

BMR683 Series DC-DC Converters	1/28701-BMR683 Rev.A	Sept 2020
Input 36 - 60 V, Output up to 17.9 A / 500 W	© Flex	

Key Features

- Industry standard Quarter-Brick with digital PMBus interface 58.4 x 36.8 x 12.7 mm (2.3 x 1.45 x 0.5 in)
- High efficiency, typ. 95.5% at full load, 28 Vout
- 1500 Vdc input to output functional isolation
- Meets safety requirements according to IEC/EN/UL 62368-1
- PMBus Revision 1.3 compliant
- 12.02 million hours MTBF
- ISO 9001/14001 certified supplier

Power Management

- Configurable soft start/stop
- Precision delay and ramp-up
- Voltage margining
- Voltage/current/temperature monitoring
- Configurable output voltage
- Power good

Safety Approvals

Design for Environment

Meets requirements in high-temperature lead-free soldering processes.

Options	Description
n ₁	0 = Standard pin length 5.33 mm 4 = Pin length 2.79 mm
n ₂	3 = Baseplate
n ₃ n ₄	00 = 36-60 Vin, 18-32 Vout adjusted, DOSA 7 pin digital interface
n ₅ n ₆ n ₇	200 = 28 V standard configuration
n ₈	Blank = 20 converters (through hole pin)/tray, 3 trays/ box, PE foam dissipative

Example: Product number BMR6830300/200 equals a through hole mount lead length 5.33 mm, baseplate, digital interface with 28 V standard configuration variant.

For application specific configurations contact your local Flex sales representative.

General Information Reliability

The failure rate (λ) and mean time between failures (MTBF= $1/\lambda$) is calculated at max output power and an operating ambient temperature (T_A) of +40°C. Flex uses Telcordia SR-332 Issue 4 Method 1 to calculate the mean steady-state failure rate and standard deviation (σ).

Telcordia SR-332 Issue 4 also provides techniques to estimate the upper confidence levels of failure rates based on the mean and standard deviation.

Mean steady-	Std. deviation, σ
83 nFailures/h	7.3 nFailures/h

MTBF (mean value) for the BMR683 series = 12.02 Mh. MTBF at 90% confidence level = 10.81 Mh

Compatibility with RoHS requirements

The products are compatible with the relevant clauses and requirements of the RoHS directive 2011/65/EU and have a maximum concentration value of 0.1% by weight in homogeneous materials for lead, mercury, hexavalent chromium, PBB and PBDE and of 0.01% by weight in homogeneous materials for cadmium.

Exemptions in the RoHS directive utilized in Flex products are found in the Statement of Compliance document.

Flex fulfills and will continuously fulfill all its obligations under regulation (EC) No 1907/2006 concerning the registration, evaluation, authorization and restriction of chemicals (REACH) as they enter into force and is through product materials declarations preparing for the obligations to communicate information on substances in the products.

Quality Statement

The products are designed and manufactured in an industrial environment where quality systems and methods like ISO 9000, Six Sigma, and SPC are intensively in use to boost the continuous improvements strategy. Infant mortality or early failures in the products are screened out and they are subjected to an ATE-based final test. Conservative design rules, design reviews and product qualifications, plus the high competence of an engaged work force, contribute to the high quality of the products.

Warranty

Warranty period and conditions are defined in Flex General Terms and Conditions of Sale.

Limitation of Liability

Flex does not make any other warranties, expressed or implied including any warranty of merchantability or fitness for a particular purpose (including, but not limited to, use in life support applications, where malfunctions of product can cause injury to a person's health or life).

© Flex 2020

The information and specifications in this technical specification is believed to be correct at the time of publication. However, no liability is accepted for inaccuracies, printing errors or for any consequences thereof. Flex reserves the right to change the contents of this technical specification at any time without prior notice.

Safety Specification

General information

Flex DC/DC converters and DC/DC regulators are designed in accordance with the safety standards IEC 62368-1, EN 62368-1 and UL 62368-1 *Safety of Information Technology Equipment.*

IEC/EN/UL 62368-1 contains requirements to prevent injury or damage due to the following hazards:

- Electrical shock
- · Energy hazards
- Fire
- · Mechanical and heat hazards
- · Radiation hazards
- Chemical hazards

On-board DC/DC converters and DC/DC regulators are defined as component power supplies. As components they cannot fully comply with the provisions of any safety requirements without "conditions of acceptability". Clearance between conductors and between conductive parts of the component power supply and conductors on the board in the final product must meet the applicable safety requirements. Certain conditions of acceptability apply for component power supplies with limited stand-off (see Mechanical Information and Safety Certificate for further information). It is the responsibility of the installer to ensure that the final product housing these components complies with the requirements of all applicable safety standards and regulations for the final product.

Component power supplies for general use should comply with the requirements in IEC/EN/UL 62368-1 Safety of Information Technology Equipment. Product related standards, e.g. IEEE 802.3af Power over Ethernet, and ETS-300132-2 Power interface at the input to telecom equipment, operated by direct current (dc) are based on IEC/EN/UL 62368-1 with regards to safety.

Flex DC/DC converters, Power interface modules and DC/DC regulators are UL 62368-1 recognized and certified in accordance with EN 62368-1. The flammability rating for all construction parts of the products meet requirements for V-0 class material according to IEC 60695-11-10, *Fire hazard testing, test flames* – 50 W horizontal and vertical flame test methods.

BMR683

BMR683 provides functional insulation between input and output according to IEC/EN/UL 62368-1.

The output is considered as safety extra low voltage (SELV) if one of the following conditions is met:

- The input source provides double or reinforced insulation from the AC mains according to IEC/EN/UL 62368-1.
- The input source provides basic or supplementary insulation from the AC mains and the product's output is reliably connected to protective earth according to IEC/EN/UL 62368-1.
- The input source is reliably connected to protective earth and provides basic or supplementary insulation according to IEC/EN/UL 62368-1 and the maximum input source voltage is 60 Vdc.

Galvanic isolation between input and output is verified in an electric strength test and the isolation voltage ($V_{\rm iso}$) meets the voltage strength requirement for basic insulation according to IEC/EN/UL 62368-1.

It is recommended to use a slow blow fuse at the input of each DC/DC converter. If an input filter is used in the circuit the fuse should be placed in front of the input filter. In the rare event of a component problem that imposes a short circuit on the input source, this fuse will provide the following functions:

- Isolate the fault from the input power source so as not to affect the operation of other parts of the system
- Protect the distribution wiring from excessive current and power loss thus preventing hazardous overheating

BMR683 Series DC-DC Converters	1/28701-BMR683 Rev.A	Sept 2020

Product specificationAbsolute Maximum Ratings

Char	Characteristics		ур тах	Unit
T_BP	T _{BP} Base plate Operating Temperature		+95	°C
T _{P1}	Operating Temperature (see Thermal Consideration section)	-40	+125	°C
Ts	Storage temperature	-55	+125	°C
VI	Input voltage	-0.5	+65	V
V_{iso}	Isolation voltage (input to output test voltage)		1 500	Vdc
V _{iso}	Isolation voltage (base plate to output test voltage)		750	Vdc
V_{tr}	Input voltage transient (t _p 100 ms)		+80	V
V_{RC}	Remote Control pin voltage	-0.3	5	V

Stress in excess of Absolute Maximum Ratings may cause permanent damage. Absolute Maximum Ratings, sometimes referred to as no destruction limits, are normally tested with one parameter at a time exceeding the limits in the Electrical Specification. If exposed to stress above these limits, function and performance may degrade in an unspecified manner.

Common Electrical Specification

This section includes parameter specifications common to all product versions within the product series. Typically, these are parameters defined by the digital controller of the products. In the table below PMBus commands for configurable parameters are written in capital letters.

 T_{P1} = -40 to +85 °C, V_{I} = 36 to 60 V, unless otherwise specified under Conditions. Typical values given at: T_{P1} = +25 °C, V_{I} = 48 V, max I_{O} , unless otherwise specified under Conditions:

Characte	ristics	Conditions	min	typ	max	Unit
f _{SW} = 1/T _{SW}	Switching Frequency			200		kHz
	Switching Frequency Range, Note 1	PMBus configurable FREQUENCY_SWITCH	150		250	kHz
	Switching Frequency Set-point Accuracy	T _{P1} = +25 °C	-2		2	%
	External Sync Pulse Width		150			ns
	Input Clock Frequency Drift Tolerance	External sync	-4		4	%

T _{INIT}	Initialization Time	From V _I > ~27 V to ready to be enabled	30		ms
T _{ONdel tot}	Output voltage	Enable by input voltage	T _{INIT} + T _{ONdel}		
ONdel_tot	Total On Delay Time	Enable by RC or CTRL pin	T _{ONdel}		
	Output voltage	PMBus configurable Turn on delay duration	0		ms
T _{ONdel}	Output voltage On Delay Time	Range TON_DELAY	0	655	ms
		Accuracy (actual delay vs set value)	±1		% ms ms %
	Output voltage	PMBus configurable Turn off delay duration, Note 2	5		ms
T_{OFFdel}	Off Delay Time	Range TOFF_DELAY	0	655	ms % ms ms % ms ms ms ms ms ms
		Accuracy (actual delay vs set value), Note 3	±1		%
		Turn on ramp duration -Stand alone	50		ms
T _{ONrise} /	Output voltage On/Off	Turn off ramp duration	Disabled in standard configuration. Turn immediately upon expiration of Turn off d		ms
$T_{OFFfall}$	Ramp Time (0-100%-0 of V _O)	Range TON_RISE/TOFF_FALL	0	655	ms
		Ramp time accuracy for standalone operation (actual ramp time vs set value)	±1		ms % ms ms % ms ms % ms
V_{loff}	Input turn off range	States the level where the output voltage is disabled, PMBus configurable	31	60	V
V _{Ion}	Input turn on range	States the level where the output voltage is enabled, PMBus configurable.	33	60	V

7

Note 1. There are configuration changes to consider when changing the switching frequency, see section Switching Frequency.

Note 2. A default value of 0 ms forces the device to Immediate Off behavior with TOFF_FALL ramp-down setting being ignored.

Note 3. The specified accuracy applies for off delay times larger than 4 ms. When setting 0 ms the actual delay will be 0 ms.

Note 4. According to the combination of command MFR_RESPONSE_UNIT_CFG and delay time set in IOUT_OC_FAULT_RESPONSE, see Appendix – PMBus commands.

Note 5. Note that higher OCP threshold than specified may result in damage of the module at OC fault conditions. Note 6. See section Over Temperature Protection (OTP).

Note 7. SCL, SDA, SALERT, PG have no internal pull up resistor.

EMC Specification

Conducted EMI measured according to EN55022 / EN55032, CISPR 22 / CISPR 32 and FCC part 15J (see test set-up). The fundamental switching frequency is 200 kHz for BMR683. The EMI characteristics below is measured at V_I = 48 V and max I_O .

Optional external filter for class B

Suggested external input filter in order to meet class B in EN 55022 / EN 55032, CISPR 22 / CISPR 32 and FCC part 15J.

EMI with filter

Layout recommendations

The radiated EMI performance of the product will depend on the PWB layout and ground layer design. It is also important to consider the stand-off of the product. If a ground layer is used, it should be connected to the output of the product and the equipment ground or chassis.

A ground layer will increase the stray capacitance in the PWB and improve the high frequency EMC performance.

Output ripple and noise

Output ripple and noise measured according to figure below. See Design Note 022 for detailed information.

Output ripple and noise test setup

Power Management Overview

This product is equipped with a PMBus interface. The product incorporates a wide range of readable and configurable power management features that are simple to implement with a minimum of external components. Additionally, the product includes protection features that continuously safeguard the load from damage due to unexpected system faults. A fault is also shown as an alert on the SALERT pin. The following product parameters can continuously be monitored by a host: Input voltage, output voltage/current, duty cycle and internal temperature.

