# /EXECUTIVE SUMMARY

The global semiconductor market remains firmly in growth mode, with demand expected to expand strongly through 2029. Asia continues to lead the cycle, supported by sustained investment and accelerating technology adoption across multiple sectors.

AI remains a key driver of semiconductor demand, particularly in data centre infrastructure, where investments continue to boost demand for memory, power, interconnect and thermal management solutions. However, the benefits are not evenly distributed. The prioritisation of High Bandwidth Memory (HBM) is tightening supply across broader memory categories and creating cost pressure in PCs, smartphones, servers and many other electronic devices across the industries. At the same time, Edge AI is extending growth opportunities into industrial and embedded applications, driving demand for analogue products, sensors, microcontrollers and power management devices.

Geopolitics continues to reshape supply chain strategies. Tariffs, export controls and localisation requirements are becoming long-term business considerations, while supply chain diversification is improving resilience but adding complexity and cost.

In Europe, manufacturing activity continued to improve during the second quarter, marking the strongest quarter since 2022. Output growth and business confidence remain positive, although export demand is still weak and economic growth expectations have softened. The coming months will show whether recent order strength can translate into a broader recovery.

As always, this edition provides the latest price and lead time overview, helping you navigate current market conditions and plan strategically for the quarters ahead.

# GLOBAL SEMI OUTLOOK BY REGION

(EXCLUDES DRAM, FLASH, MPU COMPUTE, GPU, AI PROCESSORS)

| Region    | 2025  | 2026  | 2027  | 2028  | 2029 | 3-YR CAGR | 3-YR Growth |
|-----------|-------|-------|-------|-------|------|-----------|-------------|
| Americas  | 17.2% | 15.9% | 10.8% | 4.5%  | 5.5% | 6.9%      | \$22.5      |
| Asia      | 15.6% | 12.3% | 11.6% | 10.4% | 7.5% | 9.8%      | \$90.5      |
| EMEA      | -2.8% | 13.8% | 6.1%  | 6.5%  | 8.0% | 6.9%      | \$9.6       |
| Japan     | -0.2% | 9.5%  | 10.3% | 6.2%  | 5.2% | 7.2%      | \$6.9       |
| Worldwide | 12.7% | 13.0% | 10.8% | 8.4%  | 7.0% | 8.7%      | \$129.6     |

# /2027 GLOBAL OUTLOOK

- Market entering broad-based recovery: served-semi  $\uparrow$  10.8% Y/Y to \$503B.
- The story remains expansionary, but growth leadership stays concentrated in AI infrastructure, memory, and advanced compute rather than a fully normalised end-market recovery.
- Memory availability should remain a planning constraint, even as suppliers add capacity.
- Advanced packaging, test, and wafer fab investment remain critical watchpoints because AI hardware complexity is rising faster than traditional capacity cycles can respond.
- Hyperscaler spending is still the key swing factor: the base case is continued investment, but investors are still watching utilisation, monetisation, and possible overbuild signals more closely.
- Regionalisation remains important but it will not quickly solve the memory bottleneck.
- Global GDP growth at 3.0% for 2027.
  - Major forecasters range from 2.8%–3.4%; IMF, OECD, S&P, etc.

# /EUROPEAN MANUFACTURING PMI – SNAPSHOT

The Eurozone Manufacturing PMI continued its expansionary trend for a fifth consecutive month, with only a slight decrease in June, from 51.6 to 51.4. Supporting the EU's current momentum was an increase in Manufacturing Output to 51.7, up from 51.3 in May. Among the countries included in the EU index, only France and Spain reported a decline in production. This was, in fact, the strongest manufacturing quarter for the EU since 2022. New orders were reported to have increased modestly, although export orders continue to weigh on the EU PMI. In June, manufacturers relied more heavily on existing inventories, reducing purchases and drawing down stock levels while fulfilling a greater share of business from backlogs. At the time of the survey, supply chain pressures were reported to be gradually easing, with some improvement in supplier delivery performance, although conditions remained below pre-Middle East conflict levels. The sharp increases in input cost inflation and output prices moderated, with June showing the weakest rate of increase since March. Business confidence also improved, supported by lower energy prices and improving supplier delivery performance. Looking at the broader economy, the IMF, in its latest report, downgraded the EU's 2026 GDP growth forecast to 0.9% from 1.1%, partly due to concerns over persistently high energy costs compared with the start of the year and weak consumer confidence. Over the next few months, it will be important to see whether the pull-ahead in orders observed during Q2 leads to a lull in Q3, or whether the economy gains momentum through new order growth.

