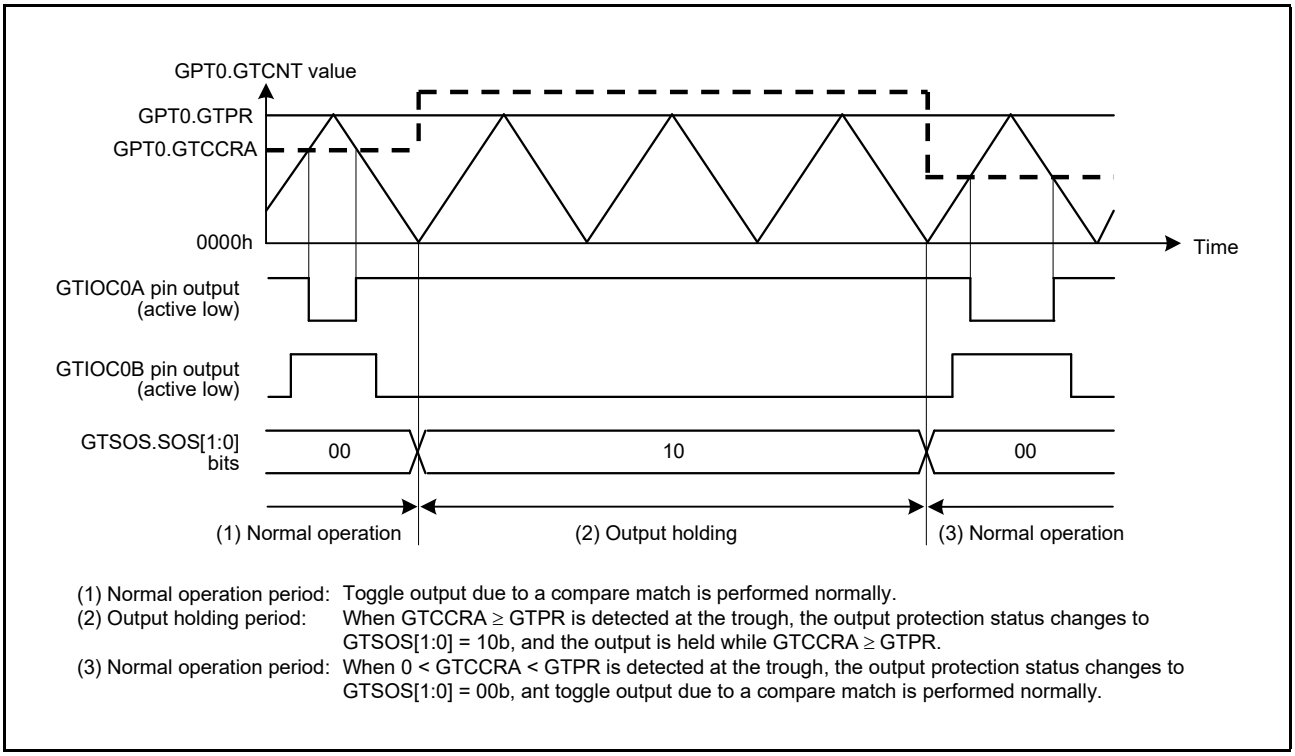


Figure 21.86 Example of Output Protection Function Operation When GTCCRA ≥ GTPR is set during Buffer Transfer at Troughs (Restored to 0 < GTCCRA < GTPR during Buffer Transfer at Troughs, Active Level: Low)

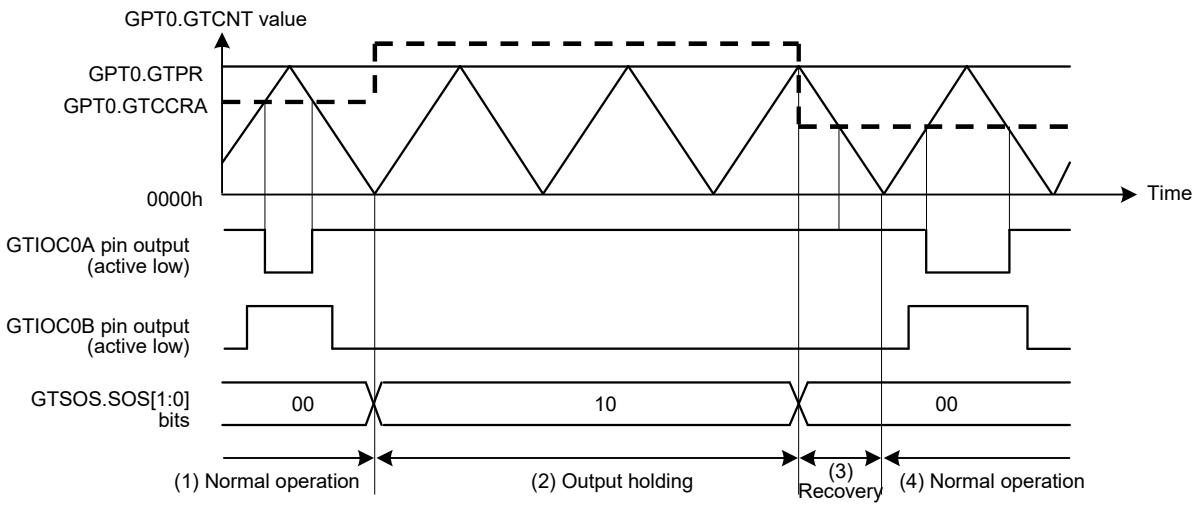
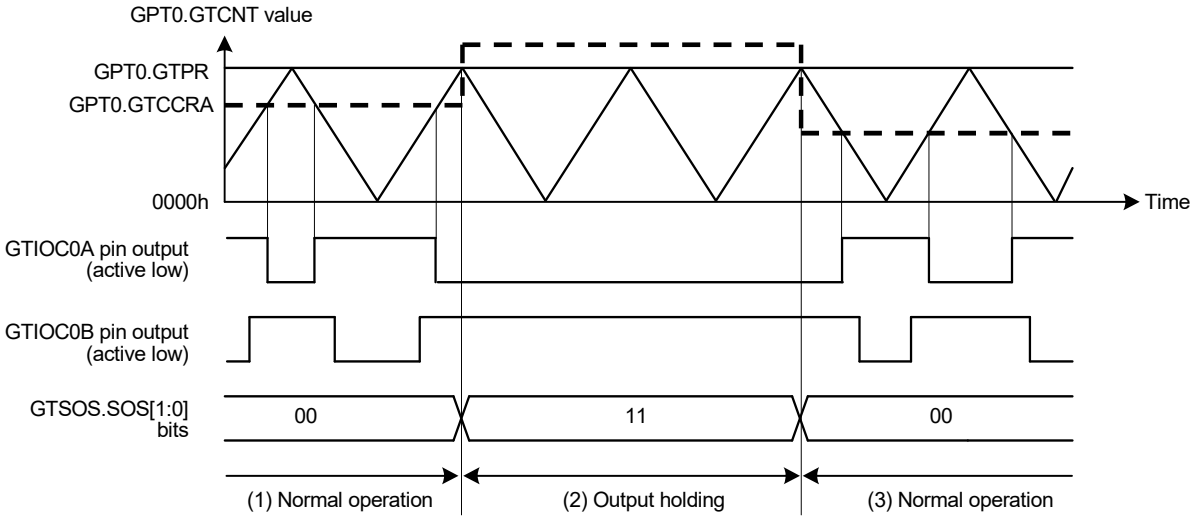


(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Output holding period: When GTCCRA ≥ GTPR is detected at the trough, the output protection status changes to GTSOS[1:0] = 10b, and the output is held while GTCCRA ≥ GTPR.
(3) Recovery period: When 0 < GTCCRA < GTPR is detected at the crest, the output protection status changes to GTSOS.SOS[1:0] = 00b, and holding output is maintained up to the next trough.
(4) Normal operation period: Toggle output due to a compare match is performed normally.

Figure 21.87 Example of Output Protection Function Operation When GTCCRA ≥ GTPR is Set during Buffer Transfer at Troughs (Restored to 0 < GTCCRA < GTPR during Buffer Transfer at Crests, Active Level: Low)

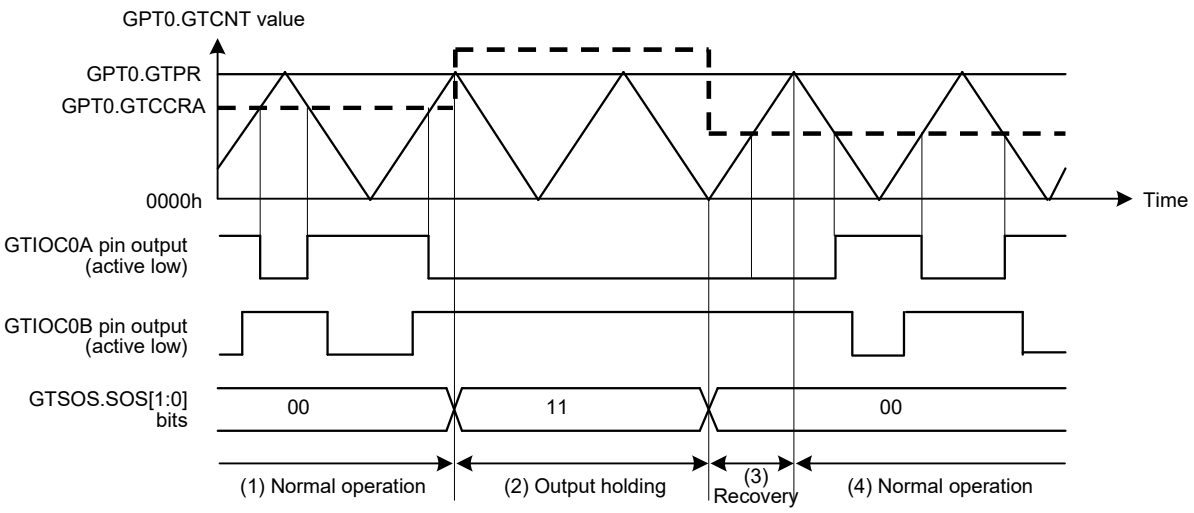
(3) Output Protection Function When GTCCRA ≥ GTPR is Set during Buffer Transfer at Crests

Figure 21.88 and Figure 21.89 show examples of output protection function operation when GTCCRA ≥ GTPR is set during buffer transfer at crests.



(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Output holding period: When GTCCRA ≥ GTPR is detected at the crest, the output protection status changes to GTSOS[1:0] = 11b, and the output is held while GTCCRA ≥ GTPR.
(3) Normal operation period: Toggle output due to a compare match is performed normally.

Figure 21.88 Example of Output Protection Function Operation When GTCCRA ≥ GTPR is Set during Buffer Transfer at Crests (Restored to 0 < GTCCRA < GTPR during Buffer Transfer at Crests, Active Level: Low)



(1) Normal operation period: Toggle output due to a compare match is performed normally.
(2) Output holding period: When GTCCRA ≥ GTPR Is detected at the crest, the output protection status changes to GTSOS[1:0] = 11b, and the output is held while GTCCRA ≥ GTPR.
(3) Recovery period: When 0 < GTCCRA < GTPR is detected at the trough, the output protection status changes to GTSOS.SOS[1:0] = 00b, and holding output is maintained up to the next crest.
(4) Normal operation period: Toggle output due to a compare match is performed normally.

Figure 21.89 Example of Output Protection Function Operation When GTCCRA ≥ GTPR is Set during Buffer Transfer at Crests (Restored to 0 < GTCCRA < GTPR during Buffer Transfer at Troughs, Active Level: Low)

(4) Restricted Specification of Output Protection Function

The GTCCRA value must be set within the range of (0 < GTCCRA < GTPR) at count start.
If an incorrect value is set in GTCCRA during count operation, (a setting outside the range of 0 < GTCCRA < GTPR), the output protection function deactivates the level of one of the positive and negative outputs. However, the function does not operate correctly if counting starts with an incorrect value set in GTCCRA.
Even when the value set in the GTCCRA register may be greater than or equal to the GTPR register setting, set the values of the GTCCRA, GTDVU, GTDVD, and GTPR registers to satisfy the conditions below.

- During buffer transfer at crests, GTCCRA < GTPR + GTDVD – 1.
- If the condition GTCCRA = GTPR may apply during buffer transfer in troughs, GTDVU < GTPR – 1.

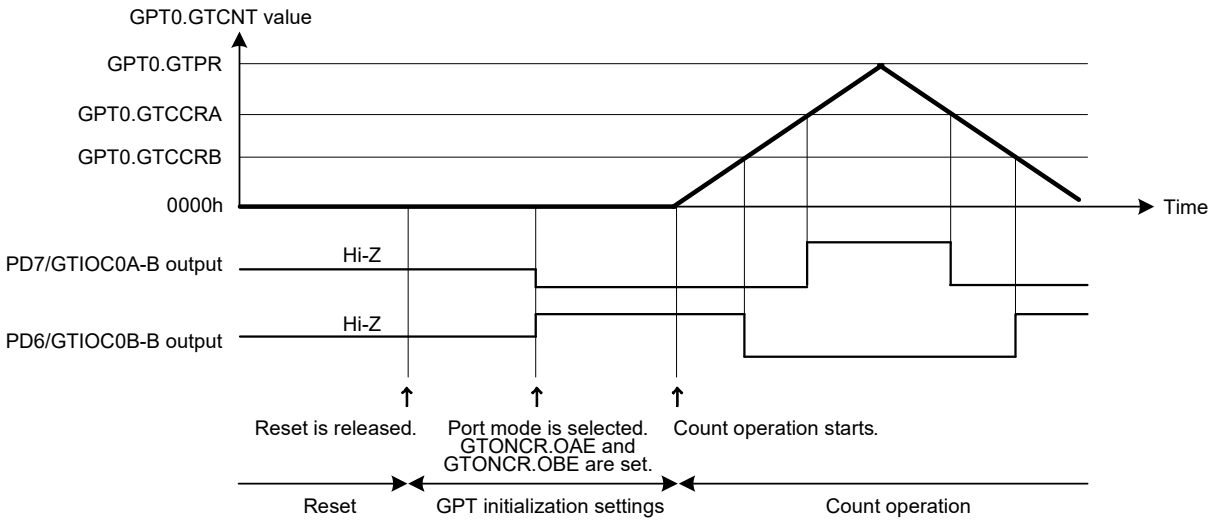
21.7.5 High-Impedance Control of GTIOC Pin Output by POE Function

For protection from system failure, the high-impedance state of the GTIOC pin output can be controlled by the port output enable (POE) function.
For details, see section 20, Port Output Enable 3 (POE3).

21.8 Initialization Method of Output Pins

21.8.1 Pin Settings after Reset

The GPT registers are initialized at a reset. Start counting after selecting the port mode (PMR and PmnPFS), setting GTIOR and the OAE and OBE bits in GTONCR and setting pins to function as GPT output.



[Setting examples]
GTIOR.GTIOA[5:0]: Initial output of low, output retained at cycle end, toggle output at compare match
GTIOR.GTIOB[5:0]: Initial output of high, output retained at cycle end, toggle output at compare match

Figure 21.90 Example of Pin Settings after Reset

21.8.2 Pin Initialization Due to Error during Operation

If an error occurs during GPT operation, the following four types of pin processing can be performed before pin initialization.

(1) Set OAHLD and OBHLD bits in GTIOR to 1 and retain the outputs at count stop.
(2) Set OAHLD and OBHLD bits in GTIOR to 0, specify arbitrary output values at OADFLT and OBDFLT in GTIOR, and output the arbitrary values at count stop.
(3) Similar to the MTU3, set the pin to output an arbitrary value as a general output port by setting the PDR, PODR, and PMR registers of the I/O port in advance. Set the OAE and OBE bits in GTONCR to 0 and the control bit in PMR that corresponds to the pin to 0 to allow the arbitrary values to be output from the pin set as a general output port when an error occurs.
(4) Drive the output to a high impedance state using the POE function of the port output enable 3 (POE3).

When automatic dead time setting has been made, clear the GTDTCR.TDE bit to 0 once after counting is stopped.

When counting is stopped, only the values of registers that are changed by a GPT external source will change. If counting is resumed, operation will carry on from where it was stopped.
If counting was stopped, registers should be initialized before counting is started.

21.9 Usage Notes

21.9.1 Module Stop Function Setting

Operation of the GPT can be disabled or enabled by the module stop control register. The initial setting is for operation of the GPT to be halted. Register access is enabled by clearing module stop state. For details, see section 9, Low-Power Consumption Function.

21.9.2 Settings of GTCCRn during Compare Match Operation (n = A, B, C, D, E, F)

(1) When automatic dead time setting has been made in triangle-wave PWM mode

GTCCRA should be set within the range of GTDVU < GTCCRA, GTDVD < GTCCRA, and GTCCRA < GTPR.
When the setting of GTCCRA = 0 or GTCCRA ≥ GTPR is made during count operation, the output protection function is activated.
Be sure to set 0 < GTCCRA < GTPR at count start. Otherwise, the output protection function is not be activated correctly.
In addition, satisfy all the conditions below.

- During buffer transfer at crests, GTCCRA < GTPR + GTDVD – 1.
- If the condition GTCCRA = GTPR may apply during buffer transfer in troughs, GTDVU < GTPR – 1.

For details, refer to section 21.7.4, Output Protection Function for GTIOC Pin Output.

(2) When automatic dead time setting has not been made in triangle-wave PWM mode

GTCCRA should be set within the range of 0 < GTCCRA < GTPR. If GTCCRA = 0 or GTCCRA ≥ GTPR is set, a compare match occurs within the cycle only when GTCCRA = 0 or GTCCRA = GTPR is satisfied. In the case of GTCCRA > GTPR, no compare match occurs.
Similarly, GTCCRB should be set within the range of 0 < GTCCRB < GTPR. If GTCCRB = 0 or GTCCRA ≥ GTPR is set, a compare match occurs within the cycle only when GTCCRB = 0 or GTCCRB = GTPR is satisfied. In the case of GTCCRB > GTPR, no compare match occurs.

(3) When automatic dead time setting has been made in saw-wave one-shot pulse mode

GTCCRC and GTCCRD should be set to satisfy the following restrictions. If the restrictions are not satisfied, correct output waveforms with secured dead time may not be obtained.

- In up-count operation: GTCCRC < GTCCRD, GTCCRC > GTDVU, GTCCRD < GTPR - GTDVD
- In down-count operation: GTCCRC > GTCCRD, GTCCRC < GTPR – GTDVU, GTCCRD > GTDVD

Similarly, GTCCRE and GTCCRF should be set to satisfy the following restrictions. If the restrictions are not satisfied, correct output waveforms with secured dead time may not be obtained.

- In up-count operation: GTCCRE < GTCCRF, GTCCRE > GTDVU, GTCCRF < GTPR - GTDVD
- In down-count operation: GTCCRE > GTCCRF, GTCCRE < GTPR – GTDVU, GTCCRF > GTDVD

(4) When automatic dead time setting has not been made in saw-wave one-shot pulse mode

GTCCRC and GTCCRD should be set to satisfy the following restrictions. If the restrictions are not satisfied, two compare matches do not occur and pulse output cannot be performed.

- In up-count operation: 0 < GTCCRC < GTCCRD < GTPR
- In down-count operation: GTPR > GTCCRC > GTCCRD > 0

Similarly, GTCCRE and GTCCRF should be set to satisfy the following restrictions. If the restrictions are not satisfied, two compare matches do not occur and pulse output cannot be performed.

- In up-count operation: 0 < GTCCRE < GTCCRF < GTPR
- In down-count operation: GTPR > GTCCRE > GTCCRF > 0

(5) In saw-wave PWM mode

GTCCRA should be set with the range of 0 < GTCCRA < GTPR. If GTCCRA = 0 or GTCCRA = GTPR is set, a compare match occurs within the cycle only when GTCCRA = 0 or GTCCRA = GTPR is satisfied. If GTCCRA > GTPR is set, no compare match occurs.
Similarly, GTCCRB should be set with the range of 0 < GTCCRB < GTPR. If GTCCRB = 0 or GTCCRB = GTPR is set, a compare match occurs within the cycle only when GTCCRB = 0 or GTCCRB = GTPR is satisfied. If GTCCRB > GTPR is set, no compare match occurs.

21.9.3 Stopping the Timer in the Safe Way

When the timer stopping by the GTSTR writing and the GPT compare match interrupt conflict, an interrupt may be generated after the GTSTR writing.
Therefore, stop the timer in the following order. Then, a compare match interrupt is not generated after the timer has been stopped, and the timer can be stopped in the safe way.
(1) Disable the interrupt request by the interrupt request enable registers (IER15 to IER18) of the ICU.
(2) Disable the interrupt request by the interrupt output setting register (GTINTAD) of the GPT.
(3) Clear the CSTn bit in GTSTR to 0.

21.9.4 Priority Order of Events for the Counter

(1) While the counter is stopped, writing to the counter is given priority over clearing.
(2) If automatic setting of the CST bit and automatic resetting of the CST bit due to writing by the CPU are in contention, the priority order is as follows:
CPU writing > Automatic setting of the CST bit > Automatic resetting of the CST bit
- Automatic setting of the CST bit
  - Hardware start by the source set by the GTHSCR and GTHSSR registers
  - Start of counting by the ECL
- Automatic resetting of the CST bit
  - Hardware stop by the source set by the GTHSCR and GTHSSR registers
  - Stop of counting by the ECL

21.9.5 Notes on Port Settings in PWM Output Operating Mode

For the 6-phase PWM output using channels 0 to 2 (GTIOC0A, GTIOC0B, GTIOC1A, GTIOC1B, GTIOC2A, and GTIOC2B), set the port pins for use as the 6-phase PWM output pins in the groups in Table 21.10.
For the port settings, see section 18, Multi-Function Pin Controller (MPC).

Table 21.10 Output Pins for Channels 0 to 2

	Specified Port					
Port Group	**GTIOC0A**	**GTIOC0B**	**GTIOC1A**	**GTIOC1B**	**GTIOC2A**	**GTIOC2B**
1*1	P16	P15	P14	P13	P12	P11
2*2	PA2	PA1	PA0	P77	P76	P75
3*2	PB7	PF6	PF5	P87	P86	PD7

Note 1. This port group is only available in 320-pin devices.
Note 2. This port group is available in both 320- and 176-pin devices.

22. 16-Bit Timer Pulse Unit (TPUa)

This LSI has two on-chip 16-bit timer pulse units (TPU) (unit 0 and unit 1) comprising six-channel 16-bit timers, and a total of 12 channels (TPU0 to TPU11).

22.1 Overview

Specifications of the TPU are listed in Table 22.1. Functions of the TPU (unit 0) are listed in Table 22.2, and functions of the TPU (unit 1) are listed in Table 22.3.
A block diagram of TPU (unit 0) is shown in Figure 22.1, and a block diagram of TPU (unit 1) is shown in Figure 22.2.

Table 22.1 Specifications of TPU

Item	Description
Pulse input/output	Maximum 16 × 2 units
Count clock	Seven or eight types are provided for each channel.
Settable operations	• Waveform output at compare match • Input capture function (noise filters can be set) • Counter clear operation • Simultaneous writing to multiple timer counters (TCNT) • Simultaneous clearing by compare match and input capture • Synchronous input/output for registers by counter synchronous operation • Maximum of 15-phase × 2 units of PWM output by combination with synchronous operation • Cascaded operation • Internal PWM feedback input select
Channels 0 and 3 (unit 0), and channels 6 and 9 (unit 1)	Buffer operation can be set.
Channels 1, 2, 4, and 5 (unit 0), and channels 7, 8, 10, and 11 (unit 1)	Phase counting mode can be set for individual channels
Interrupt source	26 sources × 2 units
Buffer operation	Automatic transfer of register data
Generation of trigger (unit 0)	Programmable pulse generator (PPG) output trigger can be generated.
Generation of trigger	Conversion start trigger for the A/D converter can be generated.
Event linking (output) (unit 0)	Six types of event signal can be output to the ELC. • Compare match A (TPU0 to TPU3) • Compare match B (TPU0 to TPU3) • Compare match C (TPU0, TPU3) • Compare match D (TPU0, TPU3) • Overflow (TPU0 to TPU3) • Underflow (TPU1, TPU2)
Event linking (input) (unit 0)	Any of the three operations in response to event reception is possible. • Starting counts (TPU0 to TPU3) • Clearing counts (TPU0 to TPU3) • Input capture operation (TPU0 to TPU3)
Low-power consumption function	Module-stop state can be set for each unit.

Note: One unit for 176-pin devices (only unit 0 is provided)

22.2 Register Descriptions

22.2.1 Timer Control Register (TCR)

TPU has 12 TCR registers in total (one register per channel).
TCR controls the TCNT counter for each channel. TCR settings should be made while TCNT counter operation is stopped.

Address(es): TPU0.TCR A008 0110h, TPU1.TCR A008 0120h, TPU2.TCR A008 0130h, TPU3.TCR A008 0140h, TPU4.TCR A008 0150h, TPU5.TCR A008 0160h, TPU6.TCR A008 0190h, TPU7.TCR A008 01A0h, TPU8.TCR A008 01B0h, TPU9.TCR A008 01C0h, TPU10.TCR A008 01D0h, TPU11.TCR A008 01E0h

	b7	b6	b5	b4	b3	b2	b1	b0
	CCLR[2:0]			CKEG[1:0]		TPSC[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	TPSC[2:0]	Timer Prescaler Select	See Table 22.5 to Table 22.10.	R/W
b4, b3	CKEG[1:0]	Input Clock Edge Select	See Table 22.11.	R/W
b7 to b5	CCLR[2:0]*1	Counter Clear Source Select	See Table 22.12 and Table 22.13.	R/W

Note 1. Bit 7 in TPU1.TCR, TPU2.TCR, TPU4.TCR, and TPU5.TCR (unit 0) and in TPU7.TCR, TPU8.TCR, TPU10.TCR, and TPU11.TCR (unit 1) is reserved. These bits are read as 0. The write value should be 0.

TPSC[2:0] Bits (Timer Prescaler Select)

These bits select the TCNT counter clock. The clock source can be selected independently for each channel.
To select the external clock as the clock source, set the bit in the port direction register (PDR) for the corresponding pin to 0 (input port), and set the bit in the port mode register (PMR) to 1 (uses the pin as an I/O port for peripheral functions). For details, see section 17, I/O Ports.

CKEG[1:0] Bits (Input Clock Edge Select)

These bits select the input clock edge.
When the internal clock is counted using both edges, the input clock period is halved (e.g. Both edges of PCLKD/4 = PCLKD/2 rising edge).
Internal clock edge selection is valid when the input clock is PCLKD/4 or slower. This setting is ignored if the input clock is PCLKD/1, or when overflow/underflow of another channel is selected.

CCLR[2:0] Bits (Counter Clear Source Select)

These bits select the clear source of the TCNT counter.

Table 22.5 Bits TPSC[2:0] (TPU0, TPU6)

Channel	Bits TPSC[2:0] b2	b1	b0	Description
TPU0 (unit 0) TPU6 (unit 1)	0	0	0	Internal clock: Counts on PCLKD/1
	0	0	1	Internal clock: Counts on PCLKD/4
	0	1	0	Internal clock: Counts on PCLKD/16
	0	1	1	Internal clock: Counts on PCLKD/64
	1	0	0	External clock • TPU0: Counts on TCLKA pin input • TPU6: Counts on TCLKE pin input
	1	0	1	External clock • TPU0: Counts on TCLKB pin input • TPU6: Counts on TCLKF pin input
	1	1	0	External clock • TPU0: Counts on TCLKC pin input • TPU6: Counts on TCLKG pin input
	1	1	1	External clock • TPU0: Counts on TCLKD pin input • TPU6: Counts on TCLKH pin input

Table 22.6 Bits TPSC[2:0] (TPU1, TPU7)

Channel	Bits TPSC[2:0] b2	b1	b0	Description
TPU1 (unit 0) TPU7 (unit 1)	0	0	0	Internal clock: Counts on PCLKD/1
	0	0	1	Internal clock: Counts on PCLKD/4
	0	1	0	Internal clock: Counts on PCLKD/16
	0	1	1	Internal clock: Counts on PCLKD/64
	1	0	0	External clock • TPU1: Counts on TCLKA pin input • TPU7: Counts on TCLKE pin input
	1	0	1	External clock • TPU1: Counts on TCLKB pin input • TPU7: Counts on TCLKF pin input
	1	1	0	Internal clock: Counts on PCLKD/256
	1	1	1	• TPU1: Counts on TPU2.TCNT counter overflow/underflow • TPU7: Counts on TPU8.TCNT counter overflow/underflow

Note: This setting is invalid when TPU1 or TPU7 is in phase counting mode.

Table 22.7 Bits TPSC[2:0] (TPU2, TPU8)

Channel	Bits TPSC[2:0] b2	b1	b0	Description
TPU2 TPU8	0	0	0	Internal clock: Counts on PCLKD/1
	0	0	1	Internal clock: Counts on PCLKD/4
	0	1	0	Internal clock: Counts on PCLKD/16
	0	1	1	Internal clock: Counts on PCLKD/64
	1	0	0	External clock • TPU2: Counts on TCLKA pin input • TPU8: Counts on TCLKE pin input
	1	0	1	External clock • TPU2: Counts on TCLKB pin input • TPU8: Counts on TCLKF pin input
	1	1	0	External clock • TPU2: Counts on TCLKC pin input • TPU8: Counts on TCLKG pin input
	1	1	1	Internal clock: Counts on PCLKD/1024

Note: This setting is invalid when TPU2 or TPU8 is in phase counting mode.

Table 22.8 Bits TPSC[2:0] (TPU3, TPU9)

Channel	Bits TPSC[2:0] b2	b1	b0	Description
TPU3 TPU9	0	0	0	Internal clock: Counts on PCLKD/1
	0	0	1	Internal clock: Counts on PCLKD/4
	0	1	0	Internal clock: Counts on PCLKD/16
	0	1	1	Internal clock: Counts on PCLKD/64
	1	0	0	External clock • TPU3: Counts on TCLKA pin input • TPU9: Counts on TCLKE pin input
	1	0	1	Internal clock: Counts on PCLKD/1024
	1	1	0	Internal clock: Counts on PCLKD/256
	1	1	1	Internal clock: Counts on PCLKD/4096

Table 22.9 Bits TPSC[2:0] (TPU4, TPU10)

Channel	Bits TPSC[2:0] b2	b1	b0	Description
TPU4 TPU10	0	0	0	Internal clock: Counts on PCLKD/1
	0	0	1	Internal clock: Counts on PCLKD/4
	0	1	0	Internal clock: Counts on PCLKD/16
	0	1	1	Internal clock: Counts on PCLKD/64
	1	0	0	External clock • TPU4: Counts on TCLKA pin input • TPU10: Counts on TCLKE pin input
	1	0	1	External clock • TPU4: Counts on TCLKC pin input • TPU10: Counts on TCLKG pin input
	1	1	0	Internal clock: Counts on PCLKD/1024
	1	1	1	• TPU4: Counts on TPU5.TCNT counter overflow/underflow • TPU10: Counts on TPU11.TCNT counter overflow/underflow

Note: This setting is invalid when TPU4 or TPU10 is in phase counting mode.

Table 22.10 Bits TPSC[2:0] (TPU5, TPU11)

Channel	Bits TPSC[2:0] b2	b1	b0	Description
TPU5 TPU11	0	0	0	Internal clock: Counts on PCLKD/1
	0	0	1	Internal clock: Counts on PCLKD/4
	0	1	0	Internal clock: Counts on PCLKD/16
	0	1	1	Internal clock: Counts on PCLKD/64
	1	0	0	External clock • TPU5: Counts on TCLKA pin input • TPU11: Counts on TCLKE pin input
	1	0	1	External clock • TPU5: Counts on TCLKC pin input • TPU11: Counts on TCLKG pin input
	1	1	0	Internal clock: Counts on PCLKD/256
	1	1	1	External clock • TPU5: Counts on TCLKD pin input • TPU11: Counts on TCLKH pin input

Note: This setting is invalid when TPU5 or TPU11 is in phase counting mode.

Table 22.11 Bits CKEG[1:0]

Bits CKEG[1:0]		Input Clock	
b4	**b3**	**Internal Clock**	**External clock**
0	0	Counted at falling edge	Counted at rising edge
0	1	Counted at rising edge	Counted at falling edge
1	0	Counted at both edges	Counted at both edges
1	1	Counted at both edges	Counted at both edges

Table 22.12 Bits CCLR[2:0] (TPU0, TPU3, TPU6, TPU9)

	Bits CCLR[2:0]			
Channel	**b7**	**b6**	**b5**	**Description**
(Unit 0) TPU0, TPU3 (Unit 1) TPU6, TPU9	0	0	0	TCNT counter clearing disabled
	0	0	1	TCNT counter cleared by TGRA compare match/input capture
	0	1	0	TCNT counter cleared by TGRB compare match/input capture
	0	1	1	TCNT counter cleared by counter clearing for another channel performing synchronous clearing/synchronous operation*2
	1	0	0	TCNT counter clearing disabled
	1	0	1	TCNT counter cleared by TGRC compare match/input capture*1
	1	1	0	TCNT counter cleared by TGRD compare match/input capture*1
	1	1	1	TCNT counter cleared by counter clearing for another channel performing synchronous clearing/synchronous operation*2

Note 1. When TGRC or TGRD is used as a buffer register, TCNT counter is not cleared because the buffer register setting has priority, and compare match/input capture does not occur.
Note 2. Synchronous operation is selected by setting the TSYRA.SYNCj bit (j = 0, 3) in unit 0 or the TSYRB.SYNCj bit (j = 0, 3) in unit 1 to 1.

Table 22.13 Bits CCLR[2:0] (TPU1, TPU2, TPU4, TPU5, TPU7, TPU8, TPU10, TPU11)

	Bits CCLR[2:0]*1			
Channel	**b7**	**b6**	**b5**	**Description**
(Unit 0) TPU1, TPU2, TPU4, TPU5 (Unit 1) TPU7, TPU8, TPU10, TPU11	0	0	0	TCNT counter clearing disabled
	0	0	1	TCNT counter cleared by TGRA compare match/input capture
	0	1	0	TCNT counter cleared by TGRB compare match/input capture
	0	1	1	TCNT counter cleared by counter clearing for another channel performing synchronous clearing/synchronous operation*2
	1	0	0	Setting prohibited
	1	0	1	Setting prohibited
	1	1	0	Setting prohibited
	1	1	1	Setting prohibited

Note 1. Bit 7 in TPU1.TCR, TPU2.TCR, TPU4.TCR, and TPU5.TCR (unit 0) and in TPU7.TCR, TPU8TCR, TPU10.TCR, TPU11.TCR (unit 1) is reserved. These bits are read as 0. The write value should be 0.
Note 2. Synchronous operation is selected by setting the TSYRA.SYNCj bit (j = 1, 2, 4, 5) in unit 0 or the TSYRB.SYNCj bit (j = 1, 2, 4, 5) in unit 1 to 1.

22.2.2 Timer Mode Register (TMDR)

TMDR sets the operating mode of each channel.
TPU has 12 TMDR registers in total (one register per channel). TMDR settings should be made while TCNT counter operation is stopped.

Address(es): TPU0.TMDR A008 0111h, TPU1.TMDR A008 0121h, TPU2.TMDR A008 0131h, TPU3.TMDR A008 0141h, TPU4.TMDR A008 0151h, TPU5.TMDR A008 0161h, TPU6.TMDR A008 0191h, TPU7.TMDR A008 01A1h, TPU8.TMDR A008 01B1h, TPU9.TMDR A008 01C1h, TPU10.TMDR A008 01D1h, TPU11.TMDR A008 01E1h

	b7	b6	b5	b4	b3	b2	b1	b0
	ICSELD	ICSELB	BFB	BFA	MD[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	MD[3:0]	Mode Select	b3*1 b0 0 0 0 0: Normal operation 0 0 1 0: PWM mode 1 0 0 1 1: PWM mode 2 0 1 0 0: Phase counting mode 1*2 0 1 0 1: Phase counting mode 2*2 0 1 1 0: Phase counting mode 3*2 0 1 1 1: Phase counting mode 4*2 Settings other than above are prohibited.	R/W
b4	BFA*3	Buffer Operation A	0: TPUm.TGRA operates normally 1: TPUm.TGRA and TPUm.TGRC used together for buffer operation (m = 0, 3, 6, 9)	R/W
b5	BFB*4	Buffer Operation B	0: TGRB operates normally 1: TGRB and TGRD used together for buffer operation (m = 0, 3, 6, 9)	R/W
b6	ICSELB	TGRB Input Capture Input Select	0: Input capture input source is TIOCBn pin 1: Input capture input source is TIOCAn pin (n = 0 to 11)	R/W
b7	ICSELD*4	TGRD Input Capture Input Select	0: Input capture input source is TIOCDn pin 1: Input capture input source is TIOCCn pin (n = 0, 3, 6, 9)	R/W

Note 1. Bit 3 is reserved. This bit is read as 0. The write value should be 0.
Note 2. Phase counting mode cannot be set for TPU0, TPU3, TPU6, and TPU9. A 0 should be written to bit 2 for them.
Note 3. Bit 4 of TPU1, TPU2, TPU4, TPU5, TPU7, TPU8, TPU10, and TPU11 that do not have TGRC is reserved. This bit is read as 0. The write value should be 0.
Note 4. Bits 5 and 7 of TPU1, TPU2, TPU4, TPU5, TPU7, TPU8, TPU10, and TPU11 that do not have TGRD are reserved. These bits are read as 0. The write value should be 0.

MD[3:0] Bits (Mode Select)

Specifies the operating mode of the timer.

BFA Bit (Buffer Operation A)

Specifies whether TPUm.TGRA is to normally operate, or TPUm.TGRA and TPUm.TGRC are to be used together for buffer operation (m = 0, 3, 6, 9).
When TGRC is used as a buffer register, TGRC input capture/output compare is not generated.

BFB Bit (Buffer Operation B)

Specifies whether TPUm.TGRB is to normally operate, or TPUm.TGRB and TPUm.TGRD are to be used together for buffer operation (m = 0, 3, 6, 9).
When TGRD is used as a buffer register, TGRD input capture/output compare is not generated.

ICSELB Bit (TGRB Input Capture Input Select)

Selects the input capture input for TPUm.TGRB (m = 0 to 11). This function allows measurement of high-level width and period of the input pulse on a TIOCAn input pin.

ICSELD Bit (TGRD Input Capture Input Select)

Selects the input capture input for TPUm.TGRD (m = 0, 3, 6, 9).
This function allows measurement of high-level width and period of the input pulse on a TIOCCn input pin.

22.2.3 Timer I/O Control Register (TIORH, TIORL, TIOR)

TPU has four TIORH registers (one for TPU0, TPU3, TPU6, and TPU9), four TIORL registers (one for TPU0, TPU3, TPU6, and TPU9), and eight TIOR registers (one for TPU1, TPU2, TPU4, TPU5, TPU7, TPU8, TPU10, and TPU11) Thus, the TPU has 16 timer I/O control registers in total.
TIORH, TIORL, and TIOR control registers TGRA, TGRB, TGRC, and TGRD.
Note that TIORH, TIORL, and TIOR are affected by the TMDR setting.
For details, see Table 22.14 to Table 22.21.
The initial output specified by TIORH, TIORL, and TIOR is valid when the counter is stopped (the TPUA.TSTRA.CSTj bit in unit 0 or the TPUA.TSTRB.CSTj bit in unit 1 is cleared to 0 (j = 0 to 5)). In PWM mode 2, the output at the time when the TCNT counter is cleared to 0 is specified as the initial output.
When buffer operation has been selected for register TGRC or TGRD, the settings of the corresponding set of IOC[3:0] or IOD[3:0] bits becomes ineffective, and the TGRC or TGRD register simply operates as a buffer.
To specify the input capture pin in TIORH, TIORL, or TIOR, set the bit in the port direction register (PDR) for the corresponding pin to 0 (input port), and set the bit in the port mode register (PMR) to 1 (uses the pin as an I/O port for peripheral functions). For details, see section 17, I/O Ports.

- TPU0.TIORH, TPU1.TIOR, TPU2.TIOR, TPU3.TIORH, TPU4.TIOR, TPU5.TIOR, TPU6.TIORH, TPU7.TIOR, TPU8.TIOR, TPU9.TIORH, TPU10.TIOR, TPU11.TIOR

Address(es): TPU0.TIORH A008 0112h, TPU1.TIOR A008 0122h, TPU2.TIOR A008 0132h, TPU3.TIORH A008 0142h, TPU4.TIOR A008 0152h, TPU5.TIOR A008 0162h, TPU6.TIORH A008 0192h, TPU7.TIOR A008 01A2h, TPU8.TIOR A008 01B2h, TPU9.TIORH A008 01C2h, TPU10.TIOR A008 01D2h, TPU11.TIOR A008 01E2h

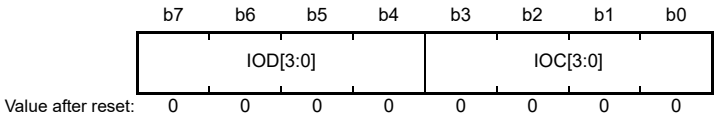
	b7	b6	b5	b4	b3	b2	b1	b0
	IOB[3:0]				IOA[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b3 to b0	IOA[3:0]	TGRA Control	See Table 22.14 to Table 22.19.*1	R/W
b7 to b4	IOB[3:0]	TGRB Control	See Table 22.14 to Table 22.19.*1	R/W

Note 1. If the IOn[3:0] (n = A, B) bits are changed to an “output prohibited” setting (0000b or 0100b) while the output of 0, output of 1, or toggling of the output in response to compare matches is in progress, the output becomes high impedance.

- TPU0.TIORL, TPU3.TIORL, TPU6.TIORL, TPU9.TIORL

Address(es): TPU0.TIORL A008 0113h, TPU3.TIORL A008 0143h, TPU6.TIORL A008 0193h, TPU9.TIORL A008 01C3h



Bit	Symbol	Bit Name	Description	R/W
b3 to b0	IOC[3:0]	TGRC Control	See Table 22.20 and Table 22.21.*1	R/W
b7 to b4	IOD[3:0]	TGRD Control	See Table 22.20 and Table 22.21.*1	R/W

Note 1. If the IOn[3:0] (n = C, D) bits are changed to an “output prohibited” setting (0000b or 0100b) while the output of 0, output of 1, or toggling of the output in response to compare matches is in progress, the output becomes high impedance.

IOA[3:0] Bits (TGRA Control)

Select the function of TPUm.TGRA (m = 0 to 11).

IOB[3:0] Bits (TGRB Control)

Select the function of TPUm.TGRB (m = 0 to 11).

IOC[3:0] Bits (TGRC Control)

Select the function of TPUm.TGRC (m = 0, 3, 6, 9).

IOD[3:0] Bits (TGRD Control)

Select the function of TPUm.TGRD (m = 0, 3, 6, 9).

Table 22.14 TPU0.TIORH, TPU6.TIORH

Bits IOA[3:0]				Description	
b3	b2	b1	b0	TPUm.TGRA (m = 0, 6) Function	TIOCAn Pin (n = 0, 6) Function and Related Issue
0	0	0	0	Output compare register	Output disabled
0	0	0	1		Initial output is low output; low output at compare match
0	0	1	0		Initial output is low output; high output at compare match
0	0	1	1		Initial output is low output; toggle output at compare match
0	1	0	0		Output disabled

Note 1. When the TPUm.TMDR.BFA bit is set to 1 (TPUm.TGRA and TPUm.TGRC are used for buffer operation) and TPUm.TGRC is used as a buffer register, this setting is invalid and input capture/output compare is not generated (m = 3, 9).

Note 2. When the TPUm.TMDR.BFB bit is set to 1 (TPUm.TGRB and TPUm.TGRD are used for buffer operation) and TPUm.TGRD is used as a buffer register, this setting is invalid and input capture/output compare is not generated (m = 3, 9).

Note 3. When the TPUm.TCR.TPSC[2:0] bits are set to 000b and PCLKD/1 is used as the TPUm.TCNT count clock, this setting is invalid and input capture is not generated (m = 4, 10).

Note 4. Selected by the TPUm.TMDR.ICSELD bit (m = 3, 9).

22.2.4 Timer Interrupt Enable Register (TIER)

TPU has 12 TIER registers in total (one register per channel).

TPUAm.TIER controls enabling or disabling of interrupt requests to individual channels (m = 0 to 11).

Address(es): TPU0.TIER A008 0114h, TPU1.TIER A008 0124h, TPU2.TIER A008 0134h, TPU3.TIER A008 0144h, TPU4.TIER A008 0154h, TPU5.TIER A008 0164h, TPU6.TIER A008 0194h, TPU7.TIER A008 01A4h, TPU8.TIER A008 01B4h, TPU9.TIER A008 01C4h, TPU10.TIER A008 01D4h, TPU11.TIER A008 01E4h

	b7	b6	b5	b4	b3	b2	b1	b0
	TTGE	—	TCIEU	TCIEV	TGIED	TGIEC	TGIEB	TGIEA
Value after reset:	0	1	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	TGIEA	TGRA Interrupt Enable	0: Interrupt requests (TGImA) disabled 1: Interrupt requests (TGImA) enabled (m = 0 to 11)	R/W
b1	TGIEB	TGRB Interrupt Enable	0: Interrupt requests (TGImB) disabled 1: Interrupt requests (TGImB) enabled (m = 0 to 11)	R/W
b2	TGIEC*1	TGRC Interrupt Enable	0: Interrupt requests (TGImC) disabled 1: Interrupt requests (TGImC) enabled (m = 0, 3, 6, 9)	R/W
b3	TGIED*1	TGRD Interrupt Enable	0: Interrupt requests (TGImD) disabled 1: Interrupt requests (TGImD) enabled (m = 0, 3, 6, 9)	R/W
b4	TCIEV	Overflow Interrupt Enable	0: Interrupt requests (TCImV) disabled 1: Interrupt requests (TCImV) enabled (m = 0 to 11)	R/W
b5	TCIEU*2	Underflow Interrupt Enable	0: Interrupt requests (TCImU) disabled 1: Interrupt requests (TCImU) enabled (m = 1, 2, 4, 5, 7, 8, 10, 11)	R/W
b6	—	Reserved	This bit is read as 1. The write value should be 1.	R/W
b7	TTGE*3	A/D Conversion Start Request Enable	0: A/D conversion start request generation disabled 1: A/D conversion start request generation enabled	R/W

Note 1. Bits 3 and 2 in TPU1.TIER, TPU2.TIER, TPU4.TIER, and TPU5.TIER of unit 0 and in TPU7.TIER, TPU8.TIER, TPU10.TIER, and TPU11.TIER of unit 1 are reserved. These bits are read as 0. The write value should be 0.

Note 2. Bit 5 in TPU0.TIER and TPU3.TIER of unit 0 and in TPU6.TIER and TPU9.TIER of unit 1 is reserved. This bit is read as 0. The write value should be 0.

Note 3. Bit 7 in TPU5.TIER of unit 0 and TPU11.TIER of unit 1 is reserved. This bit is read as 0. The write value should be 0.

TGIEA Bit (TGRA Interrupt Enable)

This bit enables or disables interrupt TGImA (m = 0 to 11).

TGIEB Bit (TGRB Interrupt Enable)

This bit enables or disables interrupt TGImB (m = 0 to 11).

TGIEC Bit (TGRC Interrupt Enable)

This bit enables or disables interrupt TGImC (m = 0, 3, 6, 9).

TGIED Bit (TGRD Interrupt Enable)

This bit enables or disables interrupt TGImD (m = 0, 3, 6, 9).

TCIEV Bit (Overflow Interrupt Enable)

This bit enables or disables interrupt TCImV (m = 0 to 11).

TCIEU Bit (Underflow Interrupt Enable)

This bit enables or disables interrupt TCImU (m = 1, 2, 4, 5, 7, 8, 10, 11).

TTGE Bit (A/D Conversion Start Request Enable)

Enables/disables generation of A/D conversion start requests by TPUm.TGRA (m = 0 to 4, 6 to 10) input capture/ compare match.

22.2.5 Timer Status Register (TSR)

TPU has 12 TSR registers in total (one register per channel).

TPUm.TSR indicates the status of individual channels, and the count direction of TPUm.TCNT counter (m = 0 to 11).

Address(es): TPU0.TSR A008 0115h, TPU1.TSR A008 0125h, TPU2.TSR A008 0135h, TPU3.TSR A008 0145h, TPU4.TSR A008 0155h, TPU5.TSR A008 0165h, TPU6.TSR A008 0195h, TPU7.TSR A008 01A5h, TPU8.TSR A008 01B5h, TPU9.TSR A008 01C5h, TPU10.TSR A008 01D5h, TPU11.TSR A008 01E5h

	b7	b6	b5	b4	b3	b2	b1	b0
	TCFD	—	TCFU	TCFV	TGFD	TGFC	TGFB	TGFA
Value after reset:	1	1	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	TGFA	Input Capture/Output Compare Flag A	0: Input capture to TPUm.TGRA or compare match with TPUm.TGRA has not occurred. 1: Input capture to TPUm.TGRA or compare match with TPUm.TGRA has occurred. (m = 0 to 11)	R/W*2
b1	TGFB	Input Capture/Output Compare Flag B	0: Input capture to TPUm.TGRB or compare match with TPUm.TGRB has not occurred. 1: Input capture to TPUm.TGRB or compare match with TPUm.TGRB has occurred. (m = 0 to 11)	R/W*2
b2	TGFC*4	Input Capture/Output Compare Flag C	0: Input capture to TPUm.TGRC or compare match with TPUm.TGRC has not occurred. 1: Input capture to TPUm.TGRC or compare match with TPUm.TGRC has occurred. (m = 0, 3, 6, 9)	R/W*2
b3	TGFD*4	Input Capture/Output Compare Flag D	0: Input capture to TPUm.TGRD or compare match with TPUm.TGRD has not occurred. 1: Input capture to TPUm.TGRD or compare match with TPUm.TGRD has occurred. (m = 0, 3, 6, 9)	R/W*2
b4	TCFV	Overflow Flag	0: TPUm.TCNT has not overflowed. 1: TPUm.TCNT has overflowed. (m = 0 to 11)	R/W*2
b5	TCFU*3	Underflow Flag	0: TPUm.TCNT has not underflowed. 1: TPUm.TCNT has underflowed. (m = 1, 2, 4, 5, 7, 8, 10, 11)	R/W*2
b6	—	Reserved	This bit is read as 1.	R
b7	TCFD*1	Counting Direction Flag	0: TPUm.TCNT counter counts down. 1: TPUm.TCNT counter counts up. (m = 1, 2, 4, 5, 7, 8, 10, 11)	R

Note 1. Bit 7 in TPU0.TSR and TPU3.TSR of unit 0 and in TPU6.TSR and TPU9.TSR of unit 1 is reserved. The bit is read as 1. The write value should be 1.

Note 2. Only writing 0 to this bit is possible; this clears the flag.

Note 3. Bit 5 in TPU0.TSR and TPU3.TSR of unit 0 and in TPU6.TSR and TPU9.TSR of unit 1 is reserved. The bit is read as 0. The write value should be 0.

Note 4. Bits 2 and 3 in TPU1.TSR, TPU2.TSR, TPU4.TSR, and TPU5.TSR of unit 0 and in TPU7.TSR, TPU8.TSR, TPU10.TSR, and TPU11.TSR of unit 1 are reserved. The bits are read as 0. The write value should be 0.

TGFA Flag (Input Capture/Output Compare Flag A)

This status flag indicates that input capture to TPUm.TGRA or compare match with TPUm.TGRA (m = 0 to 11) has occurred.

[Setting conditions]

- When TPUm.TGRA holds the value for comparison in output-compare operations, TPUm.TCNT matches TPUm.TGRA.
- When TPUm.TGRA is serving as an input-capture register, the input-capture signal has caused transfer of the value in TPUm.TCNT to TPUm.TGRA.

[Clearing condition]

- Writing 0 to TGFA after reading its value as 1.

TGFB Flag (Input Capture/Output Compare Flag B)

This status flag indicates that input capture to TPUm.TGRB or compare match with TPUm.TGRB (m = 0 to 11) has occurred.

[Setting conditions]

- When TPUm.TGRB holds the value for comparison in output-compare operations, TPUm.TCNT matches TPUm.TGRB.
- When TPUm.TGRB is serving as an input-capture register, the input-capture signal has caused transfer of the value in TPUm.TCNT to TPUm.TGRB.

[Clearing condition]

- Writing 0 to TGFB after reading its value as 1.

TGFC Flag (Input Capture/Output Compare Flag C)

This status flag indicates that input capture to TPUm.TGRC or compare match with TPUm.TGRC (m = 0, 3, 6, 9) has occurred.

[Setting conditions]

- When TPUm.TGRC holds the value for comparison in output-compare operations, TPUm.TCNT matches TPUm.TGRC.
- When TPUm.TGRC is serving as an input-capture register, the input-capture signal has caused transfer of the value in TPUm.TCNT to TPUm.TGRC.

[Clearing condition]

- Writing 0 to TGFC after reading its value as 1.

TGFD Flag (Input Capture/Output Compare Flag D)

This status flag indicates that input capture to TPUm.TGRD or compare match with TPUm.TGRD (m = 0, 3, 6, 9) has occurred.

[Setting conditions]

- When TPUm.TGRD holds the value for comparison in output-compare operations, TPUm.TCNT matches TPUm.TGRD.
- When TPUm.TGRD is serving as an input-capture register, the input-capture signal has caused transfer of the value in TPUm.TCNT to TPUm.TGRD.