The product is delivered with a default configuration suitable for a wide range operation in terms of input voltage, output voltage, and load. The configuration is stored in an internal Non-Volatile Memory (NVM). All power management functions can be reconfigured using the PMBus interface

Throughout this document, different PMBus commands are referenced. A detailed description of each command is provided in the appendix at the end of this specification.

The Flex Power Designer software suite can be used to configure and monitor this product via the PMBus interface. For more information please contact your local Flex sales representative.

SMBus Interface

This product provides a PMBus digital interface that enables the user to configure many aspects of the device operation as well as to monitor the input and output voltages, output current and device temperature. The product can be used with any standard two-wire I²C (master must allow for clock stretching) or SMBus host device. In addition, the product is compatible with PMBus version 1.3 and includes an SALERT line to help mitigate bandwidth limitations related to continuous fault monitoring. The product supports 100 kHz and 400 kHz bus clock frequency only. The PMBus signals, SCL, SDA and SALERT require passive pull-up resistors as stated in the SMBus Specification. Pull-up resistors are required to guarantee the rise time as follows:

Eq. 7
$$\tau = R_P C_p \le 1us$$

where R_ρ is the pull-up resistor value and C_ρ is the bus load. The maximum allowed bus load is 400 pF. The pull-up resistor should be tied to an external supply between 2.7 to 3.8 V, which should be present prior to or during power-up. If the proper power supply is not available, voltage dividers may be applied. Note that in this case, the resistance in the equation above corresponds to parallel connection of the resistors forming the voltage divider.

It is recommended to always use PEC (Packet Error Check) when communicating via PMBus. There is an optional setting that makes PEC required which further increase communication robustness. This can be configured by setting bit 7 in command MFR_SPECIAL_OPTIONS (0xE0).

PMBus Addressing

The following figure and table show recommended resistor values with min and max voltage range for hard-wiring PMBus addresses (series E12, 1% tolerance resistors suggested):

6	150
7	220

The SA0 and SA1 pins can be configured with a resistor to GND according to the following equation.

PMBus Address(decimal)=8 x SA0 index + SA1 index

If the calculated PMBus address is 0, 11 or 12, PMBus address 127 is assigned instead. From a system point of view, the user shall also be aware of further limitations of the addresses as stated in the PMBus Specification. It is not recommended to keep the SA0 and SA1 pins left open. See section Address Offset how to set the command to utilize single address pin option. Specific variants may already have a default zero value set for MFR_OFFSET_ADDRESS.

Setup and hold times timing diagram

The setup time, t_{set}, is the time data, SDA, must be stable before the rising edge of the clock signal, SCL. The hold time

BMR683 Series DC-DC Converters	1/28701-BMR683 Rev.A	Sept 2020
Input 36 - 60 V, Output up to 17.9 A / 500 W	© Flex	

thold, is the time data, SDA, must be stable after the rising edge of the clock signal, SCL. If these times are violated incorrect data may be captured or meta-stability may occur and the bus communication may fail. All standard SMBus protocols must be followed, including clock stretching. This product supports the BUSY flag in the status commands to indicate product being too busy for SMBus response. A bus-free time delay between every SMBus transmission (between every stop & start condition) must occur. Refer to the SMBus specification, for SMBus electrical and timing requirements. Note that an additional delay of 5 ms has to be inserted in case of storing the RAM content into the internal non-volatile memory.

Monitoring via PMBus

It is possible to continuously monitor a wide variety of parameters through the PMBus interface. These include, but are not limited to, the parameters listed in the table below.

Parameter	PMBus Command
Input voltage	READ_VIN
Output voltage	READ_VOUT
Output current	READ_IOUT
Temperature *	READ_TEMPERATURE_1
Switching Frequency	READ_FREQUENCY
Duty cycle	READ_DUTY_CYCLE

^{*}Reports the temperature from temperature sensor set in command 0xDC, internal (controller IC)/external (temp sensor).

Monitoring Faults

Fault conditions can be detected using the SALERT pin, which will be asserted low when any number of pre-configured fault or warning conditions occurs. The SALERT pin will be held low until faults and/or warnings are cleared by the CLEAR_FAULTS command, or until the output voltage has been re-enabled. In response to the SALERT signal, the user may read a number of status commands to find out what fault

or warning condition occurred, see table below.

Fault & Warning Status	PMBus Command
Overview, Power Good	STATUS_BYTE STAUS_WORD
Output voltage level	STATUS_VOUT
Output current level	STATUS_IOUT
Input voltage level	STATUS_INPUT
Temperature level	STATUS_TEMPERATURE
PMBus communication	STATUS_CML
Miscellaneous	STATUS_MFR_SPECIFIC

Snapshot Parameter Capture

When input voltage disappears during conversion the Snapshot functionality will automatically store parametric RAM data to NVM. After one successful ramp with Vin still in the operating range, the snap shot data contains only FFh. To be able to retrieve snap shot data from the previous power cycle, it is therefore important to eliminate ramp up e.g by turning RC off or keeping Vin at 30 V. The NVM data can be read back using the MFR_GET_SNAPSHOT (0xD7) command to provide valuable information for analysis. The snap shot parameters called old are the recorded values at the fault event. All other snap shot parameters are stored to NVM when V_I falls below V_{Ioff} level. Theoretically the snapshot could be corrupted by a very fast Vin drop. Following parameters are stored to NVM:

- Input voltage old
- Output voltage old
- Output current old
- Duty cycle old
- Input voltage
- Output voltage
- Output current
- Temperature_1 (sensor select in 0xDC)
- Temperature_2
- Time in operation
- Status_word
- Status_byte
- Status_Vout
- Status_lout
- Status_Temperature
- Status_CML
- Status Other
- Status_MFR_Specific
- Snap shot cycles

Read MFR_GET_SNAPSHOT using the Flex Power Designer.

Ramp up data Capture

The command MFR_GET_RAMP_DATA (0xDB) retrieves 32 bytes of ramp data. 15 pairs of instant values of Vin and Vout are recorded during ramp and the interval is adjusted to the ramp time. Data byte 1 & 2 is the counter. Instant values of Vin & Vout are recorded as 8-bit integers, data byte 3 is the first Vin sample and data byte 4 is the first Vout sample. Vin & Vout are recorded as pairs until the ramp is finished. The record counter value is recorded just before ramp. The record value is equal to last value of "snap shot cycles" + 1. This way it can be judged whether the ramp data was recorded before or after snap shot data. Only the first ramp in a power cycle will be recorded. If the read out of the 32 bytes are all FFh then it is a successful ramp-up. Only the first ramp in a power cycle will be recorded. Thus, if the ramp fails, consequent ramp attempts will not be recorded and bit 6 in STATUS_MFR_SPECIFIC (0x80) will be set. Read MFR_GET_RAMP_DATA (0xDB) using Flex Power Designer.

BMR683 Series DC-DC Converters	1/28701-BMR683 Rev.A	Sept 2020
Input 36 - 60 V, Output up to 17.9 A / 500 W	© Flex	

Status data Capture

The command MFR_GET_STATUS_DATA (0xDF) retrieves 32 bytes consisting of a power cycle counter and 15 status words. The recording starts just after ramp has finished. Firstly, the power cycle counter is retrieved from the ramp data and stored as the first word. Secondly the status word is stored. The unit then continues to store status words every ~8 sec intervals. Total recording time is ~8 * 15 ~ 120 s.

Non-Volatile Memory (NVM)

The product incorporates two Non-Volatile Memory areas for storage of the PMBus command values; the Default NVM and the User NVM. The Default NVM is pre-loaded with Flex factory default values. The Default NVM is write-protected and can be used to restore the Flex factory default values through the command RESTORE_DEFAULT_ALL (0x12). The User NVM is pre-loaded with Flex factory default values. The User NVM is writable and open for customization. The values in NVM are loaded during initialization according to section Initialization Procedure, where after commands can be changed through the PMBus Interface. The STORE_USER_ALL (0x15) command will store the changed parameters to the User NVM.

Operating Information

Input Voltage

The input voltage range 30 to 60 Vdc meets the requirements for normal input voltage range in –48 Vdc systems. The absolute maximum continuous input voltage is 65 Vdc.

Short duration transient disturbances can occur on the DC distribution and input of the product when a short circuit fault occurs on the equipment side of a protective device (fuse or circuit breaker). The voltage level, duration and energy of the disturbance are dependent on the particular DC distribution network characteristics and can be sufficient to damage the product unless measures are taken to suppress or absorb this energy. The transient voltage can be limited by capacitors and other energy absorbing devices like zener diodes connected across the positive and negative input conductors at a number of strategic points in the distribution network. The end-user must secure that the transient voltage will not exceed the value stated in the Absolute maximum ratings. ETSI TR 100 283 examines the parameters of DC distribution networks and provides guidelines for controlling the transient and reduce its harmful effect.

Turn-on and -off Input Voltage

The product monitors the input voltage and will turn on and turn off at configured thresholds (see Electrical Specification). The turn-on input voltage voltage threshold is set higher than the corresponding turn-off threshold. Hence, there is a hysteresis between turn-on and turn-off input voltage levels.

Remote Control (RC)

The products are fitted with a remote control function referenced to the primary negative input connection (-In), with negative and positive logic options available. The RC function allows the product to be turned on/off by an external device like a semiconductor or mechanical switch.

The RC pin has an internal pull up resistor.

The external device must provide a minimum required sink current >0.5 mA to guarantee a voltage not higher than maximum voltage on the RC pin (see Electrical characteristics table). To turn off the product the RC pin should be left open for a minimum of time 150 µs, the same time requirement applies when the product shall turn on. When the RC pin is left open, the voltage generated on the RC pin is max 5 V. The standard product is provided with "negative logic" RC and will be off until the RC pin is connected to the –In. To turn off the product the RC pin should be left open. In situations where it is desired to have the product to power up automatically without the need for control signals or a switch, the RC pin shall be wired directly to –In.

Input and Output Impedance

The impedance of both the input source and the load will interact with the impedance of the product. It is important that the input source has low characteristic impedance. Minimum recommended external input capacitance is 220 μF . The electrolytic capacitors will be degraded in low temperature. The needed input capacitance in low temperature should be equivalent to 220 μF at 20°C. The performance in some applications can be enhanced by addition of external capacitance as described under External Decoupling Capacitors. If the input voltage source contains significant inductance, the addition of a low ESR ceramic capacitor of 22 - 100 μF capacitor across the input of the product will ensure stable operation. The minimum required capacitance value depends on the output power and the input voltage. The higher output power the higher input capacitance is needed.

BMR683 Series DC-DC Converters	1/28701-BMR683 Rev.A	Sept 2020
Input 36 - 60 V, Output up to 17.9 A / 500 W	© Flex	

External Decoupling Capacitors

When powering loads with significant dynamic current requirements, the voltage regulation at the point of load can be improved by addition of decoupling capacitors at the load. The most effective technique is to locate low ESR ceramic and electrolytic capacitors as close to the load as possible, using several parallel capacitors to lower the effective ESR. The ceramic capacitors will handle high-frequency dynamic load changes while the electrolytic capacitors are used to handle low frequency dynamic load changes. It is equally important to use low resistance and low inductance PWB layouts and cabling.

External decoupling capacitors will become part of the product's control loop. The control loop is optimized for a wide range of external capacitance and the maximum recommended value that could be used without any additional analysis is found in the Electrical specification.

The ESR of the capacitors is a very important parameter. Stable operation is guaranteed with a verified ESR value of >1 $m\Omega$ across the output connections.

For further information please contact your local Flex Power Modules representative.

PMBus configuration and support

The product provides a PMBus digital interface that enables the user to configure many aspects of the device operation as well as monitor the input and output parameters.