|--------------------|---------------|-----------------|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Flash              | ↑             | ↑               | 16+               | Price increases mostly across automotive and high-density NOR. Lead times 10–18 weeks (commercial) and 16–26 weeks (industrial/automotive). Availability reducing for standard Serial NOR; tighter for automotive, Octal SPI and long-life devices.          |
|                    | ↑             | ↑               | 26+               | Price increases keep going on while lead times are extending to above 30 weeks for high-density and automotive devices.                                                                                                                                      |
| eMMC               | ↑             | ↑               | 26+               | Price increases keep going on while lead times are extending to above 30 weeks for high-density and automotive devices.                                                                                                                                      |
| EEPROM             | →             | →               | 16+               | Raw material cost, energy cost drive slight upward price trend for automotive and industrial grades. Lead times 16+ weeks, extending over ~30+ weeks for automotive and long-life products.                                                                  |
| DRAM               | ↑             | ↑               | 26+               | Continuous price increases driven by AI demand and declining DDR4 production. DDR4/LPDDR4 on allocation. DDR5 lead times increasing. Supply remains tight but manageable with early forecasting and long-term commitments.                                   |
| SRAM               | →             | →               | 16+               | Raw material cost, energy cost increase drives price adjustments, with selective increases for automotive and high-reliability devices. Lead times 12–20 weeks. Good availability for standard SRAM; tighter for industrial, defense and long-life products. |
| Solid State Drives | →             | ↑               | 26+               | Moderate price increases, mainly for enterprise SSDs. Lead times stretching up across leading to tighter availability specifically tighter for enterprise PCIe Gen5 and industrial SSDs.                                                                     |

# /PRICE & LEAD TIME OVERVIEW - SUPPLIER SPECIFICS

| SUPPLIER    | PRODUCT                                          | LEAD TIME (WEEKS) | COMMENTARY                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------|--------------------------------------------------|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Microchip   | ALL                                              | 10-40             | Slightly increased lead time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Micron      | ALL                                              | 26+               | <b>Pricing Strategy:</b> Continues implementing price increases across DRAM, NAND and SSD portfolios to maximize margins driven by AI-related demand. Limited pricing flexibility on spot business. <b>Lead Time:</b> Extended (26+ weeks), with priority allocation for strategic customers and long-term supply agreements for DDR4/LPDDR4. <b>Market Position:</b> Focus remains on high-value products (HBM, DDR5 and Enterprise SSDs). Allocation is still in place for selected product families. |
| MPS         | ALL                                              | 32-52             | Increased lead time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Nexperia    | ICs                                              | 8-26              | While ICS capacity has improved, overwhelming orders globally lead to stretching lead-time.                                                                                                                                                                                                                                                                                                                                                                                                             |
|             | TSSOP/SO/VSSOP packages (major suffix PW, D, DC) | 20-24             | If Q4 orders have not yet been loaded, there may still be an opportunity to secure deliveries later in Fiscal Year 26-Q4.                                                                                                                                                                                                                                                                                                                                                                               |
|             | QFN packages (major suffix BQ, GU)               | 12-20             | Lead times reduced to 12-20 weeks. Capacity still available (but potential full soon).                                                                                                                                                                                                                                                                                                                                                                                                                  |
|             | MicroPak (major suffix GM, GS, GX, GT, GN, etc)  | 8-20              | Lead times reduced to 8-20 weeks. Capacity still available (but potential full soon).                                                                                                                                                                                                                                                                                                                                                                                                                   |
|             | Pico Gate (major suffix GW, GV)                  | 12-16             | Lead times remain at 12-16 weeks. Capacity still available (but potential full soon).                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Nordic Semi | ALL                                              | 20-30             | Slightly increased lead time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