[Clearing condition]

- Writing 0 to TGFD after reading its value as 1.

TCFV Flag (Overflow Flag)

This status flag indicates an overflow of TPUm.TCNT (m = 0 to 11).

[Setting condition]

- Overflow of the value in TPUm.TCNT (TPUm.TCNT counted from FFFFh to 0000h).

[Clearing condition]

- Writing 0 to TCFV after reading its value as 1.

TCFU Flag (Underflow Flag)

This status flag indicates an underflow of TPUm.TCNT (m = 1, 2, 4, 5, 7, 8, 10, 11).

[Setting condition]

- Underflow of the value in TPUm.TCNT (TPUm.TCNT counted from 0000h to FFFFh).

[Clearing condition]

- Writing 0 to TCFU after reading its value as 1.

22.2.6 Timer Counter (TCNT)

TPUm.TCNT is a 16-bit counter that counts the internal clock or external events (m = 0 to 11).
This counter can be read/written in 16-bit units.
This counter is initialized to 0000h by a reset.

Address(es): TPU0.TCNT A008 0116h, TPU1.TCNT A008 0126h, TPU2.TCNT A008 0136h, TPU3.TCNT A008 0146h, TPU4.TCNT A008 0156h, TPU5.TCNT A008 0166h, TPU6.TCNT A008 0196h, TPU7.TCNT A008 01A6h, TPU8.TCNT A008 01B6h, TPU9.TCNT A008 01C6h, TPU10.TCNT A008 01D6h, TPU11.TCNT A008 01E6h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

22.2.7 Timer General Register A (TGRA)
Timer General Register B (TGRB)
Timer General Register C (TGRC)
Timer General Register D (TGRD)

TPU has 32 TGR registers in total, four each for TPU0, TPU3, TPU6, and TPU9 and two each for TPU1, TPU2, TPU4, TPU5, TPU7, TPU8, TPU10, and TPU11.
TPUm.TGRA (m = 0 to 11), TPUm.TGRB (m = 0 to 11), TPUm.TGRC (m = 0, 3, 6, 9), and TPUm.TGRD (m = 0, 3, 6, 9) are 16-bit registers with a dual function as output compare and input capture registers.
These registers can be read/written in 16-bit units.
TPUm.TGRC and TPUm.TGRD can also be specified for operation as buffer registers. Register combinations during buffer operations are TPUm.TGRA-TPUm.TGRC and TPUm.TGRB-TPUm.TGRD.

Address(es): TPU0.TGRA A008 0118h, TPU0.TGRB A008 011Ah, TPU0.TGRC A008 011Ch, TPU0.TGRD A008 011Eh, TPU1.TGRA A008 0128h, TPU1.TGRB A008 012Ah, TPU2.TGRA A008 0138h, TPU2.TGRB A008 013Ah, TPU3.TGRA A008 0148h, TPU3.TGRB A008 014Ah, TPU3.TGRC A008 014Ch, TPU3.TGRD A008 014Eh, TPU4.TGRA A008 0158h, TPU4.TGRB A008 015Ah, TPU5.TGRA A008 0168h, TPU5.TGRB A008 016Ah, TPU6.TGRA A008 0198h, TPU6.TGRB A008 019Ah, TPU6.TGRC A008 019Ch, TPU6.TGRD A008 019Eh, TPU7.TGRA A008 01A8h, TPU7.TGRB A008 01AAh, TPU8.TGRA A008 01B8h, TPU8.TGRB A008 01BAh, TPU9.TGRA A008 01C8h, TPU9.TGRB A008 01CAh, TPU9.TGRC A008 01CCh, TPU9.TGRD A008 01CEh, TPU10.TGRA A008 01D8h, TPU10.TGRB A008 01DAh, TPU11.TGRA A008 01E8h, TPU11.TGRB A008 01EAh

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

22.2.8 Timer Start Register (TSTRA, TSTRB)

TSTRA starts or stops count operation for TCNT counter of TPU0 to TPU5.
TSTRB starts or stops count operation for TCNT counter of TPU6 to TPU11.
Before setting the operating mode in TPUm.TMDR or setting the TPUm.TCNT count clock in TPUm.TCR, stop the TPUm.TCNT counter.

Address(es): TPUA.TSTRA A008 0100h, TPUA.TSTRB A008 0180h

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	CST5	CST4	CST3	CST2	CST1	CST0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	CST0	Counter Start 0	0: TCNT count operation is stopped 1: TCNT performs count operation	R/W
b1	CST1	Counter Start 1		R/W
b2	CST2	Counter Start 2		R/W
b3	CST3	Counter Start 3		R/W
b4	CST4	Counter Start 4		R/W
b5	CST5	Counter Start 5		R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

CSTn Bits (Counter Start) (n = 0 to 5)

These bits start or stop the TCNT counter.
When the CSTn bit is cleared to 0 with CSTn = 1 and the corresponding TIOCyn pin (y = A to D, n = 0 to 5) specified for output, the counter stops but the output compare output level of the corresponding TIOCyn pin is retained.
If TIORH, TIORL, or TIOR is written to when the CSTn bit is 0, the pin output level will be changed to the set initial output value.

22.2.9 Timer Synchronous Register (TSYRA, TSYRB)

TSYRA selects independent operation or synchronous operation for the TCNT counters of TPU0 to TPU5.
TSYRB selects independent operation or synchronous operation for the TCNT counters of TPU6 to TPU11.

Address(es): TPUA.TSYRA A008 0101h, TPUA.TSYRB A008 0181h

	b7	b6	b5	b4	b3	b2	b1	b0

Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	SYNC0	Timer Synchronization 0	0: TCNT operates independently (TCNT presetting/clearing is unrelated to other channels) 1: TCNT performs synchronous operation*1 (TCNT synchronous presetting/synchronous clearing is possible)	R/W
b1	SYNC1	Timer Synchronization 1		R/W
b2	SYNC2	Timer Synchronization 2		R/W
b3	SYNC3	Timer Synchronization 3		R/W
b4	SYNC4	Timer Synchronization 4		R/W
b5	SYNC5	Timer Synchronization 5		R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. To set synchronous operation, the SYNCn bit (n = 0 to 5) for at least two channels must be set to 1. To set synchronous clearing, the TCNT clearing source must also be set by the TCR.CCLR[2:0] bits in addition to the SYNCn bit.

SYNCn Bits (Timer Synchronization) (n = 0 to 5)

These bits select whether the TCNT operation is independent of or synchronized with TCNT of other channels.
When synchronous operation is selected, synchronous presetting of multiple TCNT counters and synchronous clearing through counter clearing on another channel are possible.

22.2.10 Noise Filter Control Register (NFCR)

TPU has 12 noise filter control registers in total (one register per channel).
TPUm.NFCR controls noise filtering of input capture signal on each channel. Only set the TPUm.NFCR register while the TPUm.TCNT counter is stopped (m = 0 to 11).

Address(es): TPU0.NFCR A008 0108h, TPU1.NFCR A008 0109h, TPU2.NFCR A008 010Ah, TPU3.NFCR A008 010Bh, TPU4.NFCR A008 010Ch, TPU5.NFCR A008 010Dh, TPU6.NFCR A008 0188h, TPU7.NFCR A008 0189h, TPU8.NFCR A008 018Ah, TPU9.NFCR A008 018Bh, TPU10.NFCR A008 018Ch, TPU11.NFCR A008 018Dh

	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	NFCS[1:0]		NFDEN	NFCEN	NFBEN	NFAEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	NFAEN	Noise Filter Enable A	0: The noise filter for TIOCAm is disabled. 1: The noise filter for TIOCAm is enabled. (m = 0 to 11)	R/W
b1	NFBEN	Noise Filter Enable B	0: The noise filter for TIOCBm is disabled. 1: The noise filter for TIOCBm is enabled. (m = 0 to 11)	R/W
b2	NFCEN*1	Noise Filter Enable C	0: The noise filter for TIOCCm is disabled. 1: The noise filter for TIOCCm is enabled. (m = 0, 3, 6, 9)	R/W
b3	NFDEN*1	Noise Filter Enable D	0: The noise filter for TIOCDm is disabled. 1: The noise filter for TIOCDm is enabled. (m = 0, 3, 6, 9)	R/W
b5, b4	NFCS[1:0]	Noise Filter Clock Select	00: PCLKD/1 01: PCLKD/8 10: PCLKD/32 11: Clock source that drives counting	R/W
b7, b6	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

Note 1. Bits 2 and 3 in TPU1.NFCR, TPU2.NFCR, TPU4.NFCR, and TPU5.NFCR of unit 0 and bits 2 and 3 in TPU7.NFCR, TPU8.NFCR, TPU10.NFCR, TPU11.NFCR of unit 1 are reserved. The bits are read as 0. Writing to these bits is not possible.

NFAEN Bit (Noise Filter Enable A)

This bit disables or enables the noise filter for the TIOCAm pin (m = 0 to 11).
Since unexpected edges may be internally generated when the value of NFAEN is changed, select the output compare function in the timer I/O control register before changing the NFAEN value.

NFBEN Bit (Noise Filter Enable B)

This bit disables or enables the noise filter for the TIOCBm pin (m = 0 to 11).
Since unexpected edges may be internally generated when the value of NFBEN is changed, select the output compare function in the timer I/O control register before changing the NFBEN value.

NFCEN Bit (Noise Filter Enable C)

This bit disables or enables the noise filter for the TIOCCm pin (m = 0, 3, 6, 9).
Since unexpected edges may be internally generated when the value of NFCEN is changed, select the output compare function in the timer I/O control register before changing the NFCEN value.

NFDEN Bit (Noise Filter Enable D)

This bit disables or enables the noise filter for the TIOCDm pin (m = 0, 3, 6, 9).
Since unexpected edges may be internally generated when the value of NFDEN is changed, select the output compare function in the timer I/O control register before changing the NFDEN value.

NFCS[1:0] Bits (Noise Filter Clock Select)

These bits select the sampling clock for the noise filter.
When the count source is selected with NFCS[1:0] bits set to 11b, the clock that can be used as sampling clock are the internal clocks other than PCLKD/1 specified with the TPSC[2:0] bits and the external clock. To select the PCLKD/1 as both the counter clock and the sampling clock, set the NFCS[1:0] bits to 00b.
The input-capture signal is sampled on rising edges of the selected clock signal. If the sampled levels match three times in a row, the given level is passed through as the input-capture signal. If the levels do not match, the existing value is retained.
After setting the NFCS[1:0] bits, wait for two selected sampling periods before setting the input capture function.

22.2.11 PWM Feedback Select Register (PWMFBSLR)

PWMFBSLR controls internal PWM feedback input for the TPU.
This function can capture any of the PWM output signals generated with MTU3a and GPTa as an input capture input through the inside of this LSI, and measure the cycle and duty cycle of the PWM waveform.

Address(es): TPUSL.PWMFBSLR A008 0200h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	FBSL1[2:0]			—	TPU1 EN	—	—	—	FBSL0[2:0]			—	TPU0 EN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	TPU0EN	TPU (Unit 0) Internal PWM Feedback Enable*1	0: Disable (Normal TIOCAn and TIOCBn pins (n = 0 to 5) are used for TPU input capture.) 1: Enable (Internal PWM feedback input can be selected.)	R/W
b1	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b4 to b2	FBSL0[2:0]	Internal PWM Feedback Input Source Select 0	100: PWM output signals of MTU3 and MTU4 (Inside the LSI) 101: PWM output signals of MTU6 and MTU7 (Inside the LSI) 110: PWM output signals of GPT0 to GPT2 (Inside the LSI) Do not set any values other than above.	R/W
b7 to b5	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b8	TPU1EN	TPU (Unit 1) Internal PWM Feedback Enable	0: Disable (TIOCAn and TIOCBn pins (n = 6 to 11) are used for TPU input capture.) 1: Enable (Internal PWM feedback input can be selected.)	R/W
b9	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b12 to b10	FBSL1[2:0]	PWM Feedback Input Source Select 1	100: PWM output signals of MTU3 and MTU4 (Inside the LSI) 101: PWM output signals of MTU6 and MTU7 (Inside the LSI) 110: PWM output signals of GPT0 to GPT2 (Inside the LSI) Do not set any values other than above	R/W
b31 to b13	—	Reserved	This bit is read as 0. The write value should be 0.	R/W

Note 1. Be sure to enable selection of the PWM feedback input source to be used with the FBSL0[2:0] and FBSL1[2:0] bits before setting the TPUnEN bit to enable internal PWM feedback input. The setting value of FBSL0[2:0] and FBSL1[2:0] after reset is 000h (Setting prohibited). Settings of the TPUnEN bit, and FBSL0[2:0] and FBSL1[2:0] can be performed at the same time.

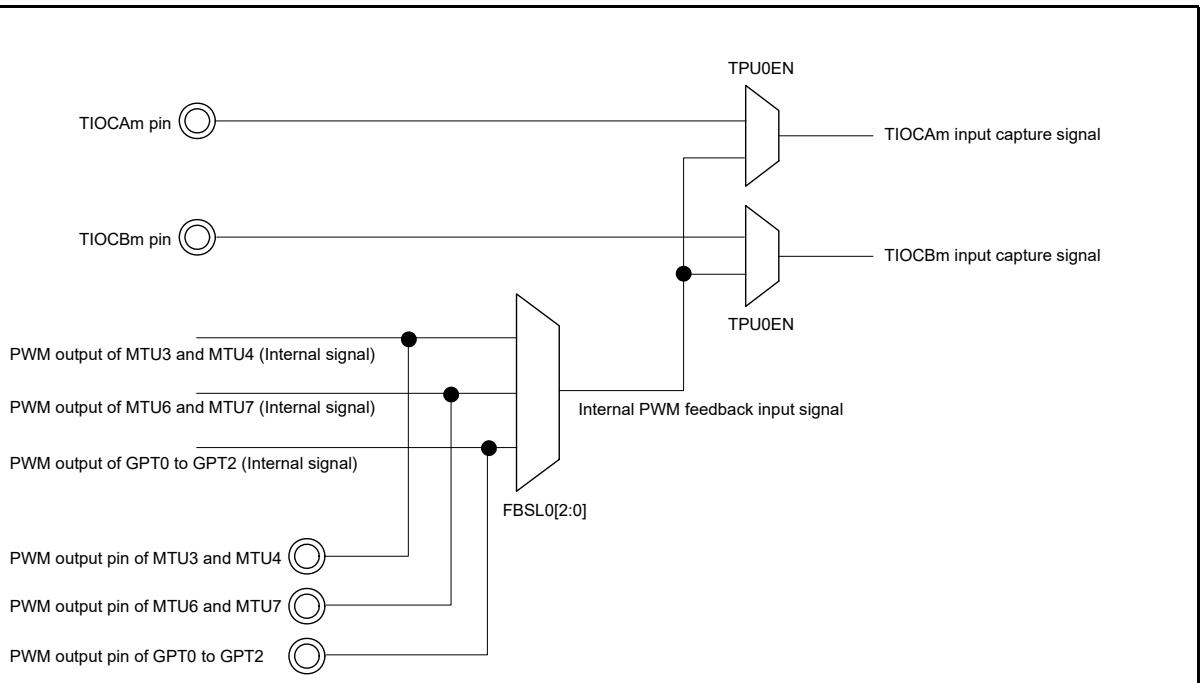
TPUnEN (TPU Unit n Internal PWM Feedback Enable) (n = 0, 1)

This bit enables TPU internal PWM feedback input.
If this function is enabled (= 1b), the PWM signal selected by the FBSLn bit is input as the TPU input capture signal through inside of the LSI. In this case, input signals on the TIOCAm and TIOCBm pins are not captured as input capture signals (m = 0 to 5 when n = 0; m = 6 to 11 when n = 1).
If this function is disabled (= 0b), input signals on the TIOCAm and TIOCBm pins are input as input capture signals.
To use normal input capture function, set this function disabled (= 0b).
When using this bit, set TGRA and TGRB of each TPU channel for input capture.
Setting of this bit should be made while TPU operation is stopped.

FBSLn (Internal PWM Feedback Input Source Select n) (n = 0, 1)

These bits select (from MTU3, MTU4, MTU6, MTU7, GPT 0, GPT1, and GPT2) the input source of internal PWM feedback that is input to TPU.
If the TPUnEN bit is “disable” (= 0b), the setting value in the FBSLn bits is invalid.
To use these bits, set TGRA and TGRB of each TPU channel for input capture. Setting of these bits should be made while TPU operation is stopped.

Figure 22.3 shows the PWM feedback setting and TPU input capture configuration. Table 22.22 describes the correspondence between the TPU input capture signals and individual I/O pins when PWM feedback is placed.



m = 0 to 5
Note: For details about the relationship between the PWMFBSLR.FBSLn[0:2] setting and the PWM output pins of MTU3a and GPTa, see Table 22.22.

22.3 Operation

22.3.1 Basic Functions

Each channel has a TPUm.TCNT counter and a TPUm.TGRy register (y = A to D).
TCNT is a 16-bit up-counter, which can function as a free-running counter, periodic counter, or event counter.
TGRy can be used as an input capture register or output compare register.

(1) Counter Operation

When the TSTRA.CSTj bit of unit 0 and the TSTRB.CSTj bit (j = 0 to 5) of unit 1 are set to 1, the TCNT counter for the corresponding channel starts counting.

(a) Example of count operation setting procedure

Figure 22.4 shows an example of the count operation setting procedure.

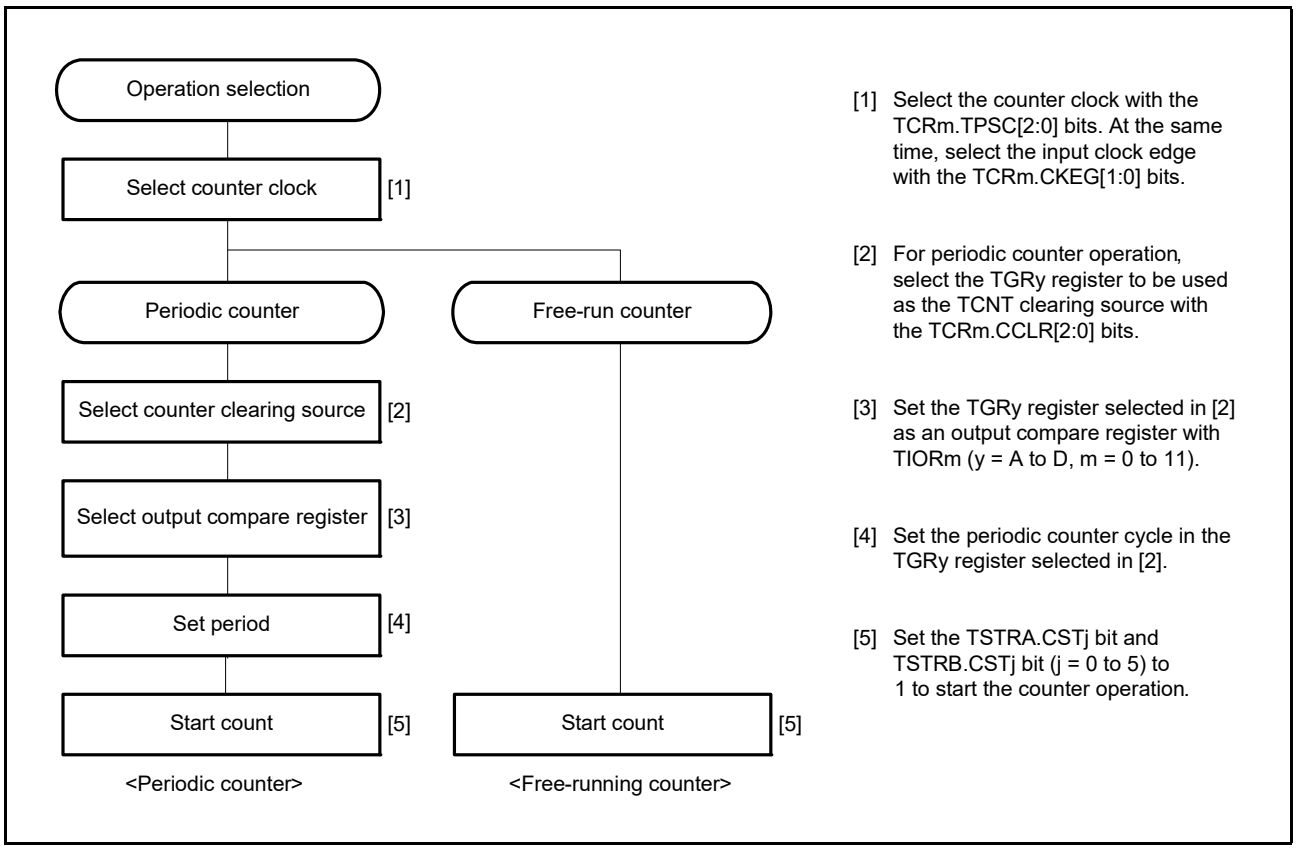

Figure 22.4 Example of Counter Operation Setting Procedure

(b) Free-running count operation and periodic count operation

Immediately after a reset, the TPUm.TCNT counters are all set as free-running counters. When the relevant bit in TSTRA of unit 0 or in TSTRB of unit 1 is set to 1, the corresponding TCNT counter starts up-count operation as a free-running counter. When TCNT overflows (changes from FFFFh to 0000h), the TPU requests an overflow interrupt (TCImV). After an overflow, TCNT restarts counting up from 0000h (m = 0 to 11).
Figure 22.5 shows free-running counter operation.

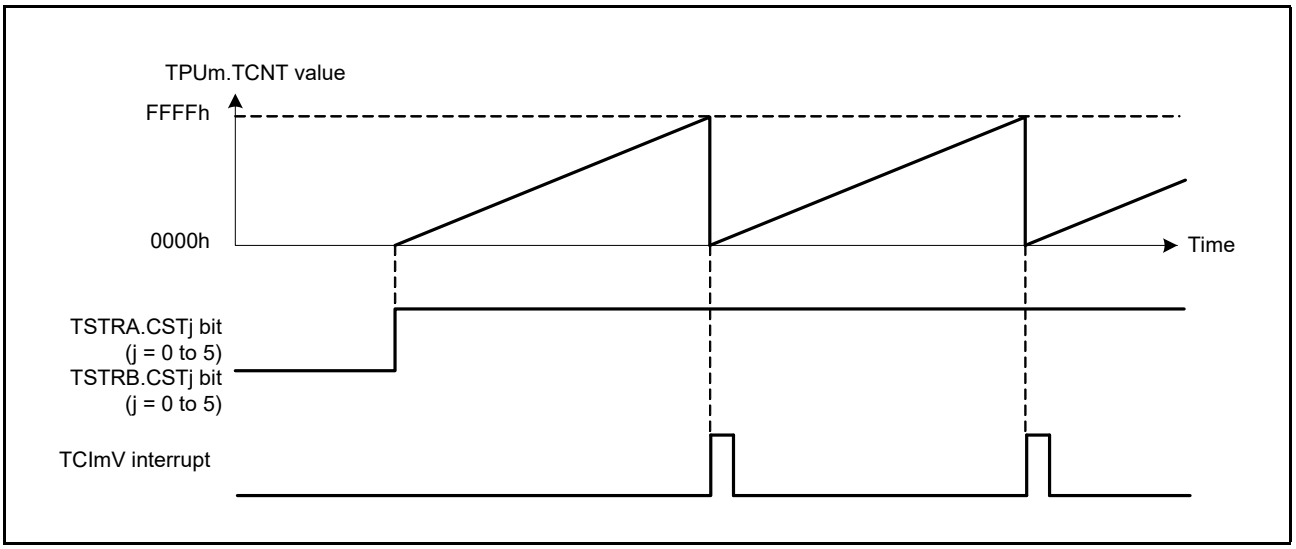

Figure 22.5 Free-Running Counter Operation

When compare match is selected as the TCNT clearing source, the TCNT counter for the relevant channel performs periodic count operation. The TPUm.TGRy register for setting the period is set as an output compare register, and counter clearing by compare match is selected by the TPUm.TCR.CCLR[2:0] bits. After the settings have been made, TCNT starts count-up operation as a periodic counter when the corresponding bit in TSTRA and TSTRB is set to 1. When the count value matches the TGRy value, TCNT is cleared to 0000h.
At this time, the TPU requests an interrupt (TGImy). After a compare match, TCNT restarts counting up from 0000h (m = 0 to 11).
Figure 22.6 shows periodic counter operation.

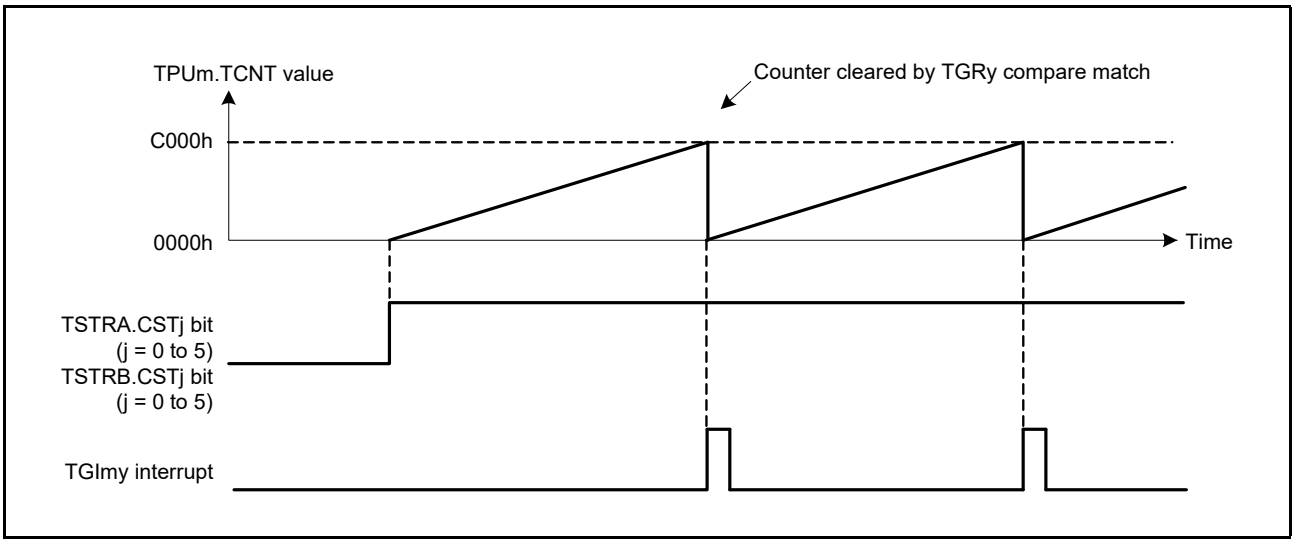

Figure 22.6 Periodic Counter Operation

(2) Waveform Output by Compare Match

The TPU can perform low, high, or toggle output from the corresponding output pin using a compare match.

(a) Example of setting procedure for waveform output by compare match

Figure 22.7 shows an example of the setting procedure for waveform output by a compare match.

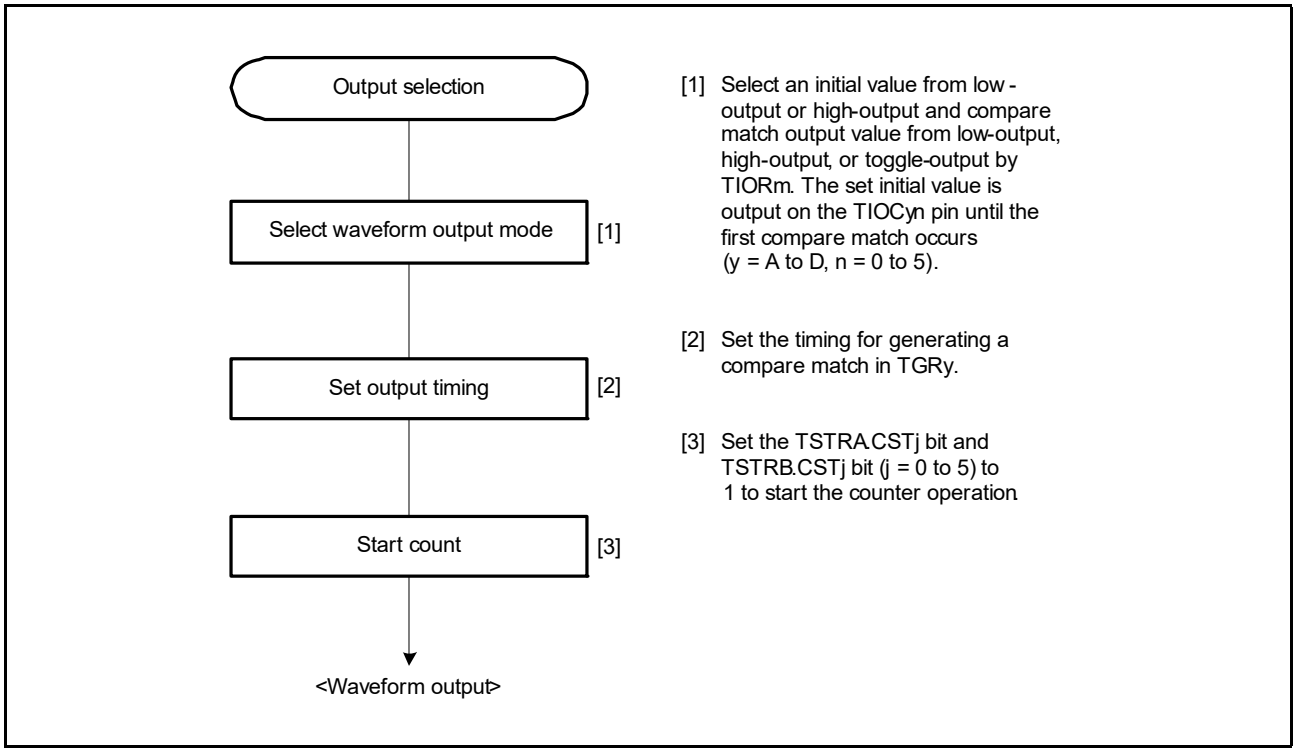

Figure 22.7 Example of Setting Procedure for Waveform Output by Compare Match

(b) Examples of waveform output operation

Figure 22.8 shows an example of low output/high output.

In this example, TPUm.TCNT (m = 0 to 11) has been set as a free-running counter, and settings have been made so that high is output by compare match A and low is output by compare match B. When the set level and the pin level match, the pin level does not change.

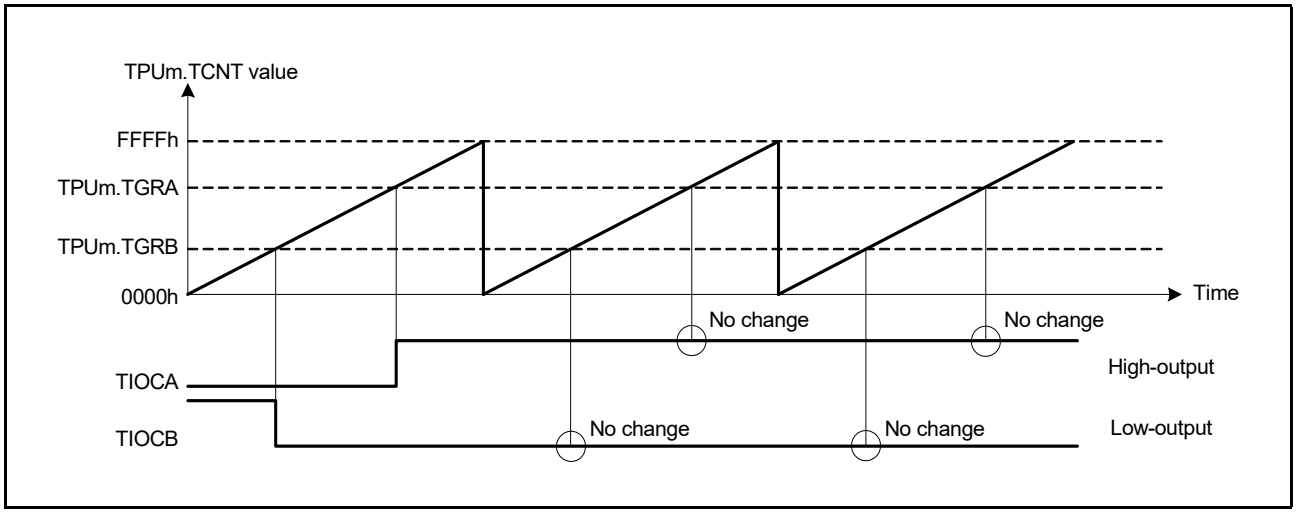

Figure 22.8 Example of Low-Output/High-Output Operation

Figure 22.9 shows an example of toggle output.
In this example, TPUm.TCNT (m = 0 to 11) has been set as a periodic counter (with counter clearing performed by compare match B), and settings have been made so that output is toggled by both compare match A and compare match B.

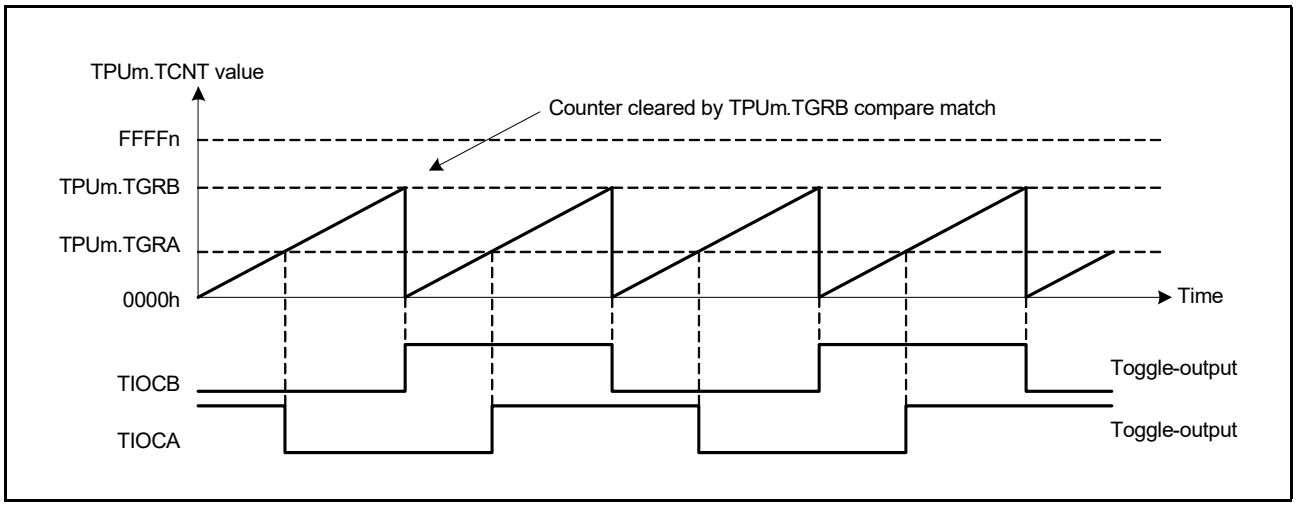

Figure 22.9 Example of Toggle Output Operation

(3) Input Capture Function

The TCNT value can be transferred to TGRy on detection of the TIOCyn pin (n = 0 to 11 when y = A, B; n = 0, 3, 6, 9 when y = C, D) input edge.

The rising edge, the falling edge, or both edges can be selected as the detection edge. It is also possible to specify the counter input clock or compare match signal of TPU0, TPU1, TPU3, and TPU4 in unit 0 and of TPU6, TPU7, TPU9, and TPU10 in unit 1 as the input capture source. Noise filtering can be applied to the input capture input.

Note: Even if the counter is halted, an input capture is generated, and flag and interrupt signals are generated.

Note: When another channel's counter input clock is used as the input capture input for TPU0, TPU3, TPU6, and TPU9, PCLKD/1 should not be selected as the counter input clock used for input capture input. Input capture will not be generated if PCLKD/1 is selected.

(a) Example of setting procedure for input capture operation

Figure 22.10 shows an example of the setting procedure for input capture operation.

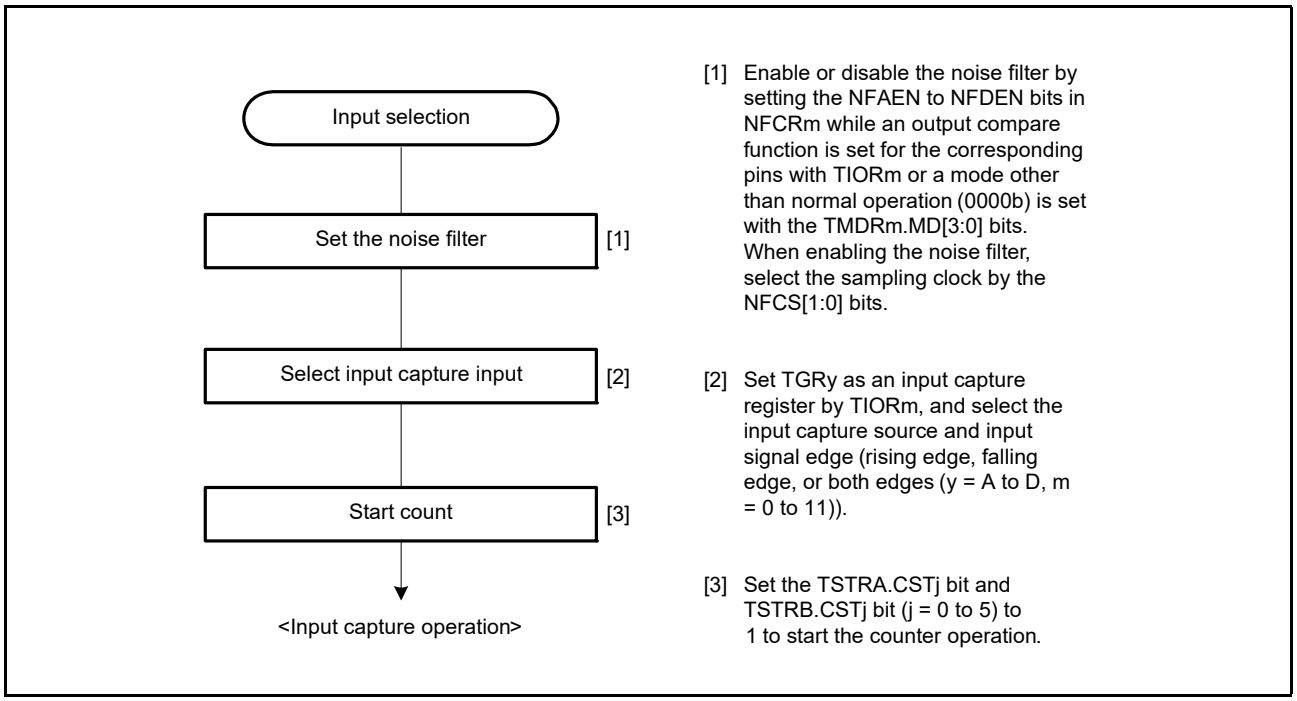

Figure 22.10 Example of Setting Procedure for Input Capture Operation

(b) Example of input capture operation

Figure 22.11 shows an example of input capture operation when the noise filter is stopped.
In this example, both rising and falling edges have been selected as the TIOCAm pin input capture input edge, the falling edge has been selected as the TIOCBm pin input capture input edge, and counter clearing by TGRB input capture has been set for TCNT (m = 0 to 11).

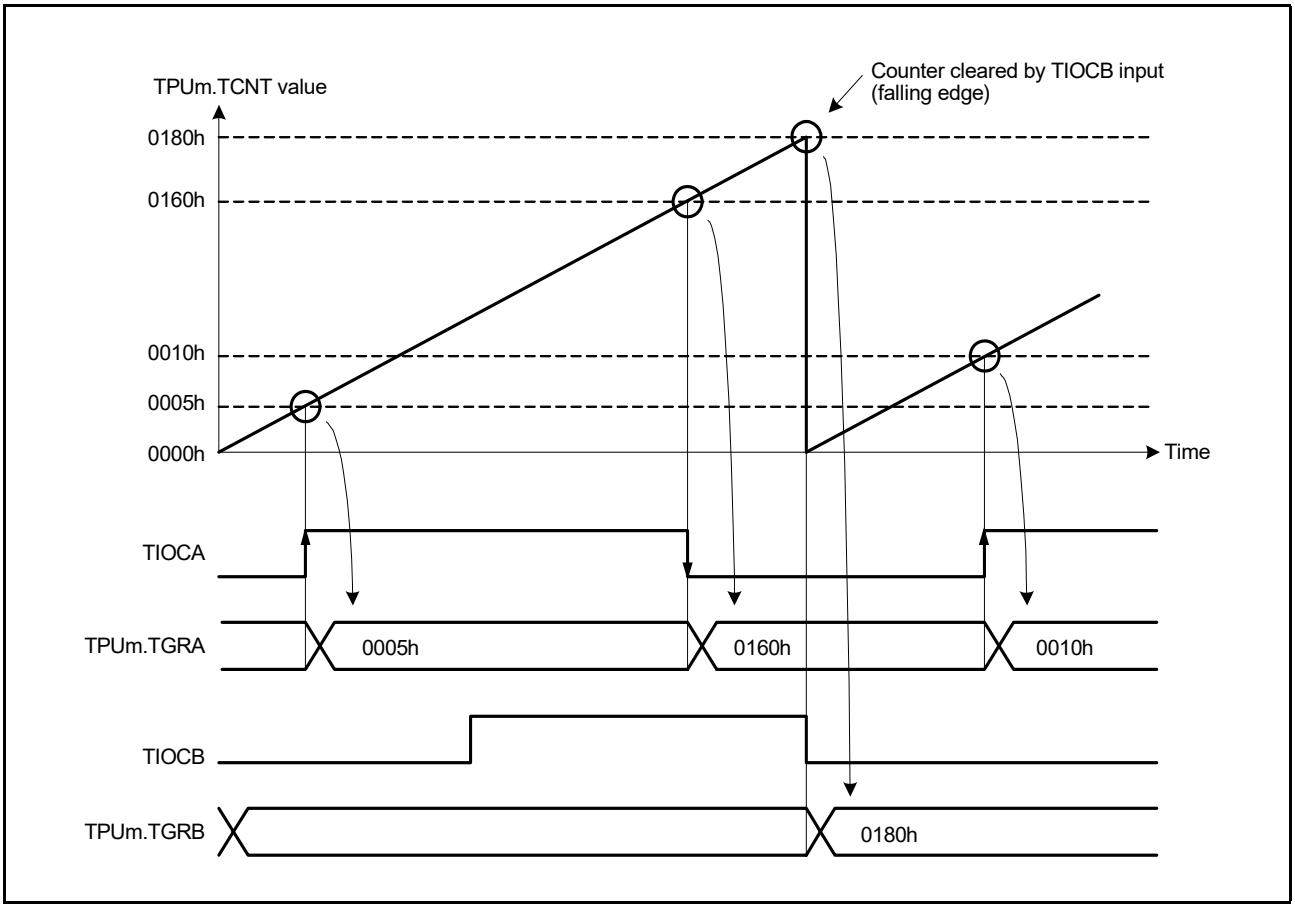

Figure 22.11 Example of Input Capture Operation (with Noise Filter Stopped)

When noise filtering is enabled, see Figure 22.32.

22.3.2 Synchronous Operation

In synchronous operation, the values in multiple TCNT counters in a unit can be rewritten simultaneously (synchronous presetting). Also, multiple TCNT counters can be cleared simultaneously (synchronous clearing) by making the appropriate setting in TCR.
Synchronous operation enables TGRy to be incremented with respect to a single time base.
All channels of TPU0 to TPU5 in unit 0 or of TPU6 to TPU11 in unit 1 can be set for synchronous operation.

(1) Example of Synchronous Operation Setting Procedure

Figure 22.12 shows an example of the synchronous operation setting procedure.

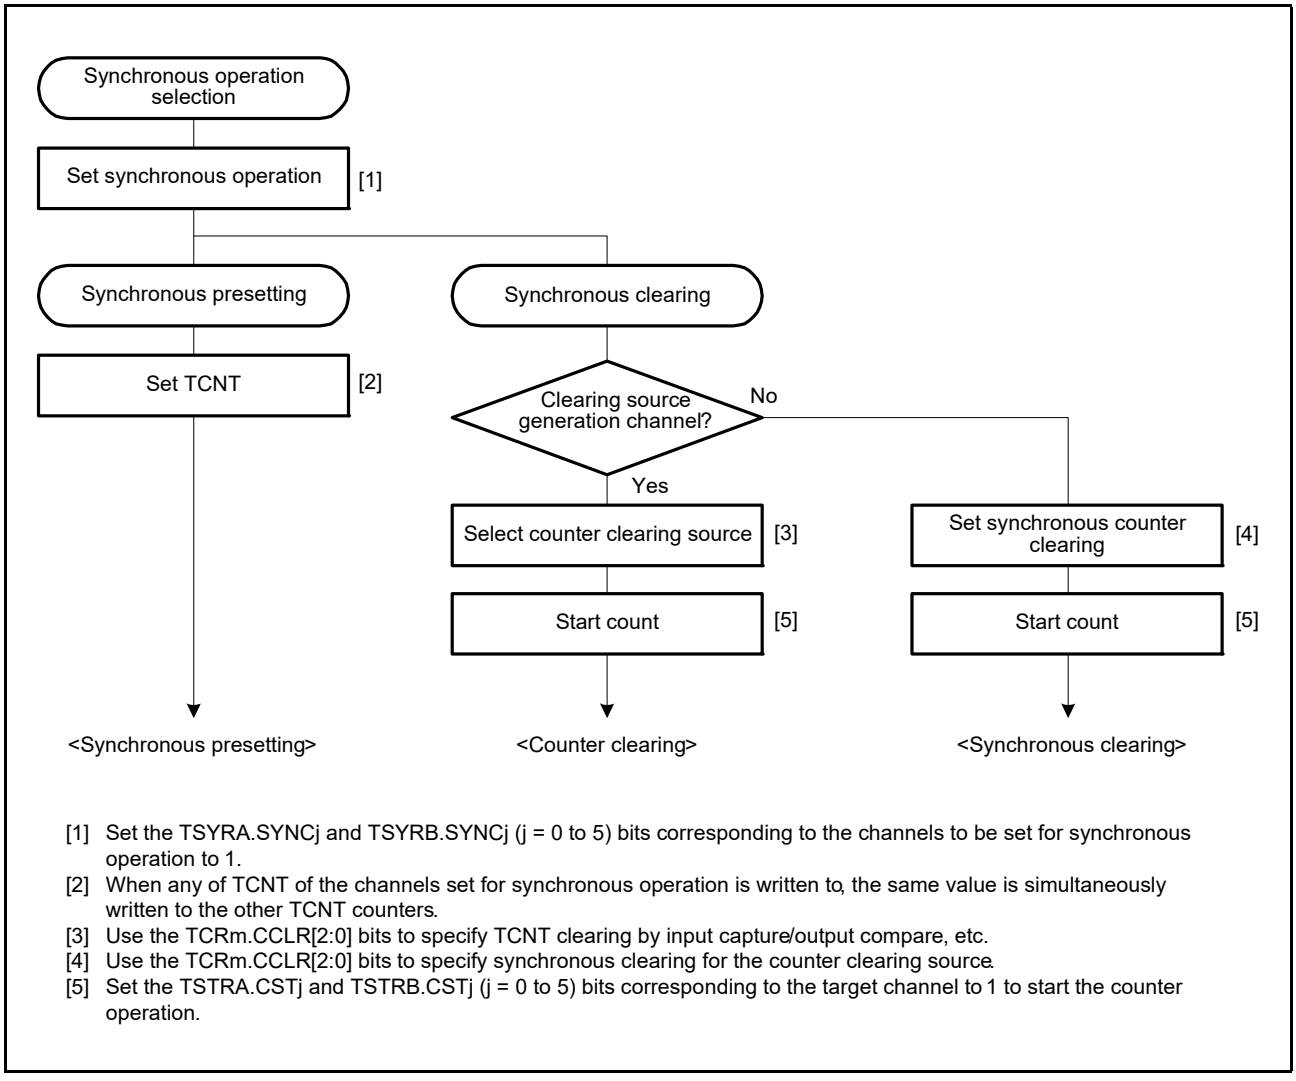

Figure 22.12 Example of Synchronous Operation Setting Procedure

(2) Example of Synchronous Operation

Figure 22.13 shows an example of synchronous operation.
In this example, synchronous operation and PWM mode 1 have been set for TPU0 to TPU2, TPU0.TGRB compare match has been set as the TPU0 counter clearing source, and synchronous clearing has been set for the TPU1 and TPU2 counter clearing source.
Three-phase PWM waveforms are output from pins TIOCA0, TIOCA1, and TIOCA2. At this time, synchronous presetting and synchronous clearing by TPU0.TGRB compare match are performed for TCNT of TPU0 to TPU2, and the data set in TPU0.TGRB is used as the PWM cycle.
For details on PWM modes, see section 22.3.5, PWM Modes.

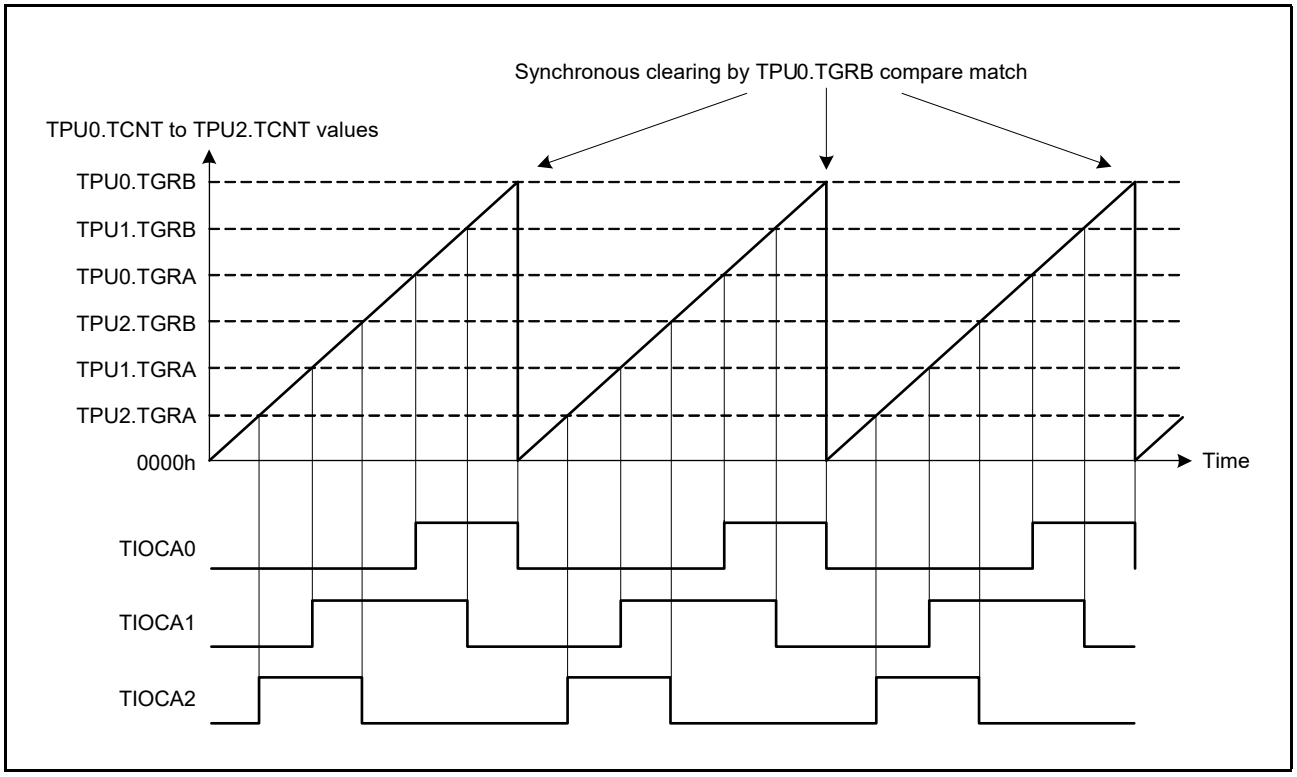

Figure 22.13 Example of Synchronous Operation

22.3.3 Buffer Operation

Buffer operation, provided for TPU0, TPU3, TPU6, and TPU9, enables TPUm.TGRC and TPUm.TGRD to be used as buffer registers.

Buffer operation differs depending on whether TPUm.TGRy has been set as an input capture register or a compare match register.

Table 22.23 lists the register combinations used in buffer operation.

Table 22.23 Register Combinations in Buffer Operation

Unit	Channel	Timer General Register	Buffer Register
0	TPU0	TPU0.TGRA	TPU0.TGRC
		TPU0.TGRB	TPU0.TGRD
	TPU3	TPU3.TGRA	TPU3.TGRC
		TPU3.TGRB	TPU3.TGRD
1	TPU6	TPU6.TGRA	TPU6.TGRC
		TPU6.TGRB	TPU6.TGRD
	TPU9	TPU9.TGRA	TPU9.TGRC
		TPU9.TGRB	TPU9.TGRD

- When TPUm.TGRy is an output compare register

When a compare match occurs, the value in the buffer register for the corresponding channel is transferred to the timer general register.

This operation is shown in Figure 22.14.