The Flex Power Designer software suite can be used to configure and monitor this product via the PMBus interface. For more information, please contact your local Flex sales representative.

Output Voltage Adjust using PMBus

The output voltage of the product can be reconfigured via PMBus command VOUT_COMMAND (0x21) or VOUT_TRIM (0x22). This can be used when adjusting the output voltage above or below output voltage initial setting up to a certain level, see Electrical specification for adjustment range. When increasing the output voltage, the voltage at the output pins must be kept within the plotted area, see graph. Output voltage setting must be kept below the threshold of the over voltage protection, (OVP) to prevent the product from shutting down. At increased output voltages the maximum power rating of the product remains the same, and the max output current must be decreased correspondingly.

Margin Up/Down Controls

These controls allow the output voltage to be momentarily adjusted, either up or down, by a nominal 10%. The margin high and margin low shall be limited to max and min output voltage, if the nominal output voltage is changed. This provides a convenient method for dynamically testing the operation of the load circuit over its supply margin or range. It can also be used to verify the function of supply voltage supervisors.

The margin up and down levels of the product can easily be re-configured using Flex Power Designer software.

Soft-start Power Up

The default rise time for a single product is 50 ms. When starting by applying input voltage the control circuit boot-up time adds an additional 100 ms delay. The soft-start and soft-stop control functionality allows the output voltage to ramp-up and ramp-down with defined timing with respect to the control of the output. This can be used to control inrush current and manage supply sequencing of multiple controllers. The rise time is the time taken for the output to ramp to its target voltage, while the fall time is the time taken for the output to ramp down from its regulation voltage to 0 V. The TON_DELAY (0x60) time sets a delay from when the output is enabled until the output voltage starts to ramp up. The TOFF_DELAY (0x64) delay time sets a delay from when the output is disabled until the output voltage starts to ramp down.

Illustration of Soft-Start and Soft-Stop.

By default, soft-stop is disabled, and the regulation of output voltage stops immediately when the output is disabled. Soft-stop can be enabled through the PMBus command ON_OFF_CONFIG (0x02). The delay and ramp times can be reconfigured using the PMBus commands TON_DELAY (0x60), TON_RISE (0x61), TOFF_DELAY (0x64) and TOFF_FALL (0x65).

BMR683 Series DC-DC Converters	1/28701-BMR683 Rev.A	Sept 2020
Input 36 - 60 V, Output up to 17.9 A / 500 W	© Flex	

Pre-bias Start-up

The product has a Pre-bias start up functionality and will not sink current during start up if a pre-bias source is present at the output terminals. If the Pre-bias voltage is lower than the target value set in VOUT_COMMAND (0x21), the product will ramp up to the target value. If the Pre-bias voltage is higher than the target value set in VOUT_COMMAND (0x21), the product will ramp down to the target value and in this case sink current for a time interval set by the command TOFF MAX WARN LIMIT (0x66).

OTP, UTP (Over/Under Temperature Protection)

The products are protected from thermal overload by an internal over temperature sensor.

The product will make continuous attempts to start up (nonlatching mode) and resume normal operation automatically when the temperature has dropped below the temperature threshold set in command OT_WARN_LIMIT (0x51).

The OTP and hysteresis of the product can be re-configured using the PMBus interface. The product has also an undertemperature protection. The OTP and UTP fault limit and fault response can be configured via the PMBus. Note: using the fault response "continue without interruption" may cause permanent damage to the product

Input Under Voltage Protection

The product can be protected from high input voltage and low input voltage. The under-voltage fault level and fault response is easily configured using Flex Power Designer software, see also Appendix – PMBus commands.

OVP (Output Over Voltage Protection)

The product includes over voltage limiting circuitry for protection of the load. The default OVP limit is 30% above the nominal output voltage. If the output voltage exceeds the OVP limit, the product can respond in different ways. The default response from an over voltage fault is to

The default response from an over voltage fault is to immediately shut down. The device will continuously check for the presence of the fault condition, and when the fault condition no longer exists the device will be re-enabled. The OVP fault level and fault response can be configured via the PMBus interface, see Appendix – PMBus commands.

OCP (Over Current Protection)

The products include current limiting circuitry for protection at continuous overload. then shutdown and automatic restart for output currents in excess of max output current (max I_O). The product will resume normal operation after removal of the overload. The load distribution should be designed for the maximum output short circuit current specified. The over current protection of the product can be configured via the PMBus interface, see Appendix – PMBus commands.

Switching frequency

The switching frequency is set to 200kHz as default but this can be reconfigured via the PMBus interface. The product is optimized at this frequency, but can run at lower and higher

frequency (150kHz-250kHz). The electrical performance can be affected if the switching frequency is changed.

Power Good

The power good pin 6 (PG) indicates when the product is ready to provide regulated output voltage to the load. During ramp-up and during a fault condition, PG is held high. By default, PG is asserted low after the output has ramped to a voltage above 16V, and de-asserted if the output voltage falls below 10V. These thresholds may be changed using the PMBus commands POWER_GOOD_ON (0x5E) and POWER_GOOD_OFF (0x5F).

By default, the PG pin is configured as Push-pull output, but it is also possible to set the output in open drain mode by the command MFR_MULTI_PIN_CONFIG (0xF9), see Appendix – PMBus commands.

The polarity is by default configured to active low, the polarity of PG can be set to active high in the command MFR_PGOOD_POLARITY (0xD0):

0xD0 = 00 (active low)

0xD0 = 01 (active high)

The product provides Power Good flag in the Status Word register that indicates the output voltage is within a specified tolerance of its target level and no-fault condition exists.

Address Offset

The command MFR_OFFSET_ADDRESS (0xEE) is used to configure an address offset. The PMBus-address offset's value increments the address value following the formula in the PMBus Addressing section of documentation.

See Appendix – PMBus commands.

BMR683 Series DC-DC Converters Input 36 - 60 V, Output up to 17.9 A / 500 W

1/28701-BMR683 Rev.A Sept 2020 © Flex

Thermal Consideration

The products are designed to operate in different thermal environments and sufficient cooling must be provided to ensure reliable operation.

For products mounted on a PWB without a heat sink attached, cooling is achieved mainly by conduction, from the pins to the host board, and convection, which is dependent on the airflow across the product. Increased airflow enhances the cooling of the product. The Output Current Derating graph found in the Output section for each model provides the available output current vs. ambient air temperature and air velocity at $V_1 = 48 \text{ V}$.

The product is tested on a 254 x 254 mm, 35 µm (1 oz), 16-layer test board mounted vertically in a wind tunnel with a cross-section of 608 x 203 mm.

For products with base plate used in a sealed box/cold wall application, cooling is achieved mainly by conduction through the cold wall. The Output Current Derating graphs are found in the Output section for each model. The product is tested in a sealed box test set up with ambient temperatures 85°C. See Design Note 028 for further details.

Definition of product operating temperature

The product operating temperatures is used to monitor the temperature of the product, and proper thermal conditions can be verified by measuring the temperature at positions P1 and P2. The temperature at these positions (T_{P1}, T_{P2}) should not exceed the maximum temperatures in the table below. The number of measurement points may vary with different thermal design and topology. Temperatures above maximum T_{P1}, measured at the reference point P1 are not allowed and may cause permanent damage.

Position	Description	Max Temp.
P1	Input capacitor	T _{P1} =125° C
P2	Base plate	T _{P2} =95° C

Soldering Information - Hole Mounting

The hole mounted product is intended for plated through hole mounting by wave or manual soldering. The pin temperature is specified to maximum to 270°C for maximum 10 seconds.

A maximum preheat rate of 4°C/s and maximum preheat temperature of 150°C is suggested. When soldering by hand, care should be taken to avoid direct contact between the hot soldering iron tip and the pins for more than a few seconds in order to prevent overheating.

A no-clean flux is recommended to avoid entrapment of cleaning fluids in cavities inside the product or between the product and the host board. The cleaning residues may affect long time reliability and isolation voltage.

Delivery Package Information

The products are delivered in antistatic trays.

PMBus Command Appendix

This appendix contains a detailed reference of the PMBus commands supported by the product.

Data Formats

The products make use of a few standardized numerical formats, along with custom data formats. A detailed walkthrough of the above formats is provided in AN304, as well as in sections 7 and 8 of the PMBus Specification Part II. The custom data formats vary depending on the command, and are detailed in the command description.

Standard Commands

The functionality of commands with code 0x00 to 0xCF is usually based on the corresponding command specification provided in the PMBus Standard Specification Part II (see Power System Management Bus Protocol Documents below). However there might be different interpretations of the PMBus Standard Specification or only parts of the Standard Specification applied, thus the detailed command description below should always be consulted.

Forum Websites

The System Management Interface Forum (SMIF)

http://www.powersig.org/

The System Management Interface Forum (SMIF) supports the rapid advancement of an efficient and compatible technology base that promotes power management and systems technology implementations. The SMIF provides a membership path for any company or individual to be active participants in any or all of the various working groups established by the implementer forums.

Power Management Bus Implementers Forum (PMBUS-IF)

http://pmbus.org/

The PMBus-IF supports the advancement and early adoption of the PMBus protocol for power management. This website offers recent PMBus specification documents, PMBus articles, as well as upcoming PMBus presentations and seminars, PMBus Document Review Board (DRB) meeting notes, and other PMBus related news.

PMBus - Power System Management Bus Protocol Documents

These specification documents may be obtained from the PMBus-IF website described above. These are required reading for complete understanding of the PMBus implementation. This appendix will not re-address all of the details contained within the two PMBus Specification documents.

Specification Part I - General Requirements Transport And Electrical Interface

Includes the general requirements, defines the transport and electrical interface and timing requirements of hard wired signals.

Specification Part II - Command Language

Describes the operation of commands, data formats, fault management and defines the command language used with the PMBus.

SMBus - System Management Bus Documents

System Management Bus Specification, Version 2.0, August 3, 2000

This specification specifies the version of the SMBus on which Revision 1.2 of the PMBus Specification is based. This specification is freely available from the System Management Interface Forum Web site at: http://www.smbus.org/specs/

PMBus Command Details

OPERATION (0x01)Description: Sets the desired PMBus enable and margin operations.

Bit	Function	Description	Value	Function	Description
7:6	Enable	Make the device enable or disable.	00	Immediate Off	Disable Immediately without sequencing.
			01	Soft Off	Disable "Softly" with sequencing.
			10	Enable	Enable device to the desired margin state.
5:4	Margin	Select between margin high/low states or nominal output.	00	Nominal	Operate at nominal output voltage.
			01	Margin Low	Operate at margin low voltage set in VOUT_MARGIN_LOW.
			10	Margin High	Operate at margin high voltage set in VOUT_MARGIN_HIGH.
3:2	Act on Fault	Set 10b to act on fault or set to 01b to ignore fault.	01	Ignore Faults	Ignore Faults when in a margined state. The device will ignore appropriate overvoltage/undervoltage warnings and faults and respond as programmed by the warning limit or fault response command.
			10	Act on Faults	Act on Faults when in a margined state. The device will handle appropriate overvoltage/undervoltage warnings and faults and respond as programmed by the warning limit or fault response command.

ON_OFF_CONFIG (0x02)
Description: Configures how the device is controlled by the CONTROL pin and the PMBus.