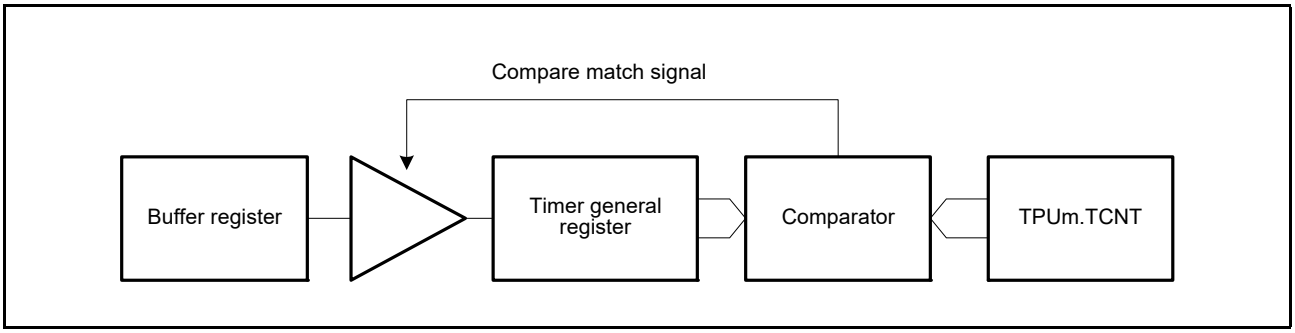

Figure 22.14 Compare Match Buffer Operation

- When TPUm.TGRy is an input capture register

When input capture occurs, the value in TPUm.TCNT is transferred to TGRy and the value previously held in TGRy is simultaneously transferred to the buffer register.

This operation is shown in Figure 22.15.

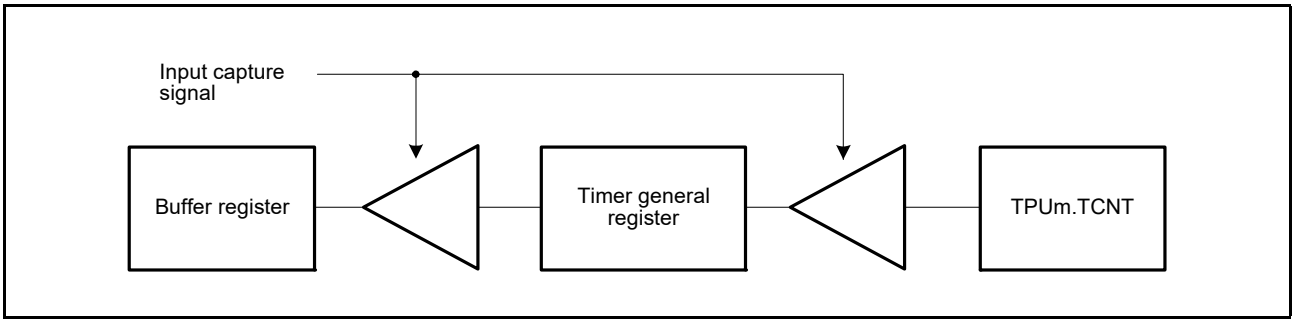

Figure 22.15 Input Capture Buffer Operation

(1) Example of Buffer Operation Setting Procedure

Figure 22.16 shows an example of the buffer operation setting procedure.

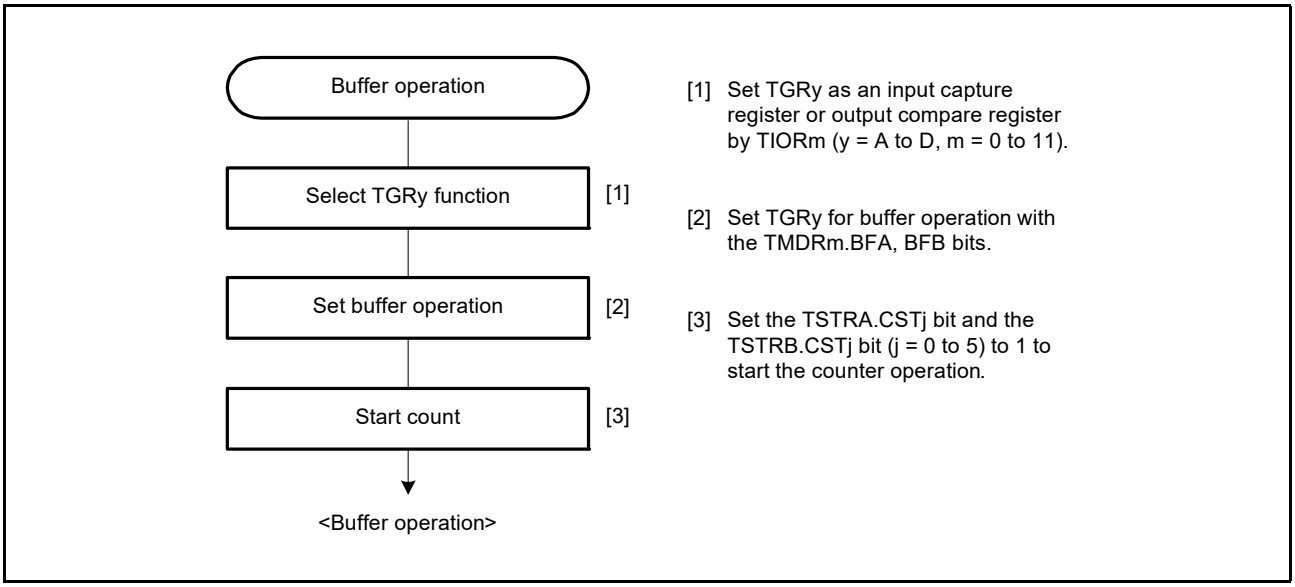

Figure 22.16 Example of Buffer Operation Setting Procedure

(2) Examples of Buffer Operation

(a) When TPUm.TGRy is an output compare register

Figure 22.17 shows an operation example in which PWM mode 1 has been set for TPU0, and buffer operation has been set for TPU0.TGRA and TPU0.TGRC. The settings used in this example are TPU0.TCNT clearing by compare match B, high output at compare match A, and low output at compare match B.
As buffer operation has been set, when compare match A occurs, the output changes and the TPU0.TGRC value is simultaneously transferred to TPU0.TGRA. This operation is repeated each time compare match A occurs.
For details on PWM modes, see section 22.3.5, PWM Modes.

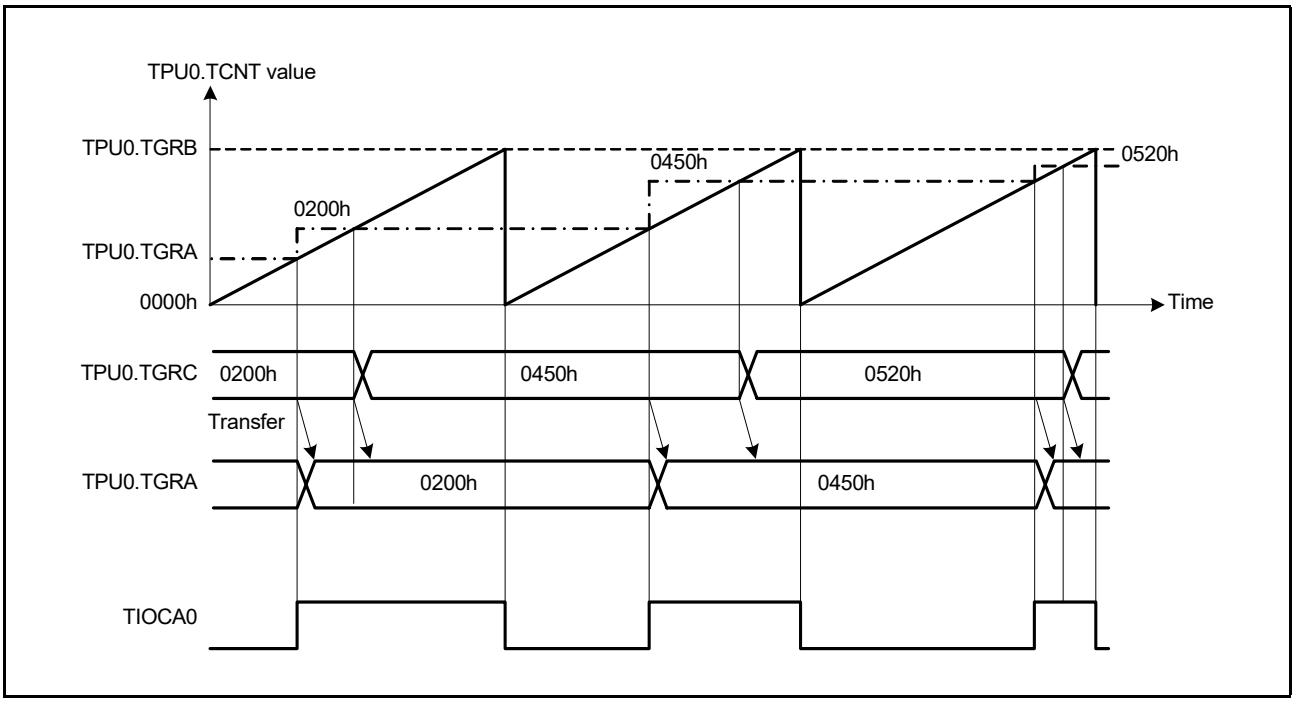

Figure 22.17 Example of Buffer Operation (1)

(b) When TPUm.TGRy is an input capture register

Figure 22.18 shows an operation example in which TPUm.TGRA has been set as an input capture register, and buffer operation has been set for TGRA and TPUm.TGRC.
Counter clearing by TGRA input capture has been set for TPUm.TCNT, and both rising and falling edges have been selected as the TIOCAn pin input capture input edge.
As buffer operation has been set, when the TCNT value is stored in TGRA upon occurrence of input capture A, the value previously stored in TGRA is simultaneously transferred to TGRC (m = 0 to 11).

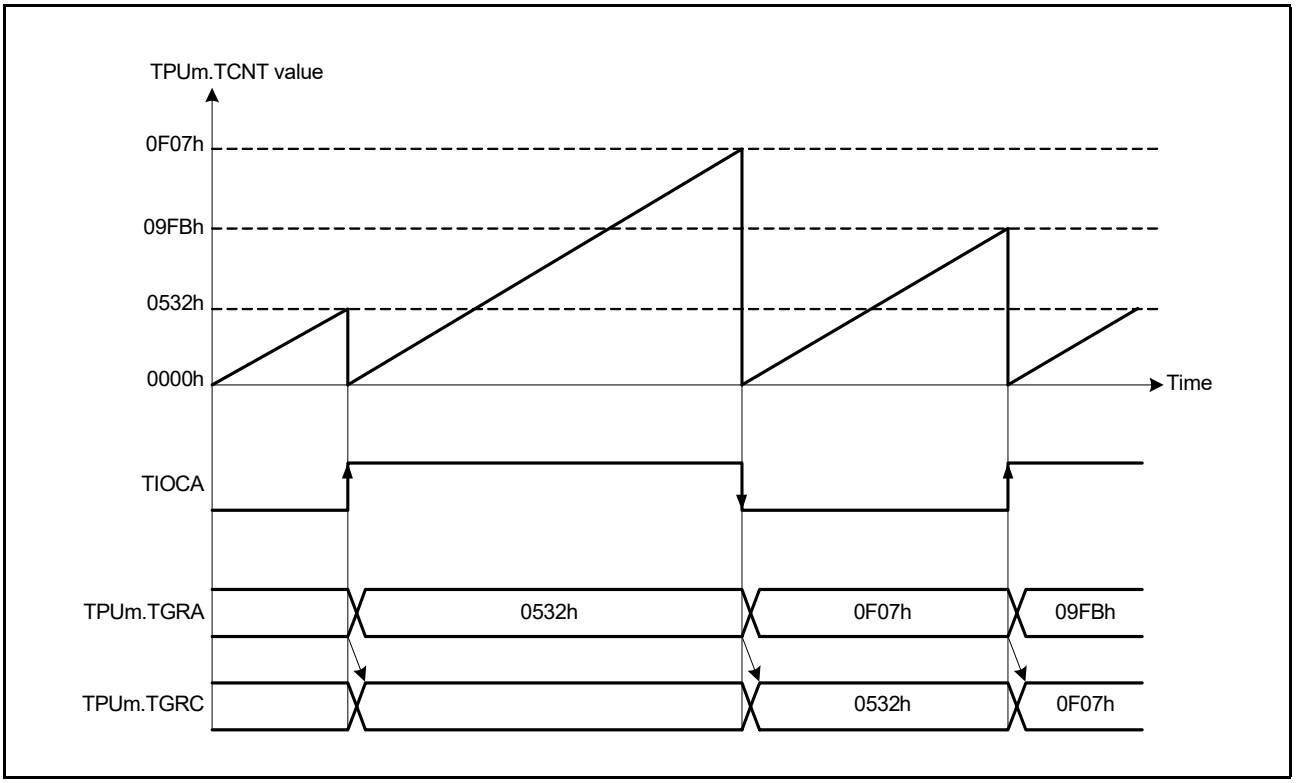

Figure 22.18 Example of Buffer Operation (2)

22.3.4 Cascaded Operation

In cascaded operation, two 16-bit counters for different channels are used together as a 32-bit counter.

In unit 0, this function works by counting the TPUm (m = 1, 4) counter clock at overflow/underflow of TPUn.TCNT (n = 2, 5) as set by the TPUm.TCR.TPSC[2:0] bits (m = 1, 4).

Underflow occurs only when the lower 16-bit TPUn.TCNT is in phase counting mode.

Table 22.24 lists the register combinations used in cascaded operation.

Note 1. When phase counting mode is set for TPU1 or TPU4, the counter clock setting is invalid and the counter operates independently in phase counting mode (this also applies to TPU7 and TPU10).

Note 2. For input capture operation with a cascade connection, be sure to see section 22.9.16, Input Capture Operation in Cascaded Operation.

Note 3. For operation in 32-bit phase counting mode, set the lower-order 16 bits of TPUn to phase counting mode and the higher-order 16 bits of TPUm to normal operating mode.

Table 22.24 Cascaded Combinations

Unit	Combination	Upper 16 Bits	Lower 16 Bits
0	TPU1 and TPU2	TPU1.TCNT	TPU2.TCNT
	TPU4 and TPU5	TPU4.TCNT	TPU5.TCNT
1	TPU7 and TPU8	TPU7.TCNT	TPU8.TCNT
	TPU10 and TPU11	TPU10.TCNT	TPU11.TCNT

(1) Example of Cascaded Operation Setting Procedure

Figure 22.19 shows an example of the setting procedure for cascaded operation.

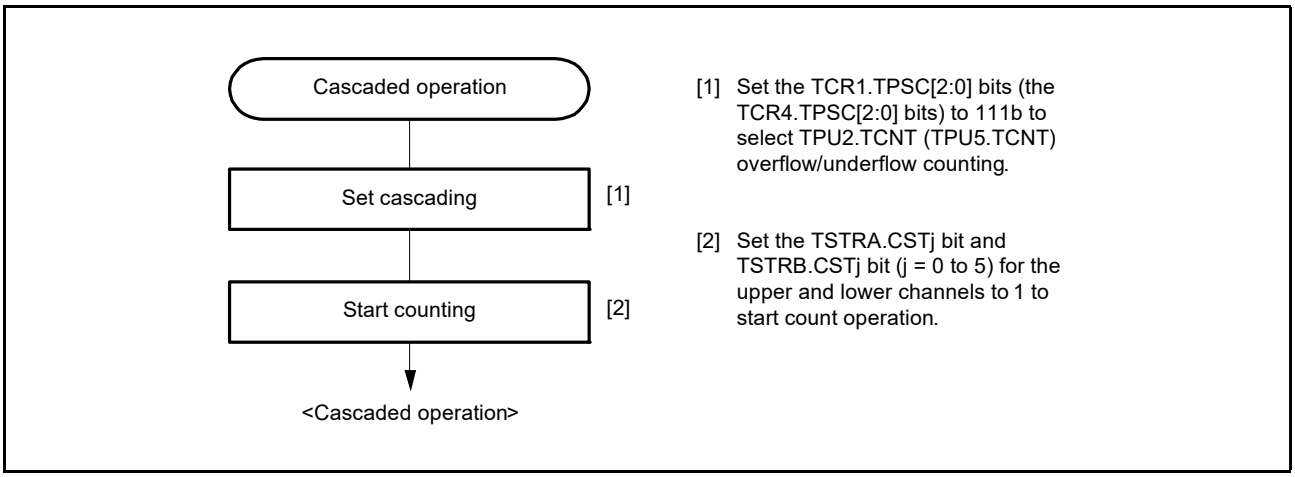

Figure 22.19 Cascaded Operation Setting Procedure

(2) Examples of Cascaded Operation

Figure 22.20 shows the operation when counting upon TPU2.TCNT overflow/underflow has been set for TPU1.TCNT, TPU1.TGRA and TPU2.TGRA have been set as input capture registers, and the rising edge of the TIOCA1 and TIOCA2 pins has been selected.

When a rising edge is simultaneously input to the TIOCA1 and TIOCA2 pins, the 16 higher-order bits and the 16 lower-order bits of the 32-bit value are transferred to the TPU1.TGRA and TPU2.TGRA registers, respectively.

However, even if the rising edge is input to the TIOCA1 and TIOCA2 pins simultaneously, the 16 higher- and 16 lower-order bits may not be captured simultaneously due to delays within the LSI chip, so a value may vary from that at the time. If this is the case, discard the captured value by following the procedure described in section 22.9.16, Input Capture Operation in Cascaded Operation.

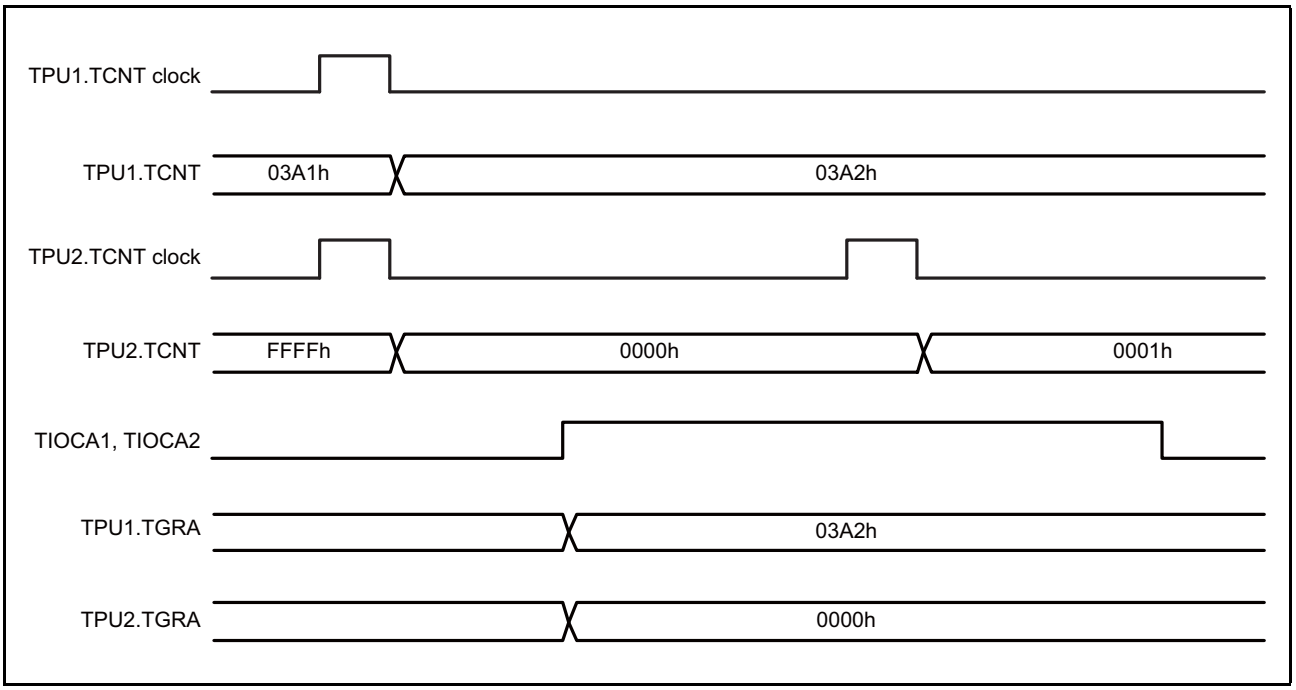

Figure 22.20 Example of Cascaded Operation (1)

Figure 22.21 shows the operation when counting upon TPU2.TCNT overflow/underflow has been set for TPU1.TCNT, and phase counting mode has been specified for TPU2.

TPU1.TCNT is incremented by TPU2.TCNT overflow and decremented by TPU2.TCNT underflow.

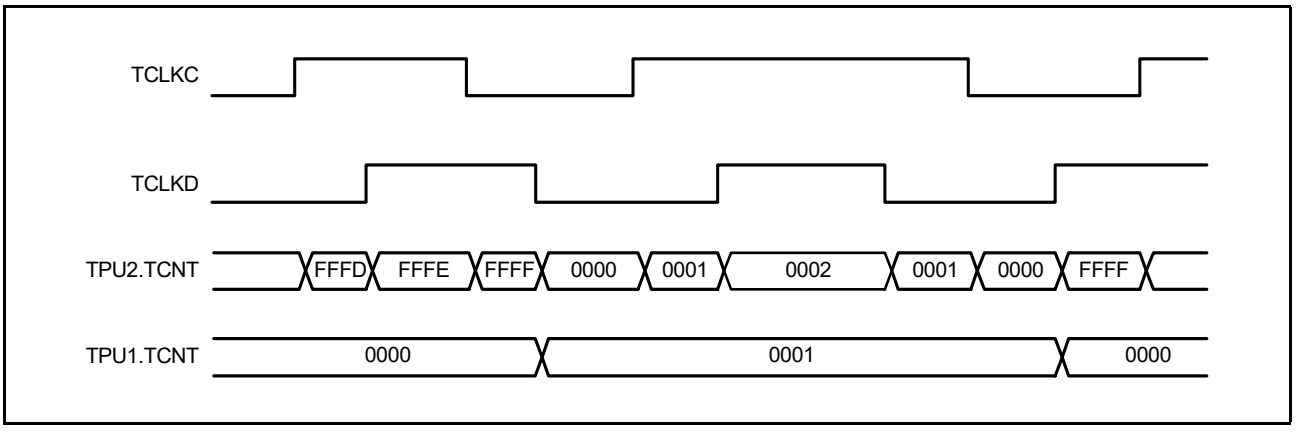

Figure 22.21 Example of Cascaded Operation (2)

22.3.5 PWM Modes

In PWM mode, PWM waveforms are output from the output pins. low-, high-, or toggle-output can be selected as the output level in response to compare match of each TGRy.
Settings of TGRy registers can output a PWM waveform in the range of 0% to 100% duty cycle.
Specifying TGRy compare match as the counter clearing source enables the cycle to be set in that register. All channels can be set for PWM mode independently. Synchronous operation is also possible.
There are two PWM modes, as described below.

1. PWM mode 1
   PWM waveform is generated from the TIOCAn and TIOCCn pins by pairing TPUm.TGRA with TPUm.TGRB and TPUm.TGRC with TPUm.TGRD. The levels specified by the TPUm.TIOR(H).IOA[3:0] bits and TPUm.TIORL.IOC[3:0] bits are output from the TIOCAn and TIOCCn pins at compare matches A and C, respectively. The levels specified by theTPUm.TIOR(H).IOB[3:0] bits and TPUm.TIORL.IOD[3:0] bits are output from the TIOCAn and TIOCCn pins at compare matches B and D, respectively. The initial output value of the TIOCAn or TIOCCn pin is the value set in the TIOR.IOA or TIORL.IOC bit. If the set values of paired TGRy registers are identical, the output value does not change even when a compare match occurs.
   In PWM mode 1, up to eight phases of PWM waveforms can be output.
2. PWM mode 2
   PWM waveform is generated by using one TPUm.TGRy as the cycle register and the others as duty cycle registers. The level specified in TPUm.TIORH, TPUm.TIORL, or TPUm.TIOR is output at compare matches. Upon counter clearing by a cycle register compare match, the output value of each pin is the initial value set in TIORH, TIORL, or TIOR. If the set values of the cycle register and duty cycle register are identical, the output value does not change even when a compare match occurs.
   In PWM mode 2, up to 15 phases (× 2 units) of PWM waveforms can be output when using synchronous operation in combination.

(m = 0 to 11 when y = A, B; m = 0, 3, 6, 9 when y = C, D)

The correspondence between PWM output pins and registers is listed in Table 22.25.

Table 22.25 PWM Output Registers and Output Pins

		Output Pin

TPU11	TPU11.TGRA	TIOCA11	TIOCA11
	TPU11.TGRB		TIOCB11

Note: In PWM mode 2, PWM waveform output is not possible for the TPUm.TGRy register in which the cycle is set.

(1) Example of PWM Mode Setting Procedure

Figure 22.22 shows an example of the PWM mode setting procedure.

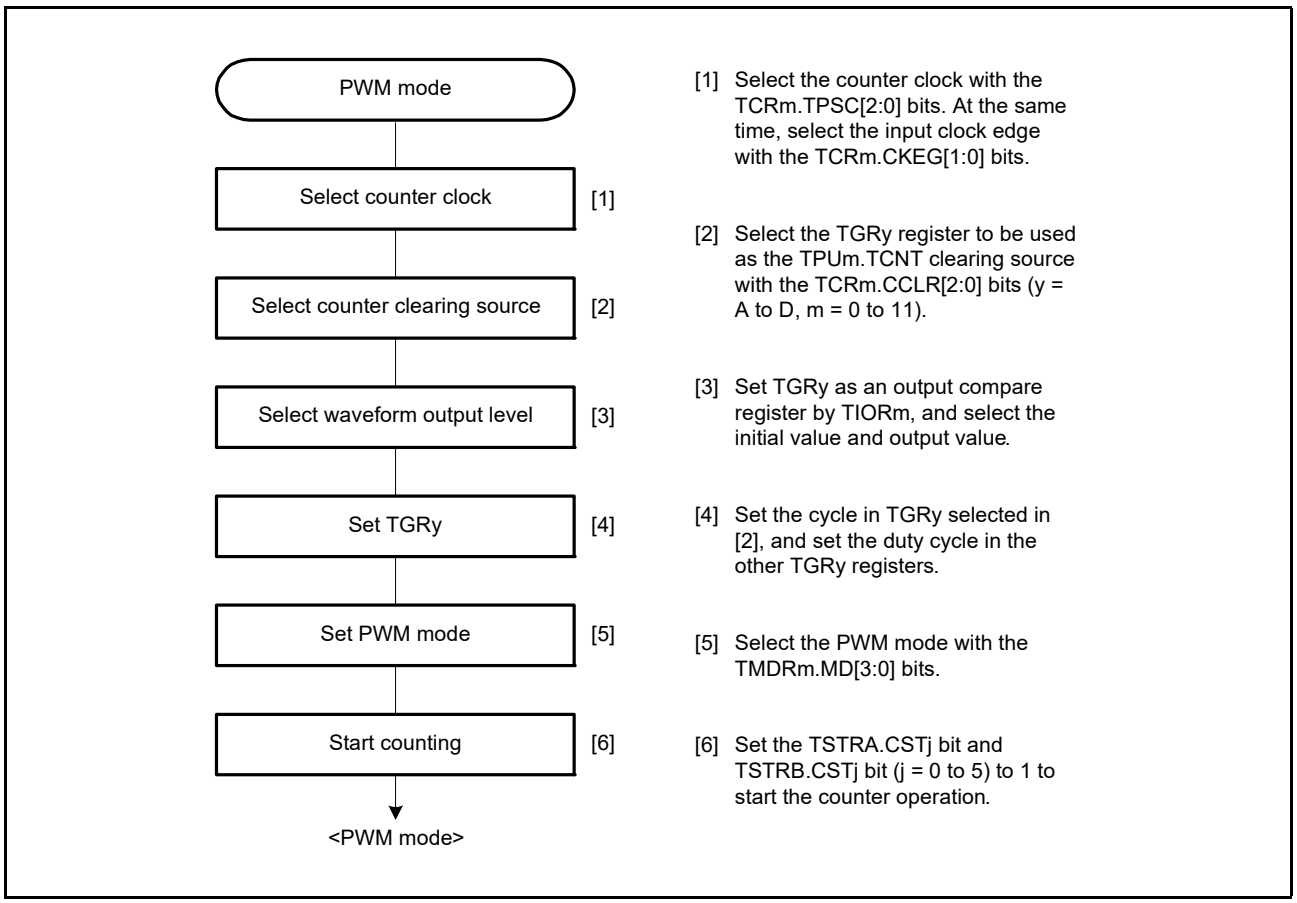

Figure 22.22 Example of PWM Mode Setting Procedure

(2) Examples of PWM Mode Operation

Figure 22.23 shows an example of PWM mode 1 operation.

In this example, TPUm.TGRA compare match is set as the TPUm.TCNT clearing source, 0 is set for the TGRA initial output value and output value, and 1 is set as the TPUm.TGRB output value (m = 0 to 11).

In this case, the value set in TGRA is used as the cycle, and the value set in TGRB is used as the duty cycle.

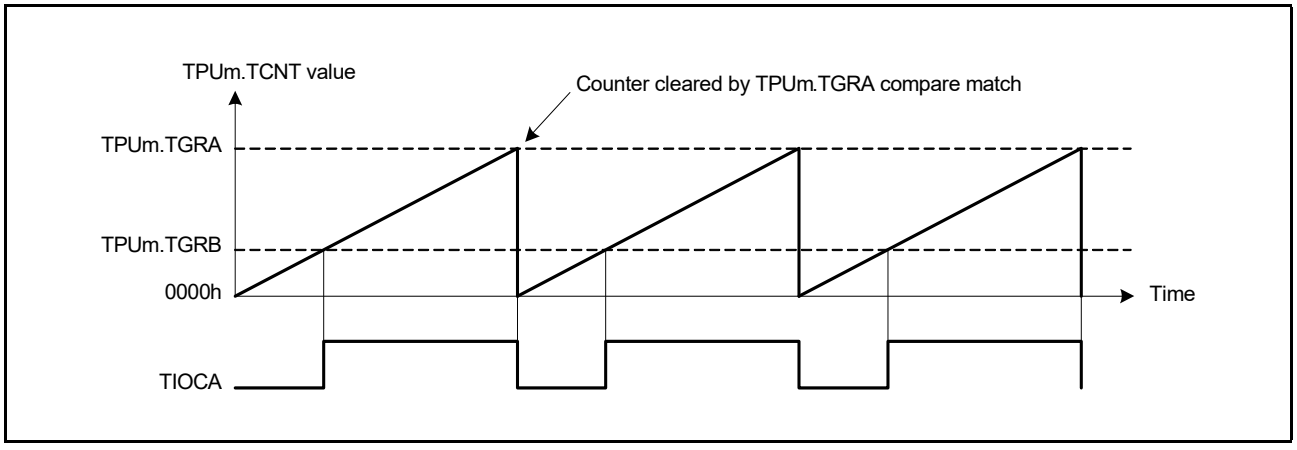

Figure 22.23 Example of PWM Mode Operation (1)

Figure 22.24 shows an example of PWM mode 2 operation.
In this example, synchronous operation is specified for TPU0 and TPU1, TPU1.TGRB compare match is set as TPUm.TCNT (m = 0, 1) clearing source, and 0 is set for the initial output value and 1 for the output value of the other TGRy registers (TPU0.TGRA to TPU0.TGRD and TPU1.TGRA), to output a 5-phase PWM waveform.
In this case, the value set in TPU1.TGRB is used as the cycle, and the values set in the other TGRy registers are used as the duty cycle.

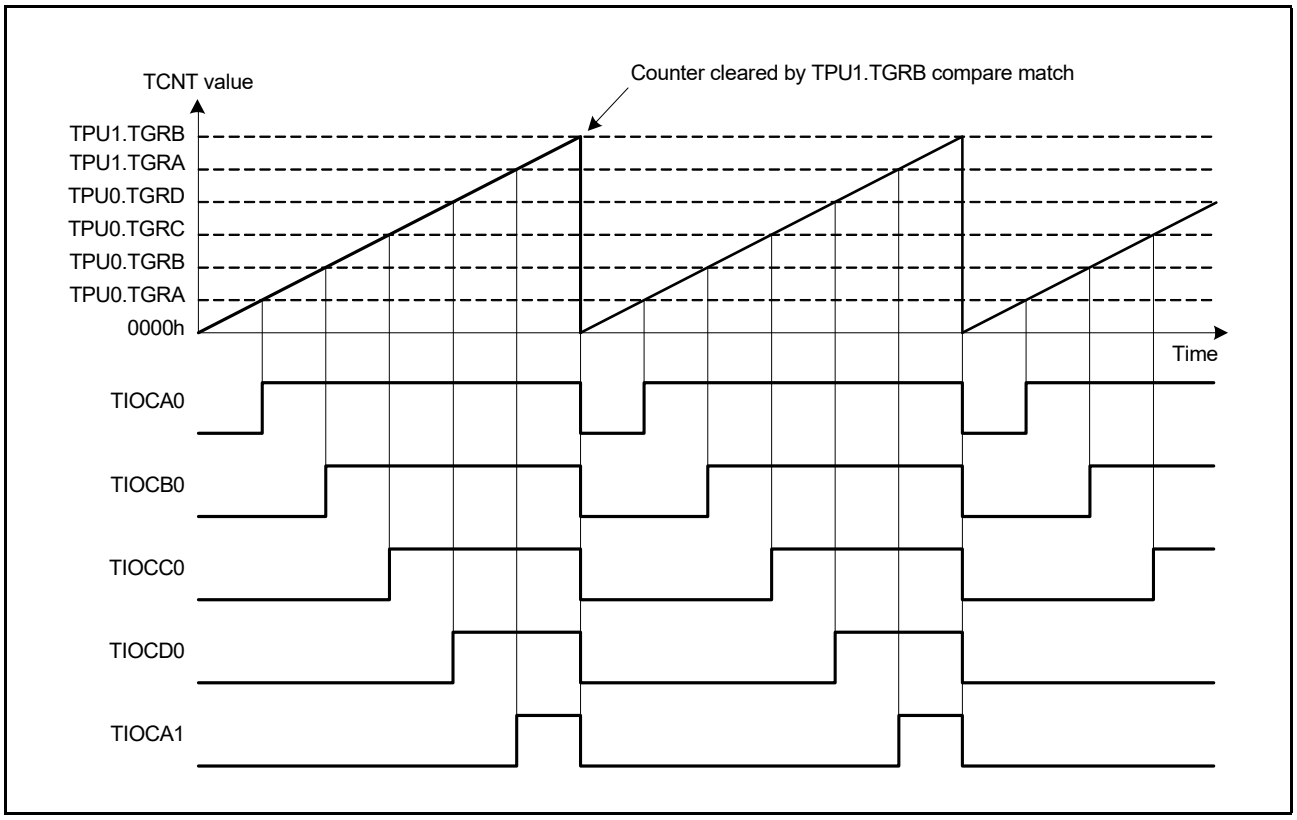

Figure 22.24 Example of PWM Mode Operation (2)

Figure 22.25 shows examples of PWM waveform output with 0% duty cycle and 100% duty cycle in PWM mode.

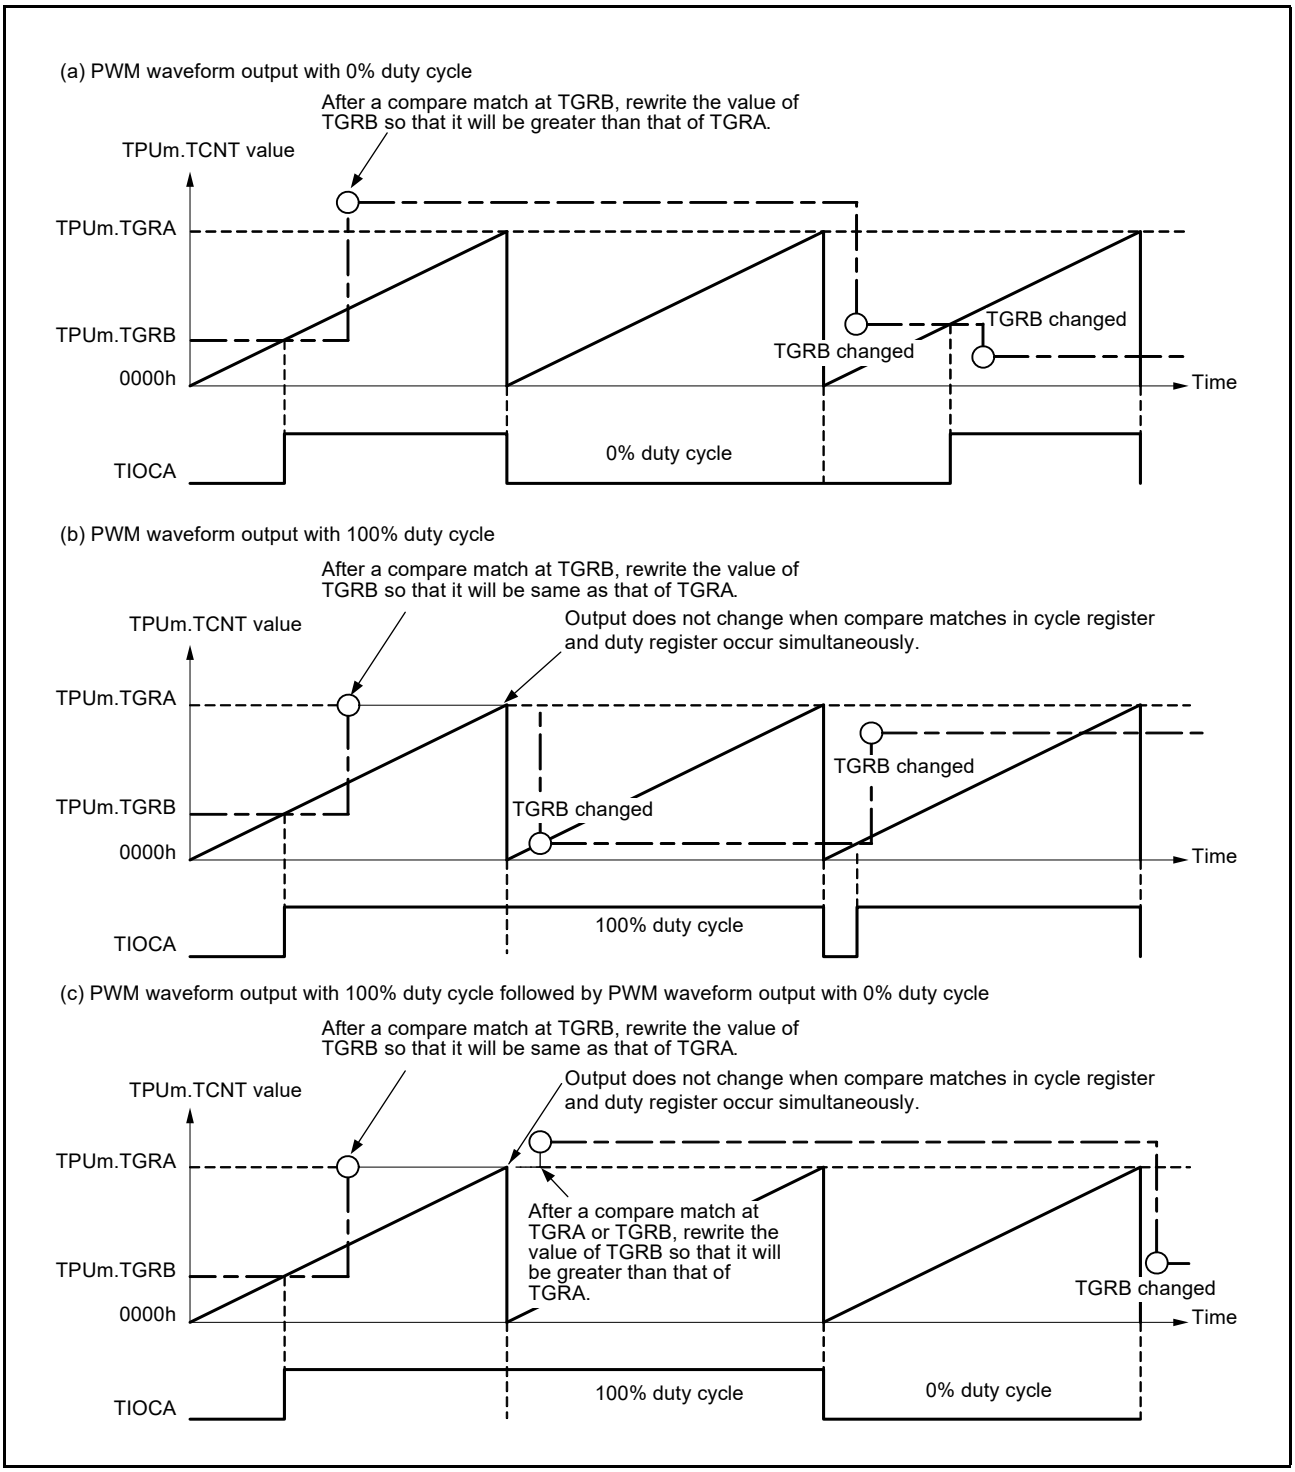

Figure 22.25 Example of PWM Mode Operation (3)

22.3.6 Phase Counting Mode

In phase counting mode, the phase difference between two external clock inputs is detected by the settings for channels 1, 2, 4, and 5 in unit 0 and for channels 7, 8, 10, and 11 in unit 1, and TPUm.TCNT is incremented/decremented accordingly (m = 1, 2, 4, 5, 7, 8, 10, 11).

When phase counting mode is set, an external clock is selected as the counter input clock and TCNT operates as an up-/down-counter regardless of the setting of the TPUm.TCR.TPSC[2:0] and CKEG[1:0] bits. However, the lower 2 bits of the TPUm.TCR.CCLR[2:0] bits and the functions of TPUm.TIORH, TPUm.TIORL, TPUm.TIOR, TPUm.TIER, and TPUm.TGRy are valid, and therefore input capture/compare match and interrupt functions are available.

This can be used for two-phase encoder pulse input.

When an overflow occurs while TCNT is counting up, a TCIV interrupt request is generated; when an underflow occurs while TCNT is counting down, a TCIU interrupt request is generated. The TPUm.TSR.TCFD flag is the count direction flag. Reading the TCFD flag provides an indication of whether TCNT is counting up or down.

Table 22.26 lists the correspondence between external clock pins and channels.

Table 22.26 Clock Input Pins in Phase Counting Mode

		External Clock Pins	
Unit	**Channel**	**A-Phase**	**B-Phase**
0	When TPU1 or TPU5 is set to phase counting mode	TCLKA	TCLKB
	When TPU2 or TPU4 is set to phase counting mode	TCLKC	TCLKD
1	When TPU7 or TPU11 is set to phase counting mode	TCLKE	TCLKF
	When TPU8 or TPU10 is set to phase counting mode	TCLKG	TCLKH

(1) Example of Phase Counting Mode Setting Procedure

Figure 22.26 shows an example of the phase counting mode setting procedure.

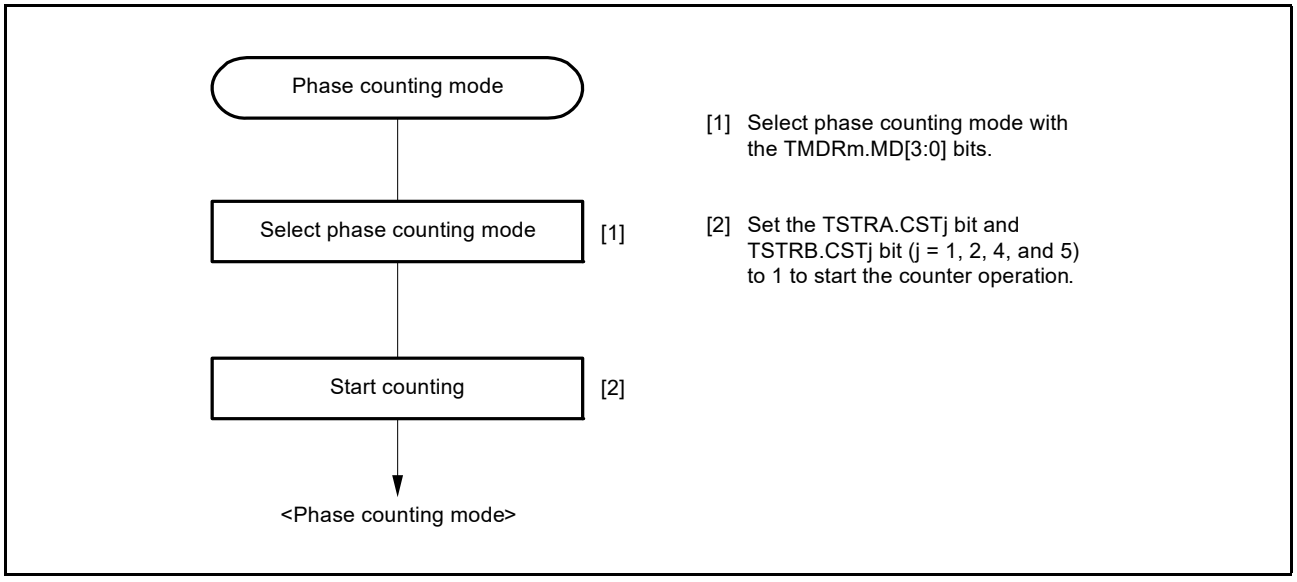

Figure 22.26 Example of Phase Counting Mode Setting Procedure

(2) Examples of Phase Counting Mode Operation

In phase counting mode, TPUm.TCNT (m = 1, 2, 4, 5, 7, 8, 10, 11) counts up or down according to the phase difference between two external clocks. There are four modes, according to the count conditions.

(a) Phase counting mode 1

Figure 22.27 shows an example of phase counting mode 1 operation for unit 0, and Table 22.27 lists the TPUm.TCNT up-/down-count conditions (m = 1, 2, 4, 5).

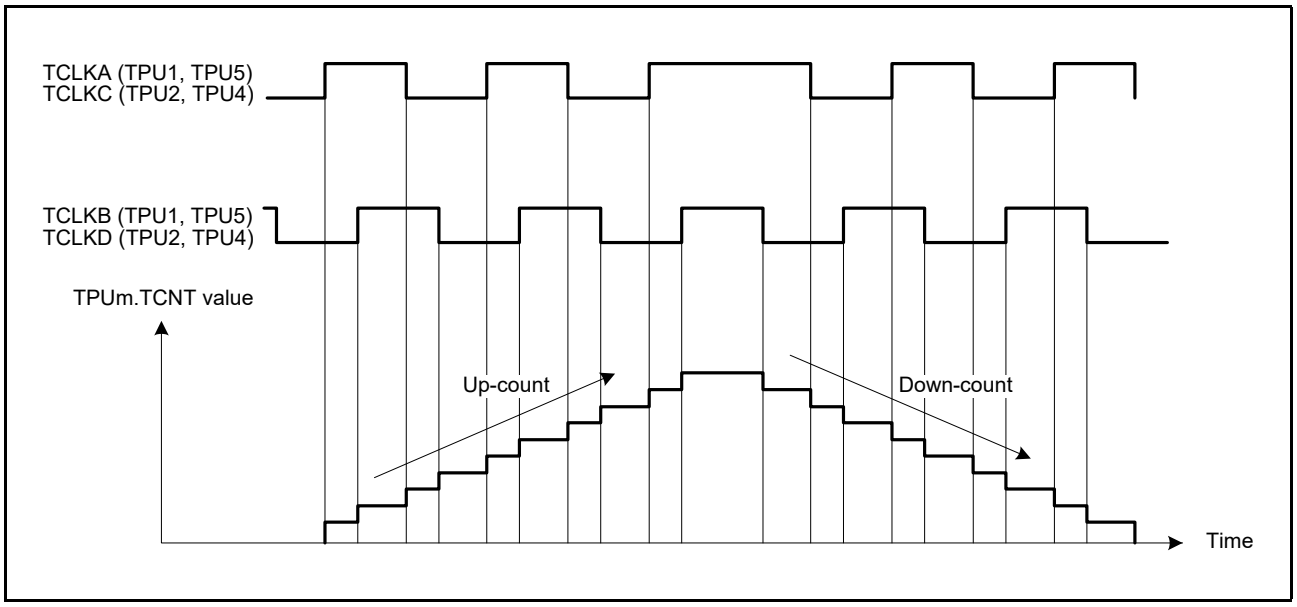

Figure 22.27 Example of Phase Counting Mode 1 Operation

Table 22.27 Up-/Down-Count Conditions in Phase Counting Mode 1

22.3.6.1 Phase Counting Mode Application Example

Figure 22.31 shows an example in which phase counting mode is set for TPU1, and TPU1 is coupled with TPU0 to input servo motor 2-phase encoder pulses in order to detect the position or speed.
In this example, TPU1 is set to phase counting mode 1, and the encoder pulse A-phase and B-phase are input to the TCLKA and TCLKB pins.
TPU0 operates with TPU0.TCNT counter clearing by TPU0.TGR compare match; TPU0.TGRA and TPU0.TGRC are used for the compare match function and are set with the speed control cycle and position control cycle. TPU0.TGRB is used for input capture, with TPU0.TGRB and TPU0.TGRD operating in buffer mode. The TPU1 counter input clock is specified as the source to drive input capture in TPU0.TGRB. The TPU0 counter values are input to and captured by TPU0.TGRB in response to counting up or down by the TPU1.TCNT counter (with the previously captured value being transferred to TPU0.TGRD), allowing measurement of edge occurrence (pulse width measurement).
TPU1.TGRA and TPU1.TGRB for TPU1 are specified for input capture, TPU0.TGRA and TPU0.TGRC compare matches are selected as the input capture source, and the up-/down-counter values for the control cycles are stored.
This procedure enables accurate position/speed detection to be achieved.

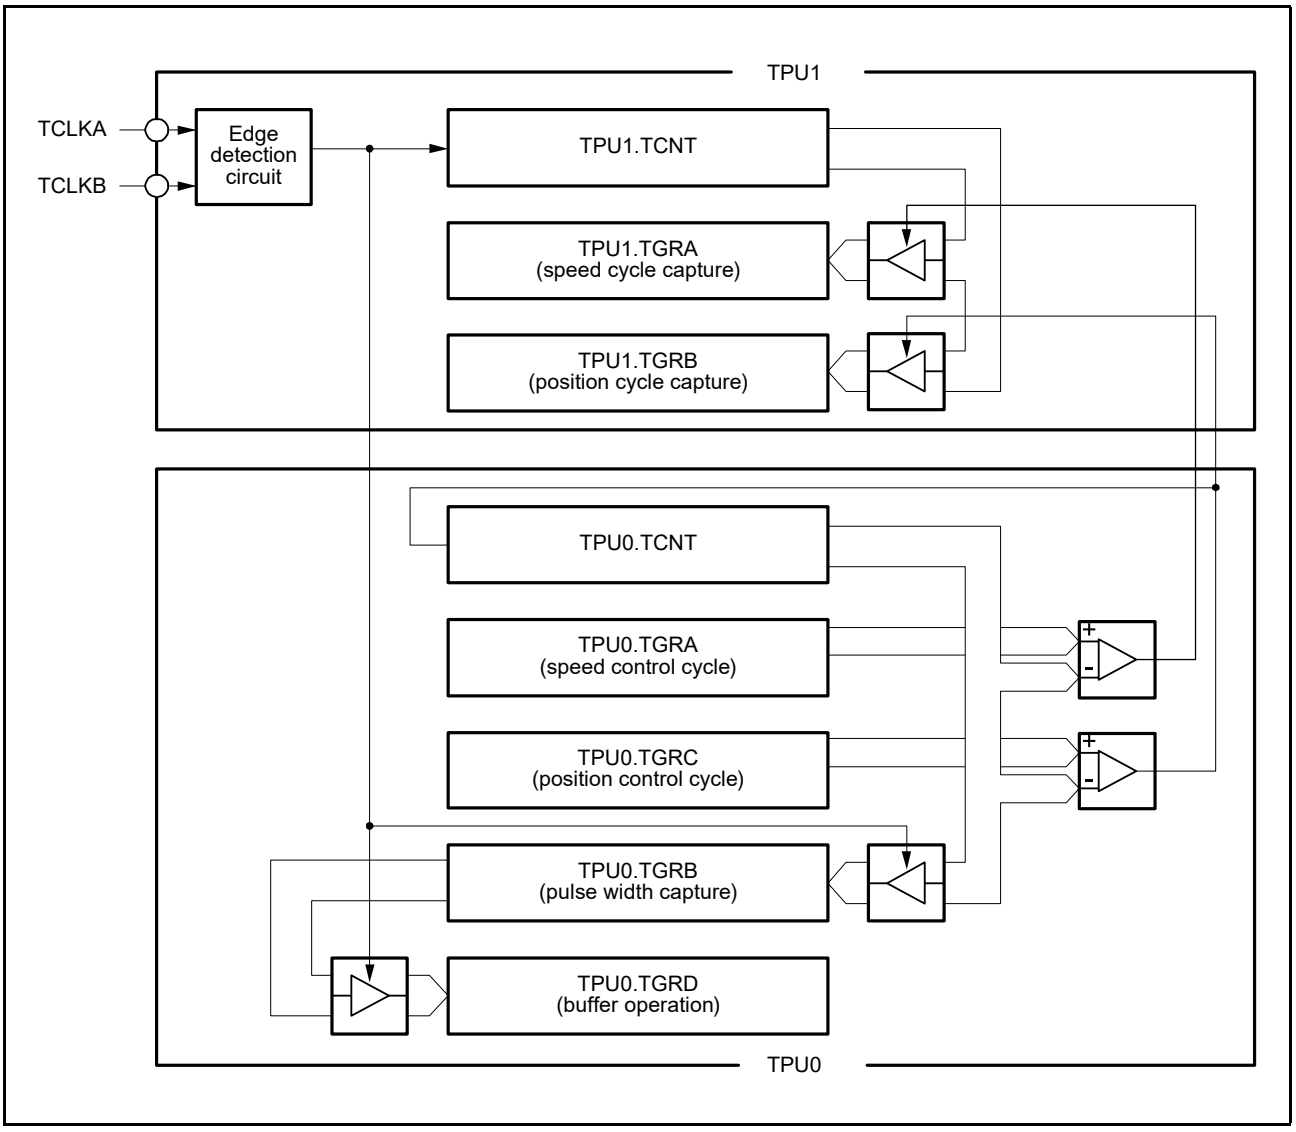

Figure 22.31 Phase Counting Mode Application Example

22.3.7 Noise Filters

Each pin for use in input capture by TPU is equipped with a noise filter. The noise filter samples input signals at the frequency of the sampling clock and pulses with levels that only match once or twice are removed.
The noise filter functionality includes enabling and disabling of the noise filter for each pin and setting of the sampling clock for each channel.
Figure 22.32 is a timing chart for the noise filter.

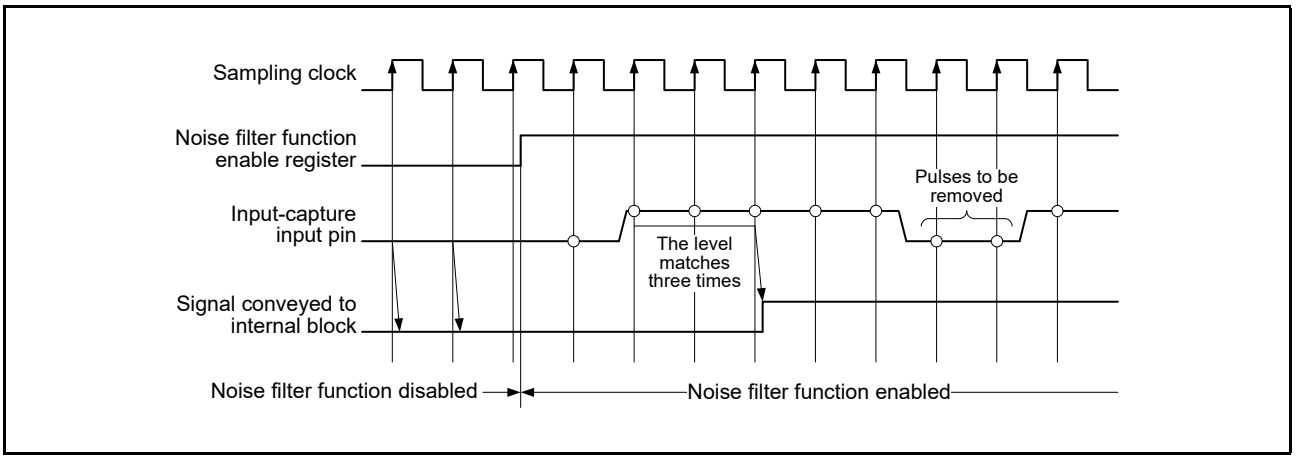

Figure 22.32 Timing Chart for the Noise Filter

If noise filtering is set, input capture operation is performed on the edges of noise-filtered signal after a minimum delay of (sampling interval × 2 + PCLKD) due to noise filtering for the input capture input.

22.3.8 Internal PWM Feedback Input Select

The internal PWM feedback input select function uses pin out signals of MTU3a and GPTa selected with PWMFBSLR.FBSLn (n = 0, 1) as the TPU input capture input through the inside of this LSI.
As an example usage, assume that pin out signals of MTU3a and GPTa that are set as the PWM output are selected as the internal PWM feedback input, and the duty cycle and cycle of the PWM waveform are measured with the input captured value.
Section 22.3.8.1 and section 22.3.8.2 describe example settings of PWM waveform measurement with the internal PWM feedback input select function. section 22.3.8.3 and section 22.3.8.4 describe example settings for measurement of the external PWM waveform input to the TIOCAm and TIOCBm pins with the normal input capture function.

22.3.8.1 Example Setting of PWM 1-Axis Measurement (TPU (Unit 0) is Set as the Internal PWM Feedback Input)

MTU3 and MTU4 are selected as the sources of PWM internal feedback input to a TPU (unit 0), and PWM waveforms can be measured through the internal circuits of the LSI chip.
In this example, TPU0 starts operation in synchronization with the carrier cycles of MTU3 or MTU4, while the latter are used for 6-phase PWM output.
An example of settings so that PWM waveforms are measured from the counter values input and captured at the times of the detection of edges in the PWM outputs is given below.
For details about the module connection in this setting, see Figure 22.33.

Prerequisite: In the PWM timer (MTU3, MTU4) used as the internal PWM feedback input source, one cycle is defined as trough-to-trough. PWM is operating with active-low setting.

(1) Stop the count operation of all channels of the TPU (unit 0). Set TGRA and TGRB of each channel for output compare (input capture disable).
(2) Set the digital noise filter for each input capture pin of the TPU (unit 0).
(3) Set the count clock, clear conditions, and operating mode for each channel of the TPU (unit 0).
Count clock: PCLKD/1
Clear conditions: Counter clear at the timing of TGRA input capture
Operating mode: Normal mode
(4) Clear the counter value of all channels of the TPU (unit 0) to 0000h.
(5) Set TGRA and TGRB for each channel of TPU (unit 0) for input capture operation.
TGRA: Rising edge detection (Falling edge detection for a reverse phase channel)
TGRB: Falling edge detection (Rising edge detection for a reverse phase channel)
(6) Set the PWMFBSLR register as follows:
TPU0EN bit: 1b (Internal PWM feedback enable)
FBSL0 bit: 100b (PWM output signals of MTU3 and MTU4)
(7) Enable interrupts by the TGRA input capture of each channel of TPU (unit 0).
(8) Counting on each channel of the TPU (unit 0) is started, triggered by the timing of the trough of the carrier of MTU3 and MTU4.
(9) An interrupt is generated due to input capture at the rising edge of PWM. The active period can be calculated with the count values at the falling edge and at the rising edge.

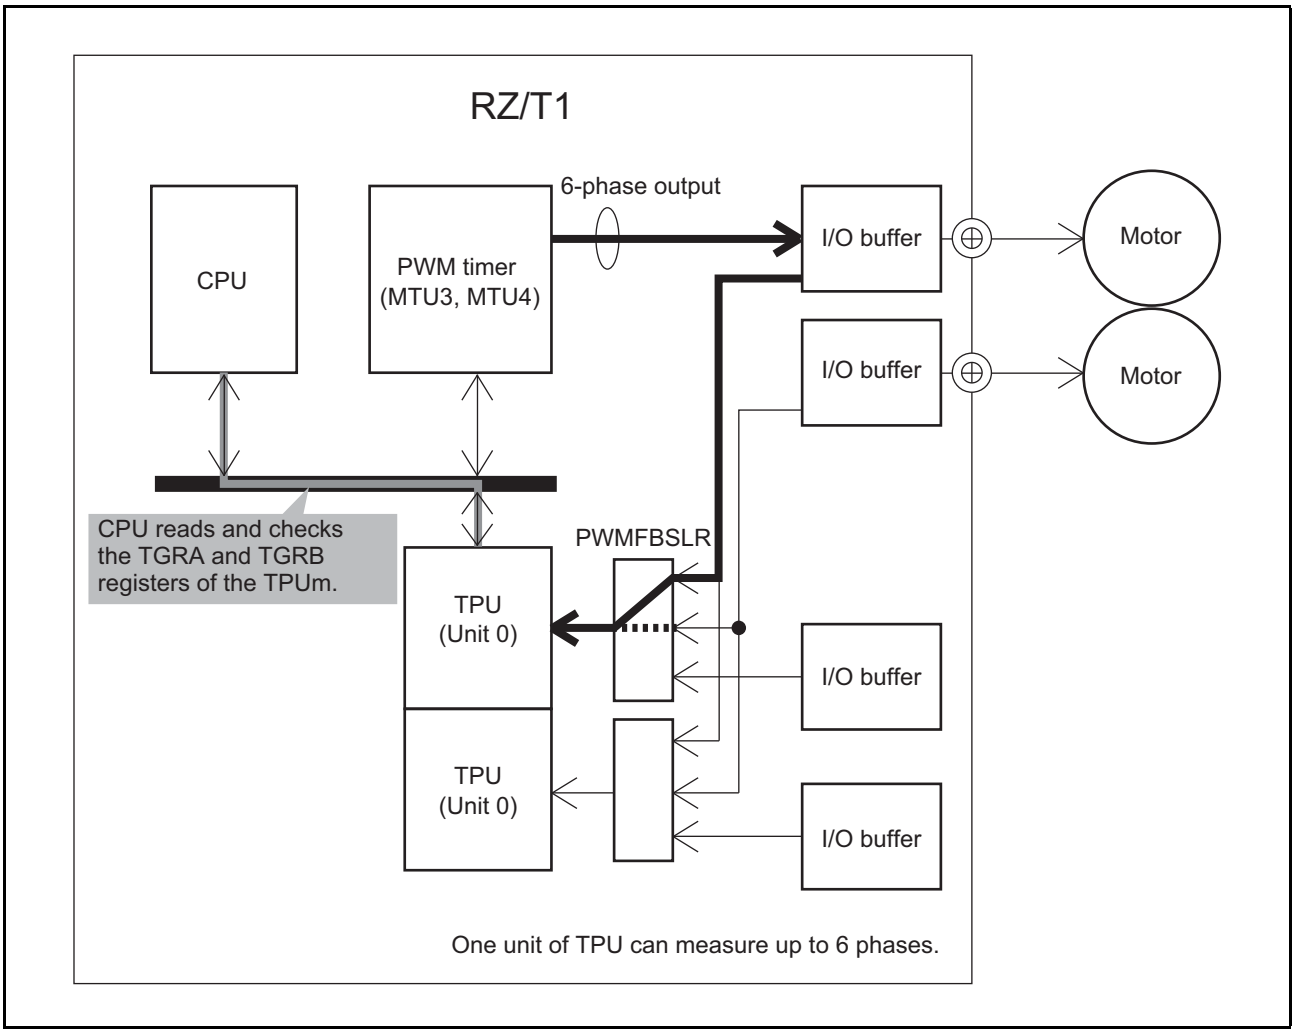

Figure 22.33 Connection Diagram of Example Setting for PWM 1-Axis Measurement

22.3.8.2 Example Setting of PWM 2-Axes Measurement (TPU (Unit 0) is Set as the Internal PWM Feedback Input)

MTU3 and MTU4, and MTU6 and MTU7, are selected by switching between them as the sources of PWM internal feedback input to a TPU (unit 0), and PWM waveforms from two axes can be measured through the internal circuits of the LSI chip.
In this example, TPU0 starts operating in synchronization with the carrier cycles of MTU3 and MTU4 or MTU6 and MTU7, while either pair is used for 6-phase PWM output.
An example of settings so that the PWM waveforms are obtained from the counter values input and captured at the times of the detection of edges in the PWM outputs is given below.
For details about connection of this module, TPU, and PWM timer, see Figure 22.34.

Prerequisite: In the PWM timer (MTU3 and MTU4, and MTU6 and MTU7) used as the internal PWM feedback input source, one cycle is defined as trough-to-trough. PWW is operating with active-low setting.

(1) Stop the count operation of all channels of the TPU (unit 0). Set TGRA and TGRB of each channel for output compare (input capture disable).
(2) Set the digital noise filter for each input capture pin of the TPU (unit 0).
(3) Set the count clock, clear conditions, and operating mode for each channel of the TPU (unit 0).
Count clock: PCLKD/1
Clear conditions: Counter clear at the timing of TGRA input capture
Operating mode: Normal mode
(4) Clear the counter value of all channels of the TPU (unit 0) to 0000h.
(5) Set TGRA and TGRB for each channel of the TPU (unit 0) for input capture operation.
TGRA: Rising edge detection (Falling edge detection for a reverse phase channel)
TGRB: Falling edge detection (Rising edge detection for a reverse phase channel)
(6) Set the PWMFBSLR register as follows:
TPU0EN bit: 1b (Internal PWM feedback enable)
FBSL0 bit: 100b (PWM output signals of MTU3 and MTU4)
(7) Enable interrupts by the TGRA input capture for each channel of the TPU (unit 0).
(8) Counting on each channel of the TPU (unit 0) is started, triggered by the timing of the trough of the carrier of MTU3 and MTU4.
(9) An interrupt is generated due to input capture at the rising edge of PWM for each phase. The active period can be calculated with the count values at the falling edge and at the rising edge.
(10) Calculate the cycle and duty cycle of the PWM feedback, stop count operation for all channels of the TPU (unit 0), and set TGRA and TGRB for output compare (input capture disable).
Disable interrupts due to TGRA input capture.
(11) Clear the counter value of all channels of the TPU (unit 0) to 0000h.
(12) Set TGRA and TGRB on each channel of the TPU (unit 0) for input capture operation.
TGRA: Rising edge detection (Falling edge detection for a reverse phase channel)
TGRB: Falling edge detection (Rising edge detection for a reverse phase channel)
(13) Set the PWMFBSLR register as follows:
TPU0EN bit: 1b (Internal feedback enable)
FBSL0 bit: 101b (PWM output signals of MTU6 and MTU7)
(14) Enable interrupts by the TGRA input capture on each channel of the TPU (unit 0).
(15) Counting on each channel of the TPU (unit 0) is started, triggered by the timing of the trough of the carrier of MTU6 and MTU7.
(16) An interrupt is generated due to interrupt capture at the rising edge of PWM for each phase.
The active period can be calculated with the count value at the falling edge and at the rising edge.
(17) After calculating the cycle and duty cycle, switch the input source, as necessary, according to the above procedure.

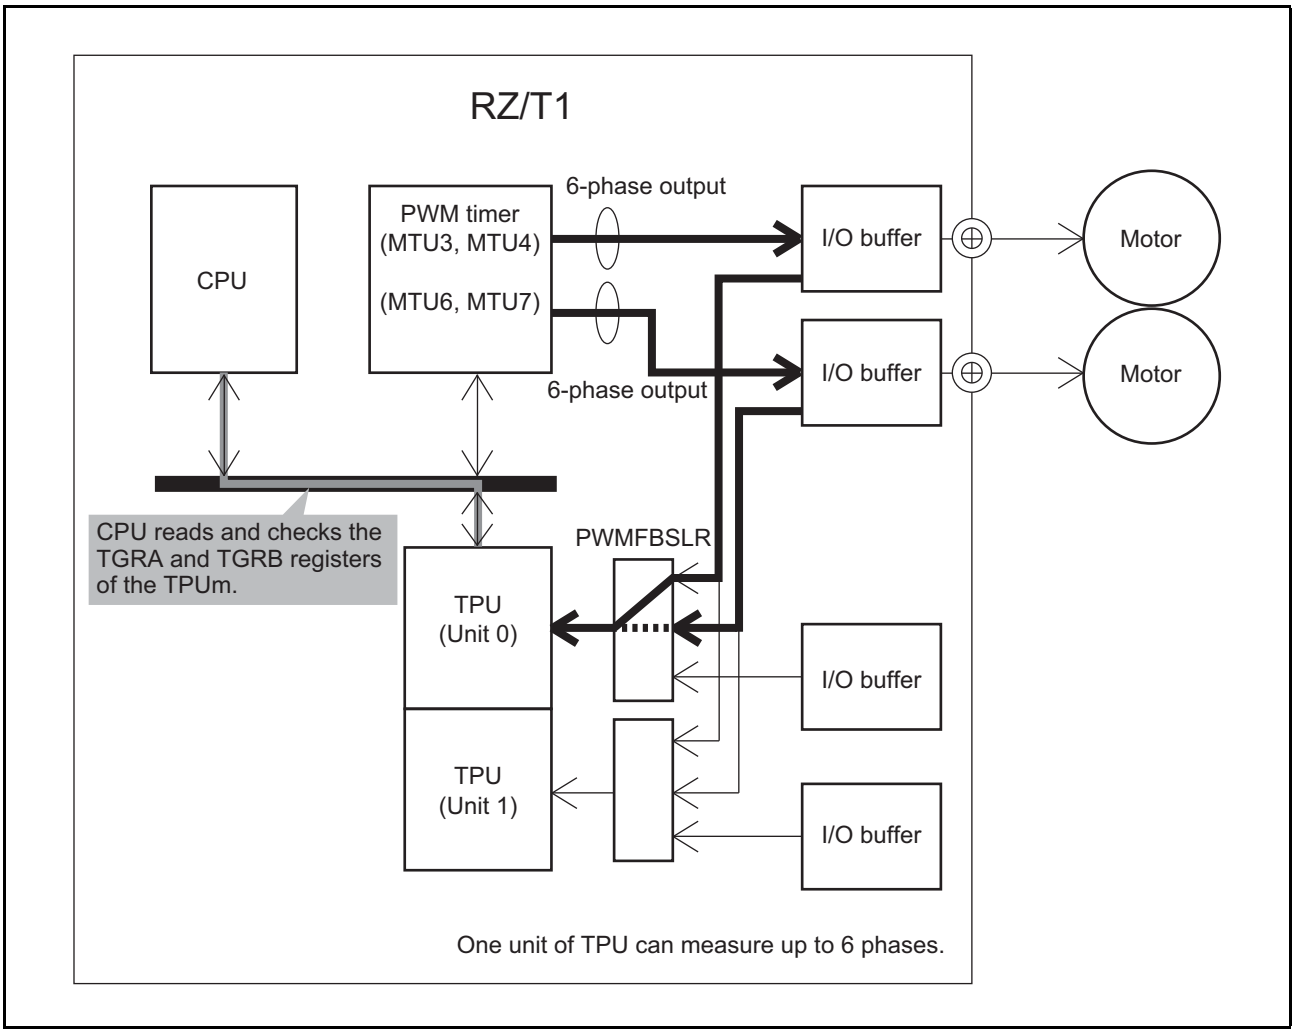

Figure 22.34 Connection Diagram of Example Setting for PWM 2-Axes Measurement

22.3.8.3 Example Setting of PWM 1-Axis Measurement (TPU (Unit 0) Is Set as the Input Capture Function)

Even when the internal PWM feedback input select function is not used (PWMFBSLR.TPUnEN bit = 0), the PWM signals externally input from the TIOCAm and TIOCBm pins can be measured (m = 0 to 5 when n = 0; m = 6 to 11 when n = 1) with the normal input capture function.
In the example below, MTU3 and MTU4 are used to output PWM waveforms. These are treated as PWM signals for external input to the LSI chip. The input signals are captured on either the TIOCAm or TIOCBm pins (m = 0 to 5) and used in the measurement of the PWM waveforms.
For details about the module connection in this setting, see Figure 22.35.

Prerequisite: MTU3a or GPTa to be used is operating as the PWM timer, where one cycle of the carrier is defined as trough-to-trough, and PWM is set to active low. This PWM output signal is externally connected to this LSI with the TIOCAm and TIOCBm pins, and the signal can be input from these pins.

(1) Stop the count operation of all channels of the TPU (unit 0). Set TGRA and TGRB on each channel for output compare (input capture disable).
(2) Set the digital noise filter for each input capture pin of the TPU (unit 0).
(3) Set the count clock, clear conditions, and operating mode for each channel of the TPU (unit 0).
Count clock: PCLKD
Clear conditions: Counter clear at the timing of TGRA input capture
Operating mode: Normal mode
(4) Clear the counter value of all channels of the TPU (unit 0) to 0000h.
(5) Set TGRA and TGRB for each channel of TPU (unit 0) for input capture operation.
TGRA: Rising edge detection (Falling edge detection for a reverse phase channel)
TGRB: Falling edge detection (Rising edge detection for a reverse phase channel)
(6) Set the PWMFBSLR register as follows:
TPU0EN bit: 1b (Internal PWM feedback disable)
FBSL0 bit: Invalid
(7) Enable interrupts by the TGRA input capture on each channel of TPU (unit 0).
(8) Counting on each channel of the TPU (unit 0) is started, triggered by the timing of the trough of the carrier that is input from outside of this LSI via the TIOCmA and TIOCmB pins (m = 0 to 5).
(9) An interrupt is generated due to input capture at the rising edge of PWM for each phase. The active period can be calculated with the count values at the falling edge and at the rising edge.

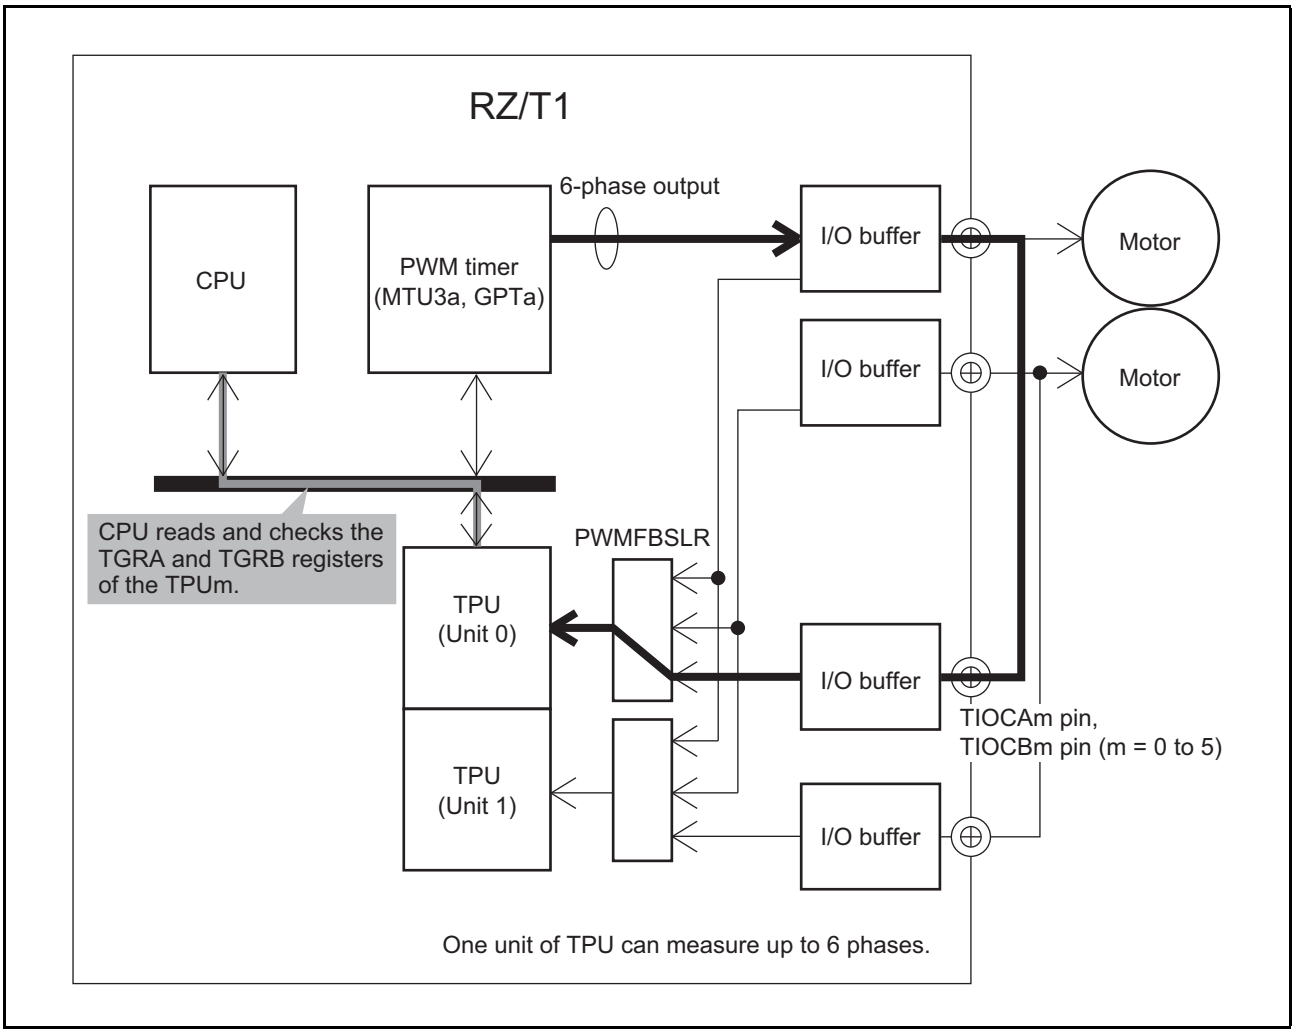

Figure 22.35 Connection Diagram of Example Setting for PWM 1-Axis Measurement

22.3.8.4 Example Setting of PWM 2-Axes Measurement (TPU (Unit 0, Unit 1) Is Set as the Input Capture Function)

Even when the internal PWM feedback input select function is not used (PWMFBSLR.TPUnEN bit = 0), the PWM signals externally input from the TIOCAm and TIOCBm pins can be measured with the normal input capture function (m = 0 to 5 when n = 0; m = 6 to 11 when n = 1).
In the example below, MTU3 and MTU4, and MTU6 and MTU7 are used to output PWM waveforms. These are treated as PWM signals on two axes to be externally input to the LSI. The input signals are captured on either the TIOCAm or TIOCBm pins (m = 0 to 11) or a TPU (unit 0 or unit 1) and used in measurement of the PWM waveforms.
For details about the module connection in this setting, see Figure 22.36.

Prerequisite: MTU3a to be used is operating as the PWM timer, where one cycle of the carrier is defined as trough-to-trough, and PWM is set to active low. This PWM output signal is externally connected to this LSI with the TIOCAm and TIOCBm pins, and the signal can be input from these pins.

(1) Stop the count operation of all channels of the TPU (unit 0) and TPU (unit 1). Set TGRA and TGRB on each channel for output compare (input capture disable).
(2) Set the digital noise filter for each input capture pin of the TPU (unit 0) and TPU (unit 0)
(3) Set the count clock, clear conditions, and operating mode for each channel of the TPU (unit 0) and TPU (unit 1).
- Unit 0/1
Count clock: PCLKD/1
Clear conditions: Counter clear at the timing of TGRA input capture
Operating mode: Normal mode
(4) Clear the counter value of all channels of the TPU (unit 0) and TPU (unit 1) to 0000h.
(5) Set TGRA and TGRB for each channel of the TPU (unit 0) for input capture operation.
- Unit 0/1
TGRA: Rising edge detection (Falling edge detection for a reverse phase channel)
TGRB: Falling edge detection (Rising edge detection for a reverse phase channel)
(6) Set the PWMFBSLR register as follows:
- Unit 0
TPU0EN bit: 0b (Internal feedback disable)
FBSL0 but: Unused
- Unit 1
TPU1EN bit: 0b (Internal feedback disable)
FBSL1 bit: Unused
(7) Enable interrupts by the TGRA input capture on each channel of the TPU (unit 0).
(8) Counting on each channel of the TPU (unit 0) is started, triggered by the timing of the trough of the carrier for the PWM timer, which input the PWM signal from the outside via the pins of the TPU (unit 0).*1
(9) Counting on each channel of the TPU (unit 1) is started, triggered by the timing of the trough of the carrier for the PWM timer, which input the PWM signal from the outside via the pins of the TPU (unit 1).*1
(10) An interrupt is generated due to interrupt capture at the rising edge of PWM for each phase.
The active period can be calculated with the count values at the falling edge and at the rising edge.

Note 1. The orders of step (8) and step (9) can be reversed.

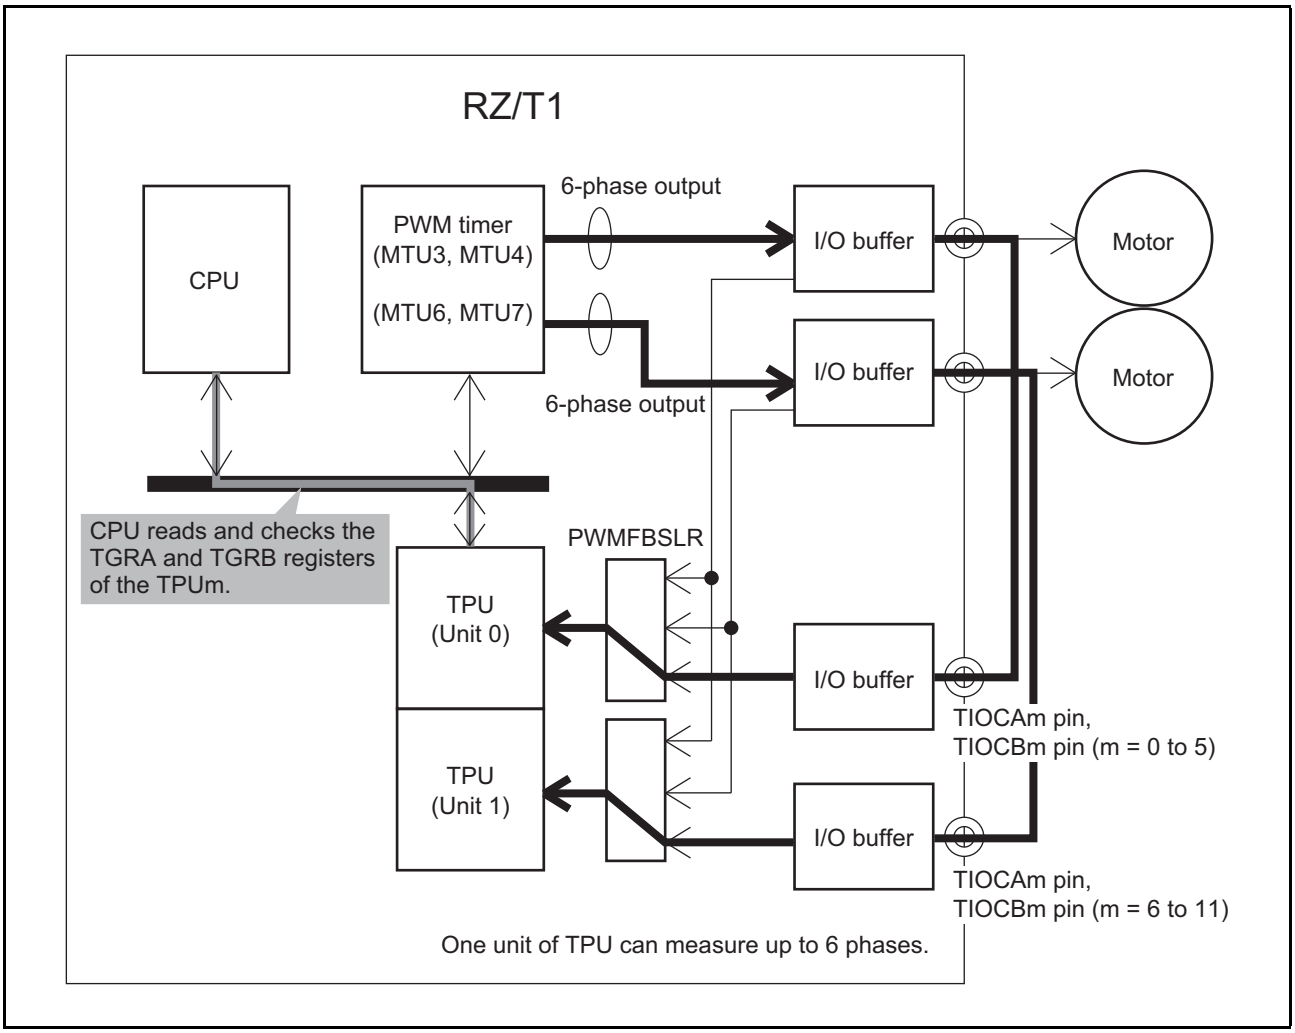

Figure 22.36 Connection Diagram of Example Setting for PWM 2-Axes Measurement

22.4 Interrupt Sources

There are three kinds of TPU interrupt sources: TPUm.TGRy input capture/compare match, TPUm.TCNT overflow, and TPUm.TCNT underflow.

Relative channel priority levels can be changed by the interrupt controller, but the priority within a channel is fixed. For details, see section 12, Interrupt Controller (ICUA).

Table 22.31 lists the TPU interrupt sources.

Table 22.31 TPU Interrupt Sources (1 / 2)

Unit	Channel	Name	Interrupt Source	DMAC Activation
0	TPU0	TGI0A	TPU0.TGRA input capture/compare match	Possible
		TGI0B	TPU0.TGRB input capture/compare match	Possible
		TGI0C	TPU0.TGRC input capture/compare match	Not possible
		TGI0D	TPU0.TGRD input capture/compare match	Not possible
		TCI0V	TPU0.TCNT overflow	Not possible
	TPU1	TGI1A	TPU1.TGRA input capture/compare match	Possible
		TGI1B	TPU1.TGRB input capture/compare match	Possible
		TCI1V	TPU1.TCNT overflow	Not possible
		TCI1U	TPU1.TCNT underflow	Not possible
	TPU2	TGI2A	TPU2.TGRA input capture/compare match	Possible
		TGI2B	TPU2.TGRB input capture/compare match	Possible
		TCI2V	TPU2.TCNT overflow	Not possible
		TCI2U	TPU2.TCNT underflow	Not possible
	TPU3	TGI3A	TPU3.TGRA input capture/compare match	Possible
		TGI3B	TPU3.TGRB input capture/compare match	Possible
		TGI3C	TPU3.TGRC input capture/compare match	Not possible
		TGI3D	TPU3.TGRD input capture/compare match	Not possible
		TCI3V	TPU3.TCNT overflow	Not possible
	TPU4	TGI4A	TPU4.TGRA input capture/compare match	Possible
		TGI4B	TPU4.TGRB input capture/compare match	Possible
		TCI4V	TPU4.TCNT overflow	Not possible
		TCI4U	TPU4.TCNT underflow	Not possible
	TPU5	TGI5A	TPU5.TGRA input capture/compare match	Possible
		TGI5B	TPU5.TGRB input capture/compare match	Possible
		TCI5V	TPU5.TCNT overflow	Not possible
		TCI5U	TPU5.TCNT underflow	Not possible

Table 22.31 TPU Interrupt Sources (2 / 2)

Unit	Channel	Name	Interrupt Source	DMAC Activation
1	TPU6	TGI6A	TPU6.TGRA input capture/compare match	Not possible
		TGI6B	TPU6.TGRB input capture/compare match	Not possible
		TGI6C	TPU6.TGRC input capture/compare match	Not possible
		TGI6D	TPU6.TGRD input capture/compare match	Not possible
		TCI6V	TPU6.TCNT overflow	Not possible
	TPU7	TGI7A	TPU7.TGRA input capture/compare match	Not possible
		TGI7B	TPU7.TGRB input capture/compare match	Not possible
		TCI7V	TPU7.TCNT overflow	Not possible
		TCI7U	TPU7.TCNT underflow	Not possible
	TPU8	TGI8A	TPU8.TGRA input capture/compare match	Not possible
		TGI8B	TPU8.TGRB input capture/compare match	Not possible
		TCI8V	TPU8.TCNT overflow	Not possible
		TCI8U	TPU8.TCNT underflow	Not possible
	TPU9	TGI9A	TPU9.TGRA input capture/compare match	Not possible
		TGI9B	TPU9.TGRB input capture/compare match	Not possible
		TGI9C	TPU9.TGRC input capture/compare match	Not possible
		TGI9D	TPU9.TGRD input capture/compare match	Not possible
		TCI9V	TPU9.TCNT overflow	Not possible
	TPU10	TGI10A	TPU10.TGRA input capture/compare match	Not possible
		TGI10B	TPU10.TGRB input capture/compare match	Not possible
		TCI10V	TPU10.TCNT overflow	Not possible
		TCI10U	TPU10.TCNT underflow	Not possible
	TPU11	TGI11A	TPU11.TGRA input capture/compare match	Not possible
		TGI11B	TPU11.TGRB input capture/compare match	Not possible
		TCI11V	TPU11.TCNT overflow	Not possible
		TCI11U	TPU11.TCNT underflow	Not possible

Note: This table lists the initial state immediately after a reset. The relative channel priority levels can be changed by the interrupt controller.

(1) Input Capture/Compare Match Interrupt

A TGImy interrupt (m = 0 to 11) is requested when the TPUm.TIER.TGIEy bit (y = A, B, C, D) is set to 1 by the occurrence of a TPUm.TGRy input capture/compare match on a channel. The TPU has 32 input capture/compare match interrupts, four each for TPU0, TPU3, TPU6, and TPU9, and two each for TPU1, TPU2, TPU4, TPU5, TPU7, TPU8, TPU10, and TPU11.

(2) Overflow Interrupt

A TCImV interrupt (m = 0 to 11) is requested when the TPUm.TIER.TCIEV bit is set to 1 by the occurrence of a TPUm.TCNT overflow on a channel. The TPU has 12 overflow interrupts, one for each channel.

(3) Underflow Interrupt

A TCImU interrupt (m = 0 to 11) is requested when the TPUm.TIER.TCIEU bit is set to 1 by the occurrence of a TPUm.TCNT underflow on a channel. The TPU has total of eight underflow interrupts, one each for TPU1, TPU2, TPU4, TPU5, TPU7, TPU8, TPU10, and TPU11.

22.5 DMAC Activation

Input capture/compare match interrupts from the TPUm.TGRA and TPUm.TGRB registers can activate the corresponding DMACs. For details, see section 15, DMA Controller (DMACAa).
As the sources for activating DMACs, the TPU can use two input capture/compare match interrupts from the TPUm.TGRA and TPUm.TGRB registers (m = 0 to 5) per channel of unit 0, twelve interrupts in total. Unit 1 does not have sources for activating DMACs.

22.6 A/D Converter Activation

The TPU can activate the A/D converter by the TPUm.TGRA input capture/compare match for each channel (m = 0 to 4, 6 to 10).
When the TPUm.TIER.TTGE bit is set to 1, the TPU requests the A/D converter to start A/D conversion by the occurrence of a TPUm.TGRA input capture/compare match on a particular channel (m = 0 to 4, 6 to 10).
For the corresponding unit of A/D converter, see section 43, 12-Bit A/D Converter (S12ADCa).

22.7 PPG Trigger

Input capture to or compare match with TGRA and TGRB in TPU0 to TPU3 of unit 0 can be made to act as a PPG1 waveform trigger. Unit 1 does not generate a PPG trigger. For details, see section 23, Programmable Pulse Generator (PPG).

22.8 Operation Timing

22.8.1 Input/Output Timing

(1) TPUm.TCNT Count Timing

Figure 22.37 shows TPUm.TCNT count timing in internal clock operation, and Figure 22.38 shows TCNT count timing in external clock operation (m = 0 to 11).

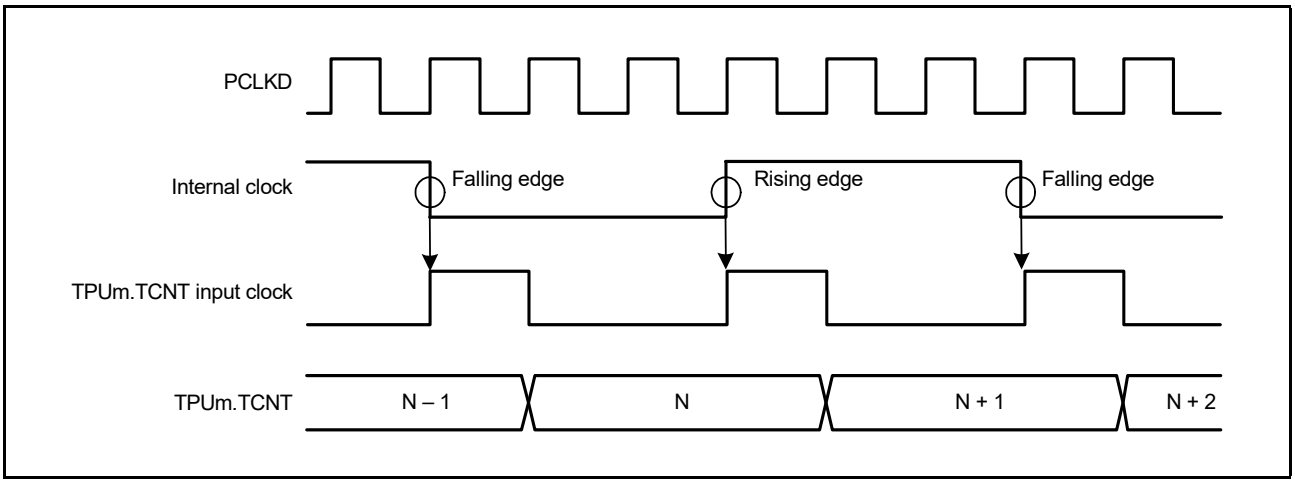

Figure 22.37 Count Timing in Internal Clock Operation

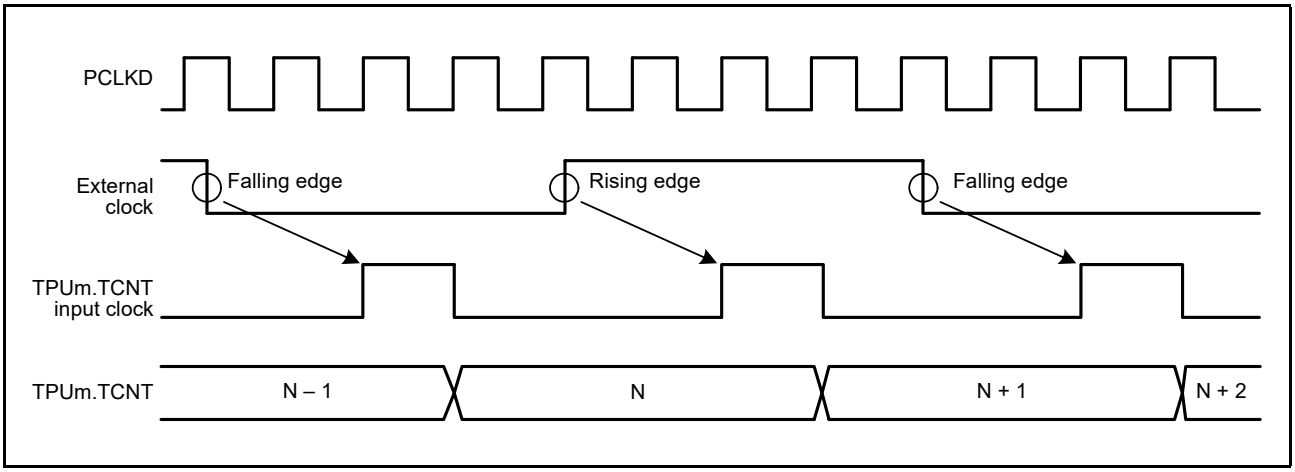

Figure 22.38 Count Timing in External Clock Operation

(2) Output Compare Output Timing

A compare match signal is generated in the final state in which TPUm.TCNT and TPUm.TGRy match (the point at which the count value matched by TCNT is updated). When a compare match signal is generated, the output value set in TPUm.TIORH, TPUm.TIORL, or TPUm.TIOR is output to the output compare output pin TIOCyn (y = A to D when n = 0, 3, 6, 9; y = A, B when n = 1, 2, 4, 5, 7, 8, 10, 11). After a match between TCNT and TGRy, the compare match signal is not generated until the TCNT input clock is generated.

Figure 22.39 shows output compare output timing.

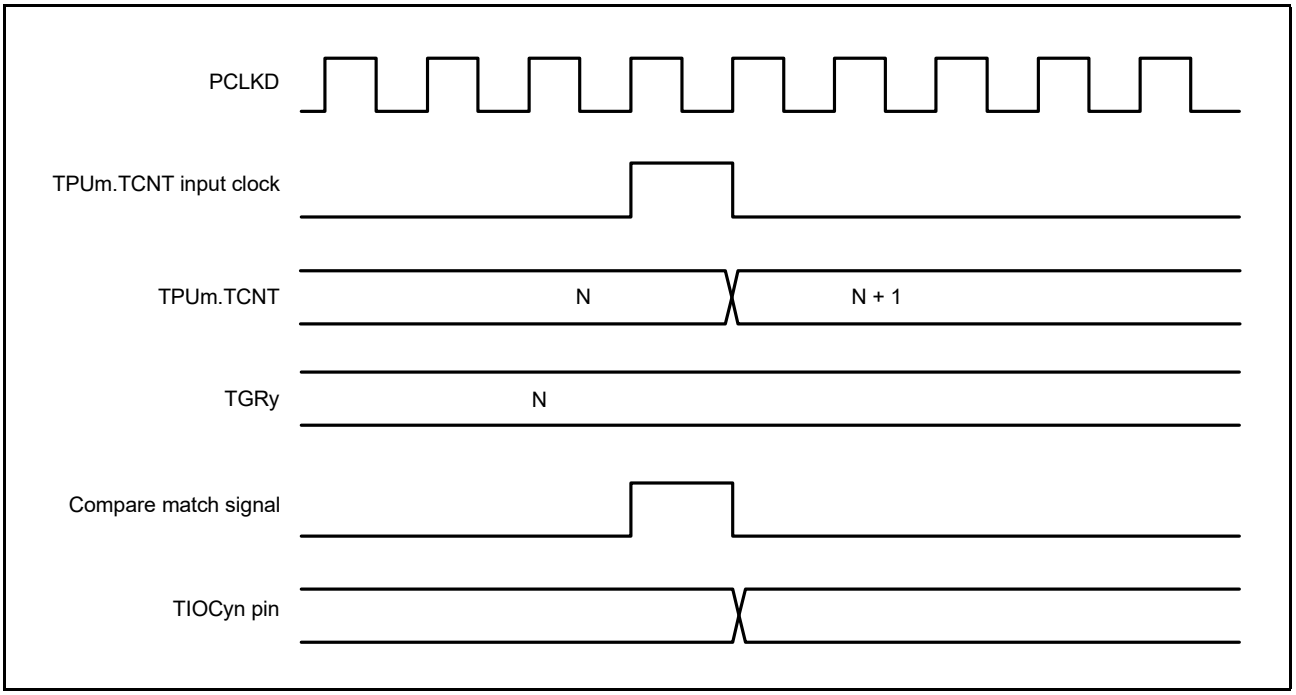

Figure 22.39 Output Compare Output Timing

(3) Input Capture Signal Timing

Figure 22.40 shows input capture signal timing.

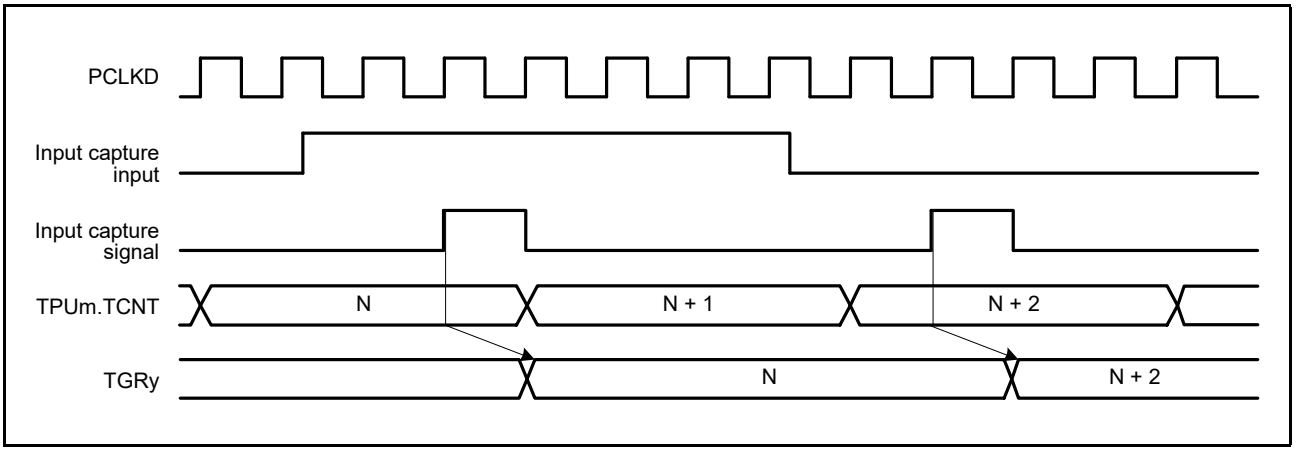

Figure 22.40 Input Capture Signal Timing

(4) Timing for Counter Clearing by Compare Match/Input Capture

Figure 22.41 shows the timing when counter clearing by compare match occurrence is specified, and Figure 22.42 shows the timing when counter clearing by input capture occurrence is specified.

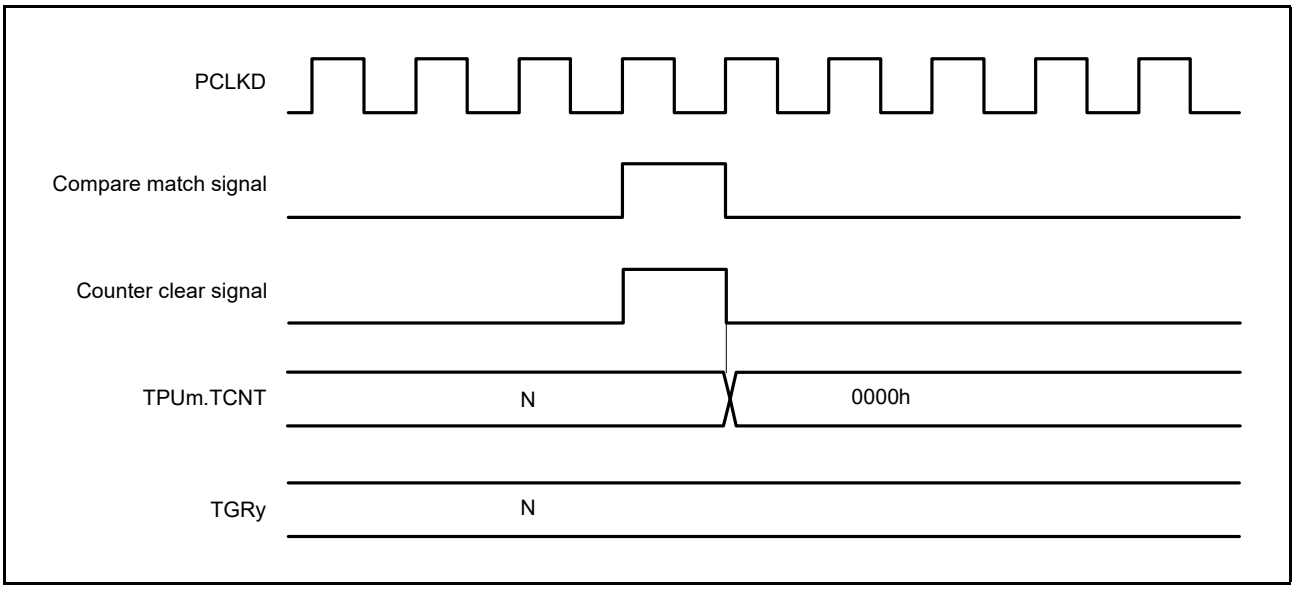

Figure 22.41 Counter Clear Timing (Compare Match)

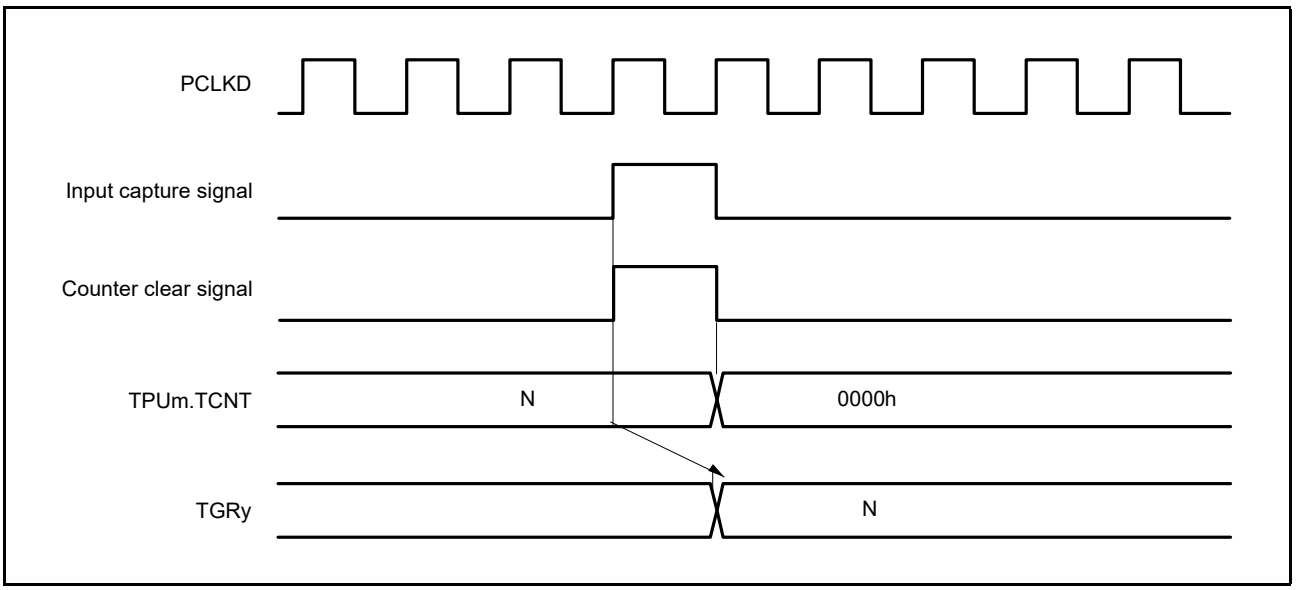

Figure 22.42 Counter Clear Timing (Input Capture)

(5) Buffer Operation Timing

Figure 22.43 and Figure 22.44 show the timings in buffer operation.