Bit	Function	Description	Value	Function	Description
4	Powerup Operation Sets the default to either operate any time power is present or for the on/off to be controlled by CONTROL pin and serial bus commands.		0	Enable Always	Unit powers up any time power is present regardless of state of the CONTROL pin.
			1	Enable pin or PMBus	Unit does not power up until commanded by the CONTROL pin and OPERATION command.
3	PMBus Enable Mode	Controls how the unit responds to commands received via the serial bus.	0	Ignore PMBus	Unit ignores the on/off portion of the OPERATION command from serial bus.
			1	Use PMBus	To start, the unit requires that the on/off portion of the OPERATION command is instructing the unit to run.
2	Enable Pin Mode	Controls how the unit responds to the CONTROL pin.	0	Ignore pin	Unit ignores the CONTROL/Enable pin.
			1	Use pin	Unit requires the CONTROL pin to be asserted to start the unit.
1	Enable Pin Polarity	Polarity of the CONTROL pin.	0	Active Low	Enable pin will cause device to enable when driven low.
			1	Active High	Enable pin will cause device to enable when driven high.
0	Disable Action	CONTROL pin action when commanding the unit to turn off.	0	Soft Off	Use the programmed turn off delay and fall time.

BMR683 Series DC-DC Converters	1/28701-BMR683 Rev.A	Sept 2020
Input 36 - 60 V, Output up to 17.9 A / 500 W	© Flex	

Bit	Function	Description	Value	Function	Description
			1	Imm. Off	Turn off the output and stop transferring energy to the output as fast as possible. The device's product literature shall specify whether or not the device sinks current to decrease the output voltage fall time.

CLEAR_FAULTS (0x03)

Description: Clears all fault status bits

WRITE_PROTECT (0x10)

Description: The WRITE_PROTECT command is used to control writing to the PMBus device. The intent of this command is to provide protection against accidental changes. This command is not intended to provide protection against deliberate or malicious changes to a device's configuration or operation.

Bit	Description	Value	Function	Description
7:0	All supported commands may have their parameters read, regardless of the WRITE_PROTECT settings.	0x80	Disable all writes	Disable all writes except to the WRITE_PROTECT command.
		0x40	Enable operation	Disable all writes except to the WRITE_PROTECT, OPERATION and PAGE commands.
		0x20	Enable control and Vout commands	Disable all writes except to the WRITE_PROTECT, OPERATION, PAGE, ON_OFF_CONFIG and VOUT_COMMAND commands.
		0x00	Enable all commands	Enable writes to all commands.

STORE_DEFAULT_ALL (0x11)

Description: Commands the device to store its configuration into the Default Store.

RESTORE_DEFAULT_ALL (0x12)

Description: Commands the device to restore its configuration from the Default Store.

STORE_USER_ALL (0x15)

Description: Stores, at the USER level, all PMBus values that were changed since the last restore command.

RESTORE_USER_ALL (0x16)

Description: Restores PMBus settings that were stored using STORE_USER_ALL. This command is automatically performed at power up.

CAPABILITY (0x19)

Description: This command provides a way for a host system to determine some key capabilities of a PMBus device.

Bit	Function	Description	Value	Function	Description
7	Packet Error Checking	Packet error checking.	00	Not supported	Packet Error Checking not supported.
			01	Supported	Packet Error Checking is supported.
6:5	Maximum Bus Speed	Maximum bus speed.	00	100kHz	Maximum supported bus speed is 100 kHz.
			01	400kHz	Maximum supported bus speed is 400 kHz.
3:0	Smbalert	SMBALERT	00	No Smbalert	The device does not have a SMBALERT# pin and does not support the SMBus Alert Response protocol.

BMR683 Series DC-DC Converters	1/28701-BMR683 Rev.A	Sept 2020
Input 36 - 60 V, Output up to 17.9 A / 500 W	© Flex	

Bit	Function	Description	Value	Function	Description
			01	Have Smbalert	The device does have a SMBALERT# pin and does support the SMBus Alert Response protocol.

VOUT_MODE (0x20)

Description: Controls how future VOUT-related commands parameters will be interpreted.

Bit	Function	Description	Format
4:0		Five bit two's complement EXPONENT for the MANTISSA delivered as the data bytes for VOUT_COMMAND in VOUT_LINEAR Mode, five bit VID	Integer Signed
		code identifier per in VID Mode or always set to 00000b in Direct Mode.	

Bit	Function	Description	Value	Function	Description
7:5		Set to 000b to select	000	Linear	Linear Mode Format.
		VOUT_LINEAR Mode (Five bit	001	VID	VID Mode.
		two's complement exponent for the MANTISSA delivered as the data bytes for an output voltage related command), set to 001b to select VID Mode (Five bit VID code identifier per) or set to 010b to select Direct Mode (Always set to 00000b).	010	Direct	Direct Mode.

VOUT_COMMAND (0x21)

Description: Commands the device to transition to a new output voltage.

Bit	Description	Format	Unit
15:0	Sets the nominal value of the output voltage.	Vout Mode	V
		Unsigned	

VOUT_TRIM (0x22)

Description: Configures a fixed offset to be applied to the output voltage when enabled.

Bit	Description	Format	Unit
15:0	Sets VOUT trim value. The two bytes are formatted as a two's complement binary mantissa, used in conjunction with the exponent set in VOUT_MODE.	Vout Mode Signed	V

VOUT_CAL_OFFSET (0x23)

Description: Vout calibration value. It is a signed number in Vout linear mode. The setting will be applied output voltage.

Bit	Description	Format	Unit
15:0	Vout calibration value. It is a signed number in Vout linear mode. The setting will be applied	Vout Mode	V
	output voltage.	Signed	

VOUT_MAX (0x24)

Description: Configures the maximum allowed output voltage.

Bit	Description	Format	Unit
15:0	Sets the maximum possible value setting of VOUT. The maximum VOUT_MAX setting is	Vout Mode	V
	110% of the pin-strap setting.	Unsigned	

VOUT_MARGIN_HIGH (0x25)

Description: Configures the target for margin-up commands.

Bit	Description	Format	Unit
15:0	Sets the value of the VOUT during a margin high.	Vout Mode Unsigned	V

BMR683 Series DC-DC Converters	1/28701-BMR683 Rev.A	Sept 2020
Input 36 - 60 V, Output up to 17.9 A / 500 W	© Flex	

VOUT_MARGIN_LOW (0x26)

Description: Configures the target for margin-down commands.

Bit	Description	Format	Unit
15:0	Sets the value of the VOUT during a margin low.	Vout Mode Unsigned	V

VOUT_TRANSITION_RATE (0x27)

Description: Configures the transition time for margins and VCOMMAND output changes.

Bit	Description	Format	Unit
15:0	Sets the transition rate during margin or other change of VOUT.	Linear	V/ms

VOUT_DROOP (0x28)

Description: Configures the Isense voltage to load current ratio.

В	3it	Description	Format	Unit
1	5:0	Sets the effective load line (V/I slope) for the rail in which the device is used.	Linear	mV/A

VOUT_SCALE_LOOP (0x29)

Description: Gain of Vout EADC sense.

Bit	Description	Format
15:0	Gain of Vout EADC sense.	Direct

VOUT_SCALE_MONITOR (0x2A)

Description: Normally there is a voltage divider in the voltage sense circuit. The scale factor is represented by VOUT_SCALE_MONITOR.

Bit	Description	Format
15:0	Normally there is a voltage divider in the voltage sense circuit. The scale factor is	Direct
	represented by VOUT_SCALE_MONITOR.	

MAX DUTY (0x32)

Description: Configures the maximum allowed duty-cycle.

Bit		Description	Format	Unit
15:	:0	Sets the maximum allowable duty cycle of the switching frequency.	Linear	%

FREQUENCY_SWITCH (0x33)

Description: Controls the switching frequency in 1kHz steps.

Bit	Description	Format	Unit
15:0	Sets the switching frequency.	Linear	kHz

VIN_ON (0x35)

Description: The VIN_ON command sets the value of the input voltage, in volts, at which the unit should start power conversion.

	Bit	Description	Format	Unit
ſ	15:0	Sets the VIN ON threshold.	Linear	V

VIN_OFF (0x36)

Description: The VIN_OFF command sets the value of the input voltage, in volts, at which the unit, once operation has started, should stop power conversion.

Bit	Description	Format	Unit
15:0	Sets the VIN OFF threshold.	Linear	V

BMR683 Series DC-DC Converters	1/28701-BMR683 Rev.A	Sept 2020
Input 36 - 60 V, Output up to 17.9 A / 500 W	© Flex	

INTERLEAVE (0x37)

Description: Configures the phase offset with respect to a common SYNC clock. When multiple product share a common DC input supply, spreading of the switching phases between the products can be utilized. This reduces the input capacitance requirements and efficiency losses, since the peak current drawn from the input supply is effectively spread out over the whole switch period. If two or more units have their outputs connected in parallel, interleaving will reduce ripple currents. This requires that the products are synchronized using the SYNC pin.

Bit	Function	Description	Format
11:8	Group ID Number	Value 0-15. Sets an ID number to a group of interleaved rails.	Integer Unsigned
7:4	Number of Rails	Value 0-15. Sets the number of units in the group, including the SYNC OUT product.	Integer Unsigned
3:0	Rail Position	Value 0-15. Sets the interleave order for this unit. The product configured to SYNC OUT shall be assigned to number 0	Integer Unsigned

IOUT_CAL_OFFSET (0x39)

Description: Sets the current-sense offset.

Bit	Description	Format	Unit
15:0	Sets an offset to IOUT readings. Use to compensate for delayed measurements of current	Linear	Α
	ramp.		

VOUT_OV_FAULT_LIMIT (0x40)

Description: Output over voltage fault limit.

	Bit	Description	Format	Unit
Ī	15:0	Output over voltage fault limit.	Vout Mode	V
			Unsigned	

VOUT_OV_FAULT_RESPONSE (0x41)

Description: Output over voltage fault response.

Bit	Function	Description	Value	Function	Description
7:6	Response	Describes the device interruption operation. 00b - The PMBus	00	Ignore Fault	The PMBus device continues operation without interruption.
		device continues operation without interruption. 01b - The PMBus device continues operation for the delay time specified by bits [2:0] and the delay time unit specified for that particular fault. If the fault condition is still present at the end of the delay time, the unit	01	Perform Retries while Operating	The PMBus device continues operation for the delay time specified by bits [2:0] and the delay time unit specified for that particular fault. If the fault condition is still present at the end of the delay time, the unit responds as programmed in the Retry Setting (bits [5:3]).
		responds as programmed in the Retry Setting (bits [5:3]). 10b - The device shuts down (disables the output) and responds	10	Disable and retry	The device shuts down (disables the output) and responds according to the retry setting in bits [5:3].
		The device shuts down (disables	11	Disable until Fault Cleared	A fault can cleared in several ways: The bit is individually cleared, The device receives a CLEAR_FAULTS command, a RESET signal (if one exists) is asserted, the output is commanded through the CTRL pin, the OPERATION command, or the combined action of the CTRL pin and OPERATION command, to turn off and then to turn back on, or Bias power is removed from the PMBus device.

 BMR683 Series DC-DC Converters
 1/28701-BMR683 Rev.A
 Sept 2020

 Input 36 - 60 V, Output up to 17.9 A / 500 W
 © Flex

Bit	Function	Description	Value	Function	Description	
5:3	Retries	The device attempts to restart the number of times set by these bits. 000b means the device does not attempt a restart. 111b means the device attempts restarting	000	Do Not Retry	A zero value for the Retry Setting means that the unit does not attempt to restart. The output remains disabled until the fault is cleared (Section 10.7).	
		continuously.	001	Retry Once	The PMBus device attempts to restart 1 time. If the device fails to restart, it disables the output and remains off until the fault is cleared as described in Section 10.7. The time between the start of each attempt to restart is set by the value in bits [2:] along with the delay time unit specified for that particular fault.	
			010	Retry Twice	The PMBus device attempts to restart 2 times. If the device fails to restart, it disables the output and remains off until the fault is cleared as described in Section 10.7. The time between the start of each attempt to restart is set by the value in bits [2:] along with the delay time unit specified for that particular fault.	
				011	Retry 3 times	The PMBus device attempts to restart 3 times. If the device fails to restart, it disables the output and remains off until the fault is cleared as described in Section 10.7. The time between the start of each attempt to restart is set by the value in bits [2:] along with the delay time unit specified for that particular fault.
			100	Retry 4 times	The PMBus device attempts to restart 4 times. If the device fails to restart, it disables the output and remains off until the fault is cleared as described in Section 10.7. The time between the start of each attempt to restart is set by the value in bits [2:] along with the delay time unit specified for that particular fault.	
			101	Retry 5 times	The PMBus device attempts to restart 5 times. If the device fails to restart, it disables the output and remains off until the fault is cleared as described in Section 10.7. The time between the start of each attempt to restart is set by the value in bits [2:] along with the delay time unit specified for that particular fault.