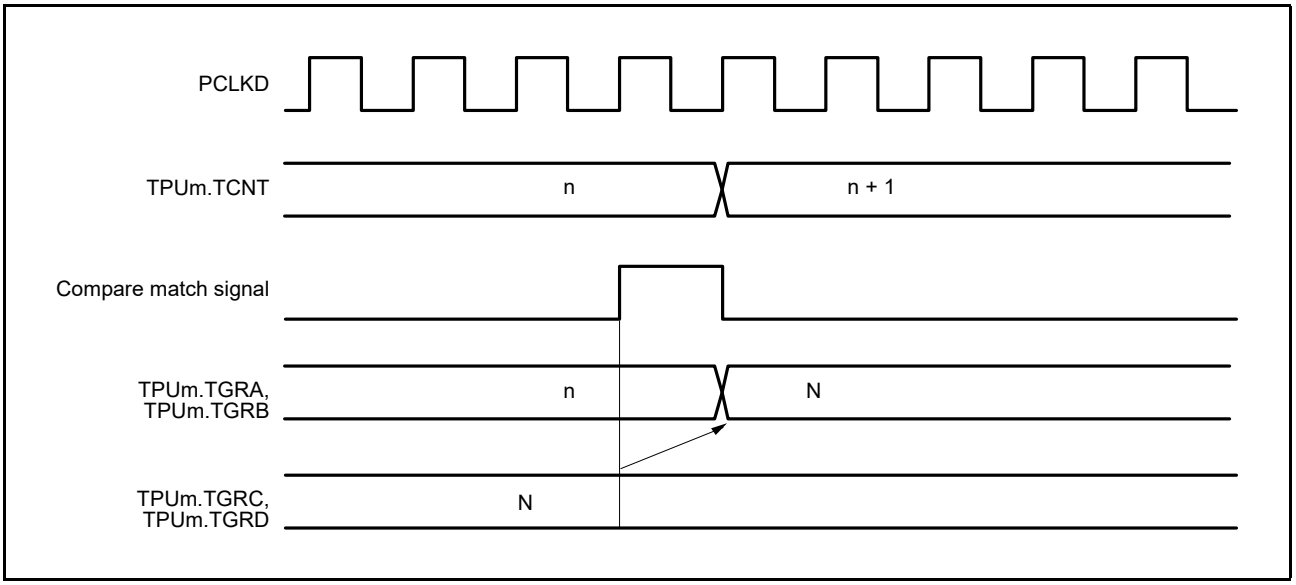

Figure 22.43 Buffer Operation Timing (Compare Match)

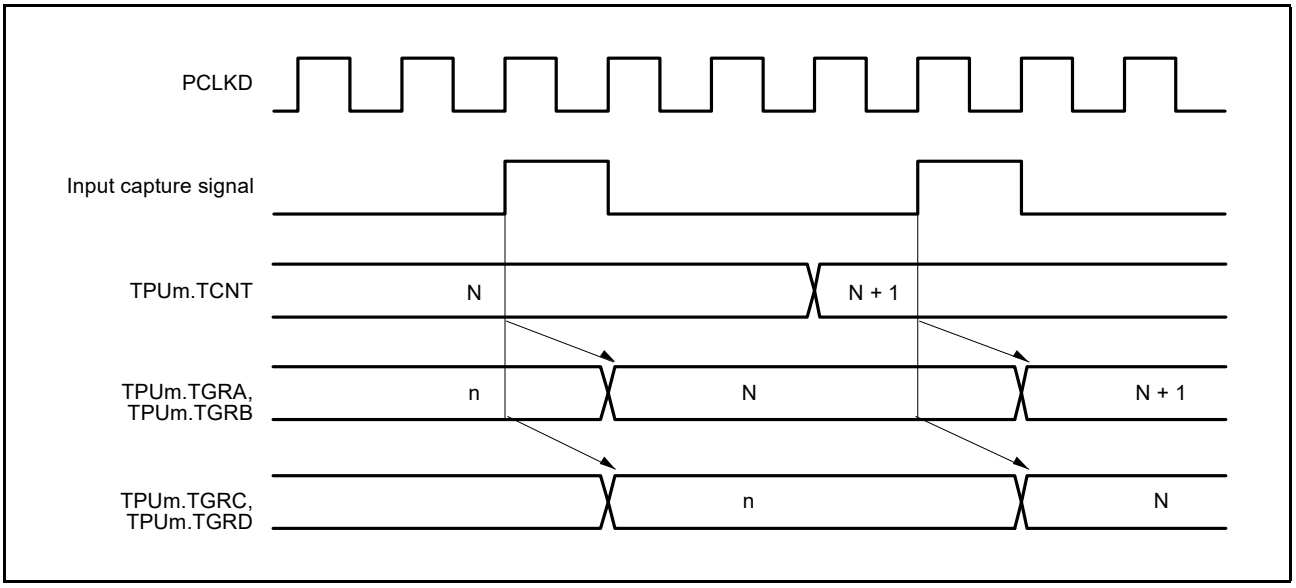

Figure 22.44 Buffer Operation Timing (Input Capture)

22.8.2 Interrupt Signal Timing

(1) Timing of Interrupt Signal Setting on Compare Match

Figure 22.45 shows the timing for setting the TGImy interrupt signal by compare match occurrence (y = A to D when m = 0, 3, 6, 9; y = A, B when m = 1, 2, 4, 5, 7, 8, 10, 11).

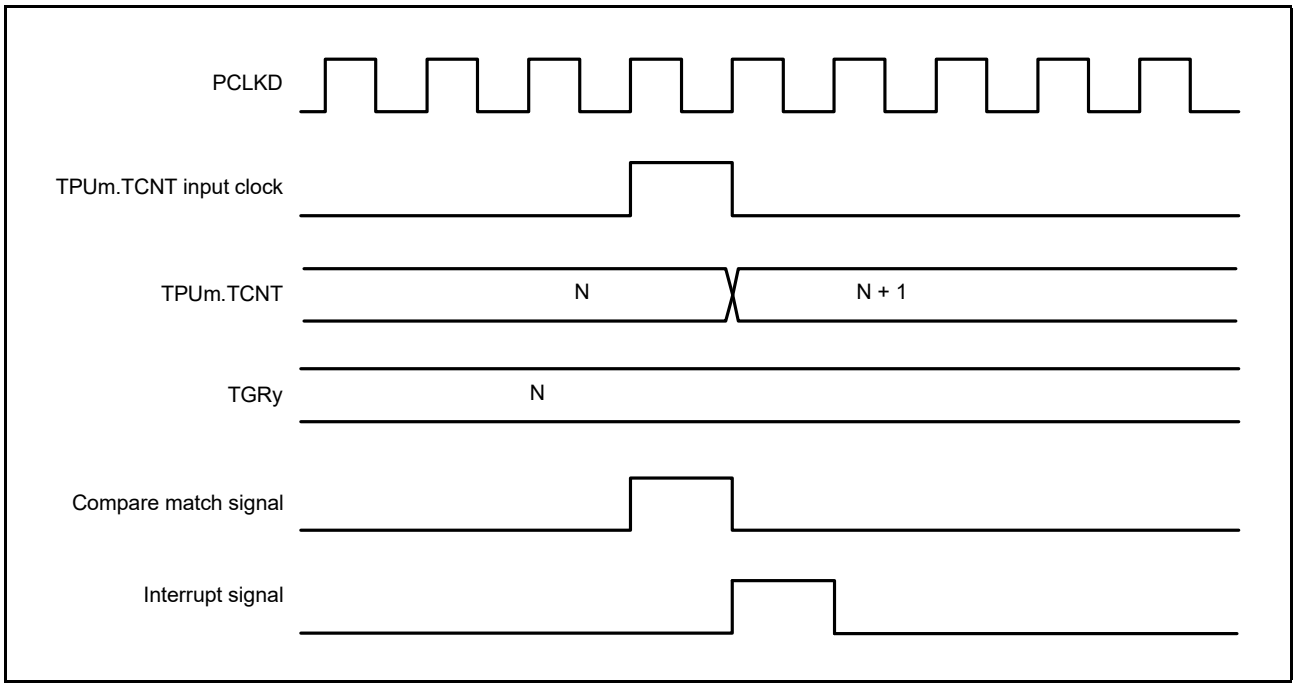

Figure 22.45 TGImy Interrupt Timing (Compare Match)

(2) Timing of Interrupt Signal Setting on Input Capture

Figure 22.46 shows the timing for setting the TGImy interrupt signal by input capture occurrence (y = A to D when m = 0, 3, 6, 9; y = A, B when m = 1, 2, 4, 5, 7, 8, 10, 11).

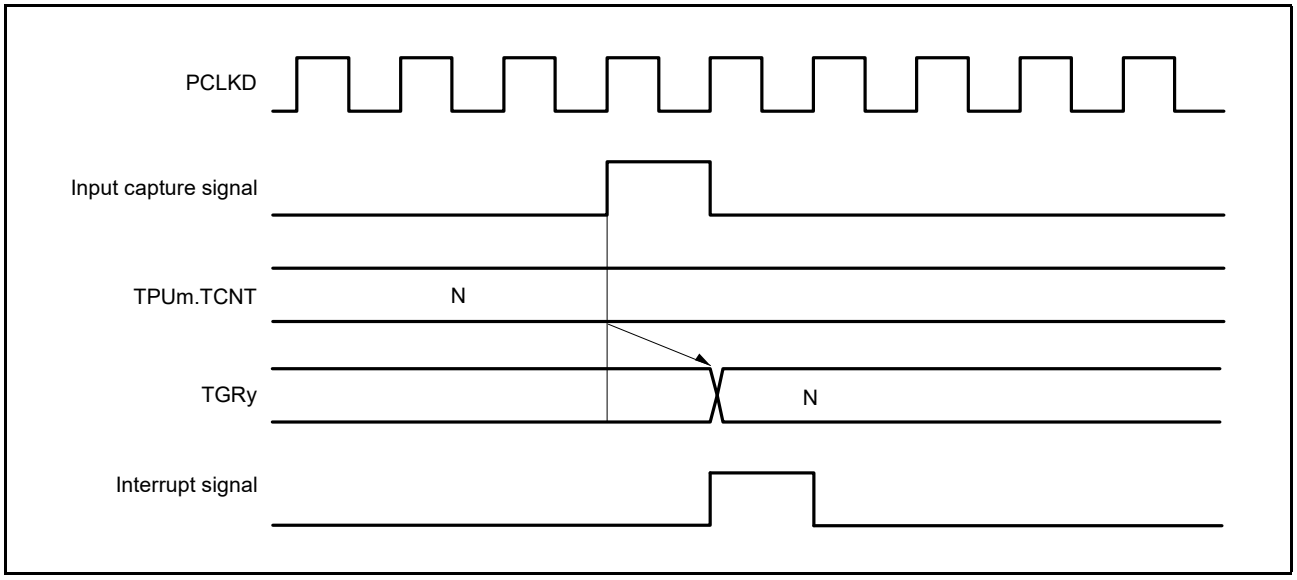

Figure 22.46 TGImy Interrupt Timing (Input Capture)

(3) Timing of TCImV/TCImU Interrupt Signal Setting

Figure 22.47 shows the timing for generating the TCImV interrupt signal by overflow occurrence (m = 0 to 11).
Figure 22.48 shows the timing for generating the TCInU interrupt signal by underflow occurrence (n = 1, 2, 4, 5, 7, 8, 10, 11).

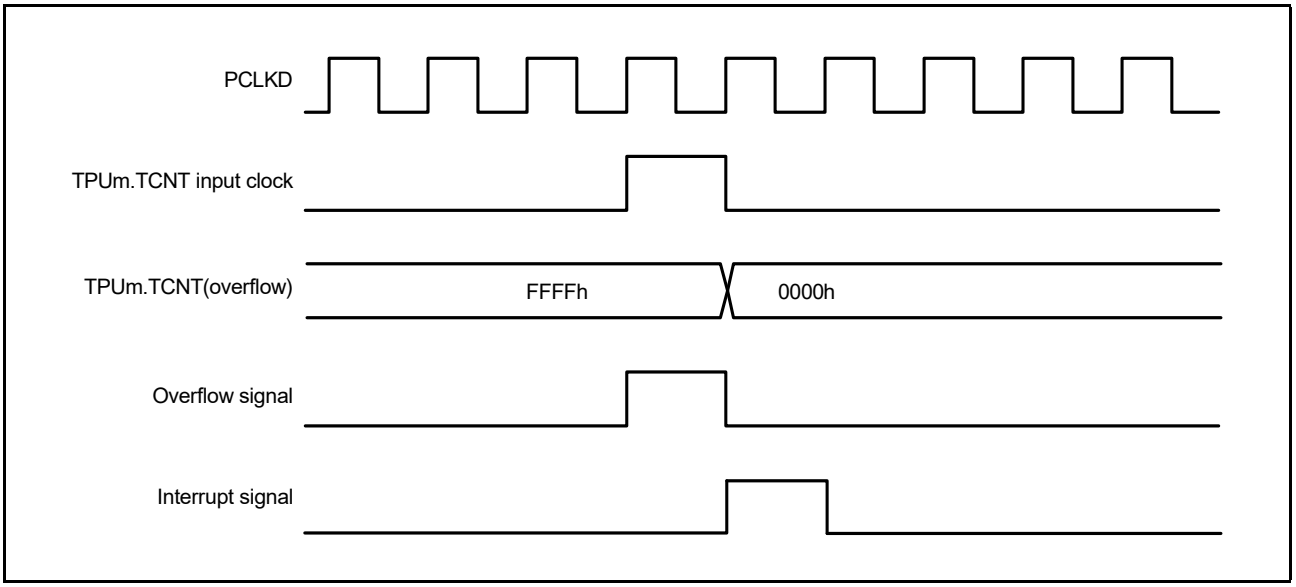

Figure 22.47 TCImV Interrupt Setting Timing

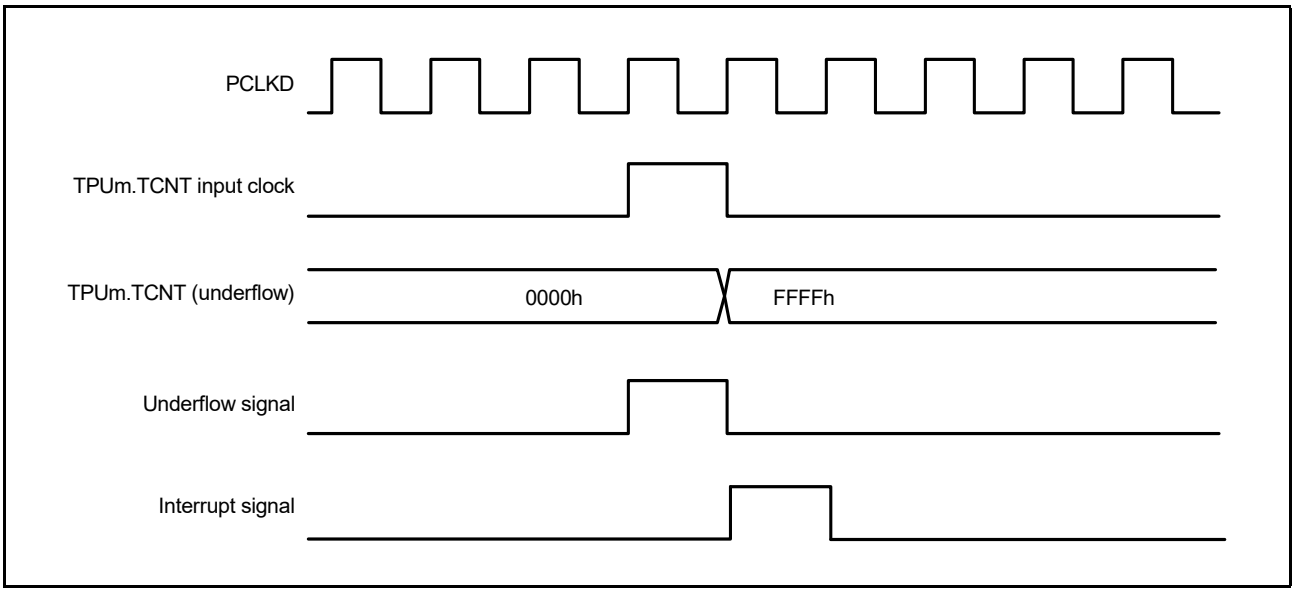

Figure 22.48 TCImU Interrupt Setting Timing

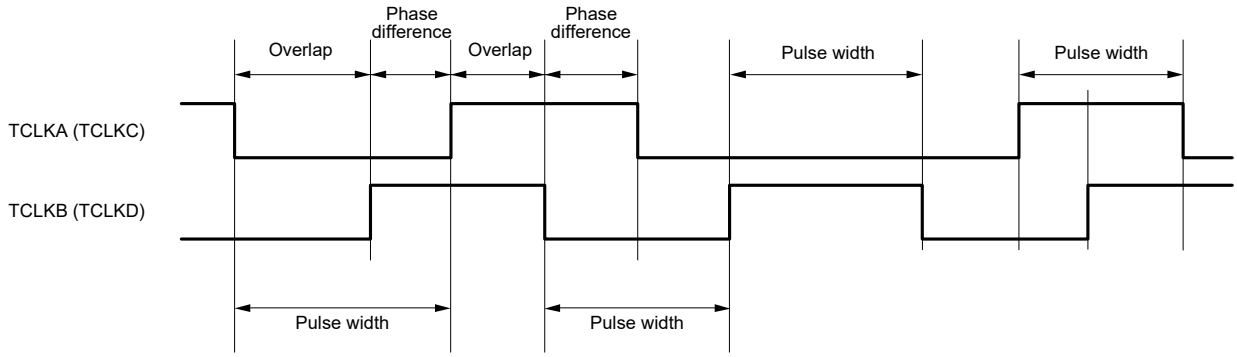
22.9 Usage Notes

22.9.1 Module-Stop Function Setting

Operation of the TPU can be disabled or enabled using the module-stop control register. The TPU does not operate with the initial setting. Register access is enabled by clearing module-stop state. For details, see section 9, Low-Power Consumption Function.

22.9.2 Input Clock Restrictions

The input clock pulse width must be at least 1.5 cycles of PCLKD in the case of single-edge detection, and at least 2.5 cycles of PCLKD in the case of both-edge detection. The TPU will not operate properly with a narrower pulse width. In phase counting mode, the phase difference and overlap between the two input clocks must be at least 1.5 cycles of PCLKD, and the pulse width must be at least 2.5 cycles of PCLKD. Figure 22.49 shows the input clock conditions in phase counting mode.



Note: Phase difference or overlap: At least 1.5 cycles of PCLKD
Pulse width : At least 2.5 cycles of PCLKD

Figure 22.49 Phase Difference, Overlap, and Pulse Width in Phase Counting Mode

22.9.3 Caution on Cycle Setting

When counter clearing by compare match is set, TPUm.TCNT is cleared in the final state in which it matches the TGRy value (the point at which the count value matched by TCNT is updated). Consequently, the actual counter frequency is given by the following formula (y = A to D when m = 0, 3, 6, 9; y = A, B when m = 1, 2, 4, 5, 7, 8, 10, 11).

$$f = \frac{f_{TCNT\_CLK}}{(N+1)}$$

f : Counter frequency
f_{TCNT_CLK} : Counter clock frequency
N : TGRy set value

22.9.4 Conflict between TPUm.TCNT Write and Clear Operations

If the counter clearing signal is generated in a TPUm.TCNT write cycle, TPUm.TCNT clearing takes precedence and the TPUm.TCNT write is not performed (m = 0 to 11). Figure 22.50 shows the timing in this case.

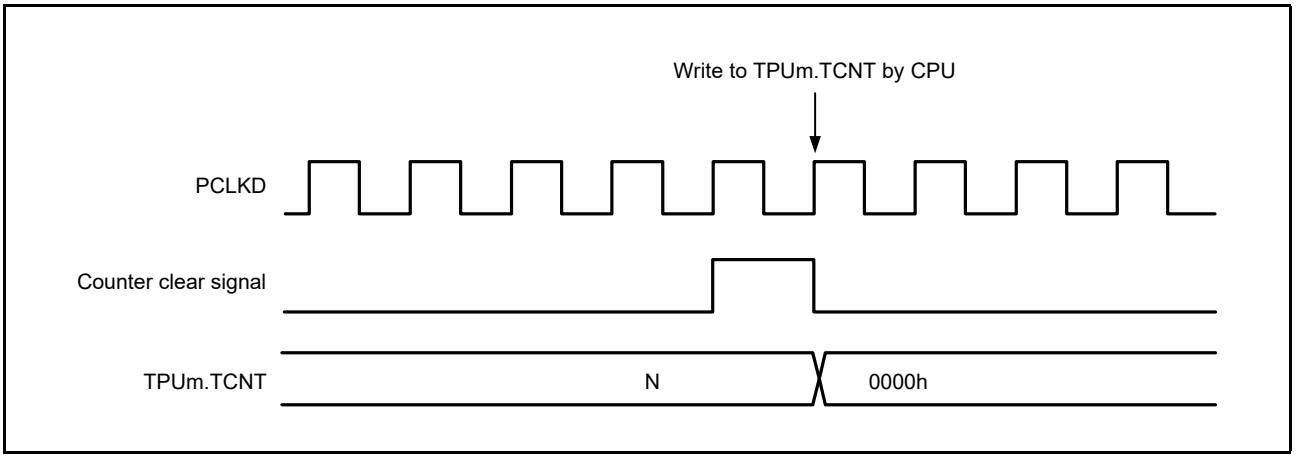


Figure 22.50 Conflict between TPUm.TCNT Write and Clear Operations

22.9.5 Conflict between TPUm.TCNT Write and Increment Operations

If incrementing occurs in a TPUm.TCNT write cycle, the TPUm.TCNT write takes precedence and TPUm.TCNT is not incremented (m = 0 to 11). Figure 22.51 shows the timing in this case.

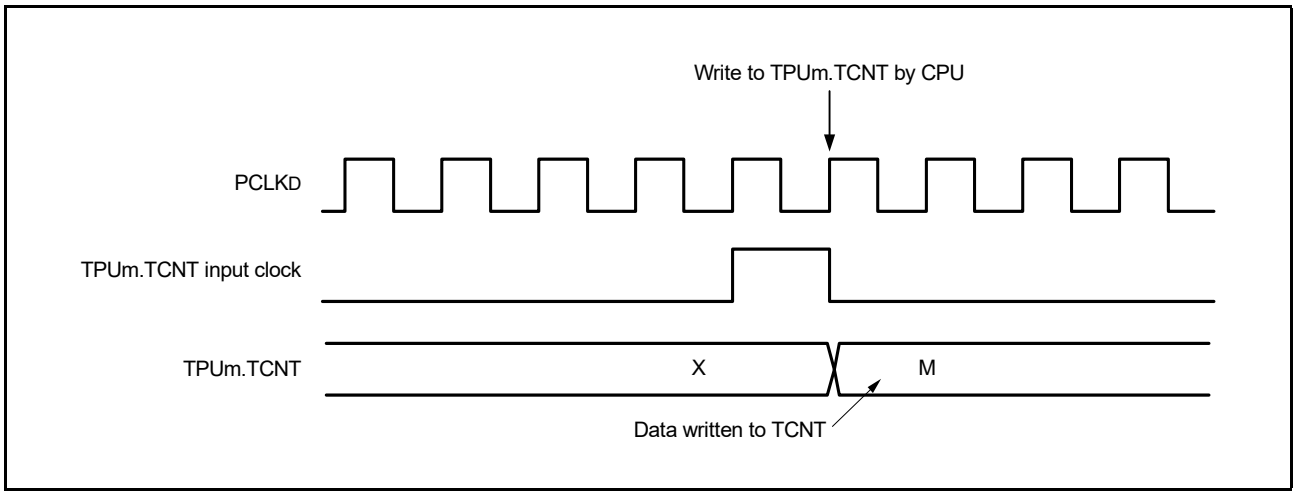

Figure 22.51 Conflict between TPUm.TCNT Write and Increment Operations

22.9.6 Conflict between TPUm.TGRy Write and Compare Match

If a compare match occurs in a TGRy write cycle, the TGRy write takes precedence and the compare match signal is disabled. A compare match also does not occur when the same value as before is written (y = A to D when m = 0, 3, 6, 9; y = A, B when m = 1, 2, 4, 5, 7, 8, 10, 11).
Figure 22.52 shows the timing in this case.

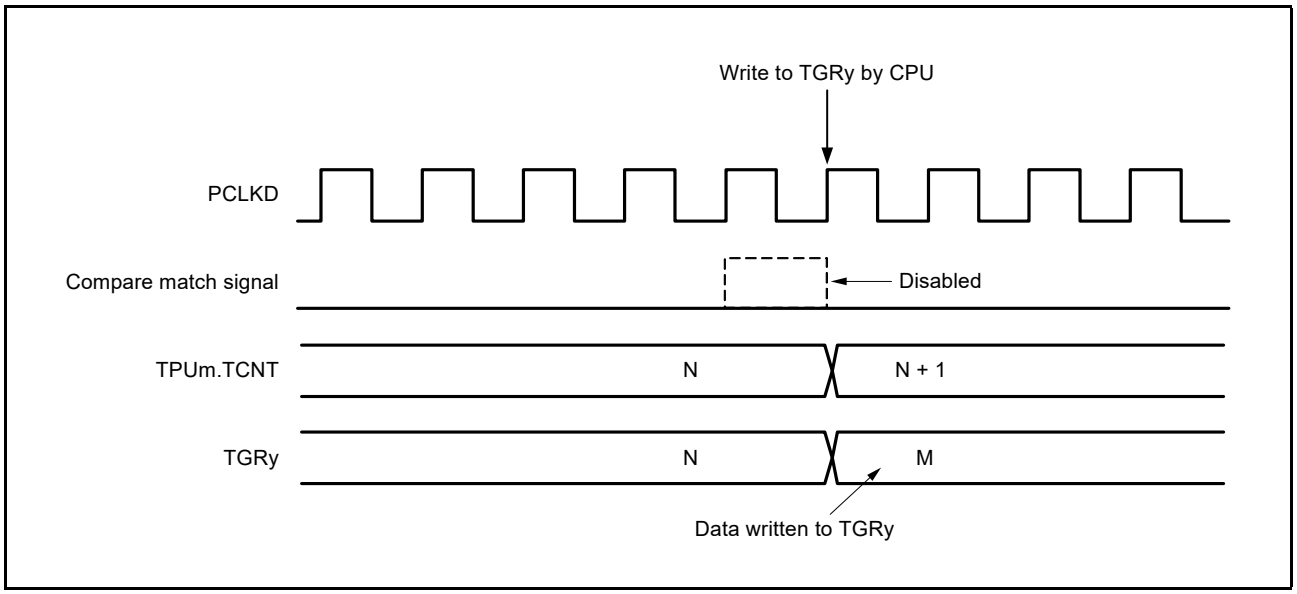

Figure 22.52 Conflict between TGRy Write and Compare Match

22.9.7 Conflict between Buffer Register Write and Compare Match

If a compare match occurs in a TGRy write cycle, the data transferred to TGRy by the buffer operation will be the data before writing (y = A to D when m = 0, 3, 6, 9; y = A, B when m = 1, 2, 4, 5, 7, 8, 10, 11).
Figure 22.53 shows the timing in this case.

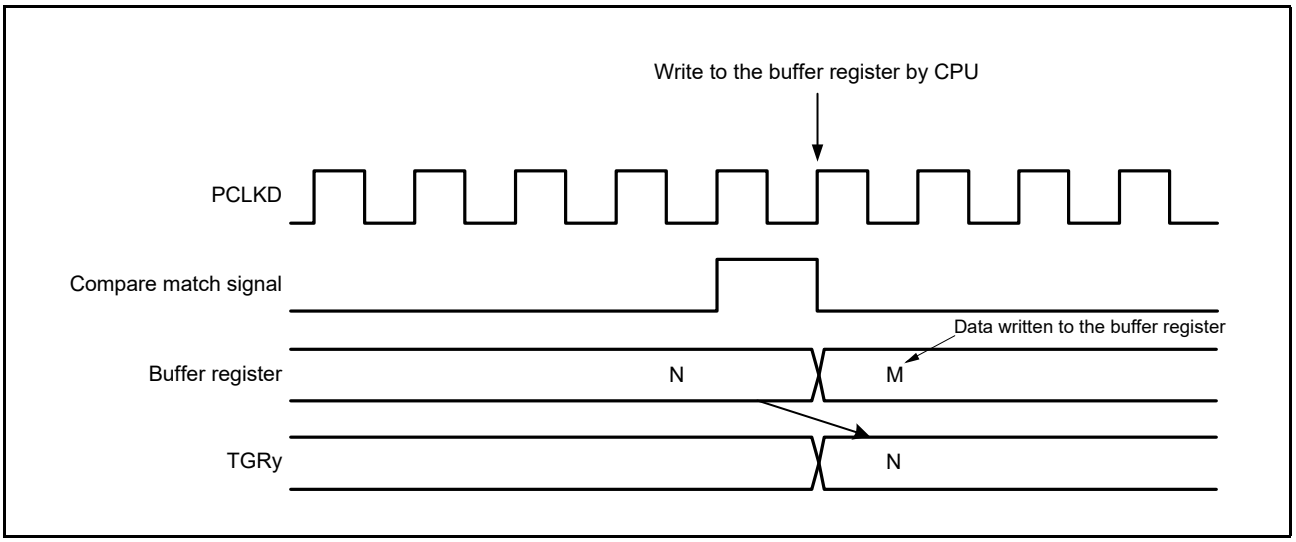

Figure 22.53 Conflict between Buffer Register Write and Compare Match

22.9.8 Conflict between TPUm.TGRy Read and Input Capture

If the input capture signal is generated in a TGRy read cycle, the data that is read will be the data before input capture transfer (y = A to D when m = 0, 3, 6, 9; y = A, B when m = 1, 2, 4, 5, 7, 8, 10, 11).
Figure 22.54 shows the timing in this case.

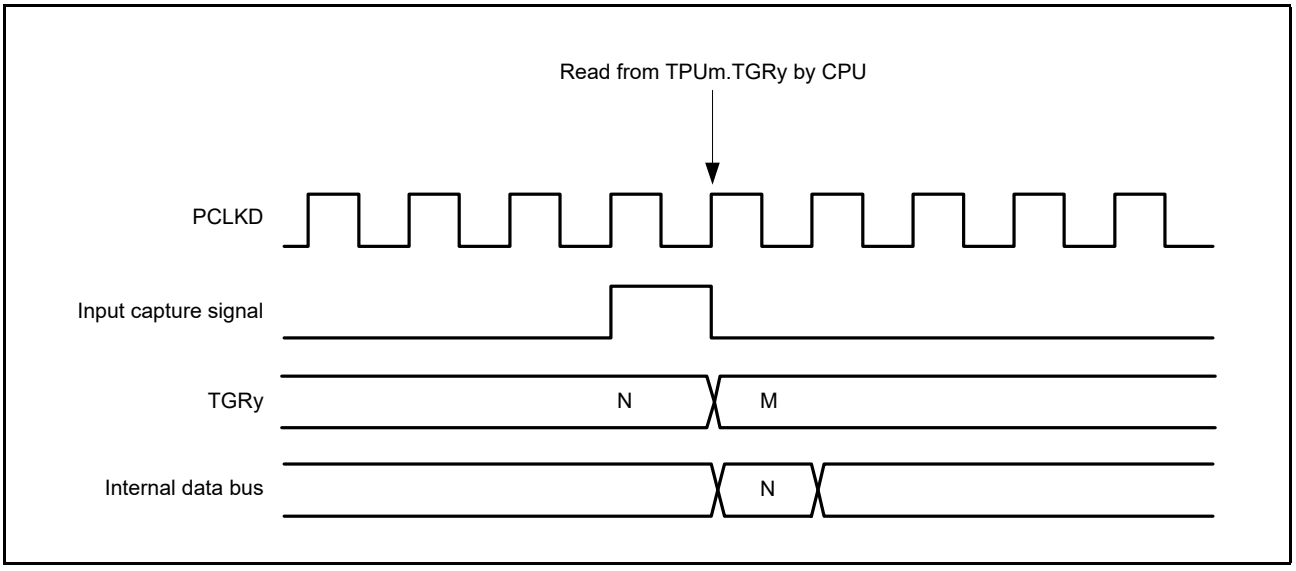

Figure 22.54 Conflict between Reading from the TPUm.TGRy Register and Input Capture

22.9.9 Conflict between TPUm.TGRy Write and Input Capture

If the input capture signal is generated in a TGRy write cycle, the input capture operation takes precedence and the write to TGRy is not performed (y = A to D when m = 0, 3, 6, 9; y = A, B when m = 1, 2, 4, 5, 7, 8, 10, 11). Figure 22.55 shows the timing in this case.

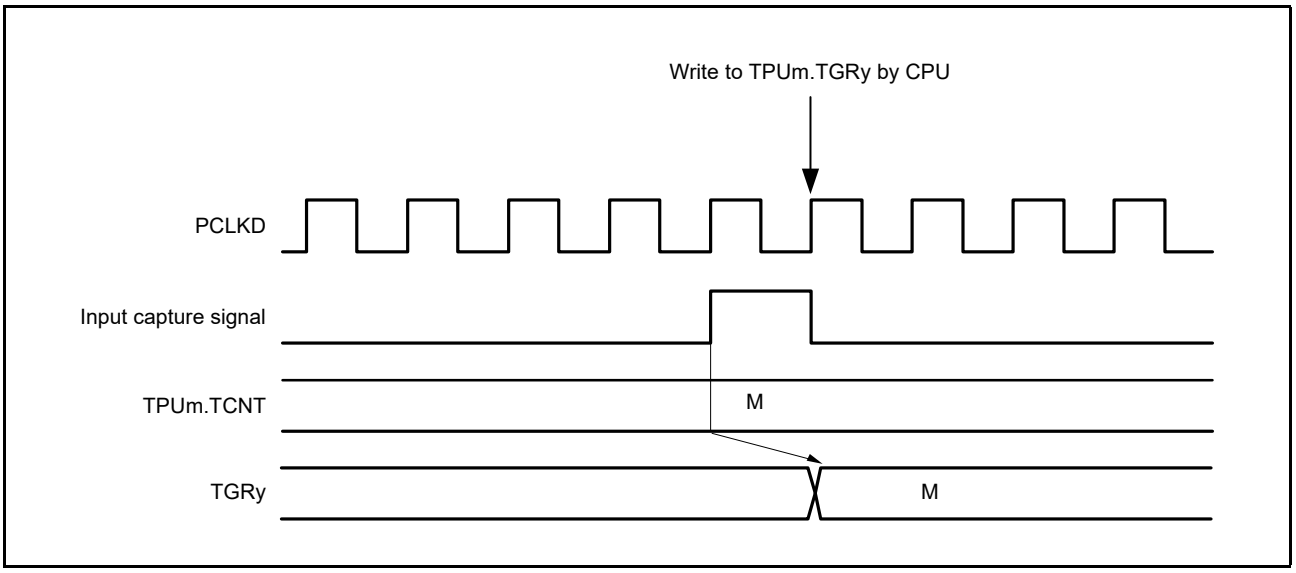

Figure 22.55 Conflict between Writing to the TPUm.TGRy Register and Input Capture

22.9.10 Conflict between Buffer Register Write and Input Capture

If the input capture signal is generated in a buffer register write cycle, the buffer operation takes precedence and the write to the buffer register is not performed (y = A to D when m = 0, 3, 6, 9; y = A, B when m = 1, 2, 4, 5, 7, 8, 10, 11). Figure 22.56 shows the timing in this case.

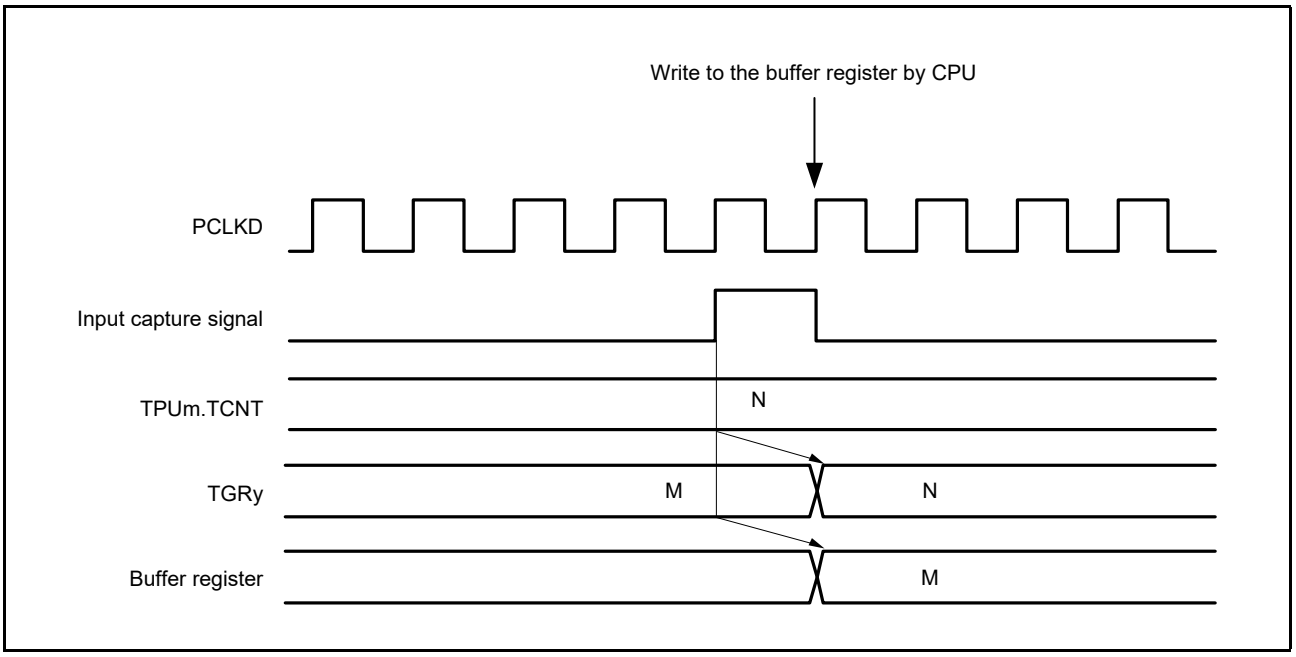

Figure 22.56 Conflict between Buffer Register Write and Input Capture

22.9.11 Conflict between Overflow/Underflow and Counter Clearing

If overflow/underflow and counter clearing*1 occur simultaneously, TPUm.TCNT counter is cleared and an overflow interrupt (TCImV)/underflow interrupt (TCInU) is generated (m = 0 to 11, n = 1, 2, 4, 5, 7, 8, 10, 11).
Figure 22.57 shows the operation timing when a TPUm.TGRy compare match is specified as the clearing source and FFFFh is set in TGRy (y = A to D when m = 0, 3, 6, 9; y = A, B when m = 1, 2, 4, 5, 7, 8, 10, 11).

Note 1. There are four counter clearing sources:
- Compare match
- Input capture
- Synchronous clearing
- Counter clear operation by an event signal

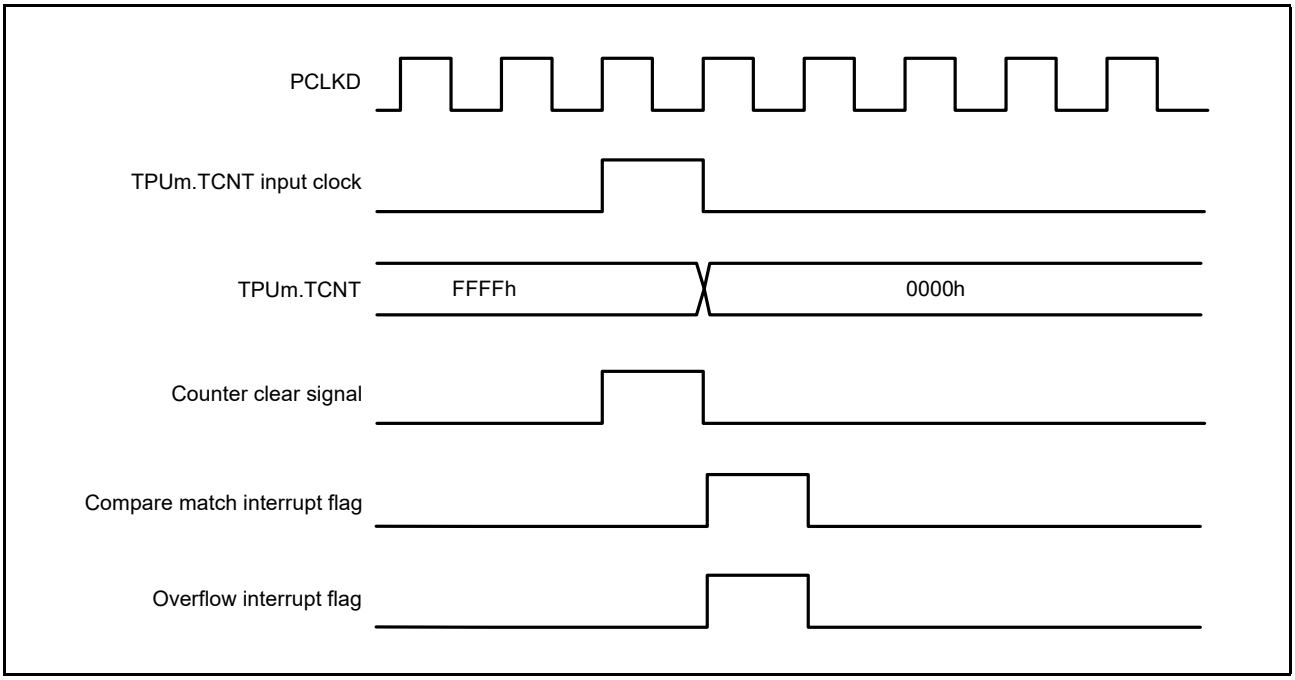

Figure 22.57 Conflict between Overflow and Counter Clearing

22.9.12 Conflict between TPUm.TCNT Write and Overflow/Underflow

If an overflow/underflow occurs due to increment/decrement in a TPUm.TCNT write cycle, the TPUm.TCNT write takes precedence.

Figure 22.58 shows the operation timing when there is conflict between TPUm.TCNT write and overflow (m = 0 to 11).

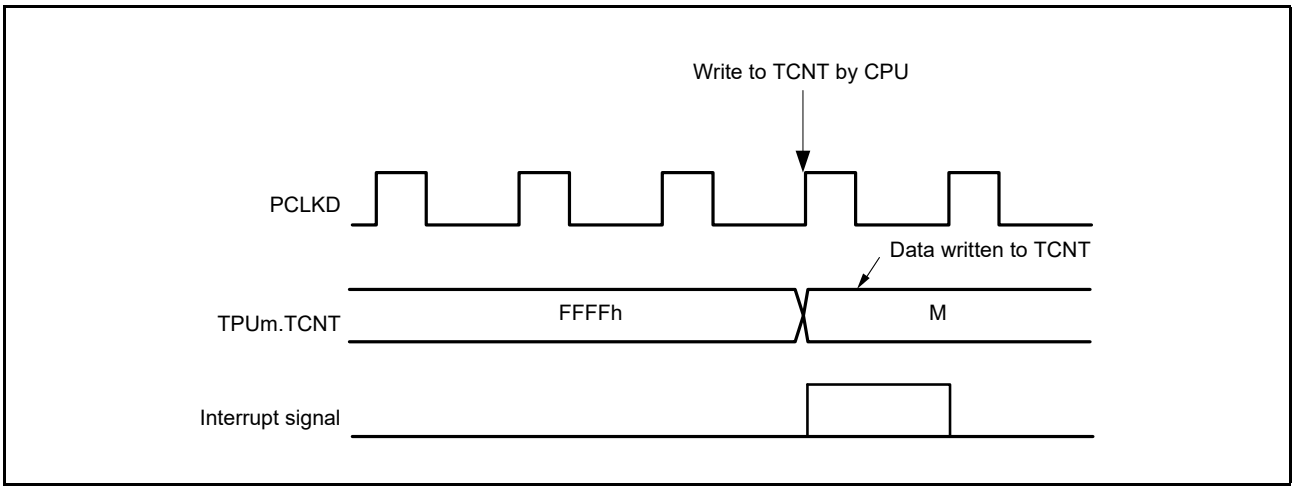

Figure 22.58 Conflict between TCNT Write and Overflow

22.9.13 Continuous Output of Interrupt Signal in Response to Compare Match

When TGRy is set to 0000h, PCLKD/1 is set as the counter clock, and compare match is set as the trigger for clearing of the counter clock, the value of the counter (TCNT) counter remains 0000h, and the interrupt signal will be output continuously (i.e. its level will be flat) rather than output over a single cycle. Consequently, interrupts will not be detected in response to second and subsequent compare matches. (y = A to D)

Figure 22.59 shows the timing for continuous output of the interrupt signal in response to a compare match.

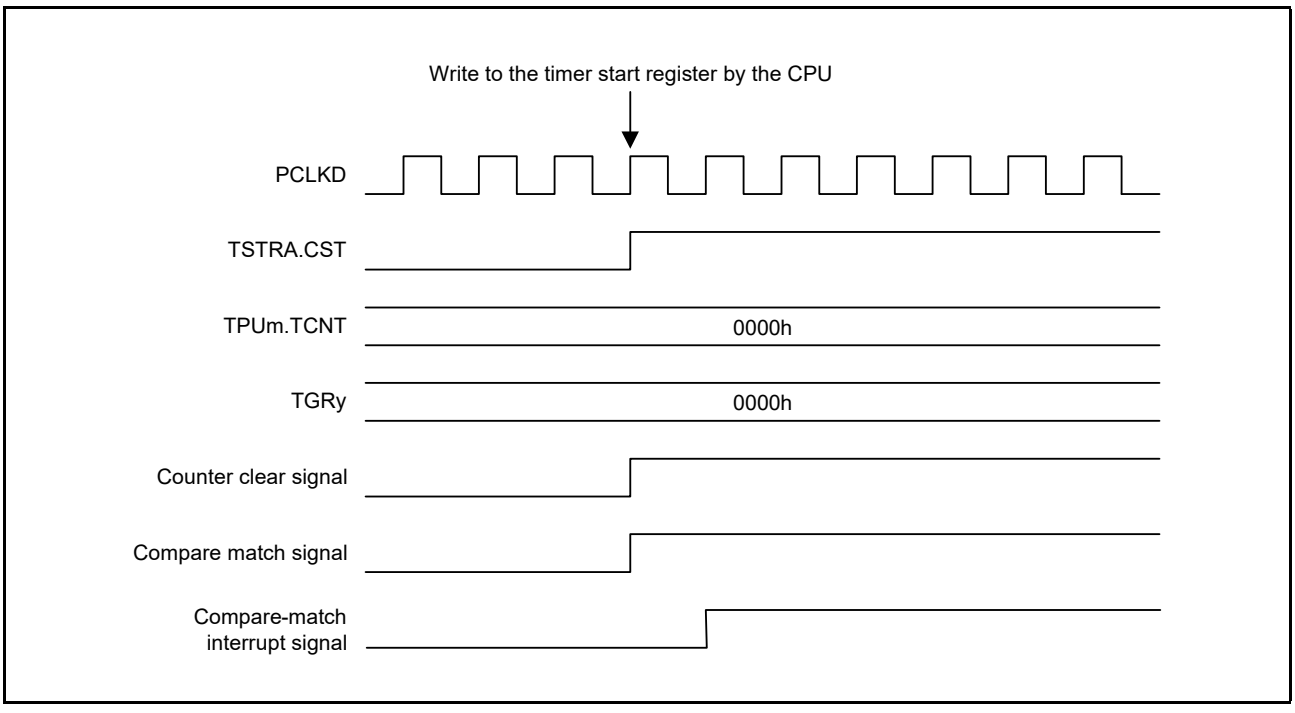

Figure 22.59 Continuous Output of the Interrupt Signal in Response to a Compare Match

22.9.14 Continuous Output of Interrupt Signal in Response to Input Capture

When input-capture signal is set on both edges and when the pulse width of the input-capture input equals to one PCLKD cycle detected by internal sampling, input capture is generated continuously on the rising and falling edges. Therefore, the interrupt signal will be output continuously (i.e. its level will be flat) rather than output over a single cycle. Consequently, interrupts will not be detected in response to second and subsequent input capture.
Figure 22.60 shows the timing for continuous output of the interrupt signal in response to input capture.

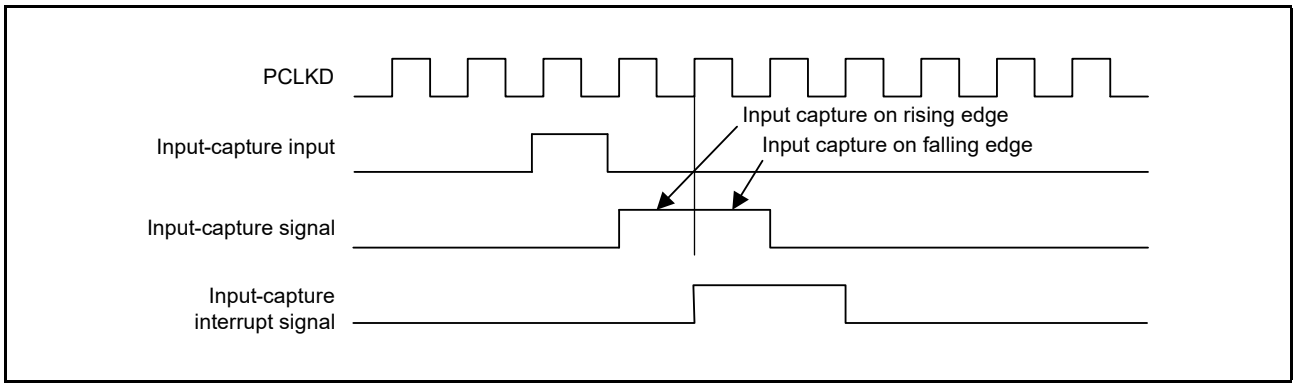

Figure 22.60 Continuous Output of the Interrupt Signal in Response to Input Capture

22.9.15 Continuous Output of Interrupt Signal in Response to Underflow

If two external clock signals' same direction edges to be phase counted are generated within two PCLKD cycles in phase counting mode 1, with TGRy being 0000h, and compare match set as the counter clear source, the TPUm.TCNT counter remains 0000h, and a compare-match interrupt signal and an underflow interrupt signal are output continuously to form a flat signal level (y = A to D, m = 1, 2, 4, 5, 7, 8, 10, 11). Consequently, interrupts will not be detected in response to second and subsequent compare match and underflow.

Figure 22.61 shows the timing for continuous output of the interrupt signal in response to underflow.

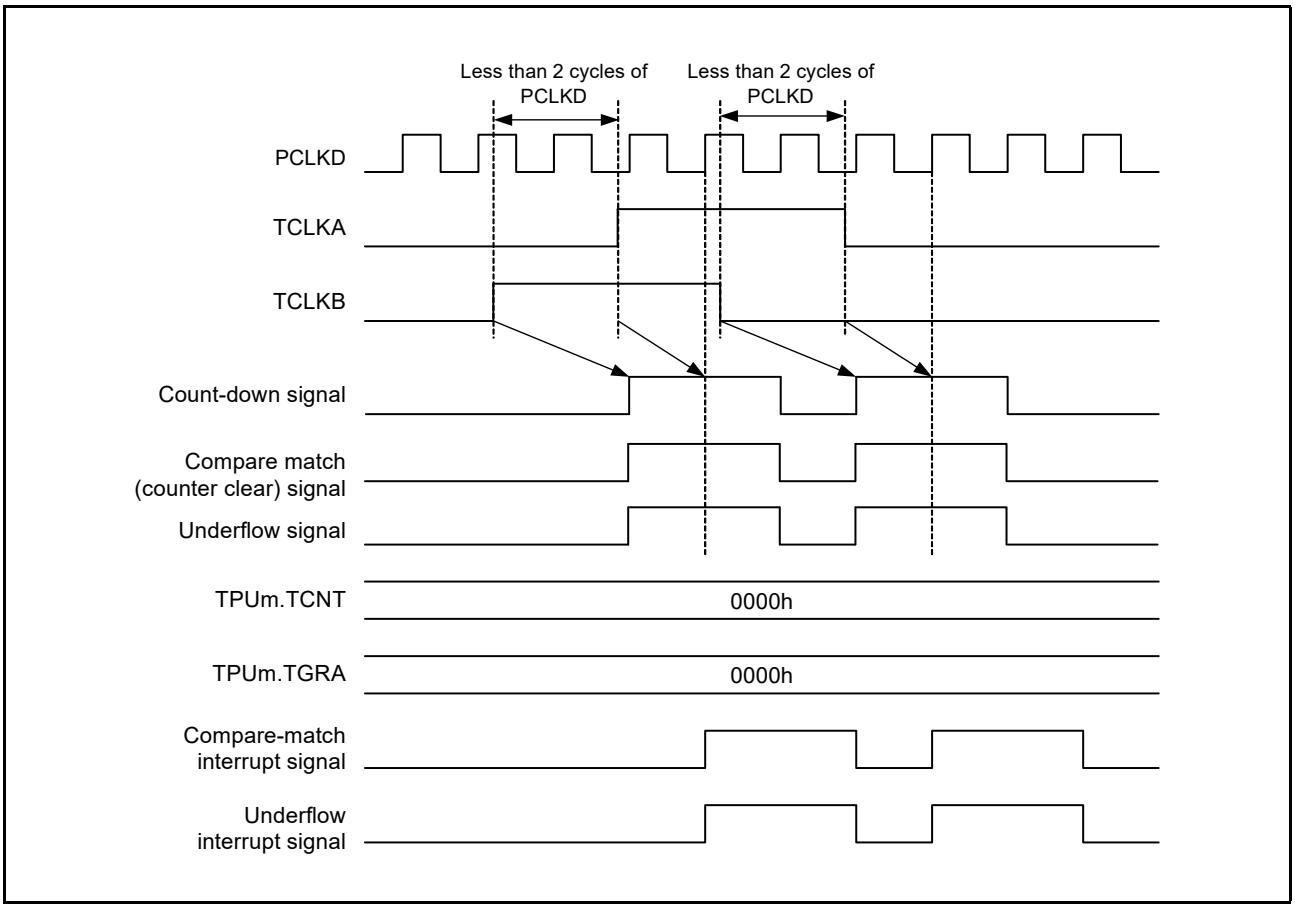

Figure 22.61 Continuous Output of the Interrupt Signal in Response to Underflow

22.9.16 Input Capture Operation in Cascaded Operation

When two 16-bit counters are cascade-connected, with the counter for the 16 higher-order bits (TPUm.TCNT; m = 1, 4, 7, 10) and the counter for the 16 lower-order bits TPUn.TCNT (n = 2, 5, 8, 11) being used together to form a 32-bit counter, if a rising edge is input to the TIOCAm and TIOCAn pins simultaneously, the value of the 16 higher-order bits is transferred to the TPUm.TGRA register and that of the 16 lower-order bits is transferred to the TPUn.TGRA register. However, even when a rising edge is input to the TIOCA1 and TIOCA2 pins simultaneously, the timing for capturing the 16 higher- and 16 lower-order bits may differ by one clock cycle due to the difference between the delays until they are latched within the LSI chip.

If such a difference coincides with an overflow of the lower-order 16-bit counter so that the value of the 32- bit counter is changing from 0000 FFFFh or 0001 0000h, while the actual value of the counter at the time of capture is 0000 FFFFh or 0001 0000h, the actual captured value may be 0000 0000h or 0001 FFFFh.

Accordingly, with input capture while the counters are in use as a 32-bit counter, if the value of the lower-order 16-bit counter when the values may deviate in the way described is 0000h or FFFFh, take care to handle processing for invalidation, for example, discarding the captured value.

Alternatively, use MTU3a, which has functionality for simultaneous input capture by two 16-bit timers cascaded to form a 32-bit timer in response to a single input trigger. For details, see section 19.6.21, Simultaneous Input Capture in MTU1.TCNT and MTU2.TCNT in Cascade Connection.

22.10 Link Operation (Unit 0 Only)

22.10.1 Transmitting an Event Signal to ELC

The TPU (unit 0) uses the ELC (event link controller) to perform link operation to the previously specified module using the interrupt request signal as the event signal.
The event signal can be output regardless of the setting of the interrupt request enable bits (TGIEA, TGIEB, TGIEC, or TGIED, and TCIEV, or TCIEU) of the corresponding TIER0 register.
Table 22.32 lists the event signals that can be transmitted through the respective channels.

Table 22.32 Ability of Interrupt Sources to Serve as Event Signals for Transmission to the ELC

Channel No.	Compare match A	Compare match B	Compare match C	Compare match D	Overflow	Underflow
Channel 0	√	√	√	√	√	—*1
Channel 1	√	√	—*2	—*2	√	√
Channel 2	√	√	—*2	—*2	√	√
Channel 3	√	√	√	√	√	—*1

√: Possible
—: Not possible
Note 1. Channels 0 and 3 do not have these interrupt request signals since they will never underflow.
Note 2. Channels 1 and 2 do not have these interrupt request signals since they do not have TGRC and TGRD registers.

22.10.2 Receiving an Event Signal from ELC

The TPU (unit 0) can perform any of the following three operations using the event link setting register of the ELC (event link controller).

(1) Start Counting

When an event signal is received while the TPU count start operation is selected by the ELOPF register of the ELC, the CSTn bit in TSTRA (the timer start register) is set to 1 and counting starts.
However, if this event is generated for the channels when the CSTn bit is set to 1, the event is ignored.
Table 22.33 lists the CSTn bits in TSTR used for each channel.
Figure 22.62 shows the timing of the count start operation.

For details on the setting procedure to start counting, see section 22.3.1, (1) Counter Operation.

Table 22.33 Correspondence between Channels and CSTn Bits in TSTRA

Channel No.	CSTn Bits in TSTRA
Channel 0	CST0
Channel 1	CST1
Channel 2	CST2
Channel 3	CST3

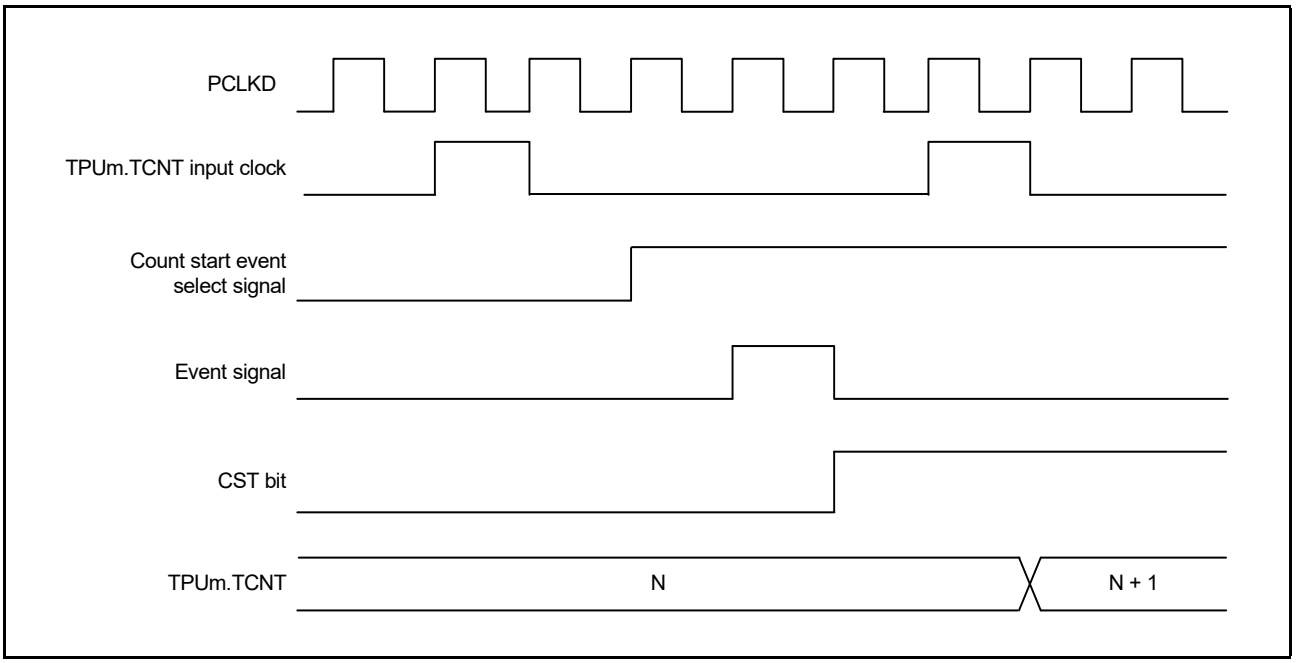

Figure 22.62 Start Counting on Reception of the Event Signal

(2) Clear Counting

Counter clearing operation of a TPU is selected by the ELOPF register of the ELC. When the event specified in the corresponding ELSRn register is generated, the timer counter (TCNT) is returned to its initial value (0000h). Counting continues, however, if the setting of the CSTn bit of the timer start register (TSTRA) is 1 at this time, so counting can be automatically restarted in this way.

Table 22.33 lists the CSTn bits in TSTR used for each channel.

Figure 22.63 shows the timing of the count restart operation.

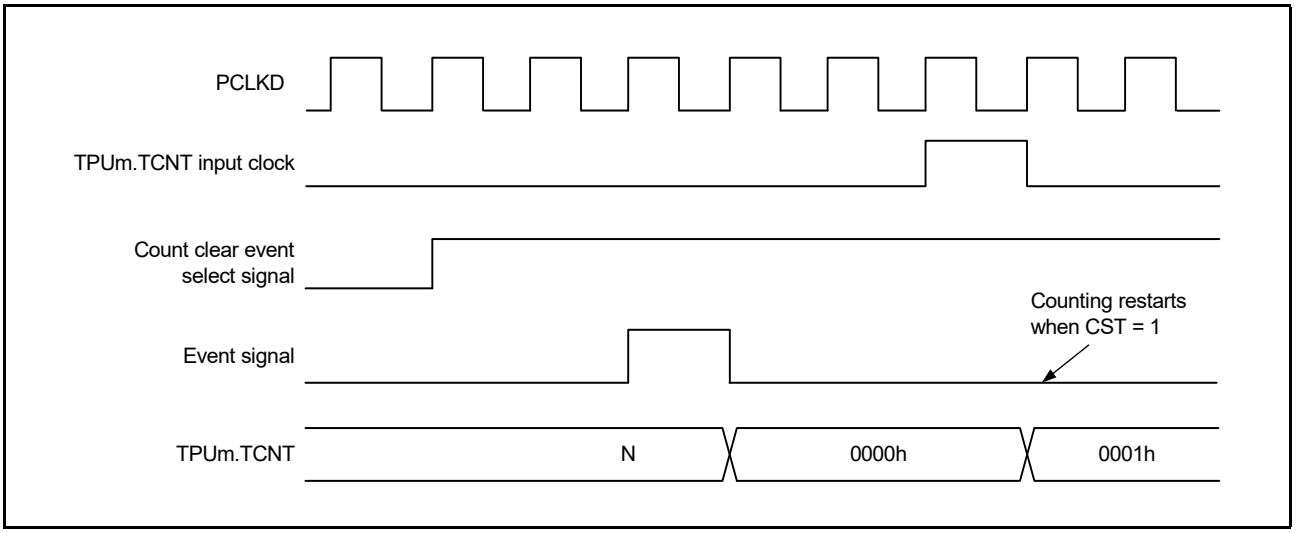

Figure 22.63 Restart Counting on Reception of the Event Signal

(3) Input Capture Operation

When an event signal is received while the TPU input capture operation is selected by the ELOPF register of the ELC, the value of TCNT (the timer counter) of the corresponding channel is captured in TGRA (timer general register A).
When using input capture due to the event link, set the IOA bit in TIOR (the timer I/O control register) to specify input capture, and then set the CSTn bit in TSTRA (the timer start register) to 1 to start counting.
Table 22.34 lists TGRA and TIOR register bits used for each channel. For the CSTn bits in TSTRA used for each channel, see Table 22.33.
Figure 22.64 shows the timing of input capture operation.
When input capture operation due to the event link is selected, the setting of TIOR and the corresponding input capture (the linkage of the TIOCAm pin (input capture pin) input with the specific operation of other channels) are not effective (n = 0 to 11).

For details on the setting procedure for input capture, see section 22.3.1, (3) Input Capture Function.

Table 22.34 TGR and TIOR Used for Input Capture by ELC

Channel No.	Capture Destination Registers	Bits in TIOR
Channel 0	TGRA (channel 0)	IOA[3:0] bits (TIORH0)
Channel 1	TGRA (channel 1)	IOA[3:0] bits (TIOR1)
Channel 2	TGRA (channel 2)	IOA[3:0] bits (TIOR2)
Channel 3	TGRA (channel 3)	IOA[3:0] bits (TIORH3)

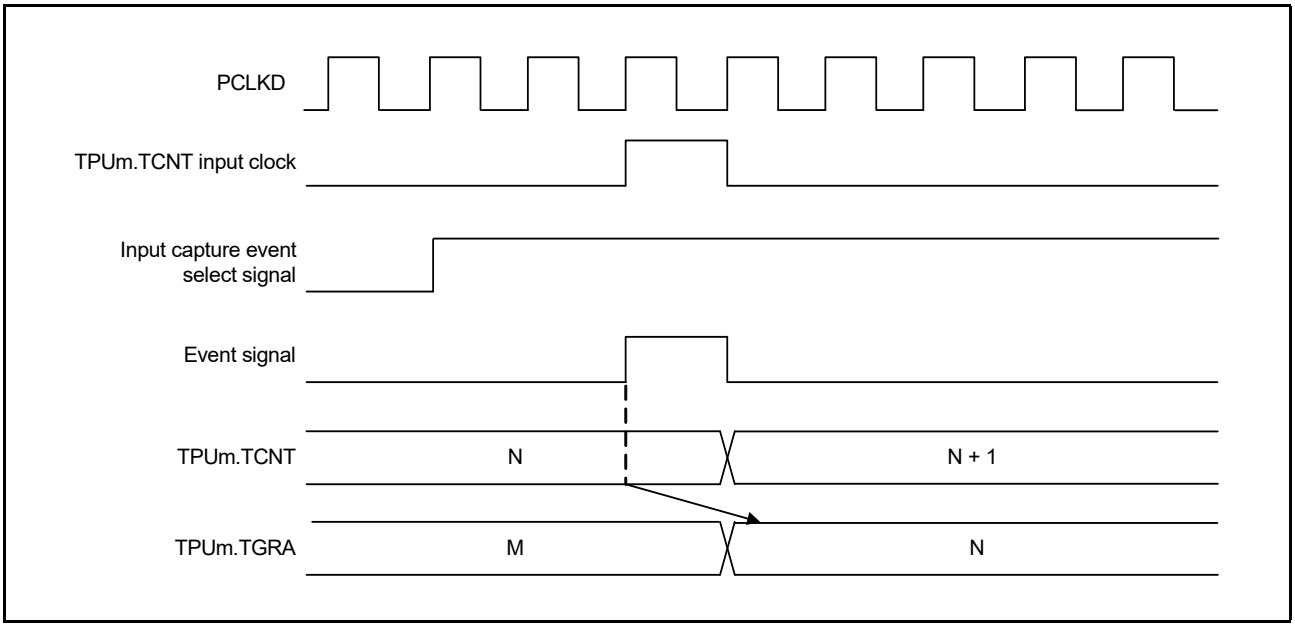

Figure 22.64 Input Capture on Reception of the Event Signal

22.10.3 Usage Notes on Operation on Reception of the Event Link Signal

The followings are the notes on using the TPU (unit 0) for event link operations.

(1) Start Counting

When writing to the CSTn bit in TSTRA (the timer start register) and a counting start are in contention, writing to the CSTn bit does not proceed since setting of the CSTn bit to 1 in response to the event takes priority.
Figure 22.65 shows the timing in this case.
Furthermore, even when a counting start due to the event link is selected, CPU writing to the CSTn bit proceeds if the event signal is at a low level.

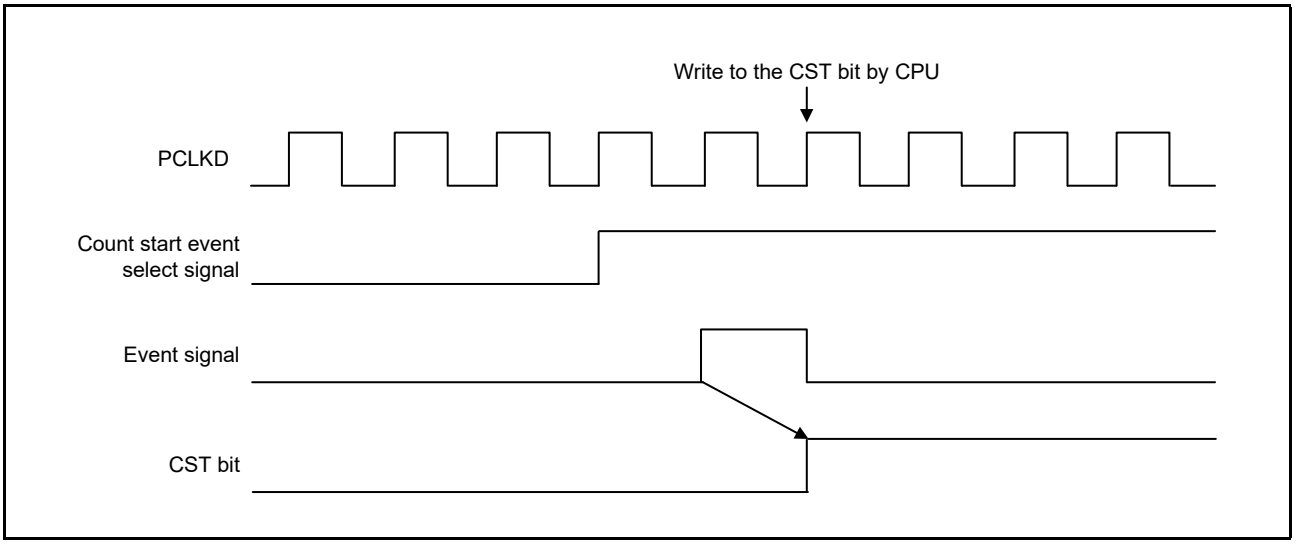

Figure 22.65 Conflict between Writing to the CSTn Bit and Counting Start

(2) Clear Counting

When a TCNT (a timer counter) write cycle and a counting clear are in contention, writing to TCNT does not proceed since the counter value initialization in response to the counting clear takes priority.
Figure 22.66 shows the timing in this case.
Furthermore, even when a counting clear due to the event link is selected, CPU writing to TCNT proceeds if the event signal is at a low level.

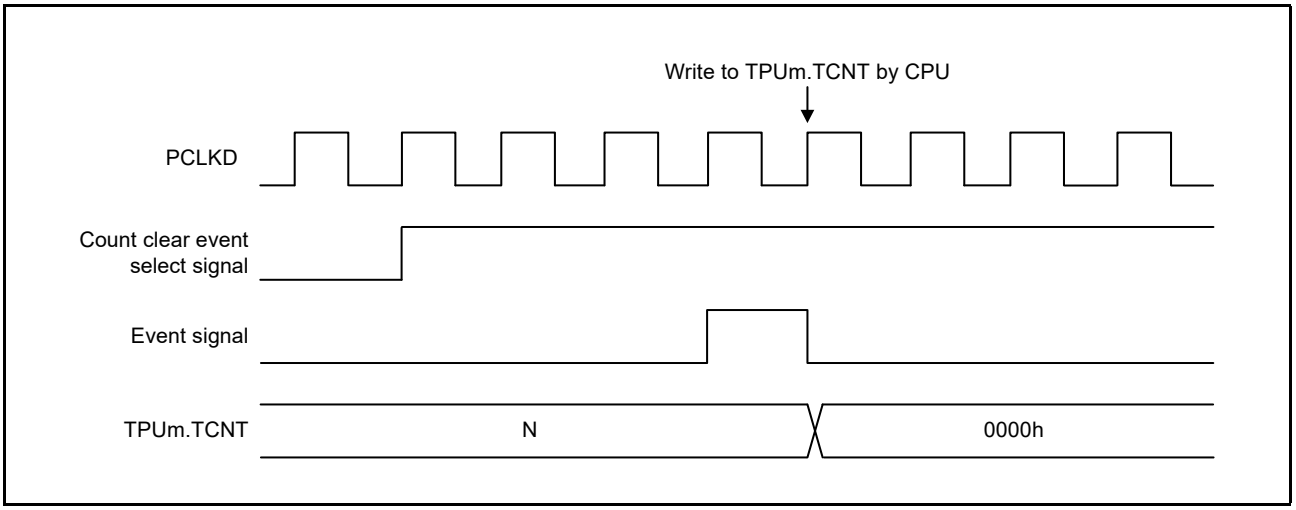

Figure 22.66 Conflict between TCNT Write Cycle and Counting Clear

(3) Input Capture Operation

If a TGRy (the timer general register) read/write cycle and input capture operation are in contention, operation proceeds as follows (y = A to D).

(a) Conflict between TGRy Read Cycle and Input Capture

The internal data bus reads the data before input capture transfer.
Figure 22.67 shows the timing in this case.

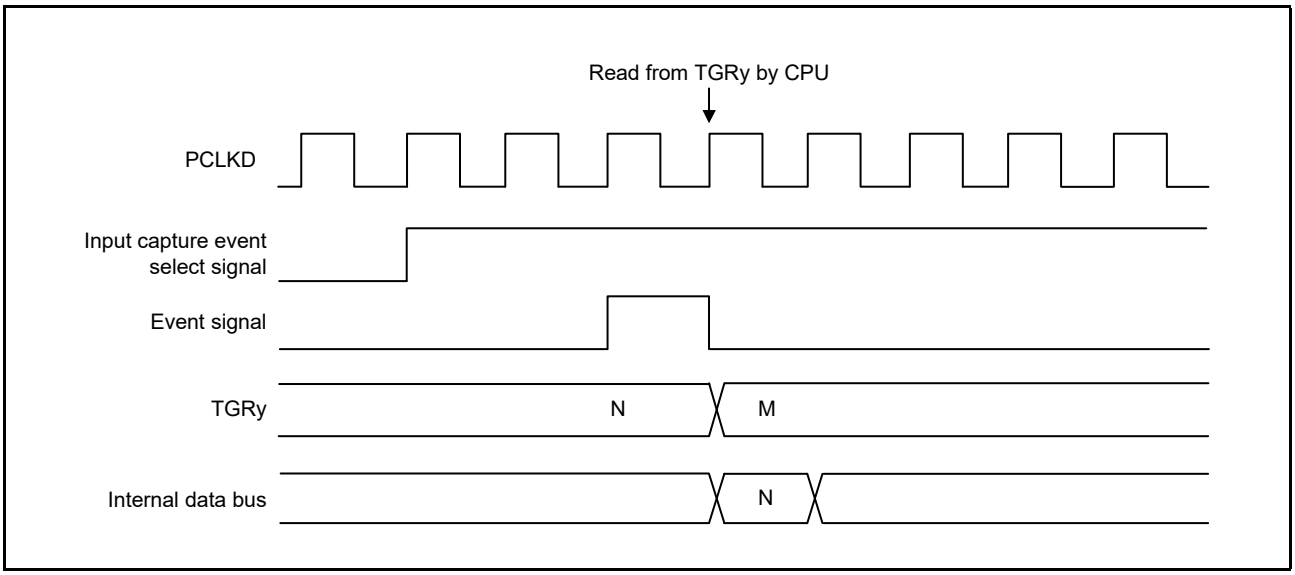

Figure 22.67 Conflict between TGRy Read Cycle and Input Capture Operation

(b) Conflict between TGRy Write Cycle and Input Capture

Writing to TGRy does not proceed since input capture takes priority.
Figure 22.68 shows the timing in this case.
Furthermore, even when input capture operation due to the event link is selected, CPU writing to TGRy proceeds if the event signal is at a low level.

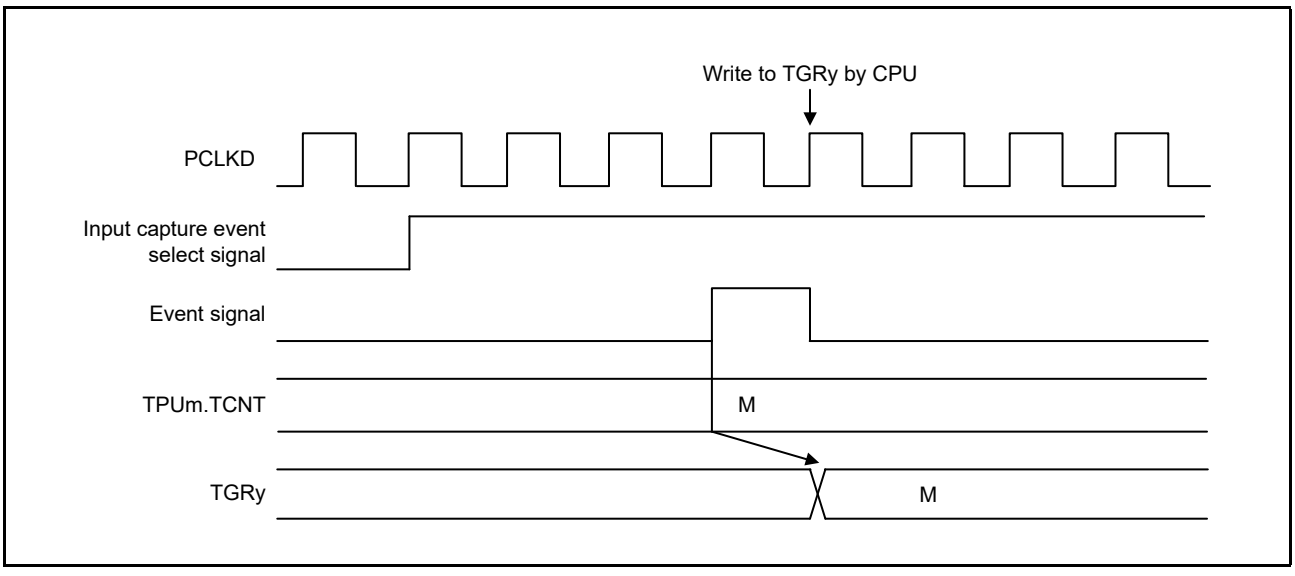

Figure 22.68 Conflict between TGRy Write Cycle and Input Capture Operation

22.10.4 Notes on Transmitting the Event Link Signal

The followings are the notes on transmitting the event link signal.

(1) Transmitting the Compare Match Event Signal

When the TGRy register is set to 0000h, PCLKD/1 is set as the counter clock (TCRn.TPSC[2:0] = 000b), and compare match is set as the trigger for clearing of the counter clock , the value of the TCNT remains 0000h, and the event output signal will be output continuously (i.e. its level will be flat) rather than output over a single cycle (y = A to D).
Figure 22.69 shows the timing for continuous output of the event output signal in response to a compare match.

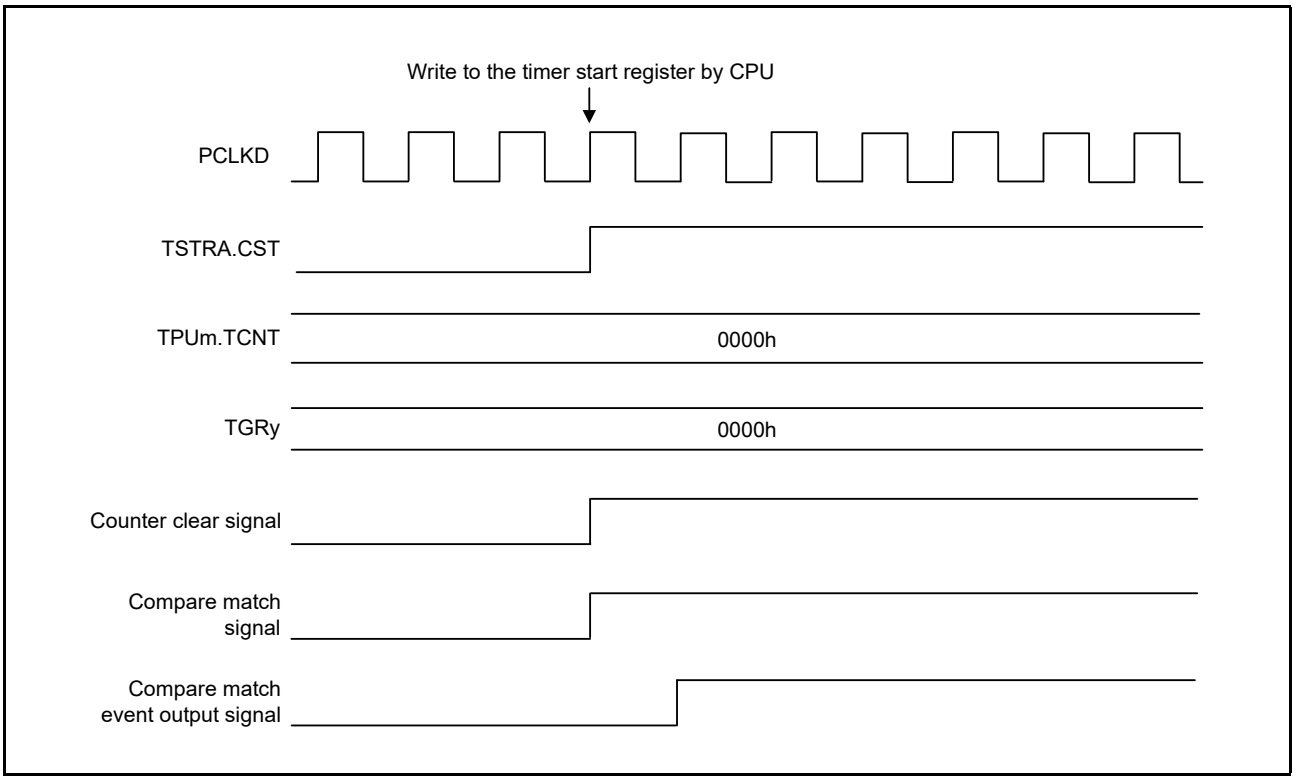

Figure 22.69 Continuous Output of the Compare Match Event Output Signal

(2) Transmitting the Underflow Event Signal

If two external clock signals' same direction edges to be phase counted are generated within two PCLKD cycles in phase counting mode 1, with TGRy being 0000h, and compare match set as the counter clear source, the TCNT counter remains 0000h, and a compare-match event signal and an underflow event signal are output continuously to form a flat signal level (y = A to D).

Figure 22.70 shows the timing for continuous output of the event output signal in response to underflow.

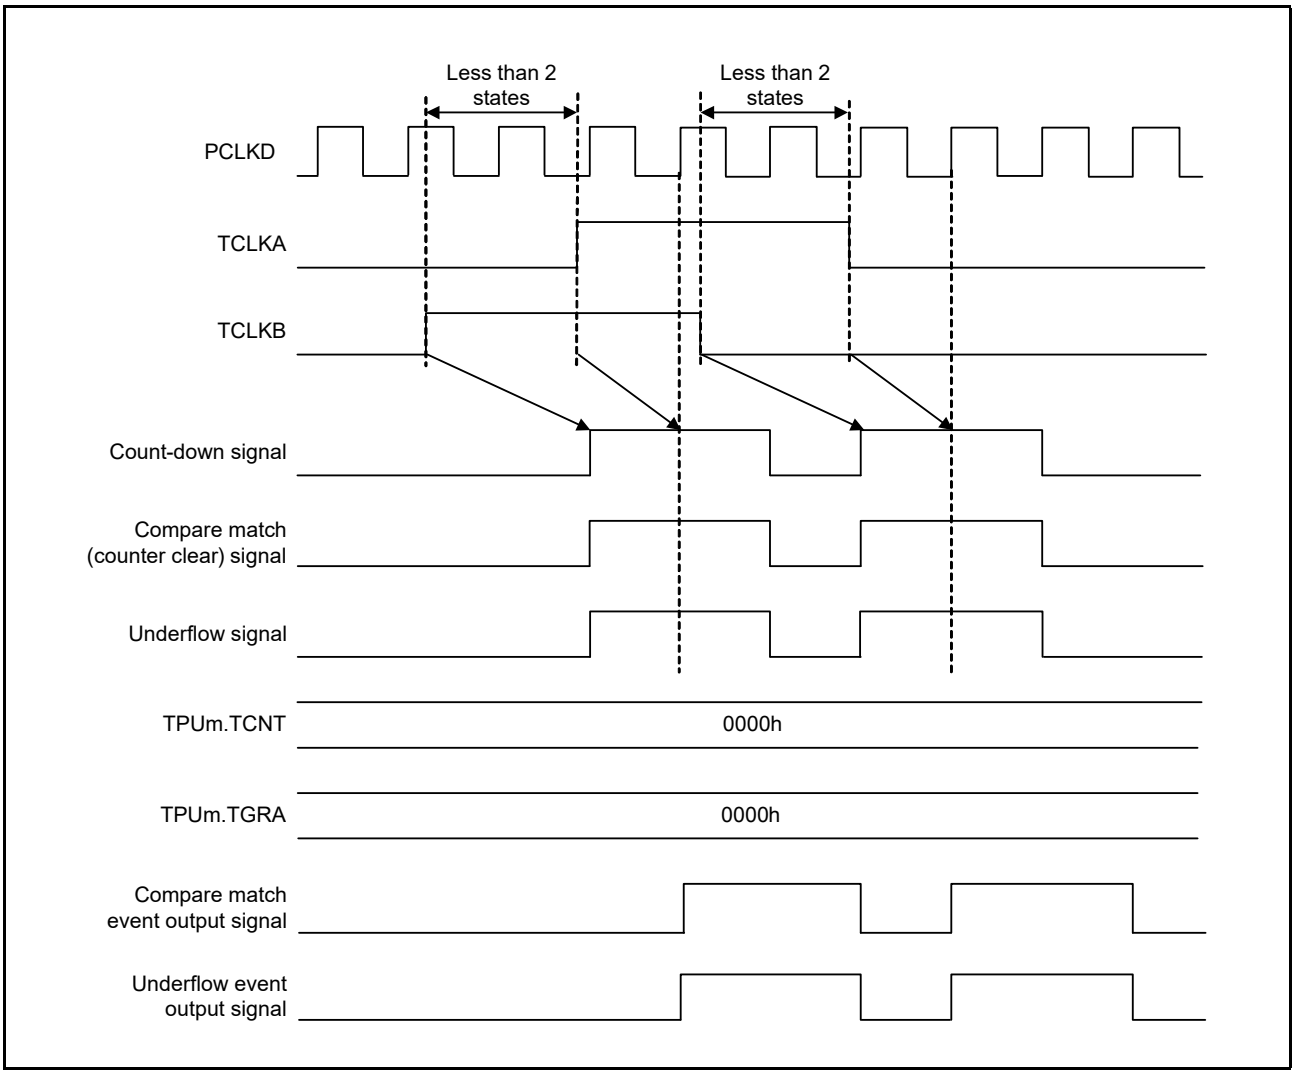

Figure 22.70 Continuous Output of the Underflow Event Output Signal

23. Programmable Pulse Generator (PPG)

The programmable pulse generator (PPG) generates pulse outputs by using the 16-bit timer pulse unit (TPUa) and the multi-function timer pulse unit 3 (MTU3a) as a time base.
The pulse outputs from the PPGs are divided into 4-bit groups, and one PPG unit has four groups (16 bits) of pulse output pins.
Individual pulse output groups can operate all simultaneously and independently.
This LSI has two internal PPG units (PPG0 and PPG1).

23.1 Overview

Table 23.1 lists the specifications of the PPG and Table 23.2 lists PPG functions.
Figure 23.1 shows a block diagram of the PPG.

Table 23.1 Specifications of PPG

Item	Specifications
Number of output bits	Up to 32 bits (Two units are used. Up to 16 bits per unit.)*1
Pulse output	• Two units, each capable of output through four pin groups • Output trigger signals are selectable. • Non-overlapping operation is possible. • Inverted output is selectable.
Output data transfer	Can operate together with the DMAC (when TPUa (unit 0) and MTU3a interrupts are in use)
Power consumption reducing function	Module-stop state can be set for each unit.

Note 1. One unit for 176-pin devices (only unit 0 is provided)

23.2 Register Descriptions

23.2.1 PPG Trigger Select Register (PTRSLR)

The PTRSLR register selects the trigger input for PPG (unit 1) from the multi-function timer pulse unit 3 (MTU3a) or from unit 0 of the 16-bit timer pulse unit (TPUa).

Address(es): PPG1: A008 0520h

Bit	Symbol	Bit Name	Description	R/W
b0	PTRSL	PPG Trigger Select	Selects the output trigger channels for PPG1 from the set of MTU0 to MTU3, or from the set of TPU0 to TPU3. 0: Selects the set of MTU0 to MTU3 as the trigger channels for PPG1. 1: Selects the set of TPU0 to TPU3 as the trigger channels for PPG1.	R/W
b7 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

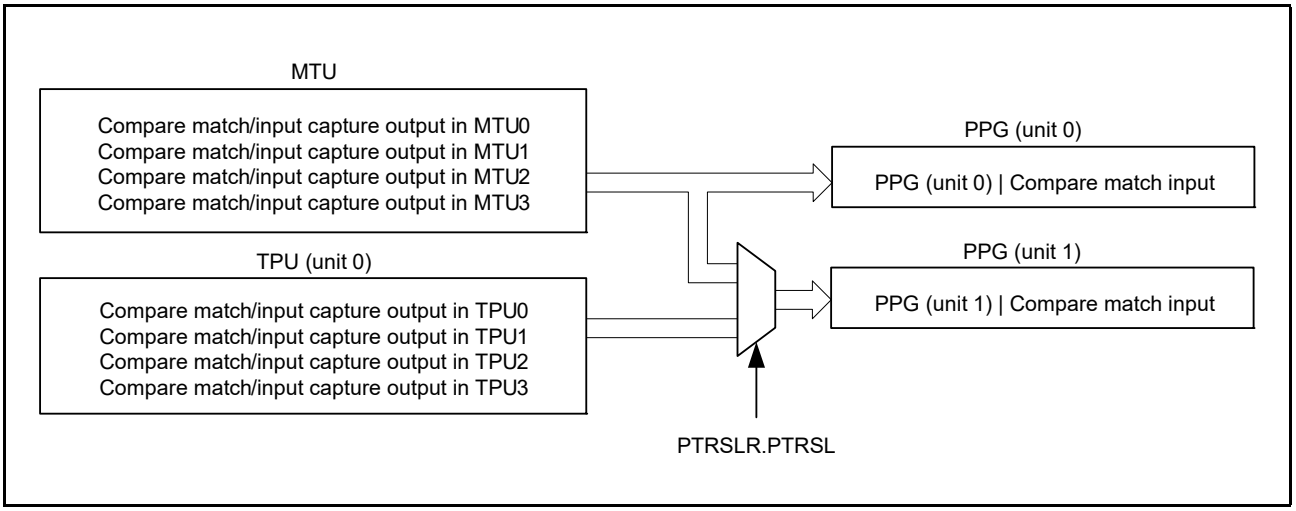

Figure 23.2 Block Diagram of PPG Trigger Selection

23.2.2 Next Data Enable Registers H (NDERH) Next Data Enable Registers L (NDERL)

The NDERH and NDERL registers select the pins (PO15 to PO8) and pins (PO7 to PO0), respectively, for outputs of pulse on a bit-by-bit basis. By setting the bits corresponding to individual pins so that data transfer is enabled, pulse output is enabled for the pins.

b7	NDER7	Next Data Transfer Enable		R/W

NDER0 to NDER7 Bits (Next Data Transfer Enable)

When these bits are set to 1, if the trigger selected in PCR occurs, data is transferred from the corresponding bit in NDRL to the bit in PODRL. When these bits are set to 0, the data is not transferred from NDRL to PODRL.

23.2.3 Output Data Registers H (PODRH) Output Data Registers L (PODRL)

The PODRH and PODRL registers store the values output from the pins for pulse output (PO15 to PO8, PO7 to PO0). When an output trigger is generated, the values of bits for which data transfer is enabled in the NDERH register are transferred from the NDRH register to the corresponding bits in the PODRH register. In the same way, the values of bits for which data transfer is enabled in the NDERL register are transferred from the NDRL register to the corresponding bits in the PODRL register.

Bit	Symbol	Bit Name	Description	R/W
b0	POD8	Output Data Register	0: The low level is output on the POi pin. 1: The high level is output on the POi pin. (i = 15 to 8)	R/W
b1	POD9	Output Data Register		R/W
b2	POD10	Output Data Register		R/W
b3	POD11	Output Data Register		R/W
b4	POD12	Output Data Register		R/W
b5	POD13	Output Data Register		R/W
b6	POD14	Output Data Register		R/W
b7	POD15	Output Data Register		R/W

POD8 to POD15 Bit (Output Data Register)

When an output trigger is generated during PPG operation, the values of bits for which data transfer is enabled in the NDERH register are transferred from the NDRH register to the corresponding bits in this register. Writing from the CPU to this register is impossible while NDERH is set to 1. The initial output level for the pulse signal can be set when the value in the NDERH register is 0.

- PODRL

Bit	Symbol	Bit Name	Description	R/W
b0	POD0	Output Data Register	0: The low level is output on the POi pin. 1: The high level is output on the POi pin. (i = 7 to 0)	R/W
b1	POD1	Output Data Register		R/W
b2	POD2	Output Data Register		R/W
b3	POD3	Output Data Register		R/W
b4	POD4	Output Data Register		R/W
b5	POD5	Output Data Register		R/W
b6	POD6	Output Data Register		R/W
b7	POD7	Output Data Register		R/W

POD0 to POD7 Bit (Output Data Register)

When an output trigger is generated during PPG operation, the values of bits for which data transfer is enabled in the NDERL register are transferred from the NDRL register to the corresponding bits in this register. Writing from the CPU to this register is impossible while the NDERL register is set to 1. The initial output level for the pulse signal can be set when the value in the NDERL register is 0.

23.2.4 Next Data Registers H (NDRH) Next Data Registers L (NDRL)

The NDRH and NDRL registers store the next data to be output from the pins for pulse output (PO15 to PO8, PO7 to PO0).

Address(es): PPG0: NDRH A008 050Ch, NDRH2 A008 050Eh
PPG1: NDRH A008 051Ch, NDRH2 A008 051Eh

	b7	b6	b5	b4	b3	b2	b1	b0
NDRL	NDR7	NDR6	NDR5	NDR4	NDR3	NDR2	NDR1	NDR0
Value after reset:	0	0	0	0	0	0	0	0

- NDRH

The NDRH address differs depending on whether the same output trigger signal is set or different output trigger signals are set for pulse output groups in the PCR register.

(1) When pulse output groups 2 and 3 have the same output trigger signal
If pulse output groups 2 and 3 have the same output trigger signal, all eight bits in the NDRH register are mapped to the same address*1 and can be accessed at one time.

- PPG0: NDRH A008 050Ch (groups 2 and 3 are mapped)
- PPG1: NDRH A008 051Ch (groups 6 and 7 are mapped)

Bit	Symbol	Bit Name	Description	R/W
b0	NDR8	Next Data Register	The output trigger signal specified by PCR transfers the values in this register to the corresponding bits in PODRH.	R/W
b1	NDR9	Next Data Register		R/W
b2	NDR10	Next Data Register		R/W

b7 to b4	—	Reserved	These bits are read as 1. The write value should be 1.	R/W

23.2.5 PPG Output Control Register (PCR)

The PCR register selects the timers for use in pulse output trigger signals and associated channels on a group-by-group basis.

Types of compare match signals for the individual timers in use differ according to the output mode set in the PMR register. For details, see section 23.2.6, PPG Output Mode Register (PMR).

23.2.6 PPG Output Mode Register (PMR)

The PMR register selects the pulse output mode and whether to invert the output or not of the PPG on a group-by-group basis.

While inverted output is selected, a low-level pulse is output to the corresponding pins when the values in PODRH and PODRL are 1, and a high-level pulse is output to the corresponding pins when the values in PODRH and PODRL are 0. In addition, when non-overlapping operation is selected, the programmable pulse generator (PPG) updates its output values on compare match A or B in MTU3a or TPUa that functions as an output trigger.

For details, see section 23.3.4, Non-Overlapping Pulse Output.

23.3 Operation

Figure 23.3 shows a schematic diagram of the programmable pulse generator (PPG).
Pulse output for individual pins is enabled when the bits corresponding to individual pulse output pins in NDERH and NDERL are set to 1 (data transfer is enabled).
An initial output value is determined by the initial settings (in PODRH and PODRL) corresponding to individual pulse output pins. When the compare match event specified as the output trigger signal by PCR occurs, the output values are updated by transfer of the values in NDRH and NDRL to PODRH and PODRL, respectively.
Consecutive output of up to 16 bits of data per unit is possible by writing new output data to NDRH and NDRL before the next compare match.

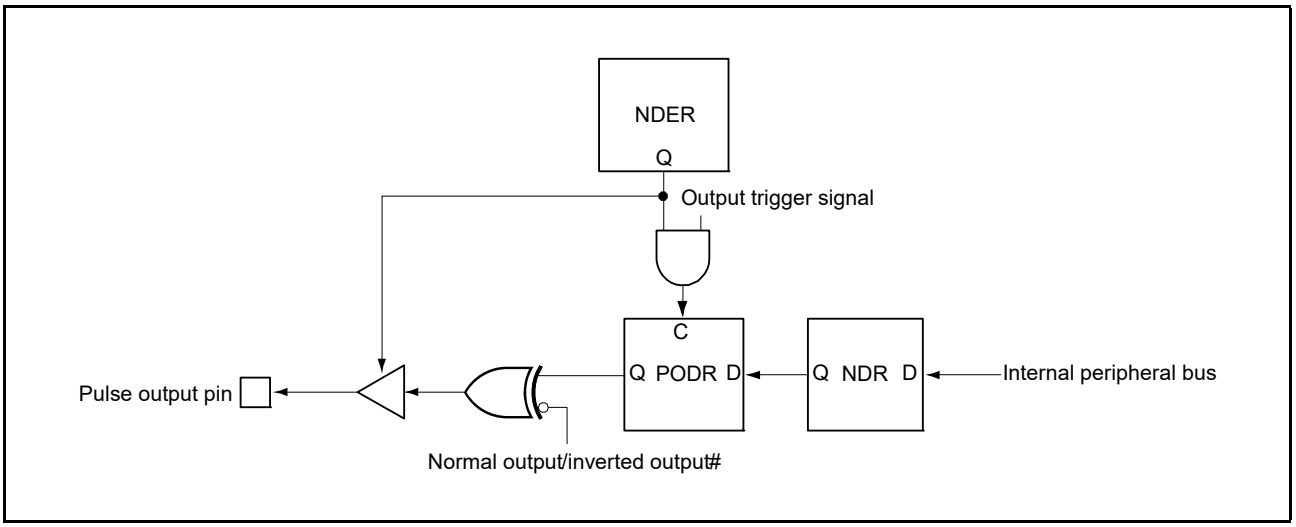

Figure 23.3 Schematic Diagram of PPG

23.3.1 Output Timing

When the selected compare match event occurs while pulse output is enabled, the contents in NDRH and NDRL are transferred to PODRH and PODRL, respectively, and then the values are output on the pulse output pins.
Figure 23.4 shows the timing of the above operation. In this case, the timing when compare match A triggers normal output from groups 2 and 3 is shown.

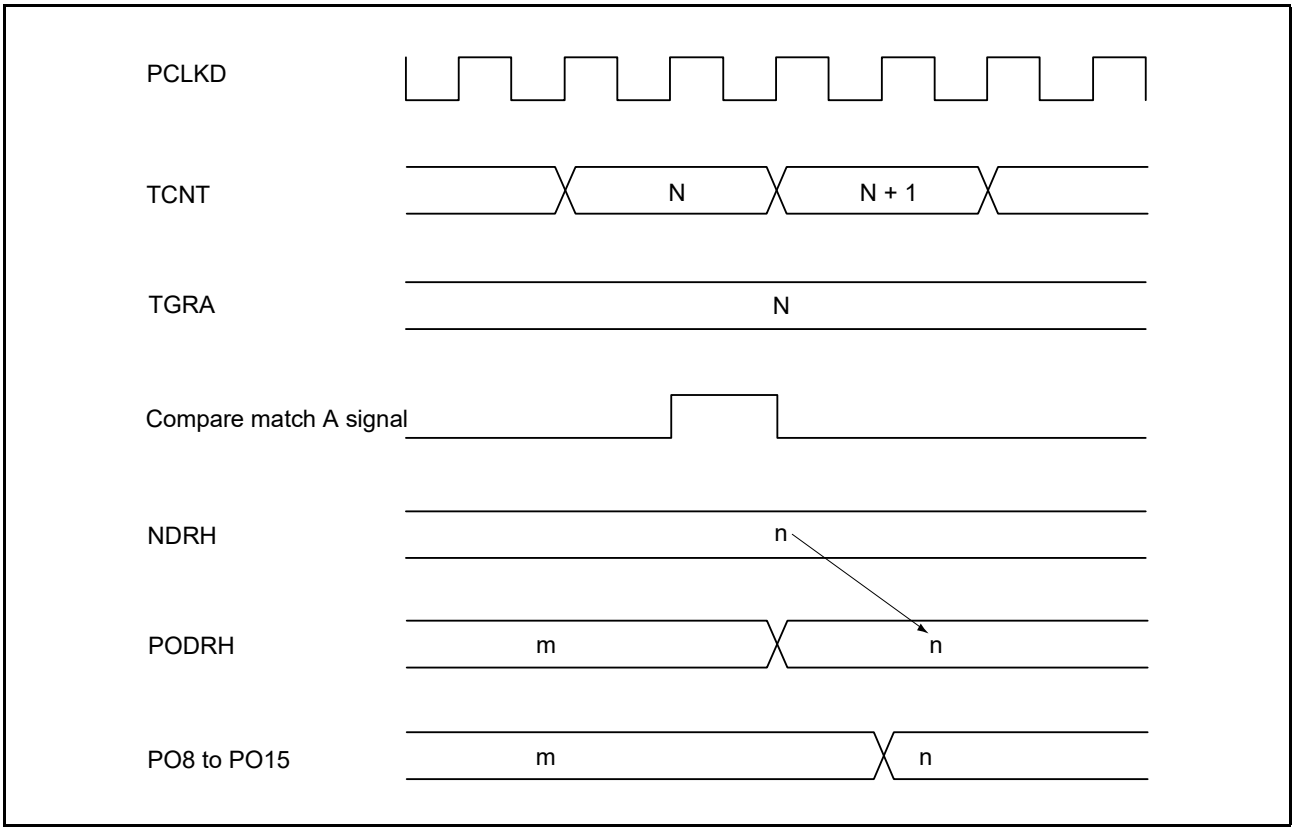

Figure 23.4 Timing of Transfer and Output of the Values in NDR (Example)

23.3.2 Sample Setup Procedure for Normal Pulse Output

Figure 23.5 shows a sample procedure for setting normal pulse output.

(1) PPG Setting

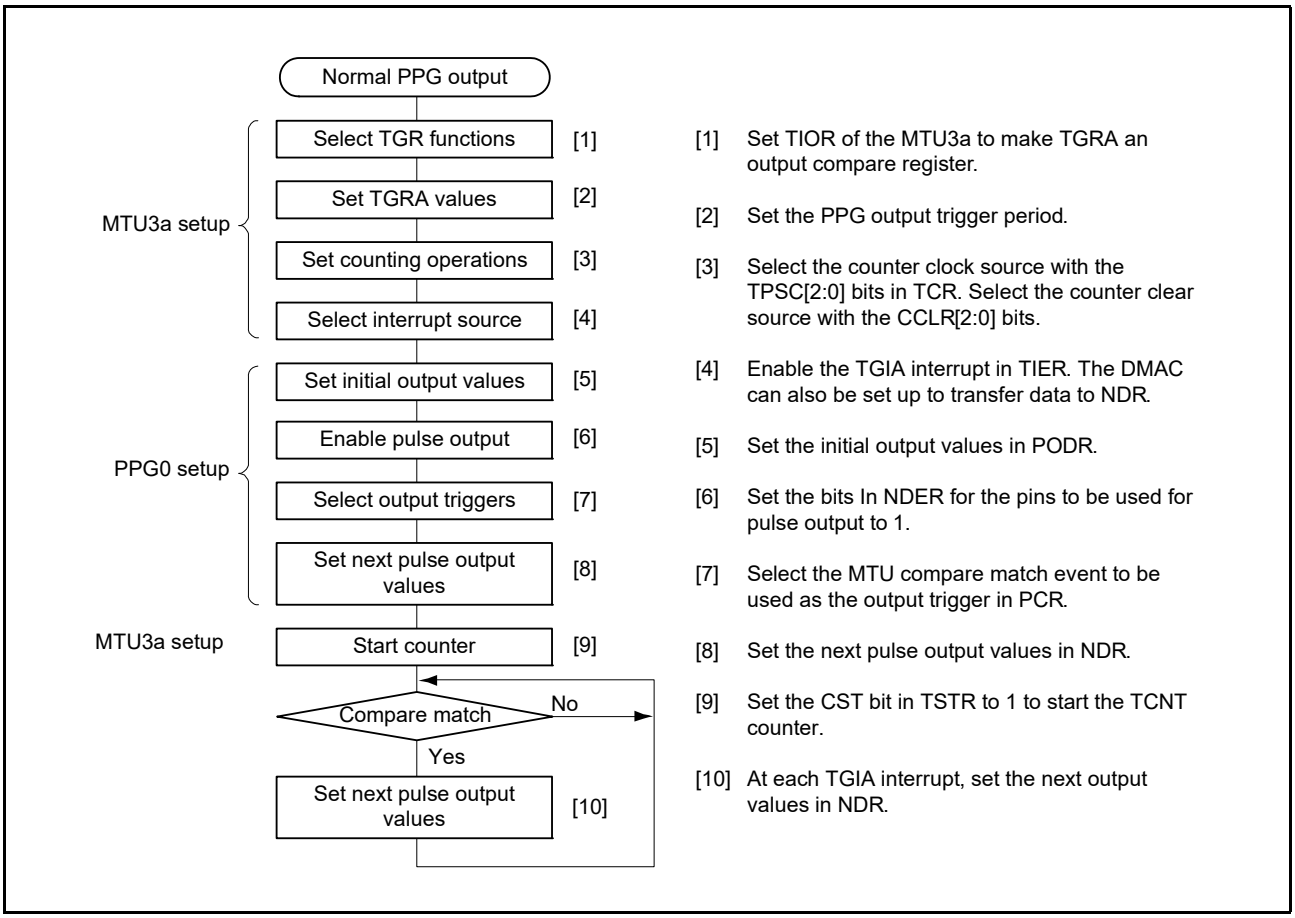

Figure 23.5 Sample Setup Procedure for Normal Pulse Output (PPG Setting)

23.3.3 Example of Normal Pulse Output (Example of Five-Phase Pulse Output)

Figure 23.6 shows an example in which five-phase pulse is output on PPG0 (PO11 to PO15) with MTU1 as the trigger for output.