TOFF_DELAY (0x64)

Description: Sets the turn-off delay.

Bit	Description	Format	Unit
15:0	Sets the delay time from DISABLE to start of VOUT fall.	Direct	ms

TOFF_FALL (0x65)

Description: Sets the turn-off transition time.

Bit	Description	Format	Unit
15:0	Sets the fall time for VOUT after DISABLE and TOFF_DELAY.	Direct	ms

TOFF_MAX_WARN_LIMIT (0x66)

Description: Sets an upper limit, in milliseconds, on how long the unit can attempt to power down the output without reaching 12.5% of the output voltage programmed at the time the unit is turned off.

Bit	Description	Format	Unit
15:0		Direct	ms

STATUS_BYTE (0x78)

Description: Returns a brief fault/warning status byte.

Bit	Function	Description	Value	Description
6	Off	This bit is asserted if the unit is not providing power	0	No fault
		to the output, regardless of the reason, including simply not being enabled.	1	Fault
5	Vout Overvoltage	An output overvoltage fault has occurred.	0	No fault
	Fault		1	Fault
4	lout Overcurrent Fault	An output overcurrent fault has occurred.	0	No fault
			1	Fault
3	Vin Undervoltage	An input undervoltage fault has occurred.	0	No fault
	Fault		1	Fault
2	Temperature	A temperature fault or warning has occurred.	0	No fault
			1	Fault
1	Communication/Logic	A communications, memory or logic fault has	0	No fault
		occurred.	1	Fault
0	None of the Above	A fault or warning not listed in bits [7:1] has	0	No fault
		occurred.	1	Fault

STATUS_WORD (0x79)

Description: Returns an extended fault/warning status byte.

BMR683 Series DC-DC Converters	1/28701-BMR683 Rev.A	Sept 2020
Input 36 - 60 V, Output up to 17.9 A / 500 W	© Flex	

Bit	Function	Description	Value	Description
15	Vout	An output voltage fault or warning has occurred.	0	No fault
			1	Fault
14	lout/Pout	An output current or output power fault or warning	0	No Fault.
		has occurred.	1	Fault.
13	Input	An input voltage, input current, or input power fault	0	No Fault.
		or warning has occurred.	1	Fault.
11	Power-Good	The Power-Good signal, if present, is negated.	0	No Fault.
			1	Fault.
6	Off	This bit is asserted if the unit is not providing power	0	No fault
		to the output, regardless of the reason, including	1	Fault
		simply not being enabled.		
5	Vout Overvoltage	An output overvoltage fault has occurred.	0	No Fault.
	Fault		1	Fault.
4	lout Overcurrent Fault	An output overcurrent fault has occurred.	0	No Fault.
			1	Fault.
3	Vin Undervoltage	An input undervoltage fault has occurred.	0	No Fault.
	Fault		1	Fault.
2	Temperature	A temperature fault or warning has occurred.	0	No Fault.
			1	Fault.
1	Communication/Logic	A communications, memory or logic fault has	0	No fault.
		occurred.	1	Fault.
0	None of the Above	A fault or warning not listed in bits [7:1] has	0	No fault.
		occurred.	1	Fault.

STATUS_VOUT (0x7A)

Description: Returns Vout-related fault/warning status bits.

Bit	Function	Description	Value	Description
7	Vout Overvoltage	Vout Overvoltage Fault.	0	No Fault.
	Fault		1	Fault.
6	Vout Overvoltage	Vout Overvoltage Warning.	0	No Warning.
	Warning		1	Warning.
5	Vout Undervoltage	Vout Undervoltage Warning.	0	No Warning.
	Warning		1	Warning.
4	Vout Undervoltage	Vout Undervoltage Fault.	0	No Fault.
	Fault		1	Fault.
3	Vout Max Warning	Vout Max Warning (An attempt has been made to	0	No Warning.
		set the output voltage to value higher than allowed	1	Warning.
		by the Vout Max command (Section 13.5).		
2	Ton Max Fault	Ton-Max Fault.	0	No Fault
			1	Fault.
1	Toff Max Warning	Toff Max Warning.	0	No Warning.
			1	Warning.

STATUS_IOUT (0x7B)Description: Returns lout-related fault/warning status bits.

Bit	Function	Description	Value	Description
7	Iout Overcurrent Fault	lout Overcurrent Fault.	0	No Fault.
			1	Fault.
6	Iout Overcurrent And	lout Overcurrent and low voltage fault.	0	No Fault.
	Low Voltage Fault		1	Fault.
5	Iout Over Current	Iout Overcurrent Warning.	0	No Warning.
	Warning		1	Warning.
4	Iout Undercurrent	Iout Undercurrent Fault.	0	No Fault.
	Fault		1	Fault.

STATUS_INPUT (0x7C)

Description: Returns VIN/IIN-related fault/warning status bits.

BMR683 Series DC-DC Converters	1/28701-BMR683 Rev.A	Sept 2020
Input 36 - 60 V, Output up to 17.9 A / 500 W	© Flex	

Bit	Function	Description	Value	Description
7	Vin Overvoltage Fault	Vin Overvoltage Fault.	0	No Fault.
	_		1	Fault.
6	Vin Overvoltage	VIN Overvoltage Warning.	0	No Warning.
	Warning		1	Warning.
5	Vin Undervoltage	Vin Undervoltage Warning.	0	No Warning.
	Warning		1	Warning.
4	Vin Undervoltage	Vin Undervoltage Fault.	0	No Fault.
	Fault		1	Fault.
3	Insufficient Vin	Asserted when either the input voltage has never	0	No Insuffient VIN
		exceeded the input turn-on threshold Vin-On, or if		encountered yet.
		the unit did start, the input voltage decreased below the turn-off threshold.	1	Insufficient Unit is off.

STATUS_TEMPERATURE (0x7D)

Description: Returns the temperature-related fault/warning status bits

Bit	Function	Description	Value	Description
7	Overtemperature	Overtemperature Fault.	0	No Fault.
	Fault		1	Fault.
6	Overtemperature	Overtemperature Warning.	0	No Warning.
	Warning		1	Warning.
5	Undertemperature	Undertemperature Warning.	0	No Warning.
	Warning		1	Warning.
4	Undertemperature	Undertemperature Fault.	0	No Fault.
	Fault		1	Fault.

STATUS_CML (0x7E)

Description: Returns Communication/Logic/Memory-related fault/warning status bits.

Bit	Function	Description	Value	Description
7	Invalid Or Unsupported	Invalid Or Unsupported Command Received.	0	No Invalid Command Received.
	Command Received		1	Invalid Command Received.
6	Invalid Or Unsupported Data	Invalid Or Unsupported Data Received.	0	No Invalid Data Received.
	Received		1	Invalid Data Received.
5	Packet Error Check	Packet Error Check Failed.	0	No Failure.
	Failed		1	Failure.
4	Memory Fault	Memory Fault Detected.	0	No Fault.
	Detected		1	Fault.
1	Other Communication	A communication fault other than the ones listed in	0	No Fault.
	Fault	this table has occurred.	1	Fault.
0	Memory Or Logic	Other Memory Or Logic Fault has occurred.	0	No Fault.
	Fault	-	1	Fault.

READ_VIN (0x88)

Description: Returns the measured input voltage.

Bit	Description	Format	Unit
15:0	Returns the input voltage reading.	Linear	V

READ_VOUT (0x8B)Description: Returns the measured output voltage.

Bit	Description	Format	Unit
15:0	Returns the measured output voltage.	Vout Mode Unsigned	V

52

BMR683 Series DC-DC Converters	1/28701-BMR683 Rev.A	Sept 2020

READ_IOUT (0x8C)

Description: Returns the measured output current.

Bit	Description	Format	Unit
15:0	The device will NACK this command when not enabled and not in the USER_CONFIG	Linear	Α
	monitor mode.		

READ_TEMPERATURE_1 (0x8D)

Description: Returns the measured temperature (internal).

Bit	Description	Format	Unit
15:0		Linear	°C

READ_TEMPERATURE_2 (0x8E)

Description: Returns the measured temperature (internal).

Bit	Description	Format	Unit
15:0		Linear	°C

READ_DUTY_CYCLE (0x94)

Description: Returns the measured duty cycle in percent.

Bit	Description	Format	Unit
15:0	Returns the target duty cycle during the ENABLE state. The device will NACK this command when not enabled and not in the USER_CONFIG monitor mode.	Linear	%

READ_FREQUENCY (0x95)

Description: Returns the measured SYNC frequency.

Bit	Description	Format	Unit
15:0	Returns the measured operating switch frequency. The device will NACK this command	Direct	kHz
	when not enabled and not in the USER_CONFIG monitor mode.		

PMBUS_REVISION (0x98)

Description: Returns the PMBus revision number for this device.

Bit	Function	Description	Value	Function	Description
7:4	Part I Revision	Part I Revision.	0x0	1.0	Part I Revision 1.0.
			0x1	1.1	Part I Revision 1.1.
			0x2	1.2	Part I Revision 1.2.
			0x3	1.3	Part I Revision 1.3.
3:0	Part II	Part II Revision.	0x0	1.0	Part II Revision 1.0.
	Revision		0x1	1.1	Part II Revision 1.1.
			0x2	1.2	Part II Revision 1.2.
			0x3	1.3	Part II Revision 1.3.

MFR_ID (0x99)

Description: Sets the Manufacturers ID

Bit	Description	Format
95:0	Maximum of 12 characters.	ASCII

MFR_MODEL (0x9A)

Description: Sets the MFR MODEL string.

Bit	Description	Format
159:0	Maximum of 20 characters.	ASCII

MFR_REVISION (0x9B)

Description: Sets the MFR revision string.

BMR683 Series DC-DC Converters	1/28701-BMR683 Rev.A	Sept 2020
Input 36 - 60 V, Output up to 17.9 A / 500 W	© Flex	

Bit	Description	Format
95:0	Maximum of 12 characters.	ASCII

MFR_LOCATION (0x9C)

Description: Sets the MFR location string.

Bit	Description	Format
95:0	Maximum of 12 characters.	ASCII

MFR_DATE (0x9D)

Description: This command returns the date the regulator was manufactured.

Bit	Description	Format
95:0	Maximum of 12 characters.	ASCII

MFR_SERIAL (0x9E)

Description: This command returns a string of 13 characters and numbers that provides a unique identification of the regulator.

Bit	Description	Format
159:0	Maximum of 20 characters.	ASCII

USER_DATA_00 (0xB0) Description: User data

Bit	Description	Format
127:0	16 bytes of user data.	ASCII

MFR_VIN_OV_WARN_RESPONSE (0xC4)

Description: Input over voltage Warn response.