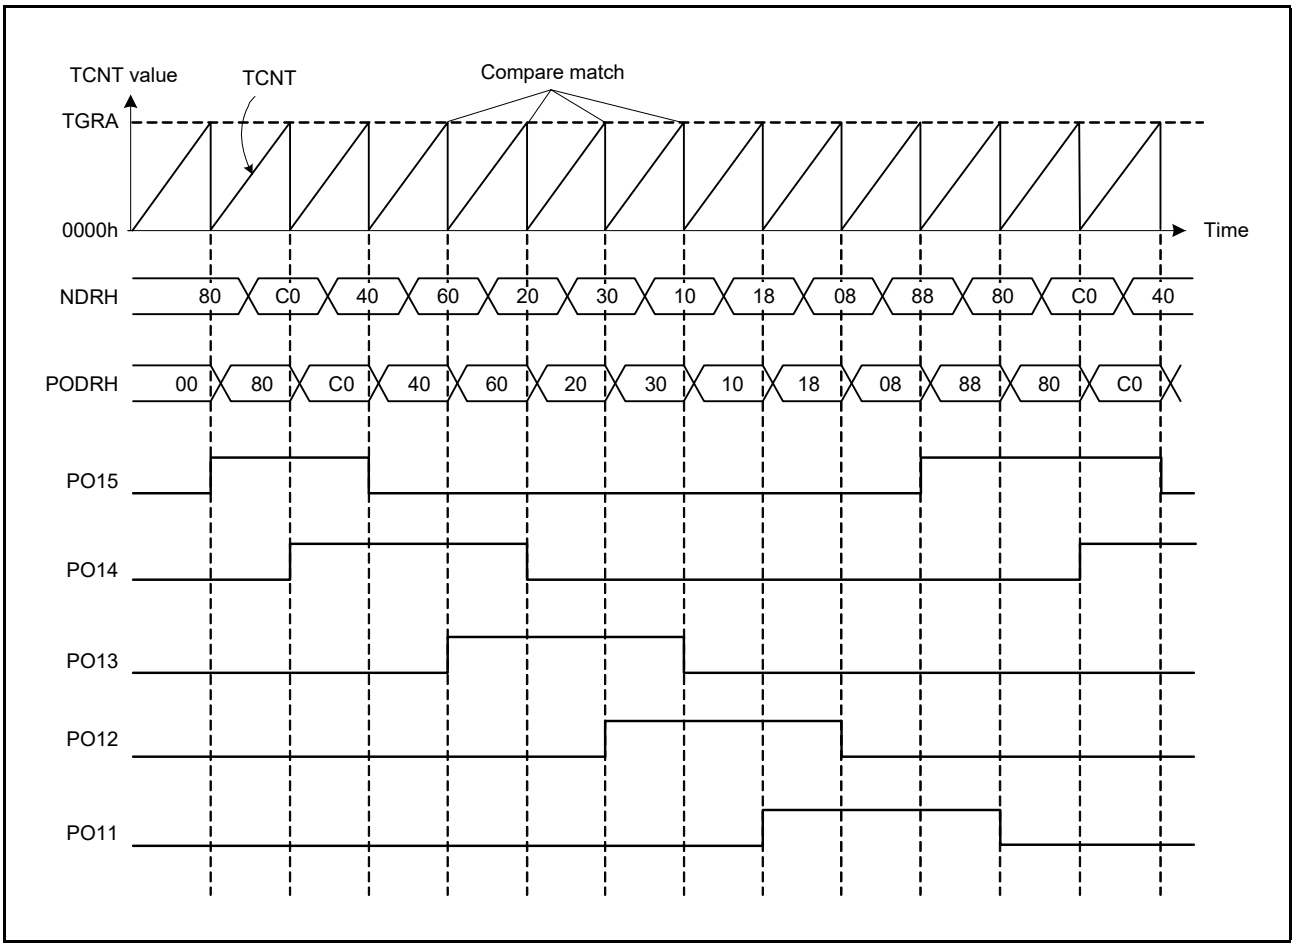

Figure 23.6 Example of Normal Pulse Output (Example of Five-Phase Pulse Output)

1. Set the MTU1.TGRA register to serve as an output compare register for trigger output. Specify the number of counting cycles in the TGRA register and select the counter clearing source as a compare match A by the MTU1.TCR.CCLR bit. Also, set the MTU1.TIER.TGIEA bit to 1 and enable the compare match/input capture A (TGIA1) interrupt request.
2. Write F8h to PPG0.NDERH and select the output triggers for the G3CMS[1:0] and G2CMS[1:0] bits in PPG0.PCR as that specified in step 1, compare match at MTU1. Then, write 80h to PPG0.NDRH as the value for output.
3. The timer counter in the MTU1 starts. When compare match A occurs, the values in PPG0.NDRH are transferred to PPG0.PODRH and output. The TGIA1 interrupt handling routine writes the next output data C0h to NDRH.
4. Five-phase pulse output (one or two phases active at a time) can be obtained subsequently by writing 40h, 60h, 20h, 30h, 10h, 18h, 08h, 88h... at successive TGIA1 interrupts.
   If the DMAC is set for activation by the TGIA1 interrupt, pulse output can be obtained without imposing a load on the CPU.

23.3.4 Non-Overlapping Pulse Output

During non-overlapping operation, data transfer from PPGn.NDRH and PPGn.NDRL to PPGn.PODRH and PPGn.PODRL is performed as follows (n = 0, 1).

- On compare match A, the contents in NDRH and NDRL are always transferred to PODRH and PODRL.
- On compare match B, data transfer proceeds for bits in NDRH and NDRL that have the value 0. It does not proceed for bits having the value 1.

Therefore, compare match B before compare match A allows 0-valued data to be transferred in advance of 1-valued data. In this case, write the next data to NDRH and NDRL from within the TGIAm (m = 0 to 3) interrupt handling routine of MTU3a, and after compare match B occurs, do not change the values in NDRH and NDRL during the interval from compare match B to compare match A (the non-overlap margin).
Figure 23.7 shows the non-overlapping pulse output operation.

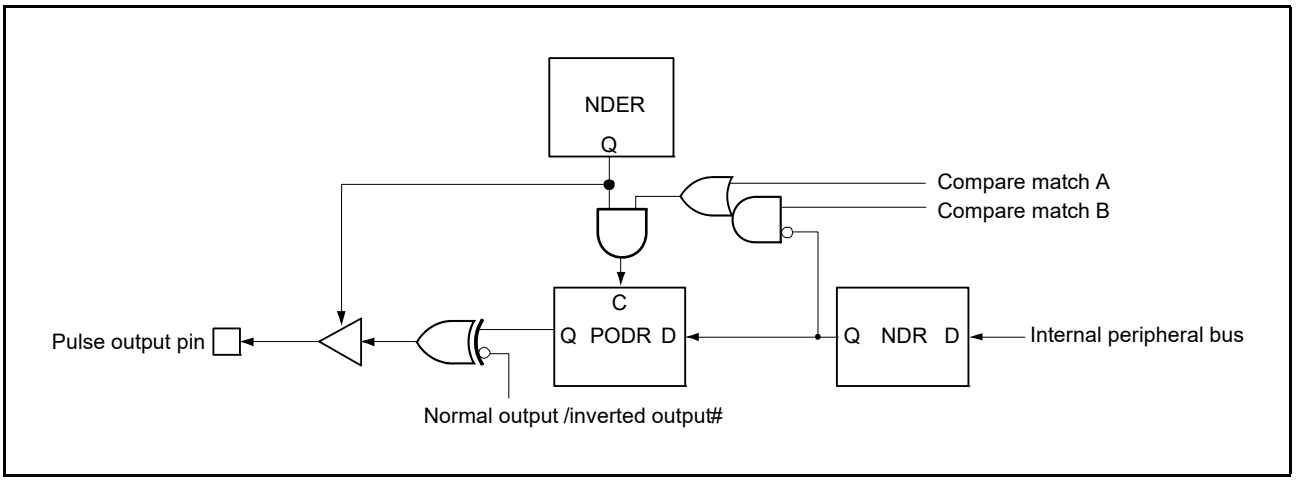

Figure 23.7 Non-Overlapping Pulse Output

Using a TGIAm interrupt to activate transfer by the DMAC can also write the next data to NDRH and NDRL. In any case, the next data must be written before the next compare match B occurs.
Figure 23.8 shows the timing of the above procedure.

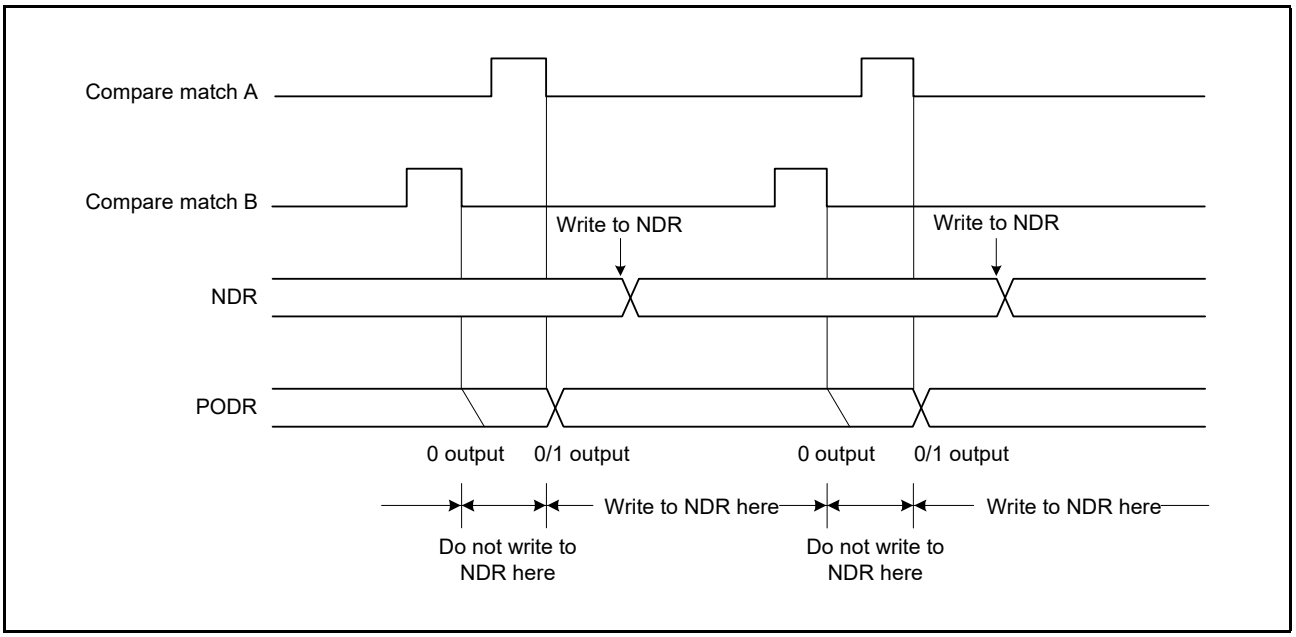

Figure 23.8 Non-Overlapping Operation and Write Timing to PPGn.NDRH and PPGn.NDRL

23.3.5 Sample Setup Procedure for Non-Overlapping Pulse Output

Figure 23.9 shows a sample procedure for setting up non-overlapping pulse output.

(1) PPG Setting

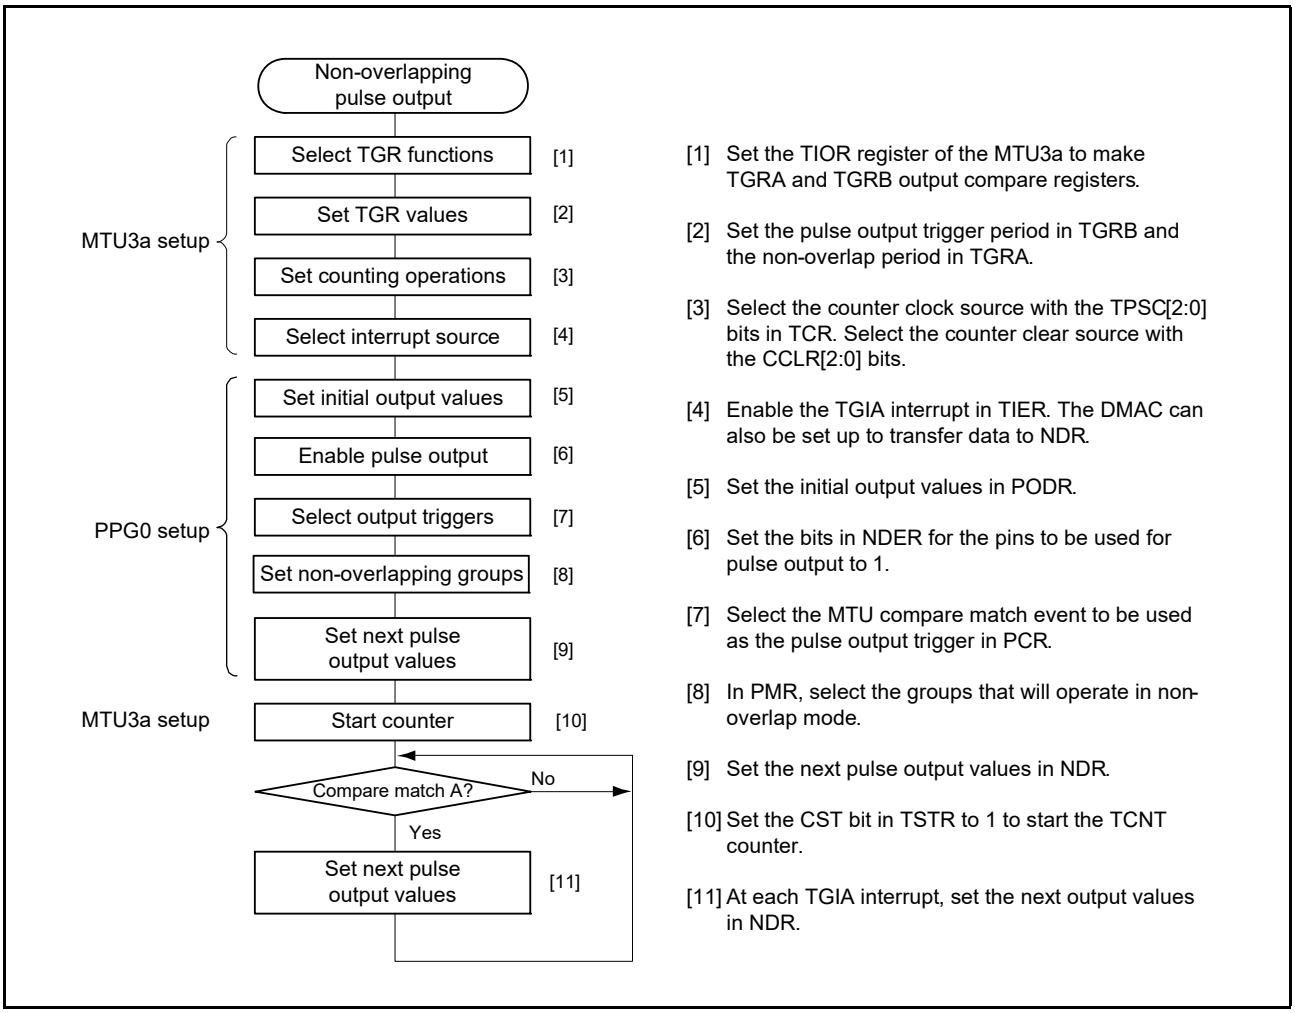

Figure 23.9 Sample Setup Procedure for Non-Overlapping Pulse Output (PPG Setting)

23.3.6 Example of Non-Overlapping Pulse Output (Example of Four-Phase Complementary Non-Overlapping Output)

Figure 23.10 shows an example in which four-phase complementary non-overlapping pulse is output on PPG0 (PO8 to PO15) with MTU1 as the trigger for output.

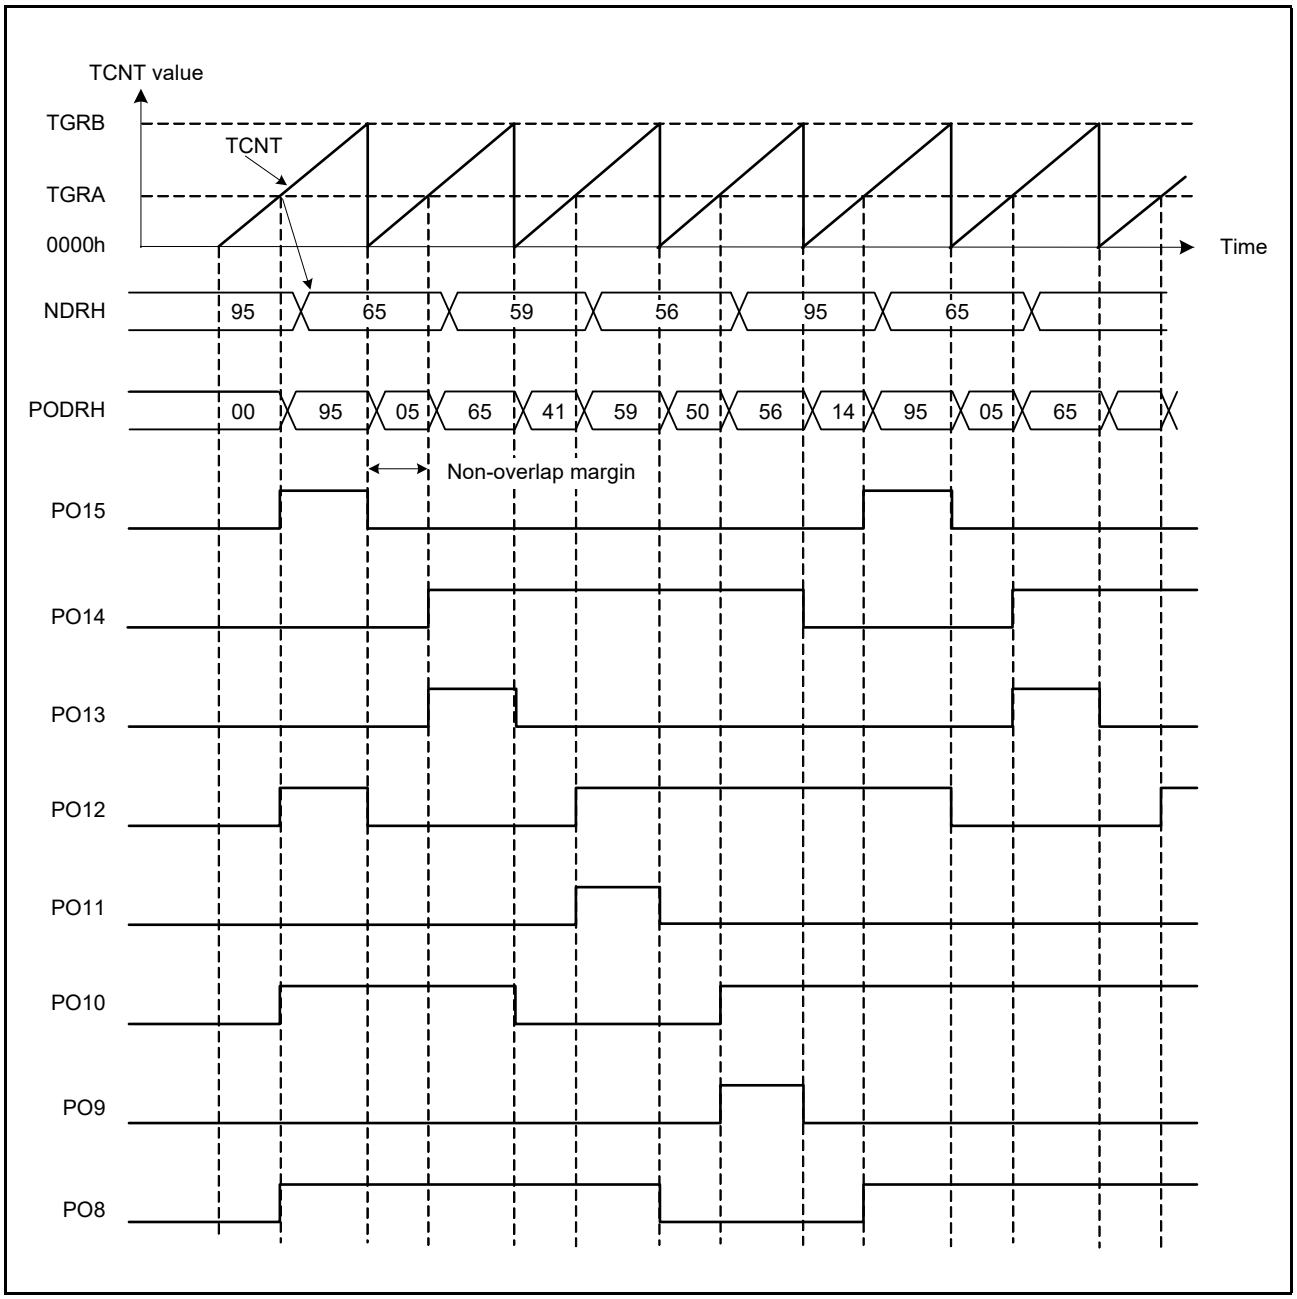

Figure 23.10 Example of Non-Overlapping Pulse Output (Four-Phase Complementary Non-Overlapping Output)

1. Set output compare registers of the TGRA and TGRB of MTU1 so that the corresponding compare match signals are the output triggers. Set the trigger period in TGRB and the non-overlap margin in TGRA, and specify MTU1.TCR.CCLR to set the counter to be cleared by compare match B. Set MTU1.TIER.TGIEA to 1 to enable the compare match/input capture A (TGIA1) interrupt.
2. Write FFh in PPG0.NDERH, and set the G3CMS[1:0] and G2CMS[1:0] bits in PPG0.PCR to select the respective compare matches in the MTU1 selected in the previous step to be the output triggers.
   Set the G3NOV and G2NOV bits in PPG0.PMR to 1 to select non-overlapping outputs. Write output data 95h in PPG0.NDRH.
3. The timer counter in MTU1 starts. When a compare match with MTU1.TGRB occurs, outputs change from high to low. When a compare match with MTU1.TGRA occurs, outputs change from low to high (the change from low to high is delayed by the value set in TGRA).
   The TGIA1 interrupt handling routine writes the next output data 65h in PPG0.NDRH.
4. Four-phase complementary non-overlapping pulse output can be obtained subsequently by writing 59h, 56h, 95h... at successive TGIA1 interrupts.
   If the DMAC is set for activation by the TGIA1 interrupt, pulse output can be obtained without imposing a load on the CPU.

23.3.7 Inverted Pulse Output

When the G3INV, G2INV, G1INV, and G0INV bits in the PMR register are cleared to 0, the values that are the inverse of the respective values in PODRH and PODRL can be output.

Figure 23.11 shows the outputs when the G3INV and G2INV bits are cleared to 0 in addition to the settings in Figure 23.10.

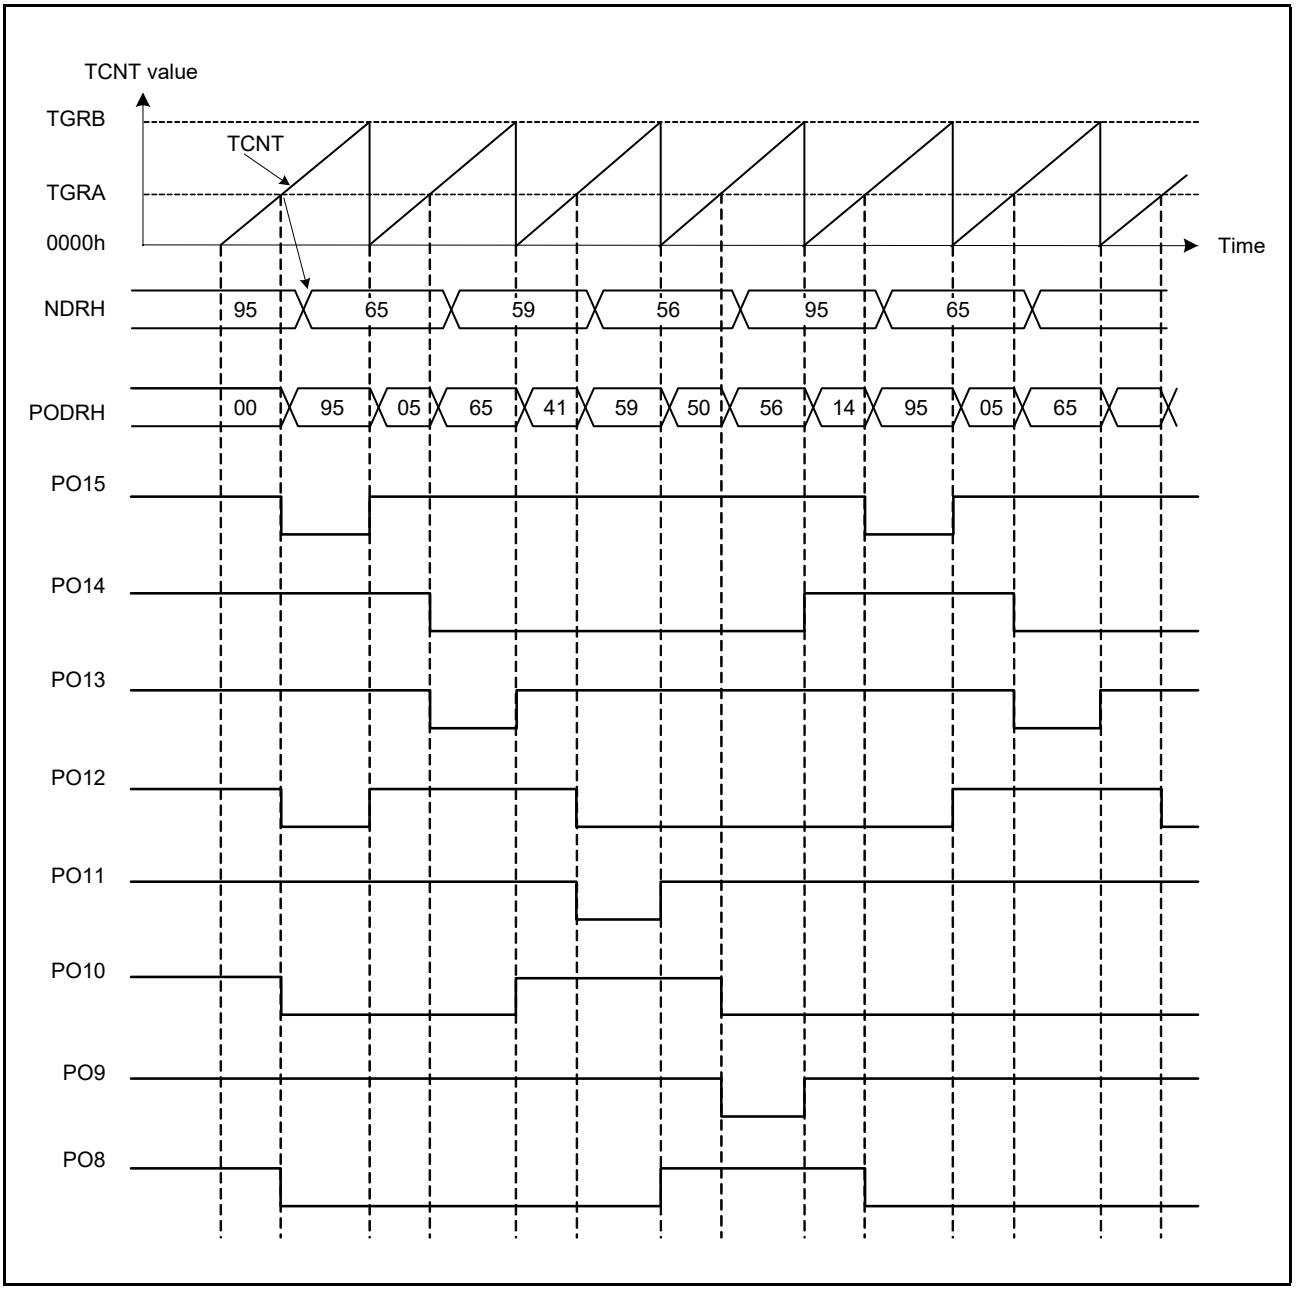

Figure 23.11 Inverted Pulse Output (Example)

23.3.8 Pulse Output Triggered by Input Capture

Pulse output from the PPG1 can be triggered by MTU3a or TPUa input capture as well as by compare match. When TGRA in the timer selected by PCR functions as an input capture register, pulse output is triggered by the input capture signal.

Figure 23.12 shows the timing of pulse output triggered by input capture.

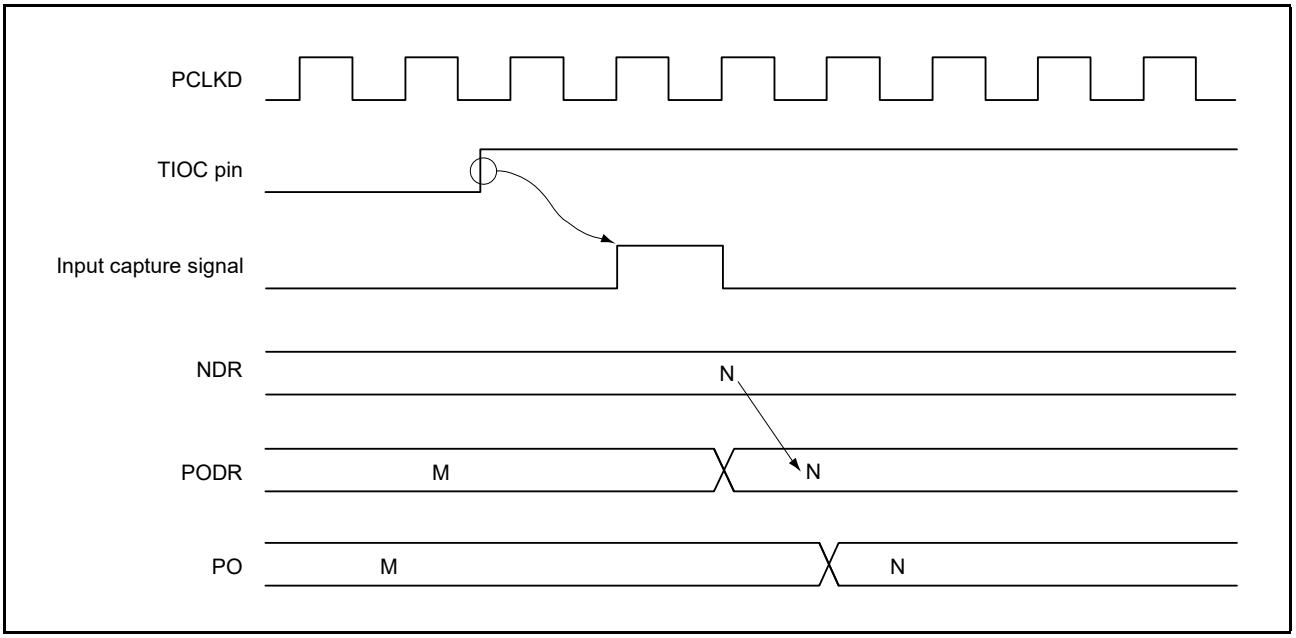

Figure 23.12 Timing of Pulse Output Triggered by Input Capture (Example)

23.4 Usage Note

23.4.1 Module-Stop Function Setting

Operation of the PPG can be disabled or enabled by the module stop control register. The initial setting is for operation of the PPG to be stopped. Register access is enabled by clearing module-stop state. For details, see section 9, Low-Power Consumption Function.

24. Compare Match Timer (CMT)

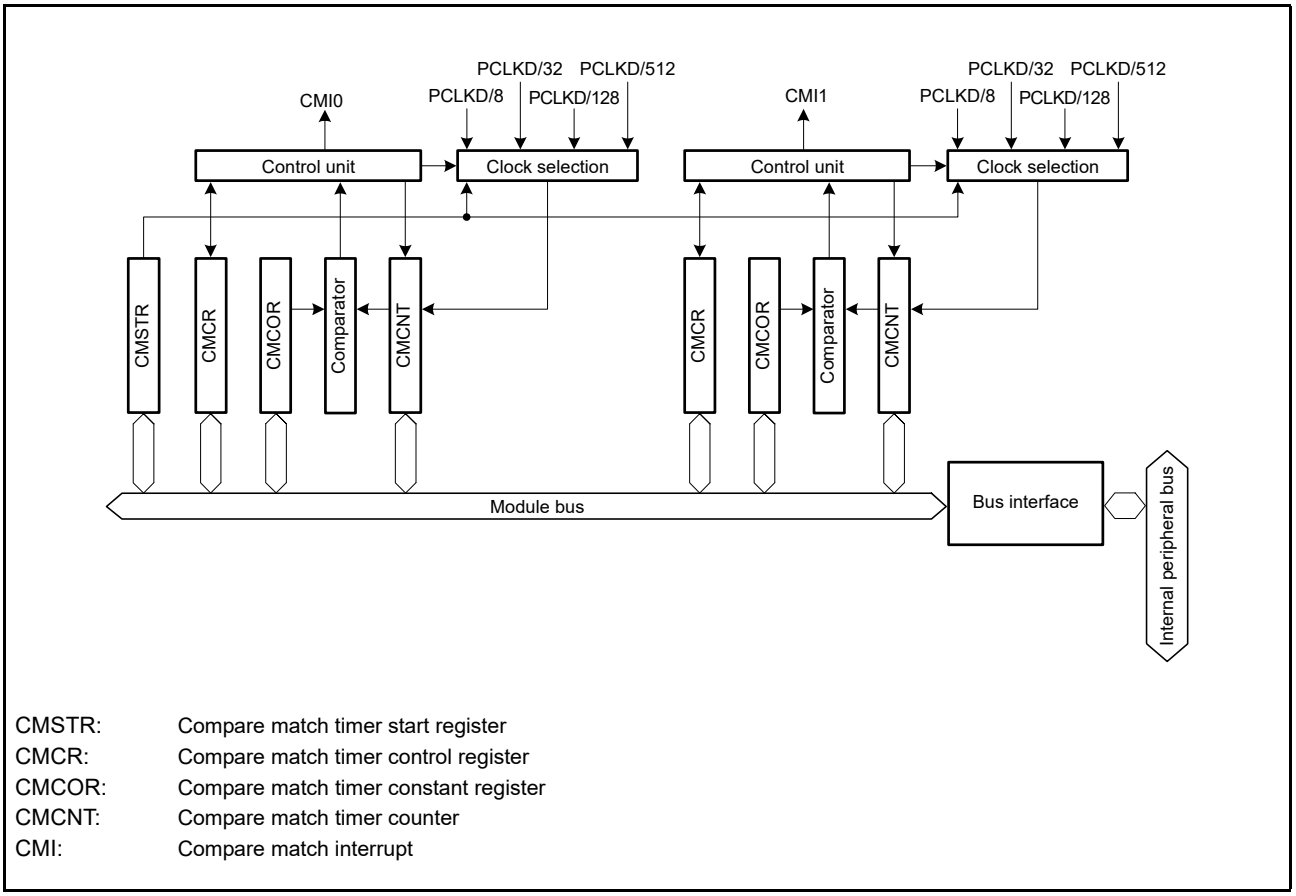
The compare match timer (CMT) consists of a two-channel 16-bit timer, and can generate interrupts at set intervals by using its 16-bit counter.

24.1 Overview

Table 24.1 lists the specifications for the CMT.
Figure 24.1 shows a block diagram of the CMT.

Table 24.1 CMT Specifications

Item	Description
Number of internal channels	Two channels × three units
Timer counter (per channel)	16-bit up counter (Counted according to the count enable signal output by the prescaler.) Returned to 0000h after compare match.
Prescaler (per channel)	9-bit counter (Linked with enabling/disabling of timer counter operation.) • Outputs four types of count enable signals. The type can be selected from PCLKD/8, PCLKD/32, PCLKD/128, and PCLKD/512.
Event link function (only channel 1 of unit 0)	One of the following three operations is possible depending on the received event: • Count start • Event count • Count clear This function can issue a compare match event.
Reset	Asynchronous reset



CMSTR: Compare match timer start register
CMCR: Compare match timer control register
CMCOR: Compare match timer constant register
CMCNT: Compare match timer counter
CMI: Compare match interrupt

Figure 24.1 Block Diagram of CMT (Units 0 to 2)

24.2 Register Descriptions

24.2.1 Compare Match Timer Start Register 0 (CMSTR0)

The CMSTR0 register sets starting or stopping of the CMT0.CMCNT and CMT1.CMCNT counters of unit 0.

Address(es): A008 0000h

b1	STR5	Counter Start 5	This bit selects starting or stopping of the CMT5.CMCNT counter operation. The corresponding prescaler starts or stops according to the setting of this bit. 0: The CMT5.CMCNT counter is stopped. 1: The CMT5.CMCNT counter is started.	R/W
b15 to b2	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

24.2.4 Compare Match Timer Control Register (CMCR)

The CMCRn register specifies a clock used for count-up operation.

Address(es): CMT0: A008 0002h, CMT1: A008 0008h, CMT2: A008 0022h, CMT3: A008 0028h, CMT4: A008 0042h, CMT5: A008 0048h

b6	CMIE	Compare Match Interrupt Enable	This bit selects whether to enable or disable generation of a compare match interrupt (CMIn) when the values in the CMCNT counter and in the CMCOR register match (n = 0 to 5). 0: Compare match interrupt (CMIn) disabled 1: Compare match interrupt (CMIn) enabled	R/W
b7	—	Reserved	When read, the value returned is undefined. The write value should be 0.	R/W
b15 to b8	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

24.2.5 Compare Match Timer Counter (CMCNT)

The CMCNT counter (the main unit of the compare match timer) is a readable/writable up-counter.
When an internal clock is selected by the CMCR.CKS[1:0] bits and the CMSTRm.STRn (m = 0 to 2, n = 0 to 5) bit is set to 1, the CMCNT counter starts counting up using the selected clock.
When the value in the CMCNT counter and the value in the CMCOR register match, the CMCNT counter is cleared to 0000h. At the same time, a compare match interrupt (CMIn) is generated (n = 0 to 5).

Address(es): CMT0: A008 0004h, CMT1: A008 000Ah, CMT2: A008 0024h, CMT3: A008 002Ah, CMT4: A008 0044h, CMT5: A008 004Ah

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

24.2.6 Compare Match Timer Constant Register (CMCOR)

The CMCOR register is a readable/writable register to set a cycle for compare match with the CMCNT counter.
The cycle for compare matches is as follows.

Compare-match cycle = (setting of the CMCOR register + 1) × counter-clock cycle*1

Note 1. This is a clock cycle set by the CMCR.CKS[1:0] bits.

Address(es): CMT0: A008 0006h, CMT1: A008 000Ch, CMT2: A008 0026h, CMT3: A008 002Ch, CMT4: A008 0046h, CMT5: A008 004Ch

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

24.3 Operation

24.3.1 Periodic Count Operation

When an internal clock is selected by the CMCRn.CKS[1:0] bits and the CMSTRm.STRn (m = 0 to 2, n = 0 to 5) bit is set to 1, the CMCNT counter starts counting up using the selected clock.
When the value in the CMCNT counter and the value in the CMCOR register match, the CMCNT counter is cleared to 0000h, and then a compare match interrupt (CMIn) is generated. The CMCNT counter then starts counting up again from 0000h. Figure 24.2 shows the operation of the CMCNT counter.

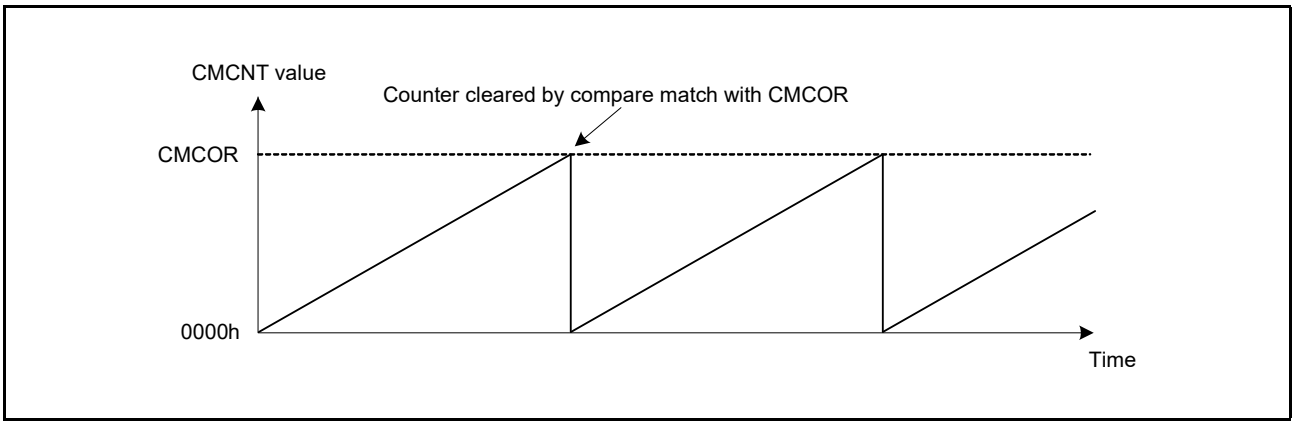

Figure 24.2 Counter Operation

24.3.2 CMCNT Count Timing

As the count clock, one of four internal clocks (PCLKD/8, PCLKD/32, PCLKD/128, and PCLKD/512) obtained by dividing the low-speed peripheral module clock (PCLKD) can be selected with the CMCR.CKS[1:0] bits. Figure 24.3 shows the timing of the CMCNT counter.

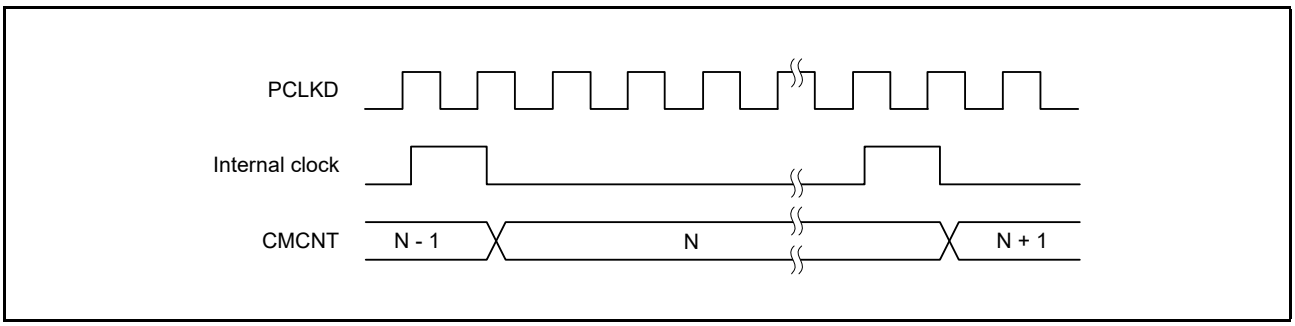

Figure 24.3 CMCNT Count Timing

24.4 Interrupts

24.4.1 Interrupt Sources

The CMT has channels and each of them to which a different vector address is allocated has a compare match interrupt (CMIn). The priority of channels can be changed by the interrupt controller settings.

Table 24.2 CMT Interrupt Sources

Name	Interrupt Sources
CMI0	Compare match between the CMT0.CMCNT counter and CMT0.CMCOR register
CMI1	Compare match between the CMT1.CMCNT counter and CMT1.CMCOR register
CMI2	Compare match between the CMT2.CMCNT counter and CMT2.CMCOR register
CMI3	Compare match between the CMT3.CMCNT counter and CMT3.CMCOR register
CMI4	Compare match between the CMT4.CMCNT counter and CMT4.CMCOR register
CMI5	Compare match between the CMT5.CMCNT counter and CMT5.CMCOR register

24.4.2 Timing of Compare Match Interrupt Generation

When the CMCNT counter and the CMCOR register match, a compare match interrupt (CMIn) is generated.
A compare match signal is generated at the last state in which the values match (the timing when the CMCNT counter updates the matched count value). That is, after a match between the CMCOR register and the CMCNT counter, the compare match signal is not generated until the CMCNT counter input clock is generated (n = 0 to 5).
Figure 24.4 shows the timing of a compare match interrupt.

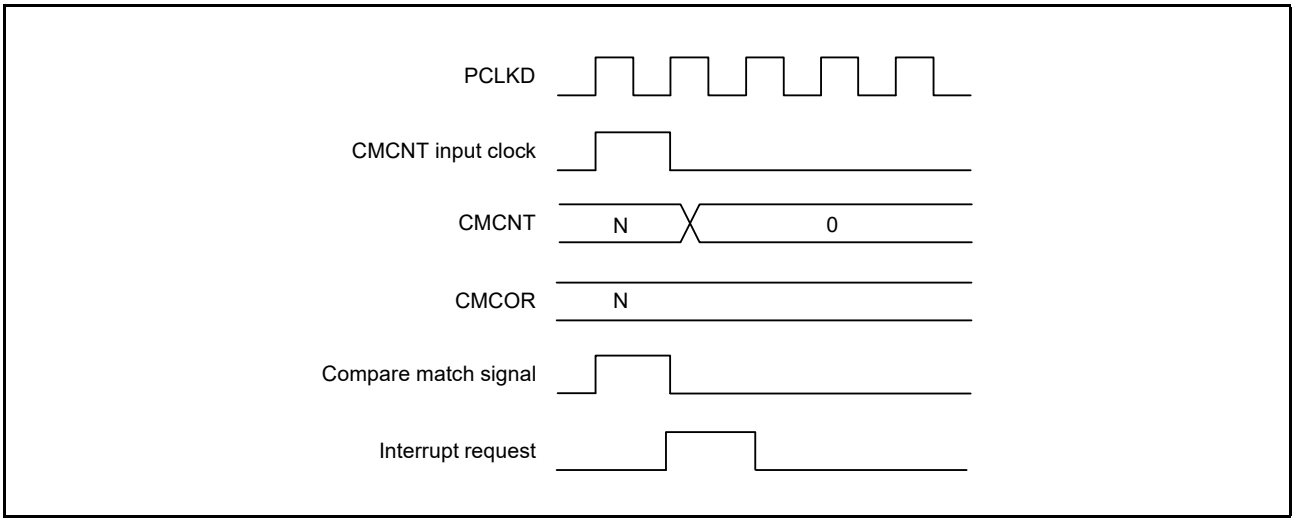

Figure 24.4 Timing a Compare Match Interrupt is Set

24.5 Event Link Operations

24.5.1 Event Issuance to ELC

The CMT issues an interrupt request when compare match occurs. Then, the CMT can use the event link controller (ELC) to perform link operation to a preset module using the interrupt request signal as the event signal.
The event signal can be output regardless of the setting of the corresponding interrupt request enable bit (CMT1.CMCR.CMIE).

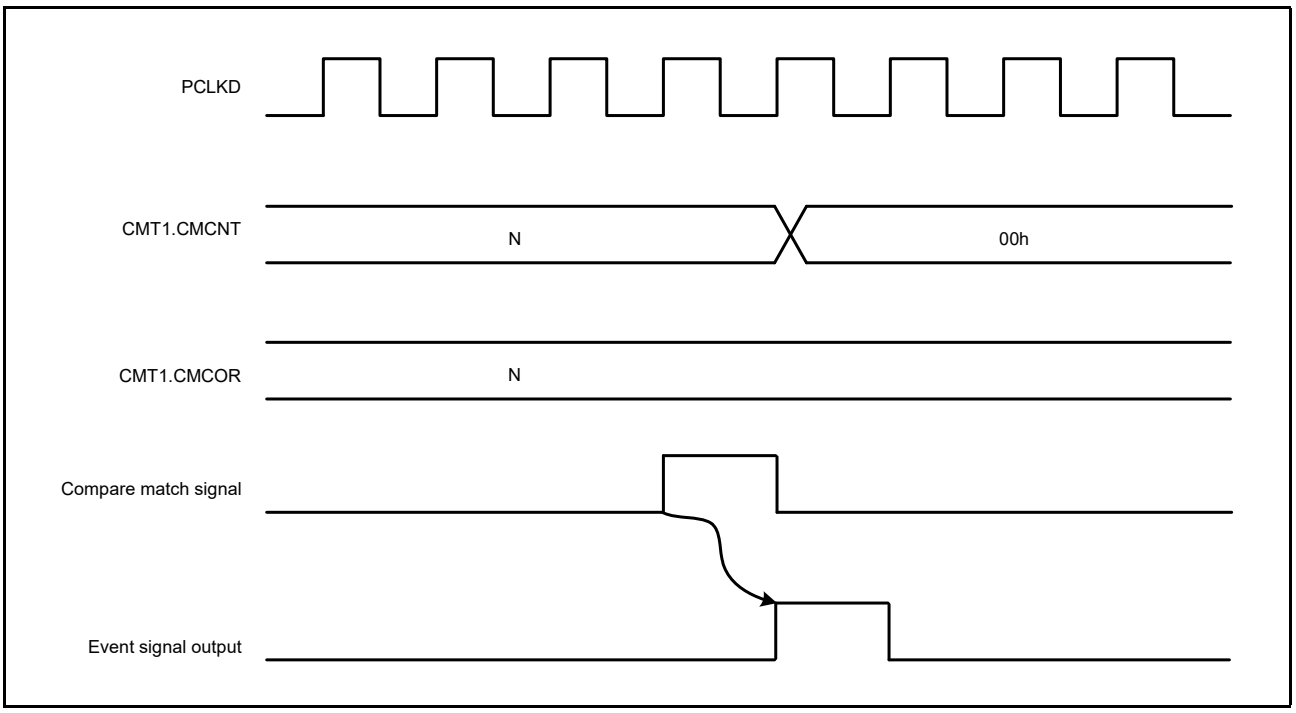

Figure 24.5 Timing of Event Issuance

24.5.2 CMT Operation When Receiving an Event from ELC

The CMT can perform either of the following three operations upon the event preset in the event link controller (ELC).

(1) Count Start

When the CMT count start operation is selected in the ELC and an event is received, the STR1 bit in the corresponding CMSTR0 (compare match timer start register 0) is set to 1, starting the count operation.
However, if the specified event occurs while the CMSTR0.STR1 bit is 1, the event is invalid.

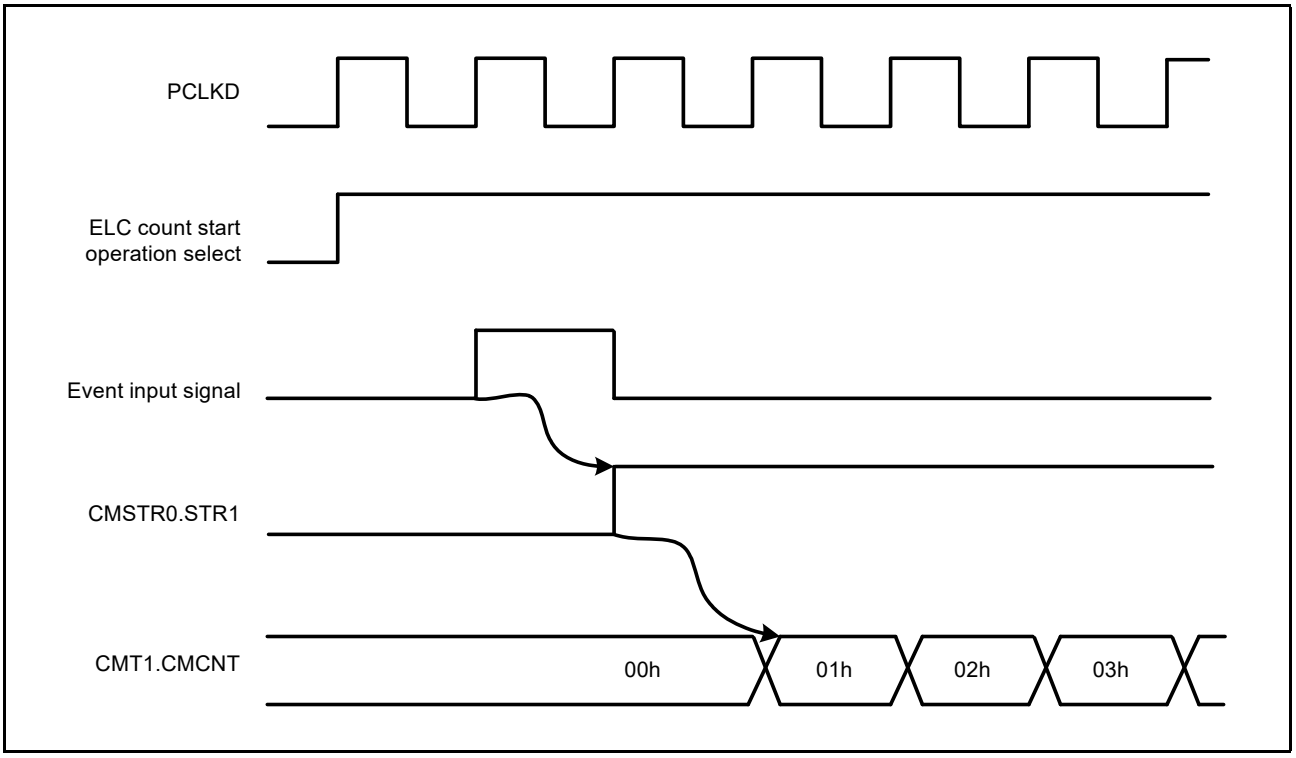

Figure 24.6 Count Start Operation at Reception of an Event

(2) Event Count

When the CMT event count operation is selected in the ELC and an event is received, the CMT1.CMCNT (compare match timer counter) is incremented, regardless of the setting of the CKS[1:0] bits in CMT1.CMCR (compare match timer control register). The STR1 bit in the CMSTR0 (compare match timer start register) must be set to 1 before receiving an event.

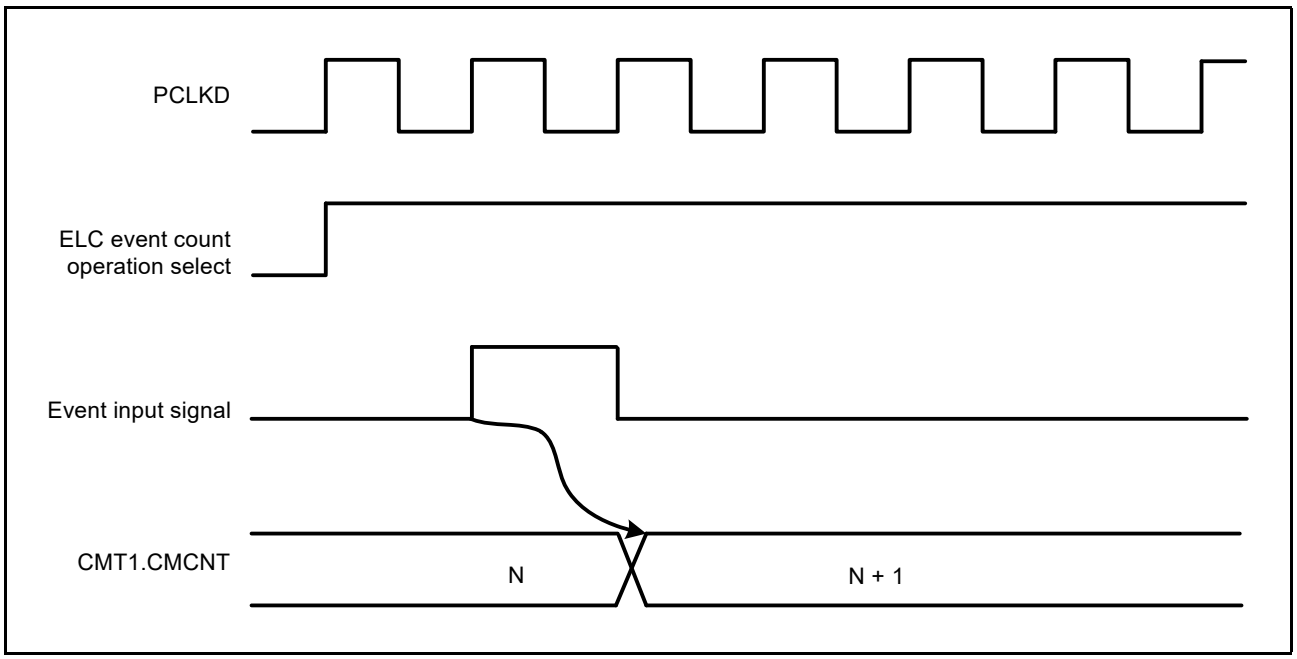

Figure 24.7 Event Count Operation at Reception of an Event

(3) Count Clear

When the CMT count clear operation is selected in the ELC and an event is received, the compare match timer counter (CMT1.CMCNT) is returned to its initial value. Counting continues, however, if the setting of the STR1 bit of compare match timer start register 0 (CMSTR0) is 1 at this time, so counting can be automatically restarted in this way.

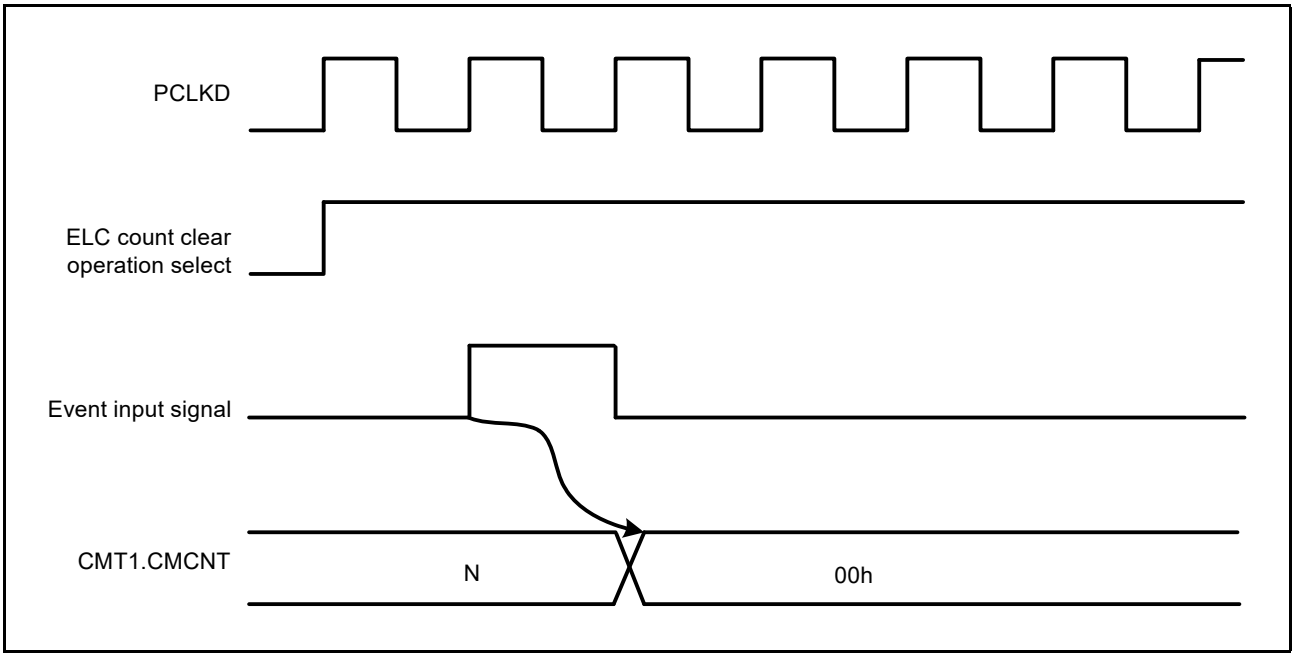

Figure 24.8 Count Clear Operation at Reception of an Event

24.5.3 Notes on CMT Event Link Operation

Note the following when using the CMT with event link operation.

(1) Count Start

When an event occurs during the write access to the STR1 bit in the CMSTR0 (compare match timer start register 0), that write access is not performed, and setting 1 according to the event occurrence takes priority.

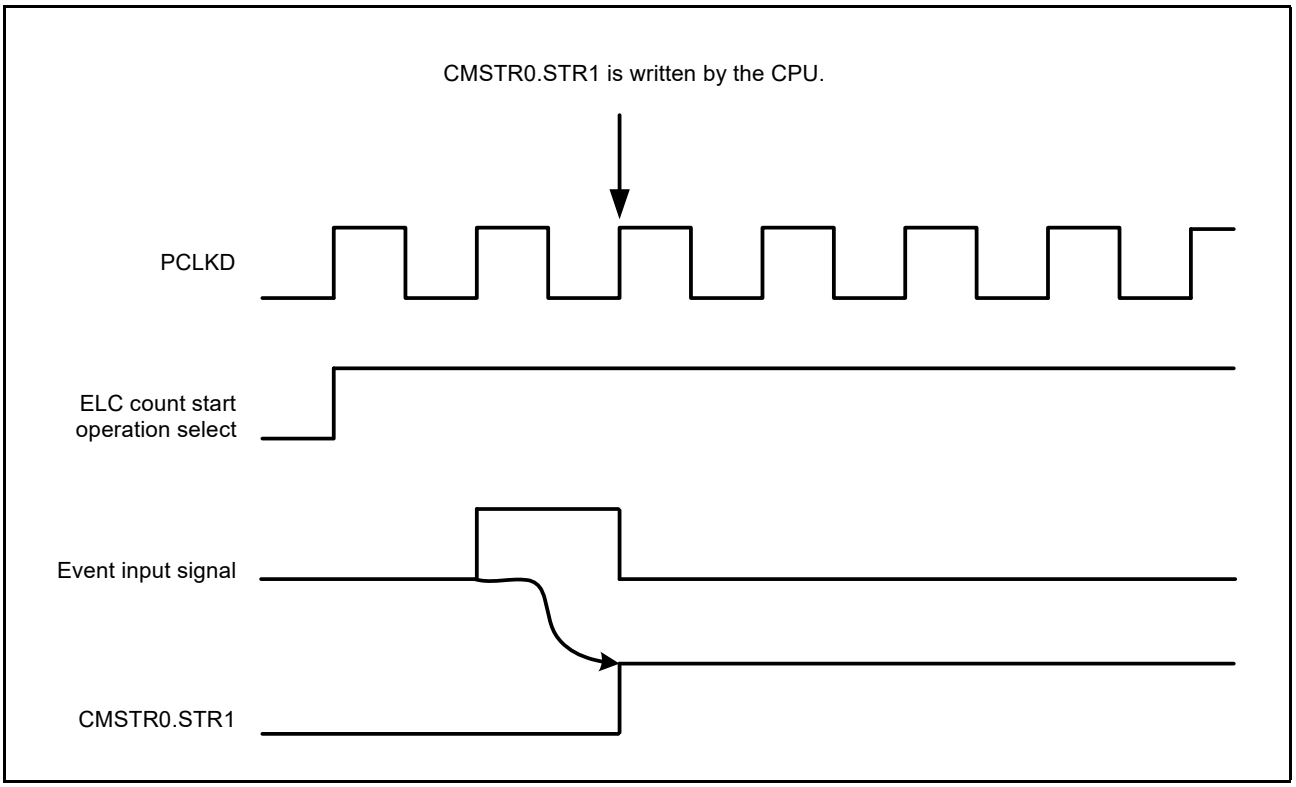

Figure 24.9 Conflict between Event Reception and Register Access at Count Start Operation

(2) Event Count

When an event occurs during the write access to the CMT1.CMCNT (compare match timer counter), that write access is not performed, and event count operation according to the event occurrence takes priority.

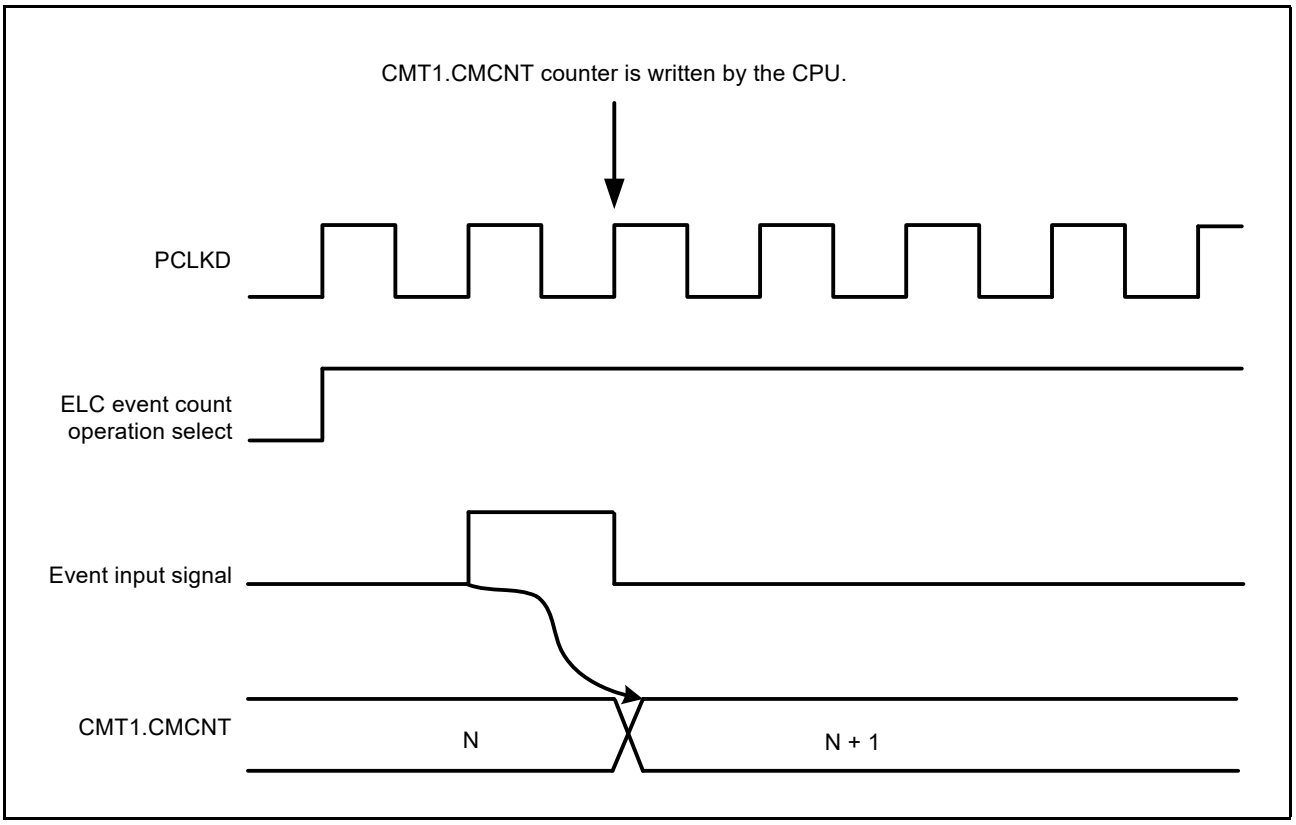

Figure 24.10 Conflict between Event Reception and Register Access at Event Count Operation

(3) Count Clear

When an event occurs during the write access to the CMT1.CMCNT (compare match timer counter), that write access is not performed, and count value initialization according to the event occurrence takes priority.

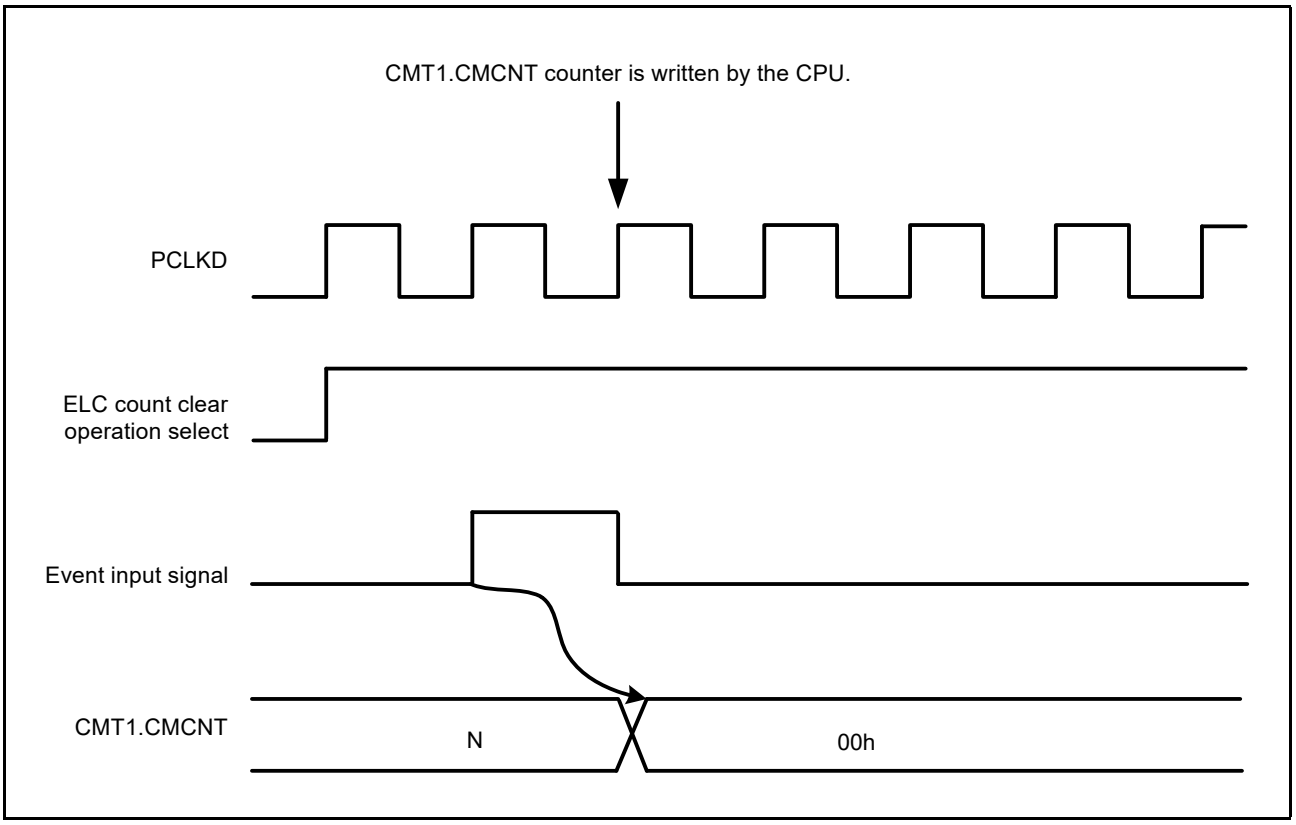

Figure 24.11 Conflict between Event Reception and Register Access at Count Clear Operation

24.6 Usage Notes

24.6.1 Setting the Module Stop Function

The CMT can be enabled or disabled using the module stop control register. After a reset, the CMT is in the module-stop state. The registers can be accessed by canceling the module-stop state. For details, see section 9, Low-Power Consumption Function.

24.6.2 Conflict between Write and Compare-Match Processes of CMCNT

When the compare match signal is generated while writing to the CMCNT counter, clearing the CMCNT counter is given priority over writing to it. In this case, the CMCNT counter is not written to. Figure 24.12 shows the timing to clear the CMCNT counter.

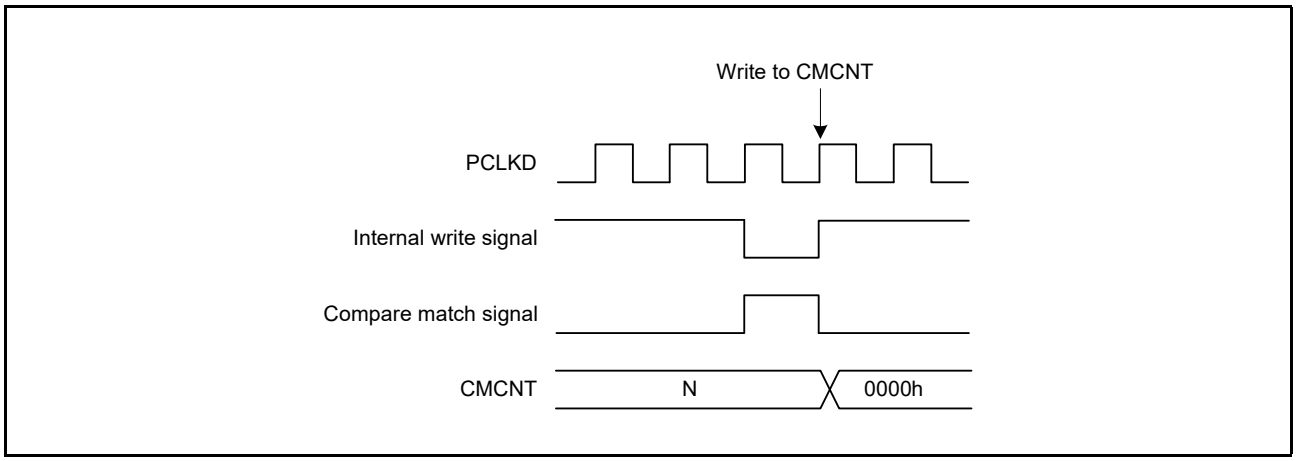

Figure 24.12 Conflict between Write and Compare Match Processes of CMCNT

24.6.3 Conflict between Write and Count-Up Processes of CMCNT

If count-up occurs during the write access to the CMCNT counter, that writing has priority over the count-up. Figure 24.13 shows the timing to write the CMCNT counter.

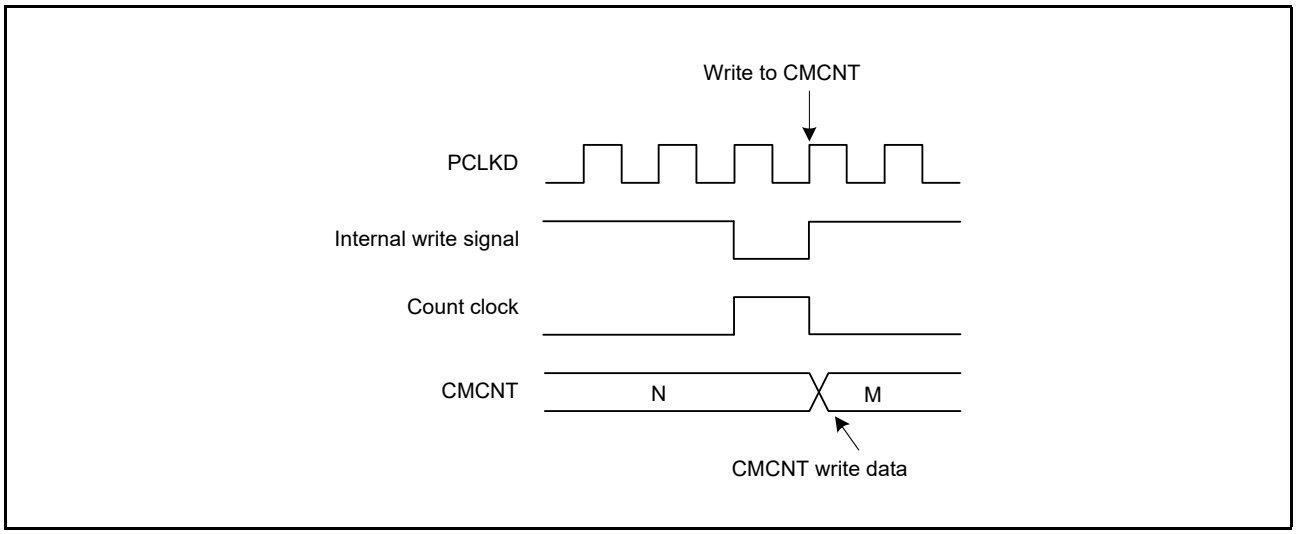

Figure 24.13 Conflict between Write and Count-Up Processes of CMCNT

Table 24.3 Summary of Conflicted Operations among Event Link Operation, Register Access, and Counter Status

Event Link Operation	Register Access	CMCNT Status	Operation to be Performed
Count start	Writing to CMSTR0.STR1	Stopped	Count start
		Compare match	Count start
		Count up	Count start
Event count	Writing to CMCNT	—	Event count
	Writing to CMCOR	Compare match	Compare match
Count clear	Writing to CMCNT	Other than compare match	Count clear
	Writing to CMCNT	Compare match	Compare match
	(No register access)	Compare match	Compare match
(No event)	Writing to CMCNT	Compare match	Compare match
		Count up	Writing to CMCNT
	Writing to CMCOR	Compare match	Compare match

25. Compare Match Timer W (CMTW)

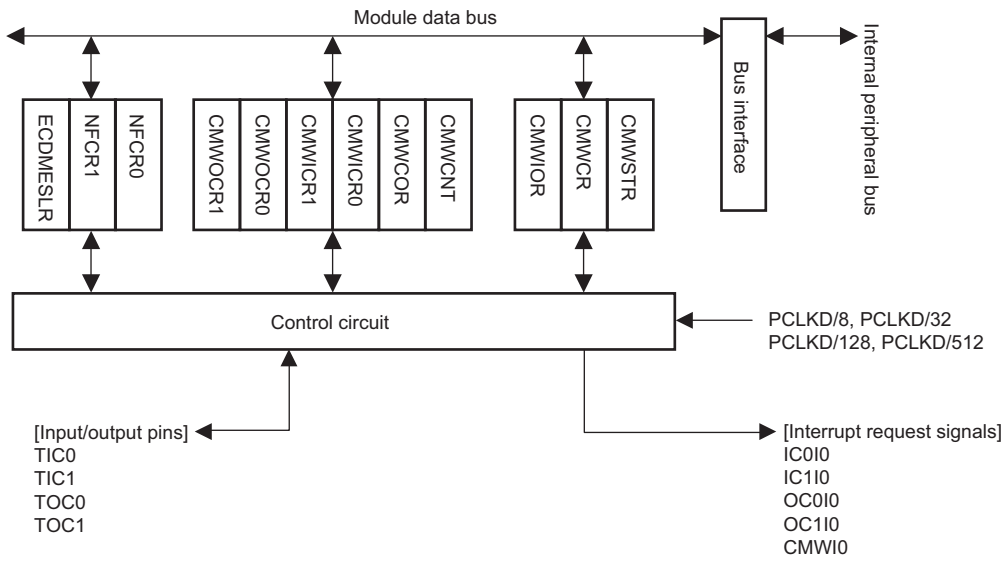
This LSI includes two units with one channel of 32-bit compare match timer W (CMTW).
CMTW has a 32-bit counter and can generate interrupts each time a set period elapses.

25.1 Overview

Table 25.1 shows the specifications of the CMTW. Figure 25.1 shows a block diagram of the CMTW.

Table 25.1 Specifications of CMTW

Item	Function
Number of channel	One channel × two units
Timer counter	16-bit/32-bit selectable up-counter Counting starts after the output of a counting enable signal from the prescaler. The counter returns to 0000 0000h after a compare match.
Prescaler	9-bit counter (operates to enable and disable the timer counter) Outputs four signals to enable counting. Selectable either of PCLKD/8, PCLKD/32, PCLKD/128, and PCLKD/512
Input capture	Up to two input capture input signals available.
Output compare	Up to two output compare output signals available.
Compare match	One compare match available.
Interrupt	• Compare match interrupt • Input capture 0 and 1 interrupts • Output compare 0 and 1 interrupts
Event link	One of the following three operations is enabled after an event signal is received: • Counting start • Event counting • Counting clear Also, the following event signal can be issued: • Compare match event
Low-power consumption function	The module-stop state can be set for each unit.



CMWSTR:	Timer start register
CMWCR:	Timer control register
CMWIOR:	Timer I/O control register
CMWCNT:	Timer counter
CMWCOR:	Compare match constant register
CMWICR0:	Input capture register 0
CMWICR1:	Input capture register 1
CMWOCR0:	Output compare register 0
CMWOCR1:	Output compare register 1
NFCR0:	Digital noise filter control register 0
NFCR1:	Digital noise filter control register 1
ECDMESLR:	ECM dynamic mode error output select register

Figure 25.1 Block Diagram of CMTW (Unit 0)

Table 25.2 shows the CMTW pin configuration.

Table 25.2 Input/Output Pins of CMTW

Unit	Pin Name	I/O	Description
CMTW0	TIC0	Input	Input capture input 0
	TIC1	Input	Input capture input 1
	TOC0	Output	Output compare output 0
	TOC1	Output	Output compare output 1
CMTW1	TIC2	Input	Input capture input 2
	TIC3	Input	Input capture input 3
	TOC2	Output	Output compare output 2
	TOC3	Output	Output compare output 3

25.2 Register Descriptions

25.2.1 Timer Start Register (CMWSTR)

The CMWSTR register is used to start or stop the CMWCNT counter.

Address(es): CMTW0.CMWSTR A008 0300h, CMTW1.CMWSTR A008 0380h

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	STR	Counter Start	0: The CMWCNT counter stops counting. (The value immediately before a stop of counting is retained and counting is stopped.) 1: The CMWCNT counter starts counting.	R/W
b15 to b1	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

STR Bit (Counter Start)

Specifies whether the timer counter operates or is stopped. The relevant prescaler operates or is stopped according to the settings of STR bit.

25.2.2 Timer Control Register (CMWCR)

The CMWCR register selects the counter clearing source and the counter input clock, and enables or disables interrupts. The CMWCR register should be set while the timer counter (CMWCNT) operation is stopped.

Address(es): CMTW0.CMWCR A008 0304h, CMTW1.CMWCR A008 0384h

R/W

CKS[1:0] Bits (Clock Select)

Select the clock to be input to the CMWCNT counter among four internal clocks obtained by dividing the peripheral clock (PCLKD). When the CMWSTR.STR bit is set to 1, the CMWCNT counter starts counting up based on the clock selected with the CMWCNT.CKS[1:0] bits.

CMWIE Bit (Compare Match Interrupt Enable)

Enables or disables compare match interrupt (CMWI) request generation when the CMWCNT counter and CMWCOR register values match.

IC0IE Bit (Input Capture 0 Interrupt Enable)

Enables or disables input capture interrupt 0 (IC0I) request generation when input capture is generated in the CMWICR0 register.

IC1IE Bit (Input Capture 1 Interrupt Enable)

Enables or disables input capture interrupt 1 (IC1I) request generation when input capture is generated in the CMWICR1 register.

OC0IE Bit (Output Compare 0 Interrupt Enable)

Enables or disables compare match interrupt 0 (OC0I) request generation when the CMWCNT counter and CMWOCR0 register values match.

OC1IE Bit (Output Compare 1 Interrupt Enable)

Enables or disables compare match interrupt 1 (OC1I) request generation when the CMWCNT counter and CMWOCR1 register values match.

CMS Bit (Timer Counter Size)

Selects either 16 or 32 bits as the size of the timer counter (CMWCNT). The size selected with the CMS bit is valid in the compare match constant register (CMWCOR), input capture registers (CMWICR0 and CMWICR1), and output compare registers (CMWOCR0 and CMWOCR1).

CCLR[2:0] Bits (Counter Clear)

Selects the CMWCNT counter clearing source.

25.2.3 Timer I/O Control Register (CMWIOR)

The CMWIOR register controls the CMWCOR, CMWICR0, CMWICR1, CMWOCR0, and CMWOCR1 registers. CMWIOR should be set while the timer counter (CMWCNT) operation is stopped.

Address(es): CMTW0.CMWIOR A008 0308h, CMTW1.CMWIOR A008 0388h

b14	—	Reserved	This bit is read as 0. The write value should be 0.	R/W
b15	CMWE	Compare Match Enable	0: Disables the compare match operation using the CMWCOR register. 1: Enables the compare match operation using the CMWCOR register.	R/W

Note 1. After reset, 0 is output until the CMWIOR register is set.

IC0[1:0] Bits (Input Compare Control 0)

Selects the input capture operation of the CMWICR0 register.

IC1[1:0] Bits (Input Capture Control 1)

Selects the input capture operation of the CMWICR1 register.

IC0E Bit (Input Capture Enable 0)

Enables or disables the input capture operation of the CMWICR0 register.

IC1E Bit (Input Capture Enable 1)

Enables or disables the input capture operation of the CMWICR1 register.

OC0[1:0] Bits (Output Compare Control 0)

Sets the output compare operation using the CMWOCR0 register.

OC1[1:0] Bits (Output Compare Control 1)

Sets the output compare operation using the CMWOCR1 register.

OC0E Bit (Compare Match Enable 0)

Enables or disables the compare match operation using the CMWOCR0 register.

OC1E Bit (Compare Match Enable 1)

Enables or disables the compare match operation using the CMWOCR1 register.

CMWE Bit (Compare Match Enable)

Enables or disables the compare match operation using the CMWCOR register.

25.2.4 Timer Counter (CMWCNT)

The CMWCNT counter is used as a readable/writable up-counter.

Before starting counter operation, the timer control register (CMWCR) should be set. When the 16-bit counter size is selected with the CMS bit in the timer control register (CMWCR), bits 15 to 0 in the CMWCNT counter are valid. Since access to this register is in 32-bit units, when writing, write 32-bit values to it with 0000h in the higher-order bits. If a value other than 0000h is set in the higher-order bits, a value greater than 0000 FFFFh may be read when this register is read.

When the STR bit is set to 1, the CMWCNT counter starts counting. When the STR bit is set to 0, the CMWCNT counter retains the value immediately before a stop of counting and stops counting.

Address(es): CMTW0.CMWCNT A008 0310h, CMTW1.CMWCNT A008 0390h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

25.2.5 Compare Match Constant Register (CMWCOR)

The CMWCOR register is a readable/writable register that specifies the time up to a compare match between the timer counter (CMWCNT) value and CMWCOR value. When the 16-bit counter size is selected with the CMS bit in the timer control register (CMWCR), bits 15 to 0 in this register are valid. Since access to this register is in 32-bit units, when writing, write 32-bit values to it with 0000h in the higher-order bits.
The cycle for compare matches is as follows.

Compare-match cycle = (setting of the CMWCOR register + 1) × counter-clock cycle*1

Note 1. This is a clock cycle set by the CMWCR.CKS[1:0] bits.

Address(es): CMTW0.CMWCOR A008 0314h, CMTW1.CMWCOR A008 0394h

25.2.6 Input Capture Registers 0 and 1 (CMWICR0 and CMWICR1)

The CMWICR0 and CMWICR1 registers are read-only registers in which the CMWCNT counter value is stored when an input capture is generated.
When the 16-bit counter size is selected with the CMS bit in the timer control register (CMWCR), bits 15 to 0 in these registers are valid. Writing to these registers is invalid.

Address(es): CMTW0.CMWICR0 A008 0318h, CMTW0.CMWICR1 A008 031Ch,
CMTW1.CMWICR0 A008 0398h, CMTW1.CMWICR1 A008 039Ch

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

25.2.7 Output Compare Registers 0 and 1 (CMWOCR0 and CMWOCR1)

The CMWOCR0 and CMWOCR1 registers are readable/writable registers that set the value to be compared when an output compare is generated.

When the 16-bit counter size is selected with the CMS bit in the timer control register (CMWCR), bits 15 to 0 of these registers become valid. Since access to this register is in 32-bit units, when writing, write 32-bit values to it with 0000h in the higher-order bits.

Address(es): CMTW0.CMWOCR0 A008 0320h, CMTW0.CMWOCR1 A008 0324h, CMTW1.CMWOCR0 A008 03A0h, CMTW1.CMWOCR1 A008 03A4h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

25.2.8 Digital Noise Filter Control Register 0 (NFCR0)

The NFCR0 register controls digital noise filters for input capture signals (TICn, n = 0, 1) of CMTW0.
The NFCR0 register should be set while the CMTW0.CMWCNT counter operation is stopped.

Address(es): CMTW.NFCR0 A008 0400h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16

	—	—	—	—	—	—	—	—	—	—	—	—	NFCS0[1:0]		NF1EN	NF0EN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	NF0EN	Digital Noise Filter Enable 0	0: The digital noise filter for the TIC0 pin is disabled. 1: The digital noise filter for the TIC0 pin is enabled.	R/W
b1	NF1EN	Digital Noise Filter Enable 1	0: The digital noise filter for the TIC1 pin is disabled. 1: The digital noise filter for the TIC1 pin is enabled.	R/W
b3, b2	NFCS0 [1:0]	Digital Noise Filter Clock Select 0	b3 b2 0 0: PCLKD/1 0 1: PCLKD/8 1 0: PCLKD/32 1 1: PCLKD/64	R/W
b31 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

NF0EN Bit (Digital Noise Filter Enable 0)

This bit enables or disables the noise filter for the TIC0 pin. Before changing the value of this bit, select the output compare function for the relevant pin in the timer I/O control register. Changing the value of the bit when the output compare function is not selected may lead to the internal generation of an unexpected edge.

NF1EN Bit (Digital Noise Filter Enable 1)

This bit enables or disables the noise filter for the TIC1 pin. Before changing the value of this bit, select the output compare function for the relevant pin in the timer I/O control register. Changing the value of the bit while the output compare function is not selected may lead to the internal generation of an unexpected edge.

NFCS0[1:0] Bits (Digital Noise Filter Clock Select 0)

These bits select the sampling clock for the digital noise filter of CMTW0.
The input-capture signal is sampled on rising edges of the selected clock signal. If the sampled levels match three times in a row, the given level is regarded as the input-capture signal. If the levels do not match, the existing value is retained.
After setting these bits, wait for two selected sampling periods before selecting the input capture function.

25.2.9 Digital Noise Filter Control Register 1 (NFCR1)

The NFCR1 register controls digital noise filters for input capture signals (TICn, n = 2, 3) of CMTW1.
The NFCR1 register should be set while the CMTW1.CMWCNT counter operation is stopped.

Address(es): CMTW.NFCR1 A008 0404h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	b15	b14	b13	b12	b11	b10	b9	b8	b7	b6	b5	b4	b3	b2	b1	b0
	—	—	—	—	—	—	—	—	—	—	—	—	NFCS1[1:0]		NF3EN	NF2EN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b0	NF2EN	Digital Noise Filter Enable 2	0: The digital noise filter for the TIC2 pin is disabled. 1: The digital noise filter for the TIC2 pin is enabled.	R/W
b1	NF3EN	Digital Noise Filter Enable 3	0: The digital noise filter for the TIC3 pin is disabled. 1: The digital noise filter for the TIC3 pin is enabled.	R/W
b3, b2	NFCS1 [1:0]	Digital Noise Filter Clock Select 1	b3 b2 0 0: PCLKD/1 0 1: PCLKD/8 1 0: PCLKD/32 1 1: PCLKD/64	R/W
b31 to b4	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

NF2EN Bit (Digital Noise Filter Enable 2)

This bit enables or disables the noise filter for the TIC2 pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register before doing so.

NF3EN Bit (Digital Noise Filter Enable 3)

This bit enables or disables the noise filter for the TIC3 pin. Since changing the value of the bit may lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the timer I/O control register before doing so.

NFCS1[1:0] Bits (Digital Noise Filter Clock Select 1)

These bits select the sampling clock for the digital noise filter of CMTW1.
The input-capture signal is sampled on rising edges of the selected clock signal. If the sampled levels match three times in a row, the given level is regarded as the input-capture signal. If the levels do not match, the existing value is retained.
After setting these bits, wait for two selected sampling periods before selecting the input capture function.

25.2.10 ECM Dynamic Mode Error Output Select Register (ECDMESLR)

The ECDMESLR register is used to select the error output signal in error control module (ECM) dynamic mode.

Address(es): CMTW.ECDMESLR A008 0410h

	b31	b30	b29	b28	b27	b26	b25	b24	b23	b22	b21	b20	b19	b18	b17	b16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Description	R/W
b2 to b0	DMERSL [2:0]	ECM Dynamic Mode Error Output Select	b2 b1 b0 0 0 0: Fixed to 0 (an output compare signal not used) 0 0 1: CMTW0.CMWCOR0 output compare signal 0 1 0: CMTW0.CMWCOR1 output compare signal 0 1 1: CMTW1.CMWCOR0 output compare signal 1 0 0: CMTW1.CMWCOR1 output compare signal Settings other than above are prohibited.	R/W
b31 to b3	—	Reserved	These bits are read as 0. The write value should be 0.	R/W

DMERSL[2:0] Bit (ECM Dynamic Mode Error Output Select)

These bits are used to select the error output signal in ECM dynamic mode from among the CMTW output compare signals.

For details of ECM dynamic mode, see section 42, Error Control Module (ECM).

25.3 Operation

When the CMWCR register is set and then the STR bit in CMWSTR is set to 1, the CMTW starts counter operation. Setting the CMWSTR.STR bit to 0 enables the CMWCNT counter to retain the value immediately before a stop of counting and stop counting. Setting CMWIOR register enables using the compare match function, input capture input function, and output compare output function.

25.3.1 Period Counting Operation

When the internal clock is selected by using the CMWCNT.CKS[1:0] bits and the CMWSTR.STR bit is set to 1, the CMWCNT counter starts counting up cycles of the selected clock. When the CCLR[2:0] bits in CMWCR are set so that CMWCNT should be cleared by a specific counter clearing source and the counter clearing source is generated, the CMWCNT counter is cleared to 0000 0000h and continues incrementing. When the CCLR[2:0] bits are set so that CMWCNT should not be cleared by any specific counter clearing source, the CMWCNT counter is cleared to 0000 0000h only when an overflow is generated (FFFF FFFFh → 0000 0000h (when the counter size is 32 bits) or 0000 FFFFh → 0000 0000h (when the counter size is 16 bits)) and continues incrementing.

25.3.2 Compare Match Function

When the values of the CMWCNT counter and CMWCOR register match, a compare match interrupt (CMWI) is generated. The CMWCNT counter operates as follows according to the setting of CMWCR.CCLR[1:0].

1. When CMWCR.CCLR[2:0] = 000b
   When the values of the CMWCNT counter and CMWCOR register match, the CMWCNT counter is cleared to 0000 0000h. The CMWCNT counter then restarts counting up from 0000 0000h.
2. When CMWCR.CCLR[2:0] ≠ 000b
   Even when the values of the CMWCNT counter and CMWCOR register match, the CMWCNT counter is not cleared to 0000 0000h but continues counting up until the clearing condition set in CMWCR.CCLR[1:0] is satisfied or the value of the counter reaches FFFF FFFFh (when the size of the counter is 32 bits) or ****FFFFh (when the size of the counter is 16 bits).
   The CMWCNT counter is then cleared to 0000 0000h and restarts counting up from 0000 0000h.

Figure 25.2 shows an example of procedure for setting compare match operation.

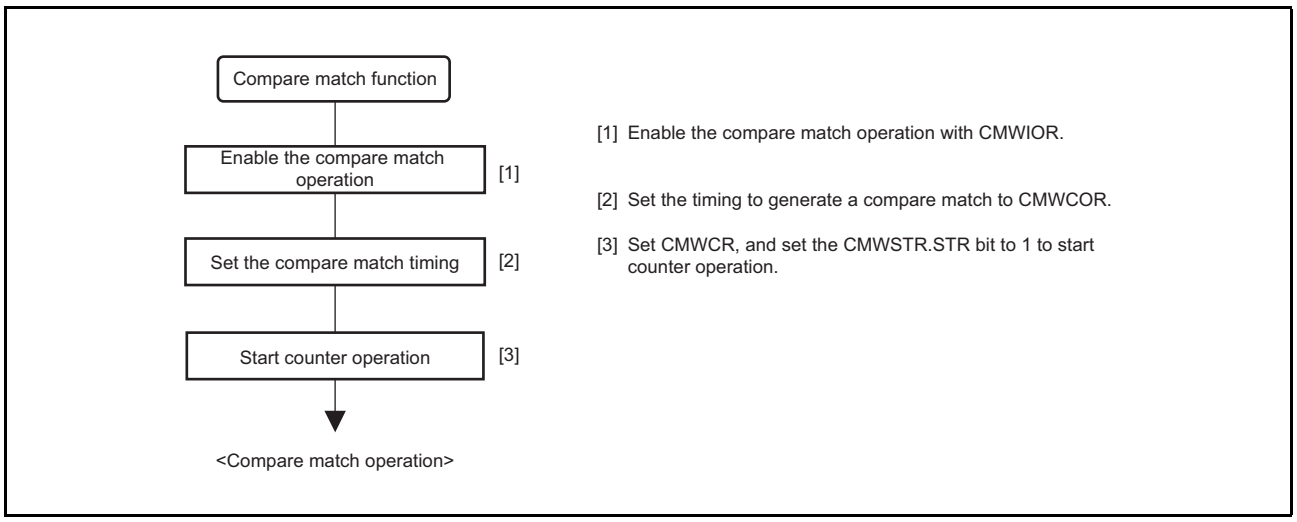

Figure 25.2 Procedure for Setting Compare Match Operation

Figure 25.3 shows an example when compare match with CMWCOR is set as a counter clearing source.

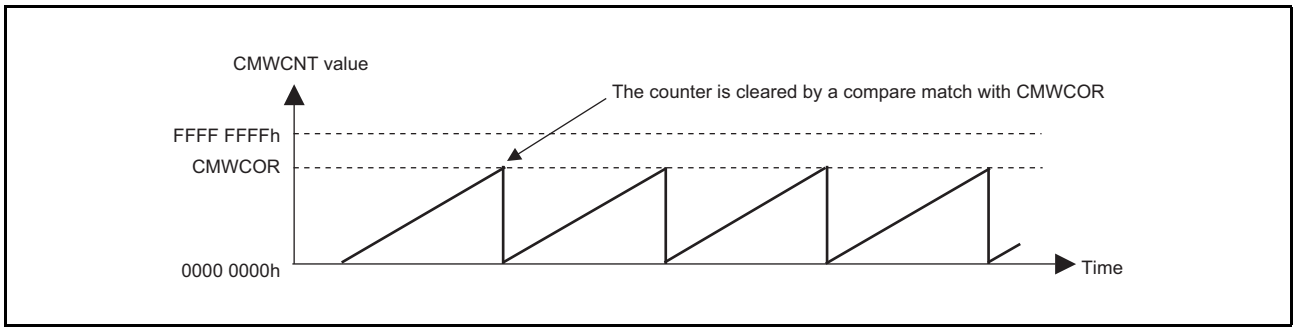

Figure 25.3 Example of Compare Match Operation

Figure 25.4 shows an example when CMWCOR is set to FFFF FFFFh and an overflow is detected.

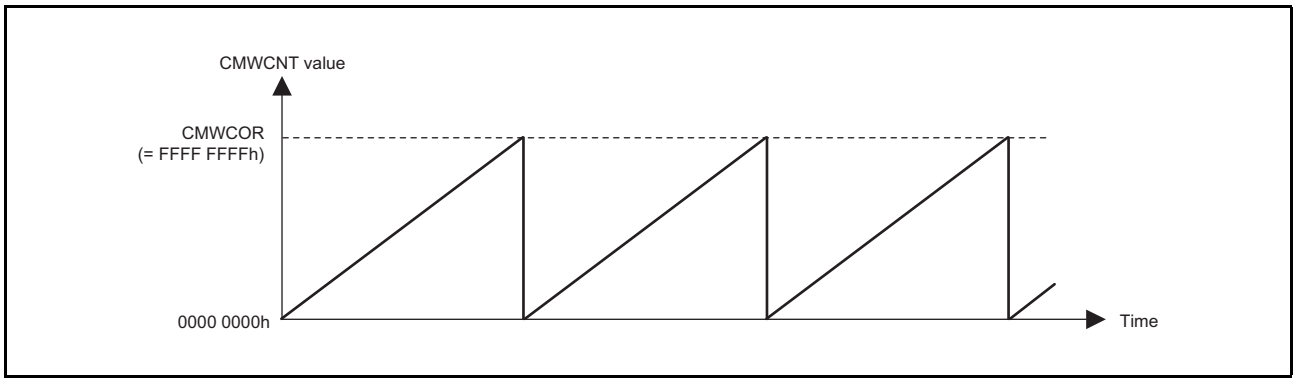

Figure 25.4 Example of Compare Match Operation (Overflow Detected)

25.3.3 Output Compare Function

Using the output compare function, toggle output from the relevant output pins can be provided. When the CMWCNT counter value matches either of the values of CMWOCR0 or CMWOCR1 register, the output compare interrupt (OC0I or OC1I) is generated. The CMWCNT counter operates as follows according to the setting of CMWCR.CCLR[2:0].

1. When CMWCR.CCLR[2:0] = 110b
   When the values of the CMWCNT counter and CMWOCR0 register match, the CMWCNT counter is cleared to 0000 0000h. The CMWCNT counter then restarts counting up from 0000 0000h.
2. When CMWCR.CCLR[2:0] = 111b
   When the values of the CMWCNT counter and CMWOCR1 register match, the CMWCNT counter is cleared to 0000 0000h. The CMWCNT counter then restarts counting up from 0000 0000h.
3. When CMWCR.CCLR[2:0] ≠ 110b or 111b
   Even when the values of the CMWCNT counter and CMWOCR0 or CMWOCR1 register match, the CMWCNT counter is not cleared to 0000 0000h but continues counting up until the clearing condition set in CMWCR.CCLR[2:0] is satisfied or the value of the counter reaches FFFF FFFFh (when the size of the counter is 32 bits) or ****FFFFh (when the size of the counter is 16 bits). The CMWCNT counter is then cleared to 0000 0000h and restarts counting up from 0000 0000h.

Figure 25.5 shows an example of procedure for setting output compare operation.

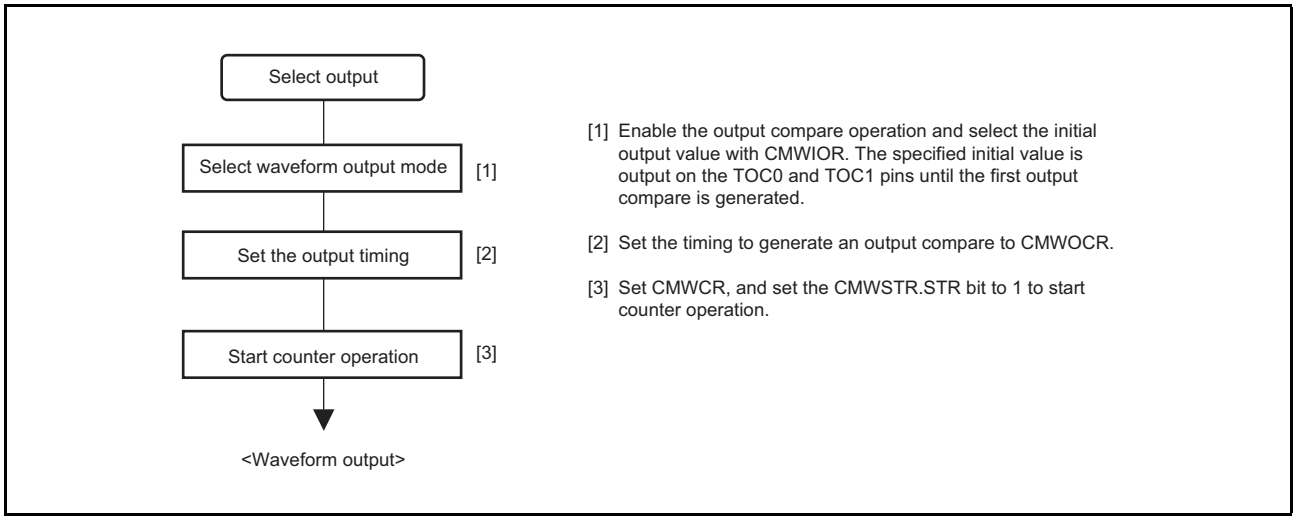

Figure 25.5 Procedure for Setting Output Compare Operation

Figure 25.6 shows an example when the counter is cleared upon compare match with CMWOCR1 register and toggle outputs are provided from the TOC0 and TOC1 pins.

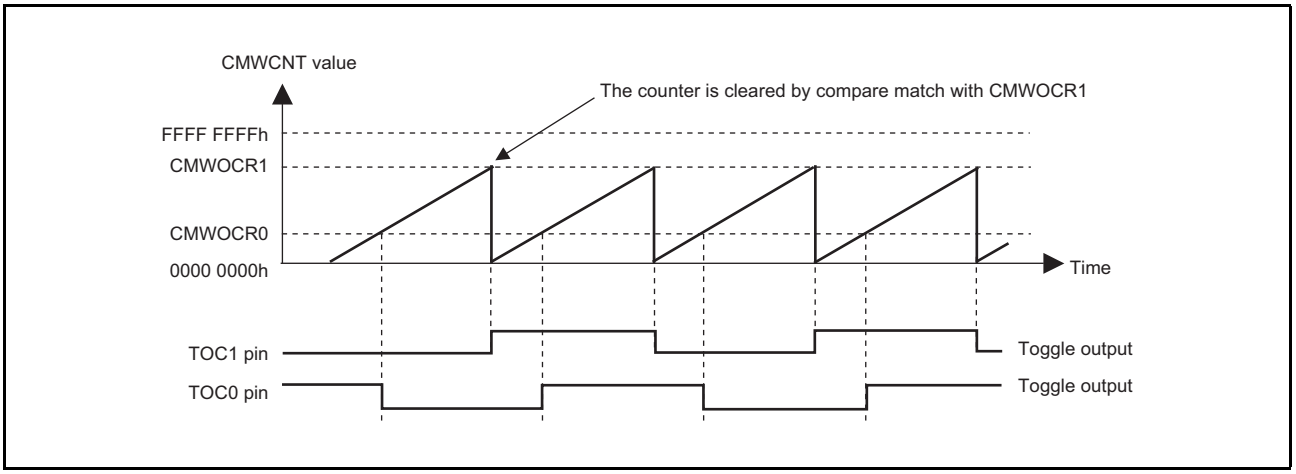

Figure 25.6 Example of Output Compare Operation

25.3.4 Input Capture Function

Through detecting the edge on the TIC0 and TIC1 pin input, the CMWCNT counter value can be transferred to CMWICR0 and CMWICR1 registers, respectively. The edges to be detected can be selected from among the rising edge alone, falling edge alone, and both the rising and falling edges. When the CMWCNT counter value is transferred to CMWICR0 or CMWICR1 register using the input capture function, an input compare interrupt (IC0I or IC1I) is generated. The CMWCNT counter operates as follows according to the setting of CMWCR.CCLR[2:0].

1. When CMWCR.CCLR[2:0] = 100b
   When the CMWCNT counter value is transferred to CMWICR0 using the input capture operation, the CMWCNT counter is cleared to 0000 0000h.
   The CMWCNT counter then restarts counting up from 0000 0000h.
2. When CMWCR.CCLR[2:0] = 101b