Bit	Function	Description	Value	Function	Description
7:6	Response		00	Ignore Fault	The PMBus device continues operation without interruption.
			01	Perform Retries while Operating	The PMBus device continues operation for the delay time specified by bits [2:0] and the delay time unit specified for that particular fault. If the fault condition is still present at the end of the delay time, the unit responds as programmed in the Retry Setting (bits [5:3]).
			10	Disable and retry	The device shuts down (disables the output) and responds according to the retry setting in bits [5:3].
			11	Disable until Fault Cleared	A fault can cleared in several ways: The bit is individually cleared, The device receives a CLEAR_FAULTS command, a RESET signal (if one exists) is asserted, the output is commanded through the CTRL pin, the OPERATION command, or the combined action of the CTRL pin and OPERATION command, to turn off and then to turn back on, or Bias power is removed from the PMBus device.

			110	Retry 6 times	The PMBus device attempts to restart 6 times. If the device fails to restart, it disables the output and remains off until the fault is cleared as described in Section 10.7. The time between the start of each attempt to restart is set by the value in bits [2:] along with the delay time unit specified for that particular fault.
			111	Retry Continuously	The PMBus device attempts to restart continuously, without limitation, until it is commanded OFF (by the CONTROL pin or OPERATION command or both), bias power is removed, or another fault condition causes the unit to shut down.
2:0	Retry Time	Number of delay time units. Used	0	1	
	and Delay	for either the amount of time the	1	2	
	Time	device is to continue operating	2	4	
		after a fault is detected or for the	3	8	
		amount of time between attempts to restart. The time unit is set in	4	16	
			5	32	
		register 0xD2.	6	64	
			7	128	

MFR_CONFIG_UNUSED_PINS (0xC5)

Description: Define if pins are used (0) or unused (1). MSB defines if unused pins should be configured as input (0) or output low(1). If an unused pin is defined as input the pin must be grounded. If an unused pin is not grounded it should be defined as output low (mainly for backward compatibility).

Bit	Function	Description	Value	Function	Description
15	Mfr.	If an unused pin is defined as	0	INPUT	
	FAULT2_CON	input the pin must be grounded, If	1	OUTPUT LOW	
	FIG	an unused pin is not grounded it			
	1.4	should be defined as output low.			
14	Mfr.	If an unused pin is defined as	0	INPUT	
	TMS_CONFIG	input the pin must be grounded, If	1	OUTPUT LOW	
		an unused pin is not grounded it			
13	Mfr.	should be defined as output low. If an unused pin is defined as	0	INPUT	
13	TDI_CONFIG	input the pin must be grounded, If	1	OUTPUT LOW	
	TDI_CONTIC	an unused pin is not grounded it	'	OUTFUT LOW	
		should be defined as output low.			
12	Mfr.	If an unused pin is defined as	0	INPUT	
	TDO_CONFIG	input the pin must be grounded, If	1	OUTPUT LOW	
		an unused pin is not grounded it			
		should be defined as output low.			
11	Mfr.	If an unused pin is defined as	0	INPUT	
	DPWM3B_CO	input the pin must be grounded, If	1	OUTPUT LOW	
	NFIG	an unused pin is not grounded it			
40	Mfr.	should be defined as output low.	0	INDUIT	
10		If an unused pin is defined as	0	INPUT	
	DPWM3A_CO NFIG	input the pin must be grounded, If an unused pin is not grounded it	1	OUTPUT LOW	
	INFIG	should be defined as output low.			
9	Mfr.	If an unused pin is defined as	0	INPUT	
	DPWM2B_CO	input the pin must be grounded, If	1	OUTPUT LOW	
	NFIG	an unused pin is not grounded it			
		should be defined as output low.			
8			0	INPUT	

BMR683 Series DC-DC Converters	1/28701-BMR683 Rev.A	Sept 2020
Input 36 - 60 V, Output up to 17.9 A / 500 W	© Flex	

Bit	Function	Description	Value	Function	Description
	Mfr. ADC_EXT_TR IG_CONFIG	If an unused pin is defined as input the pin must be grounded, if an unused pin is not grounded it should be defined as output low.	1	OUTPUT LOW	
7	Mfr. Mfr.	Define if pin is used or unused.	0	USED	
	FAULT2_UTIL IZATION	Setting a pin to unused with this command overrides other configurations.	1	UNUSED	
6	Mfr. Mfr.	Define if pin is used or unused.	0	USED	
	TMS_UTILIZA TION	Setting a pin to unused with this command overrides other configurations.	1	UNUSED	
5	Mfr. Mfr.	Define if pin is used or unused.	0	USED	
	TDI_UTILIZAT ION	Setting a pin to unused with this command overrides other configurations.	1	UNUSED	
4	Mfr. Mfr.	Define if pin is used or unused.	0	USED

	DPWM3A_UTI LIZATION	Setting a pin to unused with this command overrides other configurations.	1	UNUSED	
1	Mfr. Mfr.	Define if pin is used or unused.	0	USED	
	DPWM2B_UTI LIZATION	Setting a pin to unused with this command overrides other configurations.	1	UNUSED	
0	Mfr.	Define if pin is used or unused.	0	USED	
	ADC_EXT_TR IG_UTILIZATI ON	Setting a pin to unused with this command overrides other configurations.	1	UNUSED	

MFR_RC_LEVEL (0xC6)

Description: Set the Remote control threshold when connected to AD03

	Bit	Description	Format	Unit
Ī	7:0	Sets the level for triggering the Remote control.	Fixed Point	V
			Unsigned	

MFR_KS_PRETRIG (0xC7)

Description: Value sets the time for pre-trigger a kickstart pulse. Value=0 equals approximately 20us, each unit adds 450ns to this value

Bit	Description	Format	Unit
7:0	Sets the time for pre-trigger a kickstart pulse. Value=0 equals approximately 20us, each unit	Fixed Point	us
	adds 450ns to this value	Unsigned	

MFR_FAST_VIN_OFF_OFFSET (0xC8)

Description: Adds an offset to the fast VinOff criteria. The offset value is referenced to VinOff value. This is to shutdown the unit in a controlled fashion when Vin is falling fast.

	Bit	Description	Format	Unit
Γ	7:0	Adds an offset to the fast VinOff criteria.	Fixed Point	V
			Unsigned	

MFR_PGOOD_POLARITY (0xD0)

Description: Power good polarity (1:active high; 0: active low).

57

BMR683 Series DC-DC Converters	1/28701-BMR683 Rev.A	Sept 2020
Input 36 - 60 V, Output up to 17.9 A / 500 W	© Flex	

Bit	Description	Value	Function	Description
7:0	Power good polarity (1:active high; 0: active low).	0x00	Active Low	
		0x01	Active High	

MFR_FAST_OCP_CFG (0xD1)
Description: Set the fast OCP threshold

Bit	Function	Description	Format	Unit
12:8	OCP samples	Sets the Number of over current samples before trigger the OCP.	Integer Unsigned	sampl es
6:0	OCP level	Sets the level for triggering the fast OCP, resolution is in 128 divisions of 2.5V referenced to the maximum readout current.	Integer Unsigned	level

Bit	Function	Description	Value	Function	Description
7	Enable/Disabl	Enable or disable Fast OCP	0	Disable	Disables Fast OCP
	е		1	Enable	Enables Fast OCP

MFR_RESPONSE_UNIT_CFG (0xD2)

Description: Defines the basic units 1ms, 10ms, 100ms or 1 sec for each of the four basic responses Vout, Vin, lout and Temperature. The Configured time is calculated as: Configured time = (Retry Time and Delay Time value in specific Fault response) x (unit in 0xD2)

Bit	Function	Description	Value	Function	Description
7:6	VOUT	Set the fault response delay unit	0	1 ms/unit	
	response	according to configured delay time	1	10 ms/unit	
	delay unit	for	2	100 ms/unit	
		VOUT_OV_FAULT_RESPONSE	3	1 s/unit	
		and			
		VOUT_UV_FAULT_RESPONSE.			
5:4	Vin response	Set the fault response delay unit	0	1 ms/unit	
	delay unit	according to configured delay time	1	10 ms/unit	
		for VIN_OV_FAULT_RESPONSE	2	100 ms/unit	
		and	3	1 s/unit	
		VIN_UV_FAULT_RESPONSE.			
3:2	IOUT	Set the fault response delay unit	0	1 ms/unit	
	response	according to configured delay time	1	10 ms/unit	
	delay unit	for	2	100 ms/unit	
		IOUT_OC_FAULT_RESPONSE	3	1 s/unit	
		and			
		IOUT_OC_FAULT_RESPONSE.			
1:0	Temperature	Set the fault response delay unit	0	1 ms/unit	
	response	according to configured delay time	1	10 ms/unit	
	delay unit	for OT_FAULT_RESPONSE and	2	100 ms/unit	
		UT_FAULT_RESPONSE.	3	1 s/unit	

MFR_VIN_SCALE_MONITOR (0xD3)

Description: Vin Scale Monitor at ON and OFF.

Bit	Function	Description	Format
31:16	Mfr. Vin Scale Monitor on	Trimmed offset at ON	Byte Array
15:0	Mfr. Vin Scale Monitor Off	Trimmed Vin Scale at OFF	Byte Array

MFR_PREBIAS_DVDT_CFG (0xD4)

Description: Mfr. prebias dV/dt configuration

BMR683 Series DC-DC Converters	1/28701-BMR683 Rev.A	Sept 2020
Input 36 - 60 V, Output up to 17.9 A / 500 W	© Flex	

Bit	Function	Description	Format	Unit
63:48	Mfr. Maximum allowable positive dVin/dt	This value state the max positive Vin change limit to execute a pre-bias start.	Fixed Point Signed	V/ms
47:32	Mfr. Maximum allowable negative dVin/dt	This value state the max negative Vin change limit to execute a pre-bias start.	Fixed Point Signed	V/ms
31:16	Mfr. Maximum allowable positive dVout/dt	This value state the max positive Vout change limit to execute a pre-bias start.	Fixed Point Signed	V/ms
15:0	Mfr. Maximum allowable negative dVout/dt	This value state the max negative Vout change limit to execute a pre-bias start.	Fixed Point Signed	V/ms

MFR_FILTER_SELECT (0xD5)

Description: Filter coefficient selection

	Bit	Description	Format
Γ	7:0	Filter coefficient selection with byte 1: 0 = Vout, 1 = lout, VFF = 2	Integer Unsigned

MFR_GET_SNAPSHOT (0xD7)
Description: The MFR_GET_SNAPSHOT command is a 32-byte read-back of snapshot data values. When input voltage disappears during conversion the Snapshot functionality will automatically store this parametric data to NVM. If the snap shot data contains only FFh except for the counter, it means that the unit ramped up and then was commanded off before input voltage was removed.

Bit	Function	Description	Format	Unit
255:2 40	Snapshot Cycles	Number of shutdown in operation.	Integer Unsigned	Times
239:2 32	Manufacturer Specific Status Byte	Number of faults in previous power cycle.	Byte Array	
231:2 24	Status Other	Status other.	Byte Array	
223:2 16	Status CML	Status CML.	Byte Array	
215:2 08	Status Temperature	Status temperature.	Byte Array	
207:2 00	Status Vin	Status Vin.	Byte Array	
199:1 92	Status lout	Status iout.	Byte Array	
191:1 84	Status Vout	Status Vout.	Byte Array	
183:1 76	Status Byte	Status byte.	Byte Array	
175:1 60	Status Word	Status word.	Byte Array	
159:1 44	Time in operation	Duration of previous power cycle in seconds.	Integer Unsigned	secon ds
143:1 28	Temperature 2	Read temperature from the temperature sensor not chosen in command 0xDC MFR_SELECT_TEMPERATURE_SENSOR).	Linear	°C
127:1 12	Temperature 1	Read temperature from the temperature sensor chosen in command 0xDC MFR_SELECT_TEMPERATURE_SENSOR).	Linear	°C
111:9 6	Load Current	Load current.	Linear	А
95:80	Output Voltage	Output voltage.	Vout Mode Unsigned	V
79:64	Input Voltage	Input voltage.	Linear	V

BMR683 Series DC-DC Converters	1/28701-BMR683 Rev.A	Sept 2020
Input 36 - 60 V, Output up to 17.9 A / 500 W	© Flex	

Bit	Function	Description	Format	Unit
63:48	Duty Cycle Old	Duty cycle recorded during normal operation.	Linear	%
47:32	Load Current Old	Load current recorded during normal operation.	Linear	Α
31:16	Output Voltage Old	Output voltage recorded during normal operation.	Vout Mode Unsigned	V
15:0	Input Voltage Old	Input voltage recorded during normal operation.	Linear	V

MFR_TEMP_COMPENSATION (0xD8)

Description: Mfr. temperature compensation parameter

Bit	Function	Description	Format
63:56	Mfr. Temperature compensation deadtime added 2	MFR_TEMP_COMPENSATION_DT_ADD_2 defines the additional dead time used at temperature levels below temperature threshold 2. Unit is nano seconds. It's an unsigned byte, meaning the value can be 0-255.	Byte Array
55:48	Mfr. Temperature compensation deadtime hysteresis 2	MFR_TEMP_COMPENSATION_DT_HYS_2 defines a level for hysteresis i.e. temperature must rise over this level again before dead times are changed.	Byte Array
47:40	Mfr. Temperature compensation deadtime threshold 2	It is a signed byte with the temperature as an integer (°C). This defines a second temperature level for temperature compensation of dead times.	Byte Array
39:32	Mfr. Temperature compensation deadtime added 1	MFR_TEMP_COMPENSATION_DT_ADD_1 defines the additional dead time used at temperature levels below temperature threshold 1. Unit is nano seconds. It's an unsigned byte, meaning the value can be 0-255.	Byte Array
31:24	Mfr. Temperature compensation deadtime hysteresis 1	MFR_TEMP_COMPENSATION_DT_HYS_1 defines a level for hysteresis i.e. temperature must rise over this level again before dead times are changed.	Byte Array
23:16	Mfr. Temperature compensation deadtime threshold 1	It is a signed byte with the temperature as an integer (°C). This defines the first temperature level for temperature compensation of dead times.	Byte Array
15:8	Mfr. Temperature compensation EDAC slope	The second byte, TEMPERATURE_COMPENSATION_EDAC_SLOPE, sets the slope of the temperature compensation taking place above the EDAC_TEMP_COMP_TRESHOLD level. This is a signed byte in Q8 format. The unit is LSB/°C/256. Example: First byte represent 40°C so EDAC_TEMP_COMP_TRESHOLD = 40. Compensate EDAC with 25mV from 40°C to 120°C. The resolution is 1.6V/1024 = 1.56mV / LSB. To compensate for the 25mV droop over 80°C we need to add 25/80 = 0.3125mV/°C = 0.3125/1.56 LSB/°C = 0.2 LSB/°C to the reference DAC. 0.2*256 = 51 so EDAC_TEMP_COMP_SLOPE = 51	Byte Array
7:0	Mfr. Temperature compensation EDAC threshold	The first byte in the block is EDAC_TEMP_COMP_TRESHOLD. This defines the level where the temperature compensation shall begin. It is a signed byte with the temperature as an integer (°C). Example: First byte represent 40°C so EDAC_TEMP_COMP_TRESHOLD = 40. Compensate EDAC with 25mV from 40°C to 120°C. The resolution is 1.6V/1024 = 1.56mV / LSB. To compensate for the 25mV droop over 80°C we need to add 25/80 = 0.3125mV/°C = 0.3125/1.56 LSB/°C = 0.2 LSB/°C to the reference DAC. 0.2*256 = 51 so EDAC_TEMP_COMP_SLOPE = 51	Byte Array

MFR_SET_ROM_MODE (0xD9)

Description: Sends system into ROM mode. Issue this command before attempting to download new firmware to the controller.

BMR683 Series DC-DC Converters	1/28701-BMR683 Rev.A	Sept 2020
Input 36 - 60 V, Output up to 17.9 A / 500 W	© Flex	

Bit	Description	Format
31:0	Sends system into ROM mode. Issue this command before attempting to download new firmware to the controller.	ASCII

MFR_ISHARE_THRESHOLD (0xDA)

Description: Mfr. current sharing threshold level

Bit	Function	Description	Format	Unit
31:24	Trim limit	Set the trim limit for output voltage. This limit the output voltage to be trimmed to a certain level to prevent max-trim if the controller sense erroneous current.	Integer Unsigned	1.7mv /LSB
15:8	Positive threshold level	Set the threshold level where the output voltage is incremental trimmed to achieve current balance between paralleled device. The threshold level represent at what current level the output voltage start increasing. The hysteresis where no current balancing through CTRL pin is done is between the positive and negative threshold levels.	Integer Unsigned	~50m A/LS B
7:0	Negative threshold level	Set the threshold level where the output voltage is decremental trimmed to achieve current balance between paralleled device The threshold level represent at what current level the output voltage start decreasing. The hysteresis where no current balancing through CTRL pin is done is between the positive and negative threshold levels.	Integer Unsigned	~50m A/LS B

Bit	Function	Description	Value	Description
56	Enable/Disable	Enable or disable Active Current share	0	Disables active current
				share
			1	Enables active current
				share

MFR_GET_RAMP_DATA (0xDB)

Description: The command MFR_GET_RAMP_DATA 0xDB retrieves 32 bytes of ramp data. 15 pairs of instant values of Vin and Vout are recorded during ramp and the interval is adjusted to the ramp time. The record counter value is recorded just before ramp. The record value is equal to last value of "snap shot cycles" + 1. This way it can be judged whether the ramp data was recorded before or after snap shot data. Only the first ramp in a power cycle will be recorded. Data is reset after a successful ramp up.

Bit	Function	Description	Format	Unit
255:2	Vout 14		Integer	V
48			Unsigned	
247:2	Vin 14		Integer	V
40			Unsigned	
239:2	Vout 13		Integer	V
32			Unsigned	
231:2	Vin 13		Integer	V
24			Unsigned	
223:2	Vout 12		Integer	V
16			Unsigned	
215:2	Vin 12		Integer	V
80			Unsigned	
207:2	Vout 11		Integer	V
00			Unsigned	
199:1	Vin 11		Integer	V
92			Unsigned	
191:1	Vout 10		Integer	V
84			Unsigned	
183:1	Vin 10		Integer	V
76			Unsigned	
175:1	Vout 9		Integer	V
68			Unsigned	
167:1	Vin 9		Integer	V
60			Unsigned	
159:1	Vout 8		Integer	V
52			Unsigned	

BMR683 Series DC-DC Converters	1/28701-BMR683 Rev.A	Sept 2020
Input 36 - 60 V, Output up to 17.9 A / 500 W	© Flex	

Bit	Function	Description	Format	Unit
151:1 44	Vin 8		Integer Unsigned	V
143:1 36	Vout 7		Integer Unsigned	V
135:1 28	Vin 7		Integer Unsigned	V
127:1 20	Vout 6		Integer Unsigned	V
119:1 12	Vin 6		Integer Unsigned	V
111:1 04	Vout 5		Integer Unsigned	V
103:9 6	Vin 5		Integer Unsigned	V
95:88	Vout 4		Integer Unsigned	V
87:80	Vin 4		Integer Unsigned	V
79:72	Vout 3		Integer Unsigned	V
71:64	Vin 3		Integer Unsigned	V
63:56	Vout 2		Integer Unsigned	V
55:48	Vin 2		Integer Unsigned	V
47:40	Vout 1		Integer Unsigned	V
39:32	Vin 1		Integer Unsigned	V
31:24	Vout 0		Integer Unsigned	V
23:16	Vin 0		Integer Unsigned	V
15:0	Counter		Integer Unsigned	Times

MFR_SELECT_TEMPERATURE_SENSOR (0xDC)

Description: Select which temperature sensor, internal one or external remote temperature sensor, is used.

Bit	Description	Value	Function	Description
0	Select which temperature sensor, internal one or external remote temperature sensor, is used.	0	Internal IC Sensor	Internal IC temperature sensor selected.
		1	External Sensor	External remote temperature sensor selected.

MFR_VIN_OFFSET (0xDD)
Description: Vin offset at ON and OFF.

Bit	Function	Description	Format
31:16	Mfr. Vin Offset on	Trimmed offset at ON	Byte Array
15:0	Mfr. Vin Offset off	Trimmed offset at OFF	Byte Array

MFR_VOUT_OFFSET_MONITOR (0xDE)

Description: Output voltage trim

Bit	Description	Format	Unit
15:0	Output voltage trim	Vout Mode	V
		Signed	

BMR683 Series DC-DC Converters	1/28701-BMR683 Rev.A	Sept 2020
Input 36 - 60 V, Output up to 17.9 A / 500 W	© Flex	

MFR_GET_STATUS_DATA (0xDF)

Description: The command MFR_GET_STATUS_DATA 0xDF retrieves 32 bytes consisting of status words. The recording starts just after ramp has finished and continues during the first 128s after start up (16status word, 8s interval).

Bit	Function	Description	Format
255:2 40	Status Word 15	Status word 15.	Byte Array
239:2 24	Status Word 14	Status word 14.	Byte Array
223:2 08	Status Word 13	Status word 13.	Byte Array
207:1 92	Status Word 12	Status word 12.	Byte Array
191:1 76	Status Word 11	Status word 11.	Byte Array
175:1 60	Status Word 10	Status word 10.	Byte Array
159:1 44	Status Word 9	Status word 9.	Byte Array
143:1 28	Status Word 8	Status word 8.	Byte Array
127:1 12	Status Word 7	Status word 7.	Byte Array
111:9 6	Status Word 6	Status word 6.	Byte Array
95:80	Status Word 5	Status word 5.	Byte Array
79:64	Status Word 4	Status word 4.	Byte Array
63:48	Status Word 3	Status word 3.	Byte Array
47:32	Status Word 2	Status word 2.	Byte Array
31:16	Status Word 1	Status word 1.	Byte Array
15:0	Status Word 0	Status word 0.	Byte Array

MFR_SPECIAL_OPTIONS (0xE0)

Description: Special option configuration. Bit 0 - Reserved Bit 1 - Reserved Bit 2 - DBV: 0:Disabled 1:Enabled Bit 3 - ART/DLC: 0:Disabled 1:Enabled Bit 5 - DLS: 0:Linear droop 1:Non-linear droop Bit 6 - HRR: 0:Disabled 1:Enabled Bit 7 - Require PEC

Bit	Function	Description	Value	Function	Description
7	Require	Enables/Disables Packet Error	0		Disabled
	Packet Error Check	Check.	1		Enabled
6	Enable HRR,	Enables the HRR, Hybrid	0		Disabled
	(Hybrid Regulated Ratio)	Regulated Ratio. This enables the unit to have a duty cycle head room where max duty cycle is avoided. The output voltage will follow the input voltage ratio, below the HRR threshold set in command VIN_UV_WARN_LIMIT (0x58).	1		Enabled
5	DLS slope	Setup how the slope of the Vout	0	Linear droop	Configured with linear droop
	configuration	droop is configured, with linear or non-linear droop.	1	Non-linear droop	Configured with non-linear droop
3	Enable	Enables/Disables ART/DLC.	0		Disabled
	ART/DLC, (Adaptive Ramp-up Time, Dynamic Loop Compensation		1		Enabled
2		Enables/Disables DBV.	0		Disabled

BMR683 Series DC-DC Converters	1/28701-BMR683 Rev.A	Sept 2020
Input 36 - 60 V, Output up to 17.9 A / 500 W	© Flex	

Bit	Function	Description	Value	Function	Description
	Enable DBV, (Dynamic Bus Voltage)		1		Enabled

MFR_TEMP_OFFSET_INT (0xE1)

Description: Internal temperature offset.

Bit	Description	Format	Unit
15:0	Integer [0.1 °C]	Direct	°C

MFR_REMOTE_TEMP_CAL (0xE2)

Description: External temperature offset and slope.

Bit	Description	Format
31:0	T(C) = slope x ADC(v) + offset, Byte 0 byte 1: offset, Byte 2 byte 3: slope.	Byte Array

MFR_REMOTE_CTRL (0xE3)

Description: Primary Remote Control (RC pin) configuration.

Bit	Function	Description	Value	Function	Description
4	CTRL pin Interaction		0	OR'ed w/ CTRL pin	PriRC is OR:ed with OPERATION and CTRL pin.
	Interdetion		1	AND'ed w/	PriRC is AND:ed with OPERATION and CTRL pin.
2	Remote CTRL	PriRC Pin Enable: 0:Disabled	0	Disabled	Of ERATION and OTRE pin.
	pin Enabled	1:Enabled	1	Enabled	
1	Remote CTRL	PriRC Polarity: 0:Active Low	0	Active High	
	pin Polarity	1:Active High	1	Active Low	
0	Remote Ctrl On/Off	Primary Remote Control (RC Pin) configuration. Bit 0 - PriRC	0	Soft Stop	Pre-configured ramp down time set TOFF_FALL.
		Disable Mode: 0:Soft-Stop 1:Quick Off	1	Quick Off	Disables the output immediately.

MFR_VFF_PARAMS (0xE6)

Description: This function is dependent of voltage levels internal to the control IC. It is not recommended to change the parameters Extra compensation, Vin stable threshold and Reference DAC threshold.

Bit	Function	Description	Format
31:24	Extra compensation threshold	Set a threshold where extra compensation of the VFF response is needed. The extra compensation cut the duty cycle with 50% during one period. Too low threshold creates false triggering with noisy output voltage.	Integer Unsigned
23:16	Vin stable threshold	Set a threshold where the input voltage is considered stable and a ready for new VFF response	Integer Unsigned
15:8	Reference DAC fast recover threshold	Below this threshold the reference DAC is adjusted one LSB each interrupt (~27us) otherwise it is adjusted 3 LSB.	Integer Unsigned

Bit	Function	Description	Value	Description
0	Enable VFF, (Voltage		0	Disabled
	Feed Forward)		1	Enabled

MFR_TEMP_COEFF (0xE7)

Description: Temperature coefficient

Bit	Function	Description	Format	Unit
47:40	Mfr. Temp level 2 Comp Factor	The temperature compensation factor for current sense above temperature level 2, used to compensate IOUT_READ value.	Integer Unsigned	

BMR683 Series DC-DC Converters	1/28701-BMR683 Rev.A	Sept 2020
Input 36 - 60 V, Output up to 17.9 A / 500 W	© Flex	

Bit	Function	Description	Format	Unit
39:32	Mfr. Temp level 2 Comp	The second temperature level used to compensate IOUT_READ.	Integer Unsigned	°C
31:24	Mfr. Temp level 1 Comp Factor	The temperature compensation factor for current sense above temperature level 1, used to compensate IOUT_READ value.	Integer Unsigned	
23:16	Mfr. Temp level 1 Comp	The first temperature level used to compensate IOUT_READ.	Integer Unsigned	°C
15:0	Mfr. Temp Coeff Cu	The temperature coefficient for copper.	Direct	

MFR_FILTER_COEFF (0xE8) Description: Mfr. filter coefficients

Bit	Function	Description	Format
215:2 11	CLA scale	Filter Misc Gain Coefficient: CLA SCALE	Integer Unsigned
210:2 08	yn scale	Filter Misc Gain Coefficient: YN SCALE	Integer Unsigned

MFR_MIN_DUTY (0xEB)

Description: Set the minimum duty cycle and minimum deadtime at min duty.

Bit	Function	Description	Format	Unit
15:8	Mfr. Min duty		Integer Unsigned	ns
7:0	Mfr. Minimum deadtime		Integer Unsigned	ns

BMR683 Series DC-DC Converters	1/28701-BMR683 Rev.A	Sept 2020
Input 36 - 60 V, Output up to 17.9 A / 500 W	© Flex	

MFR_ACTIVE_CLAMP (0xEC)

Description: Active clamp

Bit	Function	Description	Format	Unit
14:8	Mfr. pulse delay	Set the delay of the pulse to the active clamp.	Integer Unsigned	x4 ns
7:0	Mfr. pulse width	Set the pulse width to the active clamp.	Integer Unsigned	x4 ns

Bit	Function	Description	Value	Function	Description
15	Active Clamp	Set the mode of the active clamp,	0	1x frequency	Set 1x frequency inverted
	mode	1x frequency A and B output		inverted	
		inverted outputs phase/2x	1	2x frequency	Set2x frequency non-inverted
		frequency on A only non-inverted		non-inverted	·

MFR_OFFSET_ADDRESS (0xEE)

Description: Value (n) add an offset to the address on SA0 pin when SA1 pin on the digital connector is used for synchronisation.

Bit De	Description	Format	Unit
7:0		Integer Unsigned	n + SA0

MFR_DBV_CONFIG (0xEF)

Description: Configuration of Dynamic Bus Voltage.

Bit	Function	Description	Format	Unit
47:40	lout Level mid to high	lout level mid to high transition.	Fixed Point Unsigned	А
39:32	lout Level high to mid	lout level high to mid transition.	Fixed Point Unsigned	А
31:24	Output Voltage Mid	Output Voltage Mid.	Fixed Point Unsigned	V
23:16	lout Level low to mid	lout level low to mid transition.	Fixed Point Unsigned	А
15:8	lout Level mid to low	lout level mid to low transition.	Fixed Point Unsigned	А
7:0	Output Voltage Low	Output Voltage Low.	Fixed Point Unsigned	V

MFR_DEBUG_BUFF (0xF0)

Description: Output contents in debug_buf.

Bit	Description	Format
63:0	Output contents in debug_buf.	Byte Array

MFR_SETUP_PASSWORD (0xF1)

Description: Once a valid new password is sent, the security is turned on.

Bit	Description	Format
95:0	A write is current password (6 bytes, default "00000000000") + new password (6 bytes) A read returns: 0x00000000000000000000000000000000000	ASCII

MFR_DISABLE_SECURITY_ONCE (0xF2)

Description: When security is on, this command is used to temporarily disable the security before the next power reset of the digital PWM controller so that a host can send any command that is either write-protected or sendbyte-protected based on a security bit mask. When security is off, this command will be NACKed.

BMR683 Series DC-DC Converters	1/28701-BMR683 Rev.A	Sept 2020
Input 36 - 60 V, Output up to 17.9 A / 500 W	© Flex	

Bit	Description	Format
47:0	A write is current password (after it was set up with MFR_SETUP_PASSWORD).	ASCII

MFR_SECURITY_BIT_MASK (0xF4)

Description: This command is used to individually enable or disable security feature for a write-protectable or sendbyte-protectable PMBUS command.

Bit	Description	Format
255:0	When protection is enabled for a PMBUS command and when security is on, the PMBUS	Byte Array
	command is write-protected or send- byte-protected.	

MFR_TRANSFORMER_TURN (0xF5)

Description: Transformer turn ratio.

Bit	Function	Description	Format
7:4	Mfr. Primary Turn	Number of turn on the primary side of transformer.	Integer Unsigned
3:0	Mfr. secondary Turn	Number of turn on the secondary side of transformer.	Integer Unsigned

MFR_OSC_TRIM (0xF6)

Description: Internal clock frequency trim value

Bit	Description	Format
7:0	Internal clock frequency trim value.	Integer Unsigned

MFR_DLC_CONFIG (0xF7)

Description: Configuration of Dynamic Loop Compensation at start up.

Bit	Function	Description	Format	Unit
63:56	Ramp Factor 3, (K3)	Ramp factor for third limit. The value in Ramp Factor 3 is multiplied with the TON_RISE value, to calculate a new TON_RISE slope. The new calculated slope will immediately act as TON_RISE	Fixed Point Signed	
55:48	Third Limit	Third limit for adjustment. When the capacitance estimation reaches over the third limit RAMP_FACTOR_3 is used and the PID setting in Bank 3 is chosen. To change PID settings in Bank 3, 0xD5 must be set to 0x03 after that 0xE8 and 0xE9 can be adjusted.	Fixed Point Signed	mF
47:40	Ramp Factor 2, (K2)	Ramp factor for second limit. The value in Ramp Factor 2 is multiplied with the TON_RISE value, to calculate a new TON_RISE slope. The new calculated slope will immediately act as TON_RISE	Fixed Point Signed	
39:32	Second Limit	Second limit for adjustment. When the capacitance estimation reach over the second limit RAMP_FACTOR_2 is used.		mF
31:24	Ramp Factor 1, (K1)			
23:16	First Limit	First limit for adjustment. When the capacitance estimation reach over the first limit RAMP_FACTOR_1 is used.		mF
15:8	Voltage End	Set the end level on the Vout ramp ON for the output cap estimation measurement.		V
7:0	Voltage Start	Set the start and end levels on the Vout ramp ON for the output cap estimation measurement.	Fixed Point Signed	V

MFR_ILIM_SOFTSTART (0xF8)

Description: During soft start ILIM is more than the user setting. The value set in this command is in % added ILIM.

Bit	Description	Format	Unit
7:0		Integer	%
		Unsigned	

BMR683 Series DC-DC Converters	1/28701-BMR683 Rev.A	Sept 2020
Input 36 - 60 V, Output up to 17.9 A / 500 W	© Flex	

MFR_MULTI_PIN_CONFIG (0xF9)

Description: The MFR_MULTI_PIN_CONFIG command can be re-configured to enable or disable different functions and set the pin configuration of the digital header (K400) (pin 6-15).

Bit	Function	Description	Value	Function	Description
6:5	Sync Mode	These bits enables or disables the	00	Disabled	
		SYNC function. When enabling choose between SYNC OUT or SYNC IN.	01	Sync in	When the product is configured to SYNC in it will synchronize its switching frequency to the product configured as SYNC out. The switching phases can be spread individually using the INTERLEAVE command 0x37
			10	Sync out	When the product is configured to SYNC out it will send out a SYNC signal that BMR458 products can connect its SYNC in pin. Only 1 product i a group can be configured to SYNC out.
3	SA1 as Sync	Change function of Pin 9 on the digital header (K400). This pin can be used as SA1 or SYNC in/out	0	SA1 normal	Pin 9 configured to set the PMBus address with a resistor connected to pin 9
			1	SA1 as Sync	Pin 9 configured to be used as SYNC input/output
2	Power Good	This bit enable or disable the	0	Disabled	·
	Enable	Power Good function	1	Enabled	
1	Power Good Output	Two output options is available for Power Good output, it is Push/Pull	0	Push/Pull	Power Good configured Push/Pull
		or Open Drain	1	Open Drain	Power Good configured Open Drain
0	CTRL Internal	Using CTRL internal resistor can	0	Disabled	
	Resistor	be useful if no external pull up or pull down resistor exist or no Digital header (K400) is mounted.	1	Enabled	

MFR_ADDED_DROOP_DURING_RAMP (0xFC)

Description: Set an added droop during ramp.

Bit	Description	Format	Unit
15:0	Sets an added effective load line (V/I slope) for the rail in which the device is used, during		mV/A
	ramp up.		

MFR_FIRMWARE_DATA (0xFD)

Description: This is a 20-byte block that contains device ID and versions of the firmware.

Bit	Description	Format
159:0	This is a 20-byte block that contains device ID and versions of the firmware.	Byte Array

MFR_RESTART (0xFE)

Description: Writing the string "ERIC" to this command code forces the unit to restart.

Bit	Description	Format
31:0		ASCII
